Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.233.4.35 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.233.4.36 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.233.4.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.233.4.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.233.4.39 eraseSubformulaFromPassedFormula()

```
template<class Settings >
ModuleInput::iterator smtrat::ICPModule< Settings >::eraseSubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	SAT, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented from smtrat::Module.

15.233.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceived↩
VariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.233.4.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.233.4.42 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.233.4.43 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.233.4.44 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.233.4.45 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.233.4.46 getBackendsAllModels()

```
void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]
```

Stores all models of a backend in the list of all models of this module.

15.233.4.47 getBackendsModel()

```
void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]
```

15.233.4.48 getCurrentBoxAsFormulas() template<class Settings >

FormulasT smtrat::ICPModule< Settings >::getCurrentBoxAsFormulas ( ) const

15.233.4.49 getCurrentBoxAsIntervals() template<class Settings >

EvalRationalIntervalMap smtrat::ICPModule< Settings >::getCurrentBoxAsIntervals ( ) const

15.233.4.50 getInfeasibleSubsets() [1/2] void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]

Copies the infeasible subsets of the passed formula.

15.233.4.51 getInfeasibleSubsets() [2/2] std::vector< FormulaSetT > smtrat::Module::getInfeasible↩Subsets (

const Module & *_backend*) const [protected], [inherited]

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.233.4.52 getInformationRelevantFormulas() const std::set< FormulaT > & smtrat::Module::get↩InformationRelevantFormulas ( ) [protected], [inherited]

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.233.4.53 getModelEqualities() std::list< std::vector< carl::Variable > > smtrat::Module↩::getModelEqualities ( ) const [virtual], [inherited]

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.233.4.54 getOrigins() [1/3] void smtrat::Module::getOrigins (

const FormulaT & *_formula*,
FormulaSetT & *_origins*) const [inline], [protected], [inherited]

Parameters

_formula	
_origins	

15.233.4.55 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.233.4.56 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.233.4.57 getReceivedFormulaSimplified()

```
std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]
```

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.233.4.58 hasLemmas()

```
bool smtrat::Module::hasLemmas ( ) [inline], [inherited]
```

Checks whether this module or any of its backends provides any lemmas.

15.233.4.59 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.233.4.60 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.233.4.61 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.233.4.62 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.233.4.63 informBackends() `void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.233.4.64 informCore()

```
template<class Settings >
bool smtrat::ICPModule< Settings >::informCore (
            const FormulaT & _constraint ) [virtual]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented from smtrat::Module.

15.233.4.65 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.233.4.66 init()

```
void smtrat::Module::init ( ) [virtual], [inherited]
```

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.233.4.67 is_minimizing()

```
bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]
```

15.233.4.68 isLemmaLevel()

```
bool smtrat::Module::isLemmaLevel (
            LemmaLevel level ) [protected], [inherited]
```

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.233.4.69 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.233.4.70 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.233.4.71 merge()

```
std::vector< FormulaT > smtrat::Module::merge (
    const std::vector< FormulaT > & _vecSetA,
    const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]
```

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.233.4.72 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.233.4.73 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.233.4.74 moduleName()

```
template<class Settings>
std::string smtrat::ICPModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.233.4.75 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

15.233.4.76 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.233.4.77 passedFormulaBegin()

```
ModuleInput::iterator smtrat::Module::passedFormulaBegin ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula. TODO: disable this method

15.233.4.78 passedFormulaEnd()

```
ModuleInput::iterator smtrat::Module::passedFormulaEnd ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula.

15.233.4.79 pPassedFormula()

```
const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline],
[inherited]
```

Returns A pointer to the formula passed to the backends of this module.

15.233.4.80 pReceivedFormula()

```
const ModuleInput* smtrat::Module::pReceivedFormula ( ) const
[inline], [inherited]
```

Returns A pointer to the formula passed to this module.

15.233.4.81 print()

```
void smtrat::Module::print (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.233.4.82 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.233.4.83 printInfeasibleSubsets()

`void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.233.4.84 printModel()

`void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.233.4.85 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.233.4.86 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.233.4.87 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.233.4.88 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.233.4.89 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.233.4.90 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.233.4.91 remove()

```
void smtrat::Module::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.233.4.92 removeCore()

```
template<class Settings >
void smtrat::ICPModule< Settings >::removeCore (
            ModuleInput::const_iterator formula ) [virtual]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.233.4.93 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
            ModuleInput::iterator _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.233.4.94 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.233.4.95 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.233.4.96 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.233.4.97 runBackends() [1/2]

`virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]`

Reimplemented in smtrat::PModule.

15.233.4.98 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.233.4.99 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.233.4.100 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.233.4.101 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.233.4.102 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.233.4.103 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.233.4.104 updateAllModels()

`void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.233.4.105 updateLemmas()

`void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.233.4.106 updateModel()

`template<class Settings >`
`void smtrat::ICPModule< Settings >::updateModel ( ) const [virtual]`

Updates the model, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented from smtrat::Module.

15.233.4.107 usedBackends()

`const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.233.5 Field Documentation

15.233.5.1 mAllBackends

`std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.233.5.2 mAllModels

`std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.233.5.3 mBackendsFoundAnswer

`std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.233.5.4 mConstraintsToInform

`carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.233.5.5 mFinalCheck

`bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.233.5.6 mFirstPosInLastBranches

`std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.233.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaToPass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.233.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.233.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.233.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.233.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.233.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.233.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.233.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.233.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.233.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.233.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.233.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.233.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

15.233.5.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.233.5.21 mSmallerMusesCheckCounter

`unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.233.5.22 mSolverState

`std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.233.5.23 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheoryPropagations [protected], [inherited]`

15.233.5.24 mUsedBackends

`std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.233.5.25 mVariableCounters

`std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.234 smtrat::icp::IcpVariable Class Reference

```
#include <IcpVariable.h>
```

Public Member Functions

- std::string moduleName () const
- IncWidthModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=NULL)

  Constructors.
- ~IncWidthModule ()
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())

- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

smtrat::IncWidthModule< Settings >::~IncWidthModule ( )
```

15.240.4 Member Function Documentation

15.240.4.1 add()

```
bool smtrat::Module::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.240.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.240.4.3 addCore()

```
template<class Settings >
bool smtrat::IncWidthModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.240.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.240.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline], [inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.240.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.240.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.240.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.240.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.240.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.240.4.11 allModels()

`const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns All satisfying assignments, if existent.

15.240.4.12 anAnswerFound()

`bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.240.4.13 answerFound()

`const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.240.4.14 backendsModel()

`const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.240.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.240.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.240.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
            const Poly & _polynomial,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.240.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
            const Poly & _polynomial,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.240.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P
>> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.240.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.240.4.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.240.4.22 checkCore()

```
template<class Settings >
Answer smtrat::IncWidthModule< Settings >::checkCore ( )  [virtual]
```

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.240.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
            std::vector< FormulaSetT >::const_iterator _infsubset,
            const std::string & _filename = "smaller_muses",
            unsigned _maxSizeDifference = 1 ) const  [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.240.4.24 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.240.4.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.240.4.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.240.4.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.240.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.240.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.240.4.30 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

15.240.4.31 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.240.4.32 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.240.4.33 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.240.4.34 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.240.4.35 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.240.4.36 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.240.4.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.240.4.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.240.4.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.240.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.240.4.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.240.4.42 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.240.4.43 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.240.4.44 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.240.4.45 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.240.4.46 getBackendsAllModels()

```
void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]
```

Stores all models of a backend in the list of all models of this module.

15.240.4.47 getBackendsModel()

```
void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]
```

15.240.4.48 getInfeasibleSubsets() [1/2]

```
void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]
```

Copies the infeasible subsets of the passed formula.

15.240.4.49 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets (
    const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.240.4.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.240.4.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.240.4.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.240.4.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.240.4.54 getOrigins() [3/3]

`const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.240.4.55 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.240.4.56 hasLemmas()

`bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.240.4.57 hasValidInfeasibleSubset()

`bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.240.4.58 id()

`std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.240.4.59 infeasibleSubsets()

`const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.240.4.60 inform()

`bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.240.4.61 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.240.4.62 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.240.4.63 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.240.4.64 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.240.4.65 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.240.4.66 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.240.4.67 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.240.4.68 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.240.4.69 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.240.4.70 model()

```
const Model& smtrat::Module::model ( ) const [inline], [inherited]
```

Returns The assignment of the current satisfiable result, if existent.

15.240.4.71 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.240.4.72 moduleName()

```
template<typename Settings >
std::string smtrat::IncWidthModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.240.4.73 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

15.240.4.74 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.240.4.75 passedFormulaBegin() `ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.240.4.76 passedFormulaEnd() `ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.240.4.77 pPassedFormula() `const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.240.4.78 pReceivedFormula() `const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.240.4.79 print() `void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.240.4.80 printAllModels() `void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.240.4.81 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.240.4.82 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const  [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.240.4.83 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.240.4.84 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.240.4.85 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const  [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.240.4.86 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

15.240.4.87 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩
InfeasibleSubset (
            ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.240.4.88 receivedVariable()

```
bool smtrat::Module::receivedVariable (
            carl::Variable::Arg _var ) const [inline], [inherited]
```

15.240.4.89 remove()

```
void smtrat::Module::remove (
            ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.240.4.90 removeCore()

```
template<class Settings >
void smtrat::IncWidthModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula ) [virtual]
```

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Reimplemented from smtrat::Module.

15.240.4.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.240.4.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected], [inherited]
```

15.240.4.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.240.4.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.240.4.95 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

15.240.4.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.240.4.97 setId()

```
void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.240.4.98 setThreadPriority()

```
void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.240.4.99 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.240.4.100 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.240.4.101 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.240.4.102 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.240.4.103 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.240.4.104 updateModel() `template<class Settings > void smtrat::IncWidthModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.240.4.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.240.5 Field Documentation

15.240.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.240.5.2 mAllModels

`std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.240.5.3 mBackendsFoundAnswer

`std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.240.5.4 mConstraintsToInform

`carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.240.5.5 mFinalCheck

`bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.240.5.6 mFirstPosInLastBranches

`std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.240.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.240.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::m↩FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.240.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.240.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.240.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.240.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.240.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.240.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.240.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.240.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.240.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.240.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.240.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplitting↩Variables [static], [inherited]`

Reusable splitting variables.

15.240.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.240.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.240.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.240.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.240.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.240.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

```

15.245.5 Field Documentation

15.245.5.1 mBtnumber template<class Settings>

```
unsigned smtrat::InequalitiesTable< Settings >::mBtnumber [protected]
```

The actual number of backtrackpoints.

15.245.5.2 mLastRestart template<class Settings>

```
unsigned smtrat::InequalitiesTable< Settings >::mLastRestart [protected]
```

15.245.5.3 mModule template<class Settings>

```
GBModule<Settings>* smtrat::InequalitiesTable< Settings >::mModule [protected]
```

A pointer to the GBModule which uses this table.

15.245.5.4 mNewConstraints template<class Settings>

```
Rows::iterator smtrat::InequalitiesTable< Settings >::mNewConstraints [protected]
```

15.245.5.5 mReducedInequalities template<class Settings>

```
Rows smtrat::InequalitiesTable< Settings >::mReducedInequalities [protected]
```

A map of pointers from received iterators to rows.

15.246 smtrat::lra::Bound< T1, T2 >::Info Struct Reference

Stores some additional information for a bound.

```
#include <Bound.h>
```

Public Member Functions

- Info (ModuleInput::iterator _position)

Data Fields

- int updated

  A value to store the information whether this bounds constraint has already been processed (=0), must be processed (>0) or must be removed from consideration (<0).

- ModuleInput::iterator position

  The position of this bounds constraint in a formula, if it has been processed already.

- FormulaT neqRepresentation

  If this bound corresponds to a constraint being p<0 or p>0 for a polynomial p, we store here the constraint p!=0.

- bool exists

  A flag which is only false, if this bound has been created for a constraint having != as relation symbol, i.e.

- const Bound< T1, T2 > * complement

15.246.1 Detailed Description

template<typename T1, typename T2>
struct smtrat::lra::Bound< T1, T2 >::Info

Stores some additional information for a bound.

15.246.2 Constructor & Destructor Documentation

15.246.2.1 Info()

```
template<typename T1, typename T2>
smtrat::lra::Bound< T1, T2 >::Info::Info (
            ModuleInput::iterator _position )  [inline]
```

15.246.3 Field Documentation

15.246.3.1 complement

```
template<typename T1, typename T2>
const Bound<T1, T2>* smtrat::lra::Bound< T1, T2 >::Info::complement
```

15.246.3.2 exists

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::Info::exists
```

A flag which is only false, if this bound has been created for a constraint having != as relation symbol, i.e.

p!=0, and not yet for the constraint p<0 or p>0.

15.246.3.3 neqRepresentation

```
template<typename T1, typename T2>
FormulaT smtrat::lra::Bound< T1, T2 >::Info::neqRepresentation
```

If this bound corresponds to a constraint being p<0 or p>0 for a polynomial p, we store here the constraint p!=0.

15.246.3.4 position

```
template<typename T1, typename T2>
ModuleInput::iterator smtrat::lra::Bound< T1, T2 >::Info::position
```

The position of this bounds constraint in a formula, if it has been processed already.

Otherwise it points to the end of a formula.

15.246.3.5 updated

`template<typename T1, typename T2>`
`int smtrat::lra::Bound< T1, T2 >::Info::updated`

A value to store the information whether this bounds constraint has already been processed (=0), must be processed (>0) or must be removed from consideration (<0).

15.249.1 Member Typedef Documentation

15.249.1.1 Value `typedef types::AttributeValue smtrat::parser::InstructionHandler::Value`

15.249.2 Constructor & Destructor Documentation

15.249.2.1 InstructionHandler() `smtrat::parser::InstructionHandler::InstructionHandler ( ) [inline]`

15.249.2.2 ~InstructionHandler() `virtual smtrat::parser::InstructionHandler::~InstructionHandler ( ) [inline], [virtual]`

15.249.3 Member Function Documentation

15.249.3.1 add() `virtual void smtrat::parser::InstructionHandler::add ( const FormulaT & f ) [pure virtual]`

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.2 addInstruction() `void smtrat::parser::InstructionHandler::addInstruction ( std::function< void() > bind ) [inline]`

15.249.3.3 addObjective()

```
virtual void smtrat::parser::InstructionHandler::addObjective (
    const Poly & p,
    OptimizationType ot )  [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.4 addSoft()

```
virtual void smtrat::parser::InstructionHandler::addSoft (
    const FormulaT & f,
    Rational weight,
    const std::string & id )  [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.5 annotateName()

```
virtual void smtrat::parser::InstructionHandler::annotateName (
    const FormulaT & f,
    const std::string & name )  [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.6 check()

```
virtual void smtrat::parser::InstructionHandler::check ( )  [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.7 cleanModel()

```
void smtrat::parser::InstructionHandler::cleanModel (
    smtrat::Model & model ) const  [inline]
```

15.249.3.8 declareFun()

```
virtual void smtrat::parser::InstructionHandler::declareFun (
    const carl::Variable &  )  [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.9 declareSort()

```
virtual void smtrat::parser::InstructionHandler::declareSort (
    const std::string & ,
    const unsigned &  )  [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.10 defineSort()

```
virtual void smtrat::parser::InstructionHandler::defineSort (
    const std::string & ,
    const std::vector< std::string > & ,
    const carl::Sort &  )  [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.11 diagnostic() [1/2]

```
std::ostream& smtrat::parser::InstructionHandler::diagnostic ( ) [inline]
```

15.249.3.12 diagnostic() [2/2]

```
void smtrat::parser::InstructionHandler::diagnostic (
    const std::string & s ) [inline]
```

15.249.3.13 echo()

```
virtual void smtrat::parser::InstructionHandler::echo (
    const std::string & s ) [inline], [virtual]
```

15.249.3.14 eliminateQuantifiers()

```
virtual void smtrat::parser::InstructionHandler::eliminate↩
Quantifiers (
    const qe::QEQuery & q ) [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.15 error()

```
OutputWrapper smtrat::parser::InstructionHandler::error ( ) [inline]
```

15.249.3.16 exit()

```
virtual void smtrat::parser::InstructionHandler::exit ( ) [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.17 get_info()

```
const auto& smtrat::parser::InstructionHandler::get_info (
    const std::string & key ) const [inline]
```

15.249.3.18 getAllModels()

```
virtual void smtrat::parser::InstructionHandler::getAllModels ( ) [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.19 getAssertions()

```
virtual void smtrat::parser::InstructionHandler::getAssertions ( ) [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.20 getAssignment()

```
virtual void smtrat::parser::InstructionHandler::getAssignment ( ) [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.21 getInfo()

```
void smtrat::parser::InstructionHandler::getInfo (
    const std::string & key ) [inline]
```

15.249.3.22 getModel()

```
virtual void smtrat::parser::InstructionHandler::getModel ( ) [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.23 getObjectives()

```
virtual void smtrat::parser::InstructionHandler::getObjectives ( ) [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.24 getOption()

```
void smtrat::parser::InstructionHandler::getOption (
    const std::string & key ) [inline]
```

15.249.3.25 getProof()

```
virtual void smtrat::parser::InstructionHandler::getProof ( ) [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.26 getUnsatCore()

```
virtual void smtrat::parser::InstructionHandler::getUnsatCore ( ) [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.27 getValue()

```
virtual void smtrat::parser::InstructionHandler::getValue (
    const std::vector< carl::Variable > & ) [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.28 has_info()

```
bool smtrat::parser::InstructionHandler::has_info (
    const std::string & key ) const [inline]
```

15.249.3.29 hasInstructions()

```
bool smtrat::parser::InstructionHandler::hasInstructions ( ) const [inline]
```

15.249.3.30 info()

```
OutputWrapper smtrat::parser::InstructionHandler::info ( ) [inline]
```

15.249.3.31 option()

```
template<typename T >
T smtrat::parser::InstructionHandler::option (
            const std::string & key ) const  [inline]
```

15.249.3.32 pop()

```
virtual void smtrat::parser::InstructionHandler::pop (
            std::size_t  )  [pure virtual]
```

Implemented in smtrat::parseformula::FormulaCollector, and smtrat::Executor< Strategy >.

15.249.3.33 printInstruction()

```
bool smtrat::parser::InstructionHandler::printInstruction ( )
const  [inline]
```

15.249.3.34 push()

```
virtual void smtrat::parser::InstructionHandler::push (
            std::size_t  )  [pure virtual]
```

Implemented in smtrat::parseformula::FormulaCollector, and smtrat::Executor< Strategy >.

15.249.3.35 regular() [1/2]

```
std::ostream& smtrat::parser::InstructionHandler::regular ( )  [inline]
```

15.249.3.36 regular() [2/2]

```
void smtrat::parser::InstructionHandler::regular (
            const std::string & s )  [inline]
```

15.249.3.37 reset()

```
virtual void smtrat::parser::InstructionHandler::reset ( )  [inline], [virtual]
```

Reimplemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.38 resetAssertions()

```
virtual void smtrat::parser::InstructionHandler::resetAssertions
( )  [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.39 runInstructions()

```
void smtrat::parser::InstructionHandler::runInstructions ( )  [inline]
```

15.249.3.40 setArtificialVariables()

```
void smtrat::parser::InstructionHandler::setArtificial↩
Variables (
            std::vector< smtrat::ModelVariable > && vars )  [inline]
```

15.249.3.41 setInfo()

```
void smtrat::parser::InstructionHandler::setInfo (
    const Attribute & attr ) [inline]
```

15.249.3.42 setLogic()

```
virtual void smtrat::parser::InstructionHandler::setLogic (
    const carl::Logic & ) [pure virtual]
```

Implemented in smtrat::Executor< Strategy >, and smtrat::parseformula::FormulaCollector.

15.249.3.43 setOption()

```
void smtrat::parser::InstructionHandler::setOption (
    const Attribute & option ) [inline]
```

15.249.3.44 setStream()

```
void smtrat::parser::InstructionHandler::setStream (
    const std::string & s,

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- IntBlastModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=NULL)

  Constructors.
- ~IntBlastModule ()

  Destructor.
- bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.

- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const

- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩ Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩ _premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())

- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.

- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.

- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.

- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.251.4 Member Function Documentation

15.251.4.1 add() `bool smtrat::Module::add (`

```
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.251.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.251.4.3 addCore()

```
template<class Settings >
bool smtrat::IntBlastModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.251.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.251.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline], [inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.251.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.251.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.251.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.251.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.251.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.251.4.11 allModels() `const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns All satisfying assignments, if existent.

15.251.4.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.251.4.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.251.4.14 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.251.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.251.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.251.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.251.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.251.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.251.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.251.4.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.251.4.22 checkCore()

```
template<class Settings >
Answer smtrat::IntBlastModule< Settings >::checkCore ( )  [virtual]
```

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.251.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
            std::vector< FormulaSetT >::const_iterator _infsubset,
            const std::string & _filename = "smaller_muses",
            unsigned _maxSizeDifference = 1 ) const  [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.251.4.24 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.251.4.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.251.4.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.251.4.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.251.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.251.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.251.4.30 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

15.251.4.31 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.251.4.32 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.251.4.33 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.251.4.34 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.251.4.35 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.251.4.36 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.251.4.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.251.4.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.251.4.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.251.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceived↩
VariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.251.4.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.251.4.42 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.251.4.43 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.251.4.44 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.251.4.45 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.251.4.46 getBackendsAllModels()

```
void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]
```

Stores all models of a backend in the list of all models of this module.

15.251.4.47 getBackendsModel()

```
void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]
```

15.251.4.48 getInfeasibleSubsets() [1/2]

```
void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]
```

Copies the infeasible subsets of the passed formula.

15.251.4.49 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets (
    const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.251.4.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.251.4.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.251.4.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.251.4.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.251.4.54 getOrigins() [3/3] const FormulaT& smtrat::Module::getOrigins (ModuleInput::const_iterator _formula) const [inline], [protected], [inherited]

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.251.4.55 getReceivedFormulaSimplified() std::pair< bool, FormulaT > smtrat::Module::get↩ ReceivedFormulaSimplified ( ) [virtual], [inherited]

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.251.4.56 hasLemmas() bool smtrat::Module::hasLemmas ( ) [inline], [inherited]

Checks whether this module or any of its backends provides any lemmas.

15.251.4.57 hasValidInfeasibleSubset() bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.251.4.58 id() std::size_t smtrat::Module::id ( ) const [inline], [inherited]

Returns A unique ID to identify this module instance.

15.251.4.59 infeasibleSubsets() const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.251.4.60 inform() bool smtrat::Module::inform (const FormulaT & _constraint) [inherited]

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.251.4.61 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.251.4.62 informCore()

```
template<class Settings >
bool smtrat::IntBlastModule< Settings >::informCore (
    const FormulaT & _constraint ) [virtual]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented from smtrat::Module.

15.251.4.63 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.251.4.64 init()

```
template<class Settings >
void smtrat::IntBlastModule< Settings >::init ( ) [virtual]
```

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not and will not be called more than once and only before the first runBackends call.

Reimplemented from smtrat::Module.

15.251.4.65 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.251.4.66 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.251.4.67 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.251.4.68 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.251.4.69 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.251.4.70 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.251.4.71 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.251.4.72 moduleName()

```
template<class Settings>
std::string smtrat::IntBlastModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.251.4.73 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

15.251.4.74 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.251.4.75 passedFormulaBegin()

```
ModuleInput::iterator smtrat::Module::passedFormulaBegin ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula. TODO: disable this method

15.251.4.76 passedFormulaEnd()

```
ModuleInput::iterator smtrat::Module::passedFormulaEnd ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula.

15.251.4.77 pPassedFormula()

```
const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline],
[inherited]
```

Returns A pointer to the formula passed to the backends of this module.

15.251.4.78 pReceivedFormula()

```
const ModuleInput* smtrat::Module::pReceivedFormula ( ) const
[inline], [inherited]
```

Returns A pointer to the formula passed to this module.

15.251.4.79 print()

```
void smtrat::Module::print (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.251.4.80 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.251.4.81 printInfeasibleSubsets()

`void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.251.4.82 printModel()

`void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.251.4.83 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.251.4.84 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.251.4.85 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.251.4.86 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.251.4.87 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.251.4.88 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.251.4.89 remove()

```
void smtrat::Module::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.251.4.90 removeCore()

```
template<class Settings >
void smtrat::IntBlastModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula ) [virtual]
```

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Reimplemented from smtrat::Module.

15.251.4.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
            ModuleInput::iterator _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.251.4.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.251.4.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.251.4.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.251.4.95 runBackends() [1/2]

`virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]`

Reimplemented in smtrat::PModule.

15.251.4.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.251.4.97 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.251.4.98 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.251.4.99 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.251.4.100 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.251.4.101 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.251.4.102 updateAllModels()

`void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.251.4.103 updateLemmas()

`void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.251.4.104 updateModel()

`template<class Settings > void smtrat::IntBlastModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.251.4.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.251.5 Field Documentation

15.251.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.251.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.251.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.251.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.251.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.251.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.251.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.251.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.251.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.251.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.251.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.251.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.251.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.251.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.251.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.251.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.251.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.251.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.251.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

15.251.5.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.251.5.21 mSmallerMusesCheckCounter

`unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.251.5.22 mSolverState

`std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.251.5.23 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheoryPropagations [protected], [inherited]`

15.251.5.24 mUsedBackends

`std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.251.5.25 mVariableCounters

`std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.252 smtrat::IntEqModule< Settings > Class Template Reference

A module which checks whether the equations contained in the received (linear integer) formula have a solution.

```
#include <IntEqModule.h>
```

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- IntEqModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=NULL)

  Constructors.
- ~IntEqModule ()
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const

- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const

- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())

- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

Stores the constraints which the backends must be informed about.

- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.

- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.252.1 Detailed Description

template<typename Settings>
class smtrat::IntEqModule< Settings >

A module which checks whether the equations contained in the received (linear integer) formula have a solution.

15.252.2 Member Typedef Documentation

15.252.2.1 SettingsType

```
template<typename Settings >
typedef Settings smtrat::IntEqModule< Settings >::SettingsType
```

15.252.3 Member Enumeration Documentation

15.252.3.1 LemmaType

```
enum smtrat::Module::LemmaType : unsigned [strong], [inherited]
```

Enumerator

NORMAL	
PERMANENT	

15.252.4 Constructor & Destructor Documentation

15.252.4.1 IntEqModule()

```
template<class Settings >
smtrat::IntEqModule< Settings >::IntEqModule (
            const ModuleInput * _formula,
            Conditionals & _conditionals,
            Manager * _manager = NULL )
```

Constructors.

15.252.4.2 ~IntEqModule()

```
template<typename Settings >
smtrat::IntEqModule< Settings >::~IntEqModule ( ) [inline]
```

15.252.5 Member Function Documentation

15.252.5.1 add()

```
bool smtrat::Module::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.252.5.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.252.5.3 addCore()

```
template<class Settings >
bool smtrat::IntEqModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.252.5.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.252.5.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline], [inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.252.5.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.252.5.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.252.5.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.252.5.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.252.5.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.252.5.11 allModels()

`const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns All satisfying assignments, if existent.

15.252.5.12 anAnswerFound()

`bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.252.5.13 answerFound()

`const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.252.5.14 backendsModel()

`const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.252.5.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.252.5.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.252.5.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
            const Poly & _polynomial,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.252.5.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
            const Poly & _polynomial,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.252.5.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P
>> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.252.5.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.252.5.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.252.5.22 checkCore()

```
template<class Settings >
Answer smtrat::IntEqModule< Settings >::checkCore ( )  [virtual]
```

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.252.5.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
            std::vector< FormulaSetT >::const_iterator _infsubset,
            const std::string & _filename = "smaller_muses",
            unsigned _maxSizeDifference = 1 ) const  [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.252.5.24 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.252.5.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.252.5.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.252.5.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.252.5.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.252.5.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.252.5.30 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

15.252.5.31 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.252.5.32 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.252.5.33 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.252.5.34 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.252.5.35 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.252.5.36 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.252.5.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.252.5.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.252.5.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.252.5.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.252.5.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.252.5.42 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.252.5.43 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.252.5.44 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.252.5.45 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.252.5.46 getBackendsAllModels()

```
void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]
```

Stores all models of a backend in the list of all models of this module.

15.252.5.47 getBackendsModel()

```
void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]
```

15.252.5.48 getInfeasibleSubsets() [1/2]

```
void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]
```

Copies the infeasible subsets of the passed formula.

15.252.5.49 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets (
    const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.252.5.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.252.5.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.252.5.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.252.5.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.252.5.54 getOrigins() [3/3]

`const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.252.5.55 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.252.5.56 hasLemmas()

`bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.252.5.57 hasValidInfeasibleSubset()

`bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.252.5.58 id()

`std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.252.5.59 infeasibleSubsets()

`const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.252.5.60 inform()

`bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.252.5.61 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.252.5.62 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.252.5.63 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.252.5.64 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.252.5.65 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.252.5.66 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.252.5.67 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.252.5.68 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.252.5.69 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.252.5.70 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.252.5.71 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.252.5.72 moduleName() `template<typename Settings > std::string smtrat::IntEqModule< Settings >::moduleName ( ) const [inline], [virtual]`

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.252.5.73 objective() `carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.252.5.74 originInReceivedFormula() `bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

15.252.5.75 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.252.5.76 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.252.5.77 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.252.5.78 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.252.5.79 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.252.5.80 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.252.5.81 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.252.5.82 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const  [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.252.5.83 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.252.5.84 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.252.5.85 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const  [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.252.5.86 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

15.252.5.87 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

15.252.5.88 receivedVariable()

`bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

15.252.5.89 remove()

`void smtrat::Module::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.252.5.90 removeCore()

`template<class Settings > void smtrat::IntEqModule< Settings >::removeCore ( ModuleInput::const_iterator _subformula ) [virtual]`

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Reimplemented from smtrat::Module.

15.252.5.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.252.5.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected], [inherited]
```

15.252.5.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.252.5.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.252.5.95 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

15.252.5.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.252.5.97 setId()

```
void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.252.5.98 setThreadPriority()

```
void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.252.5.99 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.252.5.100 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.252.5.101 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.252.5.102 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.252.5.103 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.252.5.104 updateModel() `template<class Settings > void smtrat::IntEqModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.252.5.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.252.6 Field Documentation

15.252.6.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.252.6.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.252.6.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.252.6.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.252.6.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.252.6.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.252.6.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.252.6.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module::m↩FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.252.6.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.252.6.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.252.6.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.252.6.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.252.6.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.252.6.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.252.6.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.252.6.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.252.6.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.252.6.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.252.6.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplitting↩Variables [static], [inherited]`

Reusable splitting variables.

15.252.6.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.252.6.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.252.6.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.252.6.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.252.6.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.252.6.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

```

15.262 benchmax::Jobs Class Reference

Represents a set of jobs, constructed as the cartesian product of a set of tools and a set of benchmarks.

```
#include <Jobs.h>
```

Public Member Functions

- Jobs (const Tools &tools, const BenchmarkSet &benchmarks)

  Construct jobs from a set of tools and a set of benchmark files.
- const auto & tools () const

  Returns the set of tools.
- const auto & files () const

  Returns the set of files.
- auto size () const

  Returns the overall number of jobs.
- auto begin () const

  Begin iterator.
- auto end () const

  End iterator.
- auto randomized () const

  Returns all jobs in a pseudo-randomized order.

15.262.1 Detailed Description Represents a set of jobs, constructed as the cartesian product of a set of tools and a set of benchmarks.

15.262.2 Constructor & Destructor Documentation

15.262.2.1 Jobs()

```
benchmax::Jobs::Jobs (
    const Tools & tools,
    const BenchmarkSet & benchmarks ) [inline]
```

Construct jobs from a set of tools and a set of benchmark files.

15.262.3 Member Function Documentation

15.262.3.1 begin()

```
auto benchmax::Jobs::begin ( ) const [inline]
```

Begin iterator.

15.262.3.2 end()

```
auto benchmax::Jobs::end ( ) const [inline]
```

End iterator.

15.262.3.3 files()

```
const auto& benchmax::Jobs::files ( ) const [inline]
```

Returns the set of files.

15.262.3.4 randomized()

```
auto benchmax::Jobs::randomized ( ) const [inline]
```

Returns all jobs in a pseudo-randomized order.

15.262.3.5 size()

```
auto benchmax::Jobs::size ( ) const [inline]
```

Returns the overall number of jobs.

15.262.3.6 tools()

```
const auto& benchmax::Jobs::tools ( ) const [inline]
```

Returns the set of tools.

15.272 smtrat::mcsat::onecellcad::levelwise::LevelwiseCAD Class Reference

```
#include <OneCellCAD.h>
```

Public Member Functions

- std::optional< CADCell > constructCADCellEnclosingPoint (std::vector< std::vector< TagPoly >> &polys, int sectionHeuristic, int sectorHeuristic)

  Construct a single CADCell that contains the given 'point' and is sign-invariant for the given polynomials in 'polys'.
- OneCellCAD (const std::vector< carl::Variable > &variableOrder, const carl::RealAlgebraicPoint< Rational > &point)
- std::map< carl::Variable, RAN > prefixPointToStdMap (const std::size_t componentCount)

  Create a mapping from the first variables (with index 0 to 'componentCount') in the 'variableOrder' to the first components of the given 'point'.
- std::vector< RAN > isolateLastVariableRoots (const std::size_t polyLevel, const Poly &poly)

  src/lib/datastructures/mcsat/onecellcad/OneCellCAD.h Given a poly p(x1,..,xn), return all roots of the univariate poly p(a1,..,an-1, xn), where a1,..an-1 are the first algebraic real components from 'point' (SORTED!).
- bool vanishesEarly (const std::size_t polyLevel, const Poly &poly)

  Check if an n-variate 'poly' p(x1,..,xn) with n>=1 already becomes the zero poly after plugging in p(a1,..,an-1, xn), where a1,..an-1 are the first n-1 algebraic real components from 'point'.
- bool isPointRootOfPoly (const std::size_t polyLevel, const Poly &poly)
- bool isPointRootOfPoly (const TagPoly &poly)
- std::optional< Poly > coeffNonNull (const TagPoly &boundCandidate)
- bool isMainPointInsideCell (const CADCell &cell)

Data Fields

- const std::vector< carl::Variable > & variableOrder

  Variables can also be indexed by level.
- const carl::RealAlgebraicPoint< Rational > & point

15.272.1 Member Function Documentation

15.272.1.1 coeffNonNull()

```
std::optional<Poly> smtrat::mcsat::onecellcad::OneCellCAD::coeff↩
NonNull (
            const TagPoly & boundCandidate )  [inline], [inherited]
```

15.272.1.2 constructCADCellEnclosingPoint()

```
std::optional<CADCell> smtrat::mcsat::onecellcad↩
::levelwise::LevelwiseCAD::constructCADCellEnclosingPoint (
            std::vector< std::vector< TagPoly >> & polys,
            int sectionHeuristic,
            int sectorHeuristic )  [inline]
```

Construct a single CADCell that contains the given 'point' and is sign-invariant for the given polynomials in 'polys'.

The construction fails if a polynomial vanishes (p(a_1,...,a_i-1,x_i)). Note that this cell is cylindrical only with respect to the given 'variableOrder'.

Parameters

variableOrder	must contain unique variables and at least one, because constant polynomials (without a variable) are prohibited.
point	point.size() >= variables.size().
polys	must contain only non-constant, irreducible tagged polynomials that mention only variables that appear in 'variableOrder'.

Current level is a Section

Projection part for section case

Current level is a Sector

```

src/lib/datastructures/mcsat/onecellcad/OneCellCAD.h Given a poly p(x1,..,xn), return all roots of the univariate poly p(a1,..,an-1, xn), where a1,..an-1 are the first algebraic real components from 'point' (SORTED!).

15.272.1.5 isPointRootOfPoly() [1/2]

```
bool smtrat::mcsat::onecellcad::OneCellCAD::isPointRootOfPoly (
            const std::size_t polyLevel,
            const Poly & poly ) [inline], [inherited]
```

15.272.1.6 isPointRootOfPoly() [2/2]

```
bool smtrat::mcsat::onecellcad::OneCellCAD::isPointRootOfPoly (
            const TagPoly & poly ) [inline], [inherited]
```

15.272.1.7 OneCellCAD()

```
smtrat::mcsat::onecellcad::OneCellCAD::OneCellCAD [inline]
```

15.272.1.8 prefixPointToStdMap()

```
std::map<carl::Variable, RAN> smtrat::mcsat::onecellcad::↩
OneCellCAD::prefixPointToStdMap (
            const std::size_t componentCount ) [inline], [inherited]
```

Create a mapping from the first variables (with index 0 to 'componentCount') in the 'variableOrder' to the first components of the given 'point'.

15.272.1.9 vanishesEarly()

```
bool smtrat::mcsat::onecellcad::OneCellCAD::vanishesEarly (
            const std::size_t polyLevel,
            const Poly & poly ) [inline], [inherited]
```

Check if an n-variate 'poly' p(x1,..,xn) with n>=1 already becomes the zero poly after plugging in p(a1,..,an-1, xn), where a1,..an-1 are the first n-1 algebraic real components from 'point'.

15.272.2 Field Documentation

15.272.2.1 point

```
const carl::RealAlgebraicPoint<Rational>& smtrat::mcsat::onecellcad::One↩
CellCAD::point [inherited]
```

15.272.2.2 variableOrder

```
const std::vector<carl::Variable>& smtrat::mcsat::onecellcad::One↩
CellCAD::variableOrder [inherited]
```

Variables can also be indexed by level.

Polys with mathematical level 1 contain the variable in variableOrder[0]

15.273 smtrat::LevelWiseInformation< Settings > Class Template Reference

15.279 benchmax::LocalBackend Class Reference

This backend simply runs files sequentially on the local machine.

`#include <LocalBackend.h>`

Public Member Functions

- bool suspendable () const
- void process_results (const Jobs &jobs, bool check_finished)
- void addResult (const Tool *tool, const fs::path &file, BenchmarkResult &&result)

  Add a result.
- void run (const Jobs &jobs, bool wait_for_termination)

  Run the list of tools against the list of benchmarks.

Protected Member Functions

- virtual void execute (const Tool *tool, const fs::path &file)

  Execute the tool on the file manually.
- virtual void startTool (const Tool *)

  Hook for every tool at the beginning.
- virtual void finalize ()

  Hook to allow for asynchronous backends to wait for jobs to terminate.
- void madeProgress (std::size_t files=1)

  Can be called to give information about the current progress, if available.
- virtual bool collect_results (const Jobs &, bool)
- void sanitize_results (const Jobs &jobs) const
- void write_results (const Jobs &jobs) const

Protected Attributes

- std::size_t mExpectedJobs

  Number of jobs that should be run.
- std::atomic< std::size_t > mFinishedJobs

  Number of jobs that are finished.
- std::atomic< std::size_t > mLastPercent

  Percentage of finished jobs when madeProgress() was last called.

15.279.1 Detailed Description

This backend simply runs files sequentially on the local machine.

15.279.2 Member Function Documentation

15.279.2.1 addResult()

```
void benchmax::Backend::addResult (
    const Tool * tool,
    const fs::path & file,
    BenchmarkResult && result ) [inline], [inherited]
```

Add a result.

15.279.2.2 collect_results()

```
virtual bool benchmax::Backend::collect_results (
    const Jobs & ,
    bool ) [inline], [protected], [virtual], [inherited]
```

15.279.2.3 execute()

```
virtual void benchmax::LocalBackend::execute (
    const Tool * tool,
    const fs::path & file ) [inline], [protected], [virtual]
```

Execute the tool on the file manually.

Reimplemented from benchmax::Backend.

15.279.2.4 finalize() `virtual void benchmax::Backend::finalize ( ) [inline], [protected], [virtual], [inherited]`

Hook to allow for asynchronous backends to wait for jobs to terminate.

15.279.2.5 madeProgress() `void benchmax::Backend::madeProgress ( std::size_t files = 1 ) [inline], [protected], [inherited]`

Can be called to give information about the current progress, if available.

15.279.2.6 process_results() `void benchmax::Backend::process_results ( const Jobs & jobs, bool check_finished ) [inline], [inherited]`

15.279.2.7 run() `void benchmax::Backend::run ( const Jobs & jobs, bool wait_for_termination ) [inline], [inherited]`

Run the list of tools against the list of benchmarks.

15.279.2.8 sanitize_results() `void benchmax::Backend::sanitize_results ( const Jobs & jobs ) const [inline], [protected], [inherited]`

15.279.2.9 startTool() `virtual void benchmax::Backend::startTool ( const Tool * ) [inline], [protected], [virtual], [inherited]`

Hook for every tool at the beginning.

Can be used to upload the tool to some remote system.

15.279.2.10 suspendable() `bool benchmax::Backend::suspendable ( ) const [inline], [inherited]`

15.279.2.11 write_results() `void benchmax::Backend::write_results ( const Jobs & jobs ) const [inline], [protected], [inherited]`

15.279.3 Field Documentation

15.279.3.1 mExpectedJobs `std::size_t benchmax::Backend::mExpectedJobs [protected], [inherited]`

Number of jobs that should be run.

15.279.3.2 mFinishedJobs `std::atomic<std::size_t> benchmax::Backend::mFinishedJobs [protected], [inherited]`

Number of jobs that are finished.

15.279.3.3 mLastPercent `std::atomic<std::size_t> benchmax::Backend::mLastPercent [protected], [inherited]`

Percentage of finished jobs when madeProgress() was last called.

15.282.2 Member Function Documentation

15.282.2.1 canEncode() `bool smtrat::LongFormulaEncoder::canEncode ( const ConstraintT & constraint ) [virtual]`

Implements smtrat::PseudoBoolEncoder.

15.282.2.2 doEncode() `boost::optional< FormulaT > smtrat::LongFormulaEncoder::doEncode ( const ConstraintT & constraint ) [protected], [virtual]`

Implements smtrat::PseudoBoolEncoder.

15.282.2.3 encode() `boost::optional< FormulaT > smtrat::PseudoBoolEncoder::encode ( const ConstraintT & constraint ) [inherited]`

Encodes an arbitrary constraint.

Returns encoded formula

15.282.2.4 encodingSize() `Rational smtrat::LongFormulaEncoder::encodingSize ( const ConstraintT & constraint ) [virtual]`

Reimplemented from smtrat::PseudoBoolEncoder.

15.282.2.5 generateVarChain() `FormulaT smtrat::PseudoBoolEncoder::generateVarChain ( const std::set< carl::Variable > & vars, carl::FormulaType type ) [protected], [inherited]`

15.282.2.6 name() `std::string smtrat::LongFormulaEncoder::name ( ) [inline], [virtual]`

Reimplemented from smtrat::PseudoBoolEncoder.

15.282.3 Field Documentation

15.282.3.1 problem_size `std::size_t smtrat::PseudoBoolEncoder::problem_size [inherited]`

15.283 smtrat::LRAModule< Settings > Class Template Reference

A module which performs the Simplex method on the linear part of it's received formula.

```
#include <LRAModule.h>
```

Data Structures

- struct Context

  Stores a formula, being part of the received formula of this module, and the position of this formula in the passed formula.

Public Types

- typedef Settings::BoundType LRABoundType

  Number type of the underlying value of a bound of a variable within the LRAModule.
- typedef Settings::EntryType LRAEntryType

  Type of an entry within the tableau.
- typedef lra::Bound< LRABoundType, LRAEntryType > LRABound

  Type of a bound of a variable within the LRAModule.
- typedef lra::Variable< LRABoundType, LRAEntryType > LRAVariable

  A variable of the LRAModule, being either a original variable or a slack variable representing a linear polynomial.
- typedef lra::Value< LRABoundType > LRAValue

  The type of the assignment of a variable maintained by the LRAModule. It consists of a tuple of two value of the bound type.
- typedef Settings SettingsType
- typedef carl::FastMap< carl::Variable, LRAVariable * > VarVariableMap

  Maps an original variable to it's corresponding LRAModule variable.
- typedef carl::FastPointerMap< typename Poly::PolyType, LRAVariable * > ExVariableMap

  Maps a linear polynomial to it's corresponding LRAModule variable.
- typedef carl::FastMap< FormulaT, std::vector< const LRABound * > * > ConstraintBoundsMap

  Maps constraint to the bounds it represents (e.g., equations represent two bounds)
- typedef carl::FastMap< FormulaT, Context > ConstraintContextMap

  Stores the position of a received formula in the passed formula.
- typedef lra::Tableau< typename Settings::Tableau_settings, LRABoundType, LRAEntryType > LRATableau

  The tableau which is the main data structure maintained by the LRAModule responsible for the pivoting steps.
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- LRAModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=NULL)

  Constructs a LRAModule.
- virtual ~LRAModule ()

  Destructs this LRAModule.
- bool informCore (const FormulaT &_constraint)

  Informs this module about the existence of the given constraint, which means that it could be added in future.
- void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- void init ()

  Initializes the tableau according to all linear constraints, of which this module has been informed.
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

Removes everything related to the given sub-formula of the received formula.

- Answer checkCore ()

  Checks the received formula for consistency.

- Answer checkCore_old ()
- Answer processResult (Answer _result)
- void updateModel () const

  Updates the model, if the solver has detected the consistency of the received formula, beforehand.

- unsigned currentlySatisfied (const FormulaT &) const
- const EvalRationalMap & getRationalModel () const

  Gives a rational model if the received formula is satisfiable.

- Answer optimize (Answer _result)
- Answer checkNotEqualConstraints (Answer _result)
- void processLearnedBounds ()
- void createInfeasibleSubsets (lra::EntryID _tableauEntry)
- EvalRationalIntervalMap getVariableBounds () const

  Returns the bounds of the variables as intervals.

- void printLinearConstraints (std::ostream &_out=std::cout, const std::string _init="") const

  Prints all linear constraints.

- void printNonlinearConstraints (std::ostream &_out=std::cout, const std::string _init="") const

  Prints all non-linear constraints.

- void printConstraintToBound (std::ostream &_out=std::cout, const std::string _init="") const

  Prints the mapping of constraints to their corresponding bounds.

- void printBoundCandidatesToPass (std::ostream &_out=std::cout, const std::string _init="") const

  Prints the strictest bounds, which have to be passed the backend in case.

- void printRationalModel (std::ostream &_out=std::cout, const std::string _init="") const

  Prints the current rational assignment.

- void printTableau (std::ostream &_out=std::cout, const std::string _init="") const

  Prints the current tableau.

- void printVariables (std::ostream &_out=std::cout, const std::string _init="") const

  Prints all lra variables and their assignments.

- const VarVariableMap & originalVariables () const
- const ExVariableMap & slackVariables () const
- const LRAVariable * getSlackVariable (const FormulaT &_constraint) const
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.

- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.

- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.

- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.

- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.

- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const

- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩ Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩ _premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩ Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩ ::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩ AsPremise=false)

- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.

- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.

- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.283.1 Detailed Description

template<class Settings>
class smtrat::LRAModule< Settings >

A module which performs the Simplex method on the linear part of it's received formula.

15.283.2 Member Typedef Documentation

15.283.2.1 ConstraintBoundsMap

```
template<class Settings>
typedef carl::FastMap<FormulaT, std::vector<const LRABound*>*> smtrat::LRAModule< Settings >::ConstraintBoundsMap
```

Maps constraint to the bounds it represents (e.g., equations represent two bounds)

15.283.2.2 ConstraintContextMap

```
template<class Settings>
typedef carl::FastMap<FormulaT, Context> smtrat::LRAModule< Settings >::ConstraintContextMap
```

Stores the position of a received formula in the passed formula.

15.283.2.3 ExVariableMap

```
template<class Settings>
typedef carl::FastPointerMap<typename Poly::PolyType, LRAVariable*> smtrat::LRAModule< Settings >::ExVariableMap
```

Maps a linear polynomial to it's corresponding LRAModule variable.

15.283.2.4 LRABound

```
template<class Settings>
typedef lra::Bound<LRABoundType, LRAEntryType> smtrat::LRAModule< Settings >::LRABound
```

Type of a bound of a variable within the LRAModule.

15.283.2.5 LRABoundType template<class Settings>

```
typedef Settings::BoundType smtrat::LRAModule< Settings >::LRABoundType
```

Number type of the underlying value of a bound of a variable within the LRAModule.

15.283.2.6 LRAEntryType template<class Settings>

```
typedef Settings::EntryType smtrat::LRAModule< Settings >::LRAEntryType
```

Type of an entry within the tableau.

15.283.2.7 LRATableau template<class Settings>

```
typedef lra::Tableau<typename Settings::Tableau_settings, LRABoundType, LRAEntryType> smtrat::LRAModule<
Settings >::LRATableau
```

The tableau which is the main data structure maintained by the LRAModule responsible for the pivoting steps.

15.283.2.8 LRAValue template<class Settings>

```
typedef lra::Value<LRABoundType> smtrat::LRAModule< Settings >::LRAValue
```

The type of the assignment of a variable maintained by the LRAModule. It consists of a tuple of two value of the bound type.

15.283.2.9 LRAVariable template<class Settings>

```
typedef lra::Variable<LRABoundType, LRAEntryType> smtrat::LRAModule< Settings >::LRAVariable
```

A variable of the LRAModule, being either a original variable or a slack variable representing a linear polynomial.

15.283.2.10 SettingsType template<class Settings>

```
typedef Settings smtrat::LRAModule< Settings >::SettingsType
```

15.283.2.11 VarVariableMap template<class Settings>

```
typedef carl::FastMap<carl::Variable, LRAVariable*> smtrat::LRAModule< Settings >::VarVariableMap
```

Maps an original variable to it's corresponding LRAModule variable.

15.283.3 Member Enumeration Documentation

15.283.3.1 LemmaType enum smtrat::Module::LemmaType : unsigned [strong], [inherited]

Enumerator

NORMAL	
PERMANENT	

15.283.4 Constructor & Destructor Documentation

15.283.4.1 LRAModule() template<class Settings >

```
smtrat::LRAModule< Settings >::LRAModule (
            const ModuleInput * _formula,
            Conditionals & _conditionals,
            Manager * _manager = NULL )
```

Constructs a LRAModule.

Parameters

_type	The type of this module being LRAModule.
_formula	The formula passed to this module, called received formula.
_settings	[Not yet used.]
_conditionals	Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
_manager	A reference to the manager of the solver using this module.

15.283.4.2 ~LRAModule() template<class Settings >

```
smtrat::LRAModule< Settings >::~LRAModule ( ) [virtual]
```

Destructs this LRAModule.

15.283.5 Member Function Documentation

15.283.5.1 add() bool smtrat::Module::add (

```
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.283.5.2 addConstraintToInform() void smtrat::Module::addConstraintToInform (

```
            const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.283.5.3 addCore()

```
template<class Settings >
bool smtrat::LRAModule< Settings >::addCore (
            ModuleInput::const_iterator _subformula )  [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.283.5.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
            const FormulaT & formula )  [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.283.5.5 addLemma()

```
void smtrat::Module::addLemma (
            const FormulaT & _lemma,
            const LemmaType & _lt = LemmaType::NORMAL,
            const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) )  [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.283.5.6 addOrigin()

```
void smtrat::Module::addOrigin (
            ModuleInput::iterator _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.283.5.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
            ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.283.5.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.283.5.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.283.5.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.283.5.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.283.5.12 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.283.5.13 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const
[inline], [inherited]
```

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.283.5.14 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.283.5.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.283.5.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.283.5.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.283.5.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.

Parameters

_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.283.5.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.283.5.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.283.5.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.283.5.22 checkCore()

```
template<class Settings >
Answer smtrat::LRAModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.283.5.23 checkCore_old()

```
template<class Settings>
Answer smtrat::LRAModule< Settings >::checkCore_old ( )
```

15.283.5.24 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.283.5.25 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.283.5.26 checkNotEqualConstraints()

```
template<class Settings >
Answer smtrat::LRAModule< Settings >::checkNotEqualConstraints (
    Answer _result )
```

15.283.5.27 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.283.5.28 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.283.5.29 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.283.5.30 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.283.5.31 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.283.5.32 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.283.5.33 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.283.5.34 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.283.5.35 constraintsToInform()

```
const carl::FastSet<FormulaT>& smtrat::Module::constraints↩
ToInform ( ) const  [inline], [inherited]
```

Returns The constraints which the backends must be informed about.

15.283.5.36 createInfeasibleSubsets()

```
template<class Settings >
void smtrat::LRAModule< Settings >::createInfeasibleSubsets (
            lra::EntryID _tableauEntry )
```

15.283.5.37 currentlySatisfied()

```
template<class Settings >
unsigned smtrat::LRAModule< Settings >::currentlySatisfied (
            const FormulaT & _formula ) const  [virtual]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise

Reimplemented from smtrat::Module.

15.283.5.38 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
            const FormulaT & _formula ) const  [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.283.5.39 deinform()

```
void smtrat::Module::deinform (
            const FormulaT & _constraint )  [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.283.5.40 deinformCore()

```
template<class Settings >
void smtrat::LRAModule< Settings >::deinformCore (
            const FormulaT & _constraint )  [virtual]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented from smtrat::Module.

15.283.5.41 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.283.5.42 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.283.5.43 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.283.5.44 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.283.5.45 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.283.5.46 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.283.5.47 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

15.283.5.48 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.283.5.49 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.283.5.50 getBackendsModel()

`void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.283.5.51 getInfeasibleSubsets() [1/2]

`void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.283.5.52 getInfeasibleSubsets() [2/2]

`std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.283.5.53 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.283.5.54 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.283.5.55 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.283.5.56 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.283.5.57 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.283.5.58 getRationalModel()

```
template<class Settings >
const EvalRationalMap & smtrat::LRAModule< Settings >::getRationalModel ( ) const
```

Gives a rational model if the received formula is satisfiable.

Note, that it is calculated from scratch every time you call this method.

Returns The rational model.

15.283.5.59 getReceivedFormulaSimplified()

```
std::pair< bool, FormulaT > smtrat::Module::get↩
ReceivedFormulaSimplified ( ) [virtual], [inherited]
```

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.283.5.60 getSlackVariable()

```
template<class Settings>
const LRAVariable* smtrat::LRAModule< Settings >::getSlackVariable (
    const FormulaT & _constraint ) const [inline]
```

Parameters

_constraint	The constraint to get the slack variable for.

Returns The slack variable constructed for the linear polynomial without the constant part in the given constraint.

15.283.5.61 getVariableBounds() `template<class Settings >`
`EvalRationalIntervalMap smtrat::LRAModule< Settings >::getVariableBounds ( ) const`

Returns the bounds of the variables as intervals.

Returns The bounds of the variables as intervals.

15.283.5.62 hasLemmas() `bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.283.5.63 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.283.5.64 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.283.5.65 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.283.5.66 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.283.5.67 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.283.5.68 informCore()

```
template<class Settings >
bool smtrat::LRAModule< Settings >::informCore (
    const FormulaT & _constraint ) [virtual]
```

Informs this module about the existence of the given constraint, which means that it could be added in future.

Parameters

_constraint	The constraint to inform about.

Returns false, if the it can be determined that the constraint itself is conflicting; true, otherwise.

Reimplemented from smtrat::Module.

15.283.5.69 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.283.5.70 init()

```
template<class Settings >
void smtrat::LRAModule< Settings >::init ( ) [virtual]
```

Initializes the tableau according to all linear constraints, of which this module has been informed.

Reimplemented from smtrat::Module.

15.283.5.71 is_minimizing()

```
bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]
```

15.283.5.72 isLemmaLevel()

```
bool smtrat::Module::isLemmaLevel (
    LemmaLevel level ) [protected], [inherited]
```

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.283.5.73 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.283.5.74 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.283.5.75 merge()

```
std::vector< FormulaT > smtrat::Module::merge (
    const std::vector< FormulaT > & _vecSetA,
    const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]
```

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.283.5.76 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.283.5.77 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.283.5.78 moduleName()

```
template<class Settings>
std::string smtrat::LRAModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.283.5.79 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

15.283.5.80 optimize()

```
template<class Settings >
Answer smtrat::LRAModule< Settings >::optimize (
            Answer _result )
```

15.283.5.81 originalVariables()

```
template<class Settings>
const VarVariableMap& smtrat::LRAModule< Settings >::originalVariables ( ) const [inline]
```

Returns A constant reference to the original variables.

15.283.5.82 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
            const FormulaT & _origin ) const [protected], [inherited]
```

15.283.5.83 passedFormulaBegin()

```
ModuleInput::iterator smtrat::Module::passedFormulaBegin ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula. TODO: disable this method

15.283.5.84 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.283.5.85 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.283.5.86 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.283.5.87 print()

```
void smtrat::Module::print (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.283.5.88 printAllModels()

```
void smtrat::Module::printAllModels (
    std::ostream & _out = std::cout ) [inherited]
```

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.283.5.89 printBoundCandidatesToPass()

```
template<class Settings>
void smtrat::LRAModule< Settings >::printBoundCandidatesToPass (
    std::ostream & _out = std::cout,
    const std::string _init = "" ) const
```

Prints the strictest bounds, which have to be passed the backend in case.

Parameters

_out	The output stream to print on.
_init	The beginning of each line to print.

15.283.5.90 printConstraintToBound()

```
template<class Settings>
void smtrat::LRAModule< Settings >::printConstraintToBound (
            std::ostream & _out = std::cout,
            const std::string _init = "" ) const
```

Prints the mapping of constraints to their corresponding bounds.

Parameters

_out	The output stream to print on.
_init	The beginning of each line to print.

15.283.5.91 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
            const std::string & _initiation = "***" ) const  [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.283.5.92 printLinearConstraints()

```
template<class Settings>
void smtrat::LRAModule< Settings >::printLinearConstraints (
            std::ostream & _out = std::cout,
            const std::string _init = "" ) const
```

Prints all linear constraints.

Parameters

_out	The output stream to print on.
_init	The beginning of each line to print.

15.283.5.93 printModel()

```
void smtrat::Module::printModel (
            std::ostream & _out = std::cout ) const  [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.283.5.94 printNonlinearConstraints()

```
template<class Settings>
void smtrat::LRAModule< Settings >::printNonlinearConstraints (
            std::ostream & _out = std::cout,
            const std::string _init = "" ) const
```

Prints all non-linear constraints.

Parameters

_out	The output stream to print on.
_init	The beginning of each line to print.

15.283.5.95 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
            const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.283.5.96 printRationalModel()

```
template<class Settings>
void smtrat::LRAModule< Settings >::printRationalModel (
            std::ostream & _out = std::cout,
            const std::string _init = "" ) const
```

Prints the current rational assignment.

Parameters

_out	The output stream to print on.
_init	The beginning of each line to print.

15.283.5.97 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
            const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.283.5.98 printTableau()

```
template<class Settings>
void smtrat::LRAModule< Settings >::printTableau (
            std::ostream & _out = std::cout,
            const std::string _init = "" ) const
```

Prints the current tableau.

Parameters

_out	The output stream to print on.
_init	The beginning of each line to print.

15.283.5.99 printVariables()

```
template<class Settings>
void smtrat::LRAModule< Settings >::printVariables (
            std::ostream & _out = std::cout,
            const std::string _init = "" ) const
```

Prints all lra variables and their assignments.

Parameters

_out	The output stream to print on.
_init	The beginning of each line to print.

15.283.5.100 probablyLooping()

```
bool smtrat::Module::probablyLooping (
            const typename Poly::PolyType & _branchingPolynomial,
            const Rational & _branchingValue ) const  [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.283.5.101 processLearnedBounds() template<class Settings >

void smtrat::LRAModule< Settings >::processLearnedBounds ( )

15.283.5.102 processResult() template<class Settings >

Answer smtrat::LRAModule< Settings >::processResult (
Answer _result)

15.283.5.103 receivedFormulaChecked() void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]

Notifies that the received formulas has been checked.

15.283.5.104 receivedFormulasAsInfeasibleSubset() void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (

ModuleInput::const_iterator _subformula) [inline], [protected], [inherited]

Stores an infeasible subset consisting only of the given received formula.

15.283.5.105 receivedVariable() bool smtrat::Module::receivedVariable (

carl::Variable::Arg _var) const [inline], [inherited]

15.283.5.106 remove() void smtrat::Module::remove (

ModuleInput::const_iterator _subformula) [virtual], [inherited]

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.283.5.107 removeCore() template<class Settings >

void smtrat::LRAModule< Settings >::removeCore (
ModuleInput::const_iterator _subformula) [virtual]

Removes everything related to the given sub-formula of the received formula.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.283.5.108 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.283.5.109 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected], [inherited]
```

15.283.5.110 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.283.5.111 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.283.5.112 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

15.283.5.113 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.283.5.114 setId()

`void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]`

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.283.5.115 setThreadPriority()

`void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]`

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.283.5.116 slackVariables()

`template<class Settings> const ExVariableMap& smtrat::LRAModule< Settings >::slackVariables ( ) const [inline]`

Returns A constant reference to the slack variables.

15.283.5.117 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.283.5.118 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.283.5.119 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.283.5.120 updateAllModels()

`void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.283.5.121 updateLemmas()

`void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.283.5.122 updateModel()

`template<class Settings > void smtrat::LRAModule< Settings >::updateModel ( ) const [virtual]`

Updates the model, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented from smtrat::Module.

15.283.5.123 usedBackends()

`const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.283.6 Field Documentation

15.283.6.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.283.6.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.283.6.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.283.6.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.283.6.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.283.6.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.283.6.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.283.6.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module::m↩FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.283.6.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.283.6.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.283.6.11 mInfeasibleSubsets `std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.283.6.12 mInformedConstraints `carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.283.6.13 mLastBranches `std::vector< Branching > smtrat::Module::mLastBranches = std↩ ::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.283.6.14 mLemmas `std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.283.6.15 mModel `Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.283.6.16 mModelComputed `bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.283.6.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.283.6.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.283.6.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

15.283.6.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.283.6.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.283.6.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.283.6.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.283.6.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.283.6.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.284 smtrat::LVEModule< Settings > Class Template Reference

`#include <LVEModule.h>`

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- LVEModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- ~LVEModule ()
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- virtual bool addCore (ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.

- virtual void removeCore (ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩ Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩ _premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩ Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩ ::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩ AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩ CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.284.4 Member Function Documentation

15.284.4.1 add() `bool smtrat::PModule::add (`

```
ModuleInput::const_iterator _subformula )  [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.284.4.2 addConstraintToInform() `void smtrat::Module::addConstraintToInform (`

```
const FormulaT & _constraint )  [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.284.4.3 addCore() `virtual bool smtrat::Module::addCore (`

```
ModuleInput::const_iterator formula )  [inline], [protected], [virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.284.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.284.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.284.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.284.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
            ModuleInput::const_iterator _subformula )  [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.284.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.284.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.284.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.284.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.284.4.12 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.284.4.13 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const
[inline], [inherited]
```

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.284.4.14 appliedPreprocessing()

```
bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]
```

Returns true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

15.284.4.15 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.284.4.16 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.284.4.17 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.284.4.18 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.284.4.19 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.284.4.20 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.284.4.21 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.284.4.22 check()

```
Answer smtrat::PModule::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.284.4.23 checkCore()

```
template<class Settings >
Answer smtrat::LVEModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.284.4.24 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.284.4.25 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.284.4.26 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.284.4.27 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.284.4.28 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.284.4.29 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.284.4.30 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.284.4.31 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

15.284.4.32 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.284.4.33 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.284.4.34 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.284.4.35 currentlySatisfied() `virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.284.4.36 currentlySatisfiedByBackend() `unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.284.4.37 deinform() `void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.284.4.38 deinformCore() `virtual void smtrat::Module::deinformCore ( const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.284.4.39 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.284.4.40 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.284.4.41 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceived↩
VariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.284.4.42 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBest↩
Origin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.284.4.43 firstSubformulaToPass() `ModuleInput::const_iterator smtrat::Module::firstSubformula↩ ToPass ( ) const [inline], [inherited]`

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.284.4.44 firstUncheckedReceivedSubformula() `ModuleInput::const_iterator smtrat::Module↩ ::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.284.4.45 freeSplittingVariable() `static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

15.284.4.46 generateTrivialInfeasibleSubset() `void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.284.4.47 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.284.4.48 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.284.4.49 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.284.4.50 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::getInfeasible↩ Subsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.284.4.51 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.284.4.52 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.284.4.53 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.284.4.54 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.284.4.55 getOrigins() [3/3] const FormulaT& smtrat::Module::getOrigins (ModuleInput::const_iterator _formula) const [inline], [protected], [inherited]

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.284.4.56 getReceivedFormulaSimplified() std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

15.284.4.57 hasLemmas() bool smtrat::Module::hasLemmas ( ) [inline], [inherited]

Checks whether this module or any of its backends provides any lemmas.

15.284.4.58 hasValidInfeasibleSubset() bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.284.4.59 id() std::size_t smtrat::Module::id ( ) const [inline], [inherited]

Returns A unique ID to identify this module instance.

15.284.4.60 infeasibleSubsets() const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.284.4.61 inform() bool smtrat::Module::inform (const FormulaT & _constraint) [inherited]

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.284.4.62 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.284.4.63 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.284.4.64 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.284.4.65 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.284.4.66 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.284.4.67 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.284.4.68 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.284.4.69 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.284.4.70 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.284.4.71 model()

`const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.284.4.72 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.284.4.73 moduleName()

```
template<typename Settings >
std::string smtrat::LVEModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.284.4.74 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.284.4.75 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.284.4.76 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.284.4.77 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.284.4.78 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.284.4.79 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.284.4.80 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.284.4.81 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.284.4.82 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.284.4.83 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.284.4.84 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.284.4.85 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.284.4.86 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.284.4.87 receivedFormulaChecked() `void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

15.284.4.88 receivedFormulasAsInfeasibleSubset() `void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

15.284.4.89 receivedVariable() `bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

15.284.4.90 remove() `void smtrat::PModule::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.284.4.91 removeCore() `virtual void smtrat::Module::removeCore ( ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.284.4.92 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.284.4.93 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.284.4.94 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.284.4.95 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.284.4.96 runBackends() [1/2]

```
virtual Answer smtrat::PModule::runBackends ( ) [inline],
[virtual], [inherited]
```

Reimplemented from smtrat::Module.

15.284.4.97 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.284.4.98 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ ↩ *id*	The id to set this module's id to.

15.284.4.99 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.284.4.100 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.284.4.101 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint (
    const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.284.4.102 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.284.4.103 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.284.4.104 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.284.4.105 updateModel() `template<class Settings > void smtrat::LVEModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.284.4.106 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.284.5 Field Documentation

15.284.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.284.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.284.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.284.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.284.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.284.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.284.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩ Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.284.5.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module::m↩ FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.284.5.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.284.5.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.284.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.284.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.284.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.284.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.284.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.284.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.284.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.284.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.284.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplitting↩Variables [static], [inherited]`

Reusable splitting variables.

15.284.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.284.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.284.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.284.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.284.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.284.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.285 smtrat::Manager Class Reference

Base class for solvers.

```
#include <Manager.h>
```

Public Member Functions

- Manager ()

  Constructs a manager.

- ~Manager ()

  Destructs a manager.

- bool inform (const FormulaT &_constraint)

  Informs the solver about a constraint.

- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool add (const FormulaT &_subformula, bool _containsUnknownConstraints=true)

  Adds the given formula to the conjunction of formulas, which will be considered for the next satisfiability check.

- Answer check (bool _full=true)

  Checks the so far added formulas for satisfiability.

- void push ()

  Pushes a backtrack point to the stack of backtrack points.

- bool pop ()

  Pops a backtrack point from the stack of backtrack points.

- void pop (size_t _levels)
- void clear ()
- void setObjectiveVariable (carl::Variable var)
- const carl::Variable & objectiveVariable () const
- void reset ()
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- std::list< std::vector< carl::Variable > > getModelEqualities () const

  Determines variables assigned by the currently found satisfying assignment to an equal value in their domain.

- const Model & model () const
- const std::vector< Model > & allModels () const
- std::vector< FormulaT > lemmas ()

  Returns the lemmas/tautologies which were made during the last solving provoked by check().

- const ModuleInput & formula () const
- ModuleInput::iterator formulaBegin ()
- ModuleInput::iterator formulaEnd ()
- void printAssignment () const

  Prints the currently found assignment of variables occurring in the so far added formulas to values of their domains, if the conjunction of these formulas is satisfiable.

- void printAllAssignments (std::ostream &_out=std::cout)

  Prints all assignments of variables occurring in the so far added formulas to values of their domains, if the conjunction of these formulas is satisfiable.

- void printInfeasibleSubset (std::ostream &_out=std::cout) const

  Prints the first found infeasible subset of the set of received formulas.

- void printBackTrackStack (std::ostream &_out=std::cout) const

  Prints the stack of backtrack points.

- void printStrategyGraph (std::ostream &_out=std::cout) const

  Prints the strategy of the solver maintained by this manager.

- const std::vector< Module * > & getAllGeneratedModules () const
- std::ostream & rDebugOutputChannel ()
- auto logic () const
- auto & rLogic ()
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds formula to InformationRelevantFormula.

- void clearInformationRelevantFormula ()

  Deletes all InformationRelevantFormula.

- void setLemmaLevel (LemmaLevel level)

  Sets the current level for lemma generation.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.
- std::pair< bool, FormulaT > getInputSimplified ()
- ModuleInput::iterator remove (ModuleInput::iterator _subformula)

  Removes the formula at the given position in the conjunction of formulas, which will be considered for the next satisfiability check.
- ModuleInput::iterator remove (const FormulaT &_subformula)

  Temporarily added: (TODO: Discuss with Gereon) Removes the given formula in the conjunction of formulas, which will be considered for the next satisfiability check.

Protected Member Functions

- void setStrategy (const std::initializer_list< BackendLink > &backends)
- void setStrategy (const BackendLink &backend)
- template<typename Module >
  BackendLink addBackend (const std::initializer_list< BackendLink > &backends={})
- template<typename Module >
  BackendLink addBackend (const BackendLink &backend)
- BackendLink & addEdge (std::size_t from, std::size_t to)
- std::vector< Module * > getAllBackends (Module *_module) const

  Gets all backends so far instantiated according the strategy and all previous enquiries of the given module.
- std::vector< Module * > getBackends (Module *_requiredBy, std::atomic_bool *_foundAnswer)

  Get the backends to call for the given problem instance required by the given module.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.

15.285.1 Detailed Description

Base class for solvers.

This is the interface to the user.

15.285.2 Constructor & Destructor Documentation

15.285.2.1 Manager()

`smtrat::Manager::Manager ( )`

Constructs a manager.

15.285.2.2 ~Manager()

`smtrat::Manager::~Manager ( )`

Destructs a manager.

15.285.3 Member Function Documentation

15.285.3.1 add()

```
bool smtrat::Manager::add (
    const FormulaT & _subformula,
    bool _containsUnknownConstraints = true )
```

Adds the given formula to the conjunction of formulas, which will be considered for the next satisfiability check.

Parameters

_subformula	The formula to add.
_containsUnknownConstraints	true, if the formula to add contains constraints, about which this solver was not yet informed.

Returns false, if it is easy to decide whether adding this formula creates a conflict; true, otherwise.

15.285.3.2 addBackend() [1/2]

```
template<typename Module >
BackendLink smtrat::Manager::addBackend (
            const BackendLink & backend )  [inline], [protected]
```

15.285.3.3 addBackend() [2/2]

```
template<typename Module >
BackendLink smtrat::Manager::addBackend (
            const std::initializer_list< BackendLink > & backends = {} )  [inline], [protected]
```

15.285.3.4 addEdge()

```
BackendLink& smtrat::Manager::addEdge (
            std::size_t from,
            std::size_t to )  [inline], [protected]
```

15.285.3.5 addInformationRelevantFormula()

```
void smtrat::Manager::addInformationRelevantFormula
(
            const FormulaT & formula )  [inline]
```

Adds formula to InformationRelevantFormula.

Parameters

formula	Formula to add

15.285.3.6 allModels()

```
const std::vector<Model>& smtrat::Manager::allModels ( ) const  [inline]
```

Returns A list of all assignments, such that they satisfy the conjunction of the so far added formulas.

Note, that an assignment is only provided if the conjunction of so far added formulas is satisfiable. Furthermore, when solving non-linear real arithmetic formulas the assignment could contain other variables or freshly introduced variables.

15.285.3.7 check()

```
Answer smtrat::Manager::check (
            bool _full = true )
```

Checks the so far added formulas for satisfiability.

Returns True, if the conjunction of the so far added formulas is satisfiable; False, if it not satisfiable; Unknown, if this solver cannot decide whether it is satisfiable or not.

15.285.3.8 clear() `void smtrat::Manager::clear ( ) [inline]`

15.285.3.9 clearInformationRelevantFormula() `void smtrat::Manager::clearInformationRelevant↩ Formula ( ) [inline]`

Deletes all InformationRelevantFormula.

15.285.3.10 deinform() `void smtrat::Manager::deinform ( const FormulaT & _constraint )`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.285.3.11 formula() `const ModuleInput& smtrat::Manager::formula ( ) const [inline]`

Returns The conjunction of so far added formulas.

15.285.3.12 formulaBegin() `ModuleInput::iterator smtrat::Manager::formulaBegin ( ) [inline]`

15.285.3.13 formulaEnd() `ModuleInput::iterator smtrat::Manager::formulaEnd ( ) [inline]`

15.285.3.14 getAllBackends() `std::vector<Module*> smtrat::Manager::getAllBackends ( Module * _module ) const [inline], [protected]`

Gets all backends so far instantiated according the strategy and all previous enquiries of the given module.

Parameters

_module	The module to get all backends so far instantiated according the strategy and all previous enquiries of this module.

Returns All backends so far instantiated according the strategy and all previous enquiries of the given module.

15.285.3.15 getAllGeneratedModules()

```
const std::vector<Module*>& smtrat::Manager::getAll↩
GeneratedModules ( ) const [inline]
```

Returns All instantiated modules of the solver belonging to this manager.

15.285.3.16 getBackends()

```
std::vector< Module * > smtrat::Manager::getBackends (
    Module * _requiredBy,
    std::atomic_bool * _foundAnswer ) [protected]
```

Get the backends to call for the given problem instance required by the given module.

Parameters

_requiredBy	The module asking for a backend.
_foundAnswer	A conditional

Returns A vector of modules, which the module defined by _requiredBy calls in parallel to achieve an answer to the given instance.

15.285.3.17 getInformationRelevantFormulas()

```
const std::set<FormulaT>& smtrat::Manager::get↩
InformationRelevantFormulas ( ) [inline], [protected]
```

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.285.3.18 getInputSimplified()

```
std::pair< bool, FormulaT > smtrat::Manager::getInputSimplified
( )
```

Returns A pair of a Boolean and a formula, where the Boolean is true, if the input formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this solver's input formula, if the Boolean is true.

15.285.3.19 getModelEqualities()

```
std::list< std::vector< carl::Variable > > smtrat::Manager↩
::getModelEqualities ( ) const
```

Determines variables assigned by the currently found satisfying assignment to an equal value in their domain.

Returns A list of vectors of variables, stating that the variables in one vector are assigned to equal values.

15.285.3.20 infeasibleSubsets()

```
const std::vector< FormulaSetT > & smtrat::Manager::infeasible↩
Subsets ( ) const
```

Returns All infeasible subsets of the set so far added formulas.

Note, that the conjunction of the so far added formulas must be inconsistent to receive an infeasible subset.

15.285.3.21 inform()

```
bool smtrat::Manager::inform (
    const FormulaT & _constraint )
```

Informs the solver about a constraint.

Optimally, it should be informed about all constraints, which it will receive eventually, before any of them is added as part of a formula with the interface add(..).

Parameters

_constraint	The constraint to inform about.

Returns false, if it is easy to decide (for any module used of this solver), whether the constraint itself is inconsistent; true, otherwise.

15.285.3.22 isLemmaLevel()

`bool smtrat::Manager::isLemmaLevel ( LemmaLevel level ) [inline]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.285.3.23 lemmas()

`std::vector< FormulaT > smtrat::Manager::lemmas ( )`

Returns the lemmas/tautologies which were made during the last solving provoked by check().

These lemmas can be used in the same manner as infeasible subsets are used.

Returns The lemmas/tautologies made during solving.

15.285.3.24 logic()

`auto smtrat::Manager::logic ( ) const [inline]`

Returns A constant reference to the logic this solver considers.

15.285.3.25 model()

`const Model & smtrat::Manager::model ( ) const`

Returns An assignment of the variables, which occur in the so far added formulas, to values of their domains, such that it satisfies the conjunction of these formulas.

Note, that an assignment is only provided if the conjunction of so far added formulas is satisfiable. Furthermore, when solving non-linear real arithmetic formulas the assignment could contain other variables or freshly introduced variables.

15.285.3.26 objectiveVariable()

`const carl::Variable& smtrat::Manager::objectiveVariable ( ) const [inline]`

15.285.3.27 pop() [1/2] bool smtrat::Manager::pop (void)

Pops a backtrack point from the stack of backtrack points.

This provokes, that all formulas which have been added after that backtrack point are removed.

Note, that this interface has not necessarily be used to apply a solver constructed with SMT-RAT, but is often required by state-of-the-art SMT solvers when embedding a theory solver constructed with SMT-RAT into them.

15.285.3.28 pop() [2/2] void smtrat::Manager::pop (size_t _levels)

15.285.3.29 printAllAssignments() void smtrat::Manager::printAllAssignments (std::ostream & _out = std::cout) [inline]

Prints all assignments of variables occurring in the so far added formulas to values of their domains, if the conjunction of these formulas is satisfiable.

Parameters

_out	The stream to print on.

15.285.3.30 printAssignment() void smtrat::Manager::printAssignment ( ) const

Prints the currently found assignment of variables occurring in the so far added formulas to values of their domains, if the conjunction of these formulas is satisfiable.

15.285.3.31 printBackTrackStack() void smtrat::Manager::printBackTrackStack (std::ostream & _out = std::cout) const

Prints the stack of backtrack points.

Parameters

_out	The stream to print on.

15.285.3.32 printInfeasibleSubset() void smtrat::Manager::printInfeasibleSubset (std::ostream & _out = std::cout) const

Prints the first found infeasible subset of the set of received formulas.

Parameters

_out	The stream to print on.

15.285.3.33 printStrategyGraph()

```
void smtrat::Manager::printStrategyGraph (
    std::ostream & _out = std::cout ) const [inline]
```

Prints the strategy of the solver maintained by this manager.

Parameters

_out	The stream to print on.

15.285.3.34 push()

```
void smtrat::Manager::push (
    void ) [inline]
```

Pushes a backtrack point to the stack of backtrack points.

Note, that this interface has not necessarily be used to apply a solver constructed with SMT-RAT, but is often required by state-of-the-art SMT solvers when embedding a theory solver constructed with SMT-RAT into them.

15.285.3.35 rDebugOutputChannel()

```
std::ostream& smtrat::Manager::rDebugOutputChannel ( ) [inline]
```

Returns The stream to print the debug information on.

15.285.3.36 remove() [1/2]

```
ModuleInput::iterator smtrat::Manager::remove (
    const FormulaT & _subformula ) [inline]
```

Temporarily added: (TODO: Discuss with Gereon) Removes the given formula in the conjunction of formulas, which will be considered for the next satisfiability check.

Parameters

_subformula	The formula to remove.

Returns An iterator to the formula after the position of the just removed formula. If the removed formula has been the last element, the end of the conjunction of formulas, which will be considered for the next satisfiability check is returned.

15.285.3.37 remove() [2/2]

```
ModuleInput::iterator smtrat::Manager::remove (
    ModuleInput::iterator _subformula )
```

Removes the formula at the given position in the conjunction of formulas, which will be considered for the next satisfiability check.

Parameters

_subformula	The position of the formula to remove.

Returns An iterator to the formula after the position of the just removed formula. If the removed formula has been the last element, the end of the conjunction of formulas, which will be considered for the next satisfiability check is returned.

15.285.3.38 reset() `void smtrat::Manager::reset ( )`

15.285.3.39 rLogic() `auto& smtrat::Manager::rLogic ( ) [inline]`

Returns A reference to the logic this solver considers.

15.285.3.40 setLemmaLevel() `void smtrat::Manager::setLemmaLevel ( LemmaLevel level ) [inline]`

Sets the current level for lemma generation.

Parameters

level	Level

15.285.3.41 setObjectiveVariable() `void smtrat::Manager::setObjectiveVariable ( carl::Variable var ) [inline]`

15.285.3.42 setStrategy() [1/2] `void smtrat::Manager::setStrategy ( const BackendLink & backend ) [inline], [protected]`

15.285.3.43 setStrategy() [2/2] `void smtrat::Manager::setStrategy ( const std::initializer_list< BackendLink > & backends ) [inline], [protected]`

15.285.4 Friends And Related Function Documentation

15.285.4.1 Module `friend class Module [friend]`

15.286 Minisat::Map< K, D, H, E > Class Template Reference

15.287 benchmax::MathSAT Class Reference

Tool wrapper for MathSAT for SMT-LIB.

```
#include <MathSAT.h>
```

Public Member Functions

- MathSAT (const fs::path &binary, const std::string &arguments)

  New MathSAT tool.
- virtual bool canHandle (const fs::path &path) const override

  Only handle .smt2 files.
- virtual void additionalResults (const fs::path &, BenchmarkResult &result) const override

  Computes the answer string from the exit code and parses statistics output.
- std::string name () const

  Common name of this tool.
- fs::path binary () const

  Full path to the binary.
- const std::map< std::string, std::string > & attributes () const

  A set of attributes, for example compilation options.
- std::vector< std::string > resolveDependencies () const

  Get dependencies of binary required to run it (via ldd)
- std::size_t attributeHash () const

  Hash of the attributes.
- virtual std::string getCommandline (const std::string &file) const

  Compose commandline for this tool and the given input file.
- virtual std::string getCommandline (const std::string &file, const std::string &localBinary) const

  Compose commandline for this tool with another binary name and the given input file.
- virtual std::optional< std::string > parseCommandline (const std::string &cmdline) const

  Compose commandline for this tool and the given input file.

Protected Attributes

- std::string mName

  (Non-unique) identifier for the tool.
- fs::path mBinary

  Path to the binary.
- std::string mArguments

  Command line arguments that should be passed to the binary.
- std::map< std::string, std::string > mAttributes

  Attributes of the tool obtained by introspection of the binary.

15.287.1 Detailed Description

Tool wrapper for MathSAT for SMT-LIB.

15.287.2 Constructor & Destructor Documentation

15.287.2.1 MathSAT()

```
benchmax::MathSAT::MathSAT (
    const fs::path & binary,
    const std::string & arguments ) [inline]
```

New MathSAT tool.

15.287.3 Member Function Documentation

15.287.3.1 additionalResults()

```
virtual void benchmax::MathSAT::additionalResults (
    const fs::path & ,
    BenchmarkResult & result ) const [inline], [override], [virtual]
```

Computes the answer string from the exit code and parses statistics output.

Reimplemented from benchmax::Tool.

15.287.3.2 attributeHash() `std::size_t benchmax::Tool::attributeHash ( ) const [inline], [inherited]`

Hash of the attributes.

15.287.3.3 attributes() `const std::map<std::string,std::string>& benchmax::Tool::attributes ( ) const [inline], [inherited]`

A set of attributes, for example compilation options.

15.287.3.4 binary() `fs::path benchmax::Tool::binary ( ) const [inline], [inherited]`

Full path to the binary.

15.287.3.5 canHandle() `virtual bool benchmax::MathSAT::canHandle ( const fs::path & path ) const [inline], [override], [virtual]`

Only handle .smt2 files.

Reimplemented from benchmax::Tool.

15.287.3.6 getCommandline() [1/2] `virtual std::string benchmax::Tool::getCommandline ( const std::string & file ) const [inline], [virtual], [inherited]`

Compose commandline for this tool and the given input file.

15.287.3.7 getCommandline() [2/2] `virtual std::string benchmax::Tool::getCommandline ( const std::string & file, const std::string & localBinary ) const [inline], [virtual], [inherited]`

Compose commandline for this tool with another binary name and the given input file.

15.287.3.8 name() `std::string benchmax::Tool::name ( ) const [inline], [inherited]`

Common name of this tool.

15.287.3.9 parseCommandline() `virtual std::optional<std::string> benchmax::Tool::parseCommandline ( const std::string & cmdline ) const [inline], [virtual], [inherited]`

Compose commandline for this tool and the given input file.

15.287.3.10 resolveDependencies() `std::vector<std::string> benchmax::Tool::resolveDependencies ( ) const [inline], [inherited]`

Get dependencies of binary required to run it (via ldd)

15.287.4 Field Documentation

15.287.4.1 mArguments `std::string benchmax::Tool::mArguments [protected], [inherited]`

Command line arguments that should be passed to the binary.

15.287.4.2 mAttributes `std::map<std::string,std::string> benchmax::Tool::mAttributes [protected], [inherited]`

Attributes of the tool obtained by introspection of the binary.

15.287.4.3 mBinary `fs::path benchmax::Tool::mBinary [protected], [inherited]`

Path to the binary.

15.287.4.4 mName `std::string benchmax::Tool::mName [protected], [inherited]`

(Non-unique) identifier for the tool.

15.288 smtrat::mcsat::fm::MaxSizeComparator Struct Reference

This heuristic chooses the explanation excluding the largest interval.

`#include <ConflictGenerator.h>`

Public Member Functions

- bool operator() (const Bound &b1, const Bound &b2) const

Data Fields

- bool symmetric = true

15.288.1 Detailed Description

This heuristic chooses the explanation excluding the largest interval.

15.288.2 Member Function Documentation

15.294 smtrat::MCBModule< Settings > Class Template Reference

```
#include <MCBModule.h>
```

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- MCBModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- ~MCBModule ()
- Answer checkCore ()

  Checks the received formula for consistency.
- void updateModel () const

  Updates the model, if the solver has detected the consistency of the received formula, beforehand.
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const

- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- virtual bool addCore (ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.

- virtual void removeCore (ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.

- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

Stores the position of the first constraint of which no backend has been informed about.

- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.294.4 Member Function Documentation

15.294.4.1 add()

```
bool smtrat::PModule::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.294.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint )  [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.294.4.3 addCore()

```
virtual bool smtrat::Module::addCore (
    ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.294.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.294.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.294.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.294.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.294.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.294.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.294.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.294.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const  [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.294.4.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.294.4.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.294.4.14 appliedPreprocessing() `bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]`

Returns true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

15.294.4.15 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.294.4.16 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.294.4.17 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.294.4.18 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.294.4.19 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.294.4.20 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.294.4.21 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.294.4.22 check()

```
Answer smtrat::PModule::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.294.4.23 checkCore()

```
template<class Settings >
Answer smtrat::MCBModule< Settings >::checkCore ( )  [virtual]
```

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.294.4.24 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
            std::vector< FormulaSetT >::const_iterator _infsubset,
            const std::string & _filename = "smaller_muses",
            unsigned _maxSizeDifference = 1 ) const  [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.294.4.25 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.294.4.26 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.294.4.27 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.294.4.28 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.294.4.29 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.294.4.30 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.294.4.31 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

15.294.4.32 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.294.4.33 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.294.4.34 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.294.4.35 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.294.4.36 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.294.4.37 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.294.4.38 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.294.4.39 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.294.4.40 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.294.4.41 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceived↩
VariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.294.4.42 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.294.4.43 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.294.4.44 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.294.4.45 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.294.4.46 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.294.4.47 getBackendsAllModels()

```
void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]
```

Stores all models of a backend in the list of all models of this module.

15.294.4.48 getBackendsModel()

```
void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]
```

15.294.4.49 getInfeasibleSubsets() [1/2]

```
void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]
```

Copies the infeasible subsets of the passed formula.

15.294.4.50 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets (
    const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.294.4.51 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.294.4.52 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.294.4.53 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.294.4.54 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.294.4.55 getOrigins() [3/3] const FormulaT& smtrat::Module::getOrigins (ModuleInput::const_iterator _formula) const [inline], [protected], [inherited]

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.294.4.56 getReceivedFormulaSimplified() std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

15.294.4.57 hasLemmas() bool smtrat::Module::hasLemmas ( ) [inline], [inherited]

Checks whether this module or any of its backends provides any lemmas.

15.294.4.58 hasValidInfeasibleSubset() bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.294.4.59 id() std::size_t smtrat::Module::id ( ) const [inline], [inherited]

Returns A unique ID to identify this module instance.

15.294.4.60 infeasibleSubsets() const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.294.4.61 inform() bool smtrat::Module::inform (const FormulaT & _constraint) [inherited]

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.294.4.62 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.294.4.63 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.294.4.64 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.294.4.65 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.294.4.66 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.294.4.67 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.294.4.68 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.294.4.69 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.294.4.70 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.294.4.71 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.294.4.72 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.294.4.73 moduleName() `virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns The name of the given module type as name.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::VSModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::GBModule< Settings >, smtrat::IntEqModule< Setti smtrat::CubeLIAModule< Settings >, smtrat::CurryModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IncWidthModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::BEModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::SplitSOSModule< Settings >.

15.294.4.74 objective() `carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.294.4.75 originInReceivedFormula() `bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

15.294.4.76 passedFormulaBegin() `ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.294.4.77 passedFormulaEnd() `ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.294.4.78 pPassedFormula() `const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.294.4.79 pReceivedFormula() `const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.294.4.80 print() `void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.294.4.81 printAllModels() `void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.294.4.82 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.294.4.83 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.294.4.84 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.294.4.85 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.294.4.86 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const  [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.294.4.87 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( )  [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.294.4.88 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula )  [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.294.4.89 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const  [inline], [inherited]
```

15.294.4.90 remove()

```
void smtrat::PModule::remove (
    ModuleInput::const_iterator _subformula )  [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.294.4.91 removeCore()

```
virtual void smtrat::Module::removeCore (
    ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.294.4.92 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.294.4.93 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.294.4.94 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.294.4.95 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.294.4.96 runBackends() [1/2]

`virtual Answer smtrat::PModule::runBackends ( ) [inline], [virtual], [inherited]`

Reimplemented from smtrat::Module.

15.294.4.97 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.294.4.98 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.294.4.99 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.294.4.100 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.294.4.101 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.294.4.102 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.294.4.103 updateAllModels()

`void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.294.4.104 updateLemmas()

`void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.294.4.105 updateModel()

`template<typename Settings >`
`void smtrat::MCBModule< Settings >::updateModel ( ) const [virtual]`

Updates the model, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented from smtrat::Module.

15.294.4.106 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.294.5 Field Documentation

15.294.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.294.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.294.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.294.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.294.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.294.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.294.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩ Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.294.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.294.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.294.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.294.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.294.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.294.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.294.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.294.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.294.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.294.5.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.294.5.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.294.5.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

15.294.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.294.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.294.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.294.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.294.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.294.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.295 smtrat::mcsat::MCSATBackend< Settings > Class Template Reference

15.296.1 Constructor & Destructor Documentation

15.296.1.1 MCSATMixin() `template<typename Settings>`

```
template<typename BaseModule >
smtrat::mcsat::MCSATMixin< Settings >::MCSATMixin (
            BaseModule & baseModule )  [inline], [explicit]
```

15.296.2 Member Function Documentation

15.296.2.1 addBooleanVariable() `template<typename Settings>`

```
std::size_t smtrat::mcsat::MCSATMixin< Settings >::addBooleanVariable (
            Minisat::Var variable )
```

Add a variable, return the level it was inserted on.

15.296.2.2 assignedAtTrailIndex() `template<typename Settings>`

```
int smtrat::mcsat::MCSATMixin< Settings >::assignedAtTrailIndex (
            Minisat::Var variable ) const  [inline]
```

15.296.2.3 backtrackTo() `template<typename Settings>`

```
bool smtrat::mcsat::MCSATMixin< Settings >::backtrackTo (
            Minisat::Lit literal )
```

Backtracks to the theory decision represented by the given literal.

15.296.2.4 carlVar() `template<typename Settings>`

```
const carl::Variable& smtrat::mcsat::MCSATMixin< Settings >::carlVar (
            Minisat::Var v ) const  [inline]
```

15.296.2.5 computeTheoryLevel() [1/2] `template<typename Settings>`

```
std::size_t smtrat::mcsat::MCSATMixin< Settings >::computeTheoryLevel (
            const FormulaT & f ) const  [inline]
```

15.296.2.6 computeTheoryLevel() [2/2] `template<typename Settings>`

```
std::size_t smtrat::mcsat::MCSATMixin< Settings >::computeTheoryLevel (
            Minisat::Var var ) const  [inline]
```

15.296.2.7 current() [1/2]

```
template<typename Settings>
TheoryLevel& smtrat::mcsat::MCSATMixin< Settings >::current ( ) [inline]
```

15.296.2.8 current() [2/2]

```
template<typename Settings>
const TheoryLevel& smtrat::mcsat::MCSATMixin< Settings >::current ( ) const [inline]
```

Returns the current theory level.

15.296.2.9 decisionLevel()

```
template<typename Settings>
int smtrat::mcsat::MCSATMixin< Settings >::decisionLevel (
            Minisat::Var v ) const [inline]
```

15.296.2.10 doBooleanAssignment()

```
template<typename Settings>
void smtrat::mcsat::MCSATMixin< Settings >::doBooleanAssignment (
            Minisat::Lit lit ) [inline]
```

Add a new constraint.

15.296.2.11 evaluateLiteral()

```
template<typename Settings>
Minisat::lbool smtrat::mcsat::MCSATMixin< Settings >::evaluateLiteral (
            Minisat::Lit lit ) const
```

Evaluate a literal in the theory, set lastReason to last theory decision involved.

15.296.2.12 explainInconsistency()

```
template<typename Settings>
std::optional<Explanation> smtrat::mcsat::MCSATMixin< Settings >::explainInconsistency ( )
[inline]
```

Checks if the trail is consistent after the assignment on the current level.

The trail must be consistent on the previous level.

Returns std::nullopt if consistent and an explanation.

15.296.2.13 explainTheoryPropagation()

```
template<typename Settings>
Explanation smtrat::mcsat::MCSATMixin< Settings >::explainTheoryPropagation (
            Minisat::Lit literal ) [inline]
```

15.296.2.14 fullConsistencyCheck()

```
template<typename Settings>
bool smtrat::mcsat::MCSATMixin< Settings >::fullConsistencyCheck ( ) const [inline]
```

15.296.2.15 get() template<typename Settings>

```
const TheoryLevel& smtrat::mcsat::MCSATMixin< Settings >::get (
            std::size_t level ) const  [inline]
```

Returns the respective theory level.

15.296.2.16 getDecisionLiteral() template<typename Settings>

```
Minisat::Lit smtrat::mcsat::MCSATMixin< Settings >::getDecisionLiteral (
            Minisat::Var var ) const  [inline]
```

15.296.2.17 initVariables() template<typename Settings>

```
template<typename Constraints >
void smtrat::mcsat::MCSATMixin< Settings >::initVariables (
            const Constraints & c )  [inline]
```

15.296.2.18 isAssignedTheoryVariable() template<typename Settings>

```
bool smtrat::mcsat::MCSATMixin< Settings >::isAssignedTheoryVariable (
            const carl::Variable & var ) const  [inline]
```

15.296.2.19 isBooleanDecisionFeasible() template<typename Settings>

```
std::pair<bool, std::optional<Explanation> > smtrat::mcsat::MCSATMixin< Settings >::is↩
BooleanDecisionFeasible (
            Minisat::Lit lit,
            bool always_explain = false )
```

15.296.2.20 isConsistent() [1/2] template<typename Settings>

```
bool smtrat::mcsat::MCSATMixin< Settings >::isConsistent ( )  [inline]
```

Checks if any inconsistency was detected.

15.296.2.21 isConsistent() [2/2] template<typename Settings>

```
bool smtrat::mcsat::MCSATMixin< Settings >::isConsistent (
            Minisat::Var v )  [inline]
```

15.296.2.22 isFeasible() template<typename Settings>

```
std::optional<Explanation> smtrat::mcsat::MCSATMixin< Settings >::isFeasible (
            const carl::Variable & var )  [inline]
```

15.296.2.23 isFormulaUnivariate() template<typename Settings>

```
bool smtrat::mcsat::MCSATMixin< Settings >::isFormulaUnivariate (
            const FormulaT & formula,
            std::size_t level ) const
```

Checks whether the given formula is univariate on the given level.

15.296.2.24 isTheoryVar()

```
template<typename Settings>
bool smtrat::mcsat::MCSATMixin< Settings >::isTheoryVar (
            Minisat::Var v ) const  [inline]
```

15.296.2.25 level()

```
template<typename Settings>
std::size_t smtrat::mcsat::MCSATMixin< Settings >::level ( ) const  [inline]
```

15.296.2.26 makeTheoryDecision()

```
template<typename Settings>
std::variant<Explanation,FormulasT> smtrat::mcsat::MCSATMixin< Settings >::makeTheoryDecision
(
            const carl::Variable & var )  [inline]
```

15.296.2.27 maxDegree()

```
template<typename Settings>
std::size_t smtrat::mcsat::MCSATMixin< Settings >::maxDegree (
            const Minisat::Var & var )  [inline]
```

15.296.2.28 minisatVar()

```
template<typename Settings>
Minisat::Var smtrat::mcsat::MCSATMixin< Settings >::minisatVar (
            const carl::Variable & v ) const  [inline]
```

15.296.2.29 model()

```
template<typename Settings>
const Model& smtrat::mcsat::MCSATMixin< Settings >::model ( ) const  [inline]
```

15.296.2.30 printClause()

```
template<typename Settings>
void smtrat::mcsat::MCSATMixin< Settings >::printClause (
            std::ostream & os,
            Minisat::CRef clause ) const
```

Prints a single clause.

15.296.2.31 propagateBooleanDomain()

```
template<typename Settings>
std::pair<boost::tribool, std::optional<Explanation> > smtrat::mcsat::MCSATMixin< Settings
>::propagateBooleanDomain (
            Minisat::Lit lit )
```

15.296.2.32 pushTheoryDecision()

```
template<typename Settings>
void smtrat::mcsat::MCSATMixin< Settings >::pushTheoryDecision (
            const FormulaT & assignment,
            Minisat::Lit decisionLiteral )
```

Push a theory decision.

15.296.2.33 theoryAssignmentComplete() template<typename Settings>

```
bool smtrat::mcsat::MCSATMixin< Settings >::theoryAssignmentComplete ( ) const  [inline]
```

15.296.2.34 theoryLevel() template<typename Settings>

```
std::size_t smtrat::mcsat::MCSATMixin< Settings >::theoryLevel (
            Minisat::Var var ) const  [inline]
```

15.296.2.35 theoryVarAbstractions() template<typename Settings>

```
std::vector<Minisat::Var> smtrat::mcsat::MCSATMixin< Settings >::theoryVarAbstractions ( )
const  [inline]
```

15.296.2.36 theoryVars() template<typename Settings>

```
std::vector<Minisat::Var> smtrat::mcsat::MCSATMixin< Settings >::theoryVars (
            const Minisat::Var & var )  [inline]
```

15.296.2.37 topSemanticPropagation() template<typename Settings>

```
Minisat::Var smtrat::mcsat::MCSATMixin< Settings >::topSemanticPropagation ( )  [inline]
```

Getter for semantic propagations.

15.296.2.38 undecidedBooleanVariables() template<typename Settings>

```
const std::vector<Minisat::Var>& smtrat::mcsat::MCSATMixin< Settings >::undecidedBoolean↩
Variables ( ) const  [inline]
```

15.296.2.39 undoBooleanAssignment() template<typename Settings>

```
void smtrat::mcsat::MCSATMixin< Settings >::undoBooleanAssignment (
            Minisat::Lit lit )  [inline]
```

Remove the last constraint.

f must be the same as the one passed to the last call of pushConstraint().

15.296.2.40 variable() template<typename Settings>

```
carl::Variable smtrat::mcsat::MCSATMixin< Settings >::variable (
            std::size_t level ) const  [inline]
```

Retrieve already decided theory variables.

15.296.3 Friends And Related Function Documentation

15.296.3.1 operator<< template<typename Settings>

```
template<typename Sett >
std::ostream& operator<< (
            std::ostream & os,
            const MCSATMixin< Sett > & mcm )  [friend]
```

15.297 smtrat::expression::simplifier::MergeSimplifier Struct Reference

```
#include <MergeSimplifier.h>
```

```
const ExpressionContent* smtrat::expression::simplifier::MergeSimplifier::simplify (
            const NaryExpression & expr ) const [inline], [virtual]
```

Reimplemented from smtrat::expression::simplifier::BaseSimplifier.

15.297.1.12 simplify() [5/6]

```
virtual const ExpressionContent* smtrat::expression::simplifier::BaseSimplifier::simplify (
            const QuantifierExpression & ) const [inline], [protected], [virtual], [inherited]
```

15.297.1.13 simplify() [6/6]

```
virtual const ExpressionContent* smtrat::expression::simplifier::BaseSimplifier::simplify (
            const UnaryExpression & ) const [inline], [protected], [virtual], [inherited]
```

Reimplemented in smtrat::expression::simplifier::NegationSimplifier.

15.298 benchmax::Minisat Class Reference

Tool wrapper for a Minisat solver.

```
#include <Minisat.h>
```

Public Member Functions

- Minisat (const fs::path &binary, const std::string &arguments)

  Create tool.
- virtual bool canHandle (const fs::path &path) const override

  Only handles .opb files.
- virtual void additionalResults (const fs::path &, BenchmarkResult &result) const override

  Parse results from stdout.
- std::string name () const

  Common name of this tool.
- fs::path binary () const

  Full path to the binary.
- const std::map< std::string, std::string > & attributes () const

  A set of attributes, for example compilation options.
- std::vector< std::string > resolveDependencies () const

  Get dependencies of binary required to run it (via ldd)
- std::size_t attributeHash () const

  Hash of the attributes.
- virtual std::string getCommandline (const std::string &file) const

  Compose commandline for this tool and the given input file.
- virtual std::string getCommandline (const std::string &file, const std::string &localBinary) const

  Compose commandline for this tool with another binary name and the given input file.
- virtual std::optional< std::string > parseCommandline (const std::string &cmdline) const

  Compose commandline for this tool and the given input file.

Protected Attributes

- std::string mName

  (Non-unique) identifier for the tool.
- fs::path mBinary

  Path to the binary.
- std::string mArguments

  Command line arguments that should be passed to the binary.
- std::map< std::string, std::string > mAttributes

  Attributes of the tool obtained by introspection of the binary.

15.298.1 Detailed Description

Tool wrapper for a Minisat solver.

15.298.2 Constructor & Destructor Documentation

15.298.2.1 Minisat()

```
benchmax::Minisat::Minisat (
    const fs::path & binary,
    const std::string & arguments ) [inline]
```

Create tool.

15.298.3 Member Function Documentation

15.298.3.1 additionalResults()

```
virtual void benchmax::Minisat::additionalResults (
    const fs::path & ,
    BenchmarkResult & result ) const [inline], [override], [virtual]
```

Parse results from stdout.

Reimplemented from benchmax::Tool.

15.298.3.2 attributeHash() `std::size_t benchmax::Tool::attributeHash ( ) const [inline], [inherited]`

Hash of the attributes.

15.298.3.3 attributes() `const std::map<std::string,std::string>& benchmax::Tool::attributes ( ) const [inline], [inherited]`

A set of attributes, for example compilation options.

15.298.3.4 binary() `fs::path benchmax::Tool::binary ( ) const [inline], [inherited]`

Full path to the binary.

15.298.3.5 canHandle() `virtual bool benchmax::Minisat::canHandle ( const fs::path & path ) const [inline], [override], [virtual]`

Only handles .opb files.

Reimplemented from benchmax::Tool.

15.298.3.6 getCommandline() [1/2] `virtual std::string benchmax::Tool::getCommandline ( const std::string & file ) const [inline], [virtual], [inherited]`

Compose commandline for this tool and the given input file.

15.298.3.7 getCommandline() [2/2] `virtual std::string benchmax::Tool::getCommandline ( const std::string & file, const std::string & localBinary ) const [inline], [virtual], [inherited]`

Compose commandline for this tool with another binary name and the given input file.

15.298.3.8 name() `std::string benchmax::Tool::name ( ) const [inline], [inherited]`

Common name of this tool.

15.298.3.9 parseCommandline() `virtual std::optional<std::string> benchmax::Tool::parseCommandline ( const std::string & cmdline ) const [inline], [virtual], [inherited]`

Compose commandline for this tool and the given input file.

15.298.3.10 resolveDependencies() `std::vector<std::string> benchmax::Tool::resolveDependencies ( ) const [inline], [inherited]`

Get dependencies of binary required to run it (via ldd)

15.298.4 Field Documentation

15.298.4.1 mArguments `std::string benchmax::Tool::mArguments [protected], [inherited]`

Command line arguments that should be passed to the binary.

15.298.4.2 mAttributes `std::map<std::string,std::string> benchmax::Tool::mAttributes [protected], [inherited]`

Attributes of the tool obtained by introspection of the binary.

15.298.4.3 mBinary `fs::path benchmax::Tool::mBinary [protected], [inherited]`

Path to the binary.

15.298.4.4 mName `std::string benchmax::Tool::mName [protected], [inherited]`

(Non-unique) identifier for the tool.

15.299 benchmax::Minisatp Class Reference

Tool wrapper for the Minisatp solver for pseudo-Boolean problems.

```
#include <Minisatp.h>
```

Public Member Functions

- Minisatp (const fs::path &binary, const std::string &arguments)

  Create tool, add "-v0" to arguments.

Compose commandline for this tool with another binary name and the given input file.

15.299.3.8 name()

```
std::string benchmax::Tool::name ( ) const [inline], [inherited]
```

Common name of this tool.

15.299.3.9 parseCommandline()

```
virtual std::optional<std::string> benchmax::Tool::parse↩
Commandline (
    const std::string & cmdline ) const [inline], [virtual], [inherited]
```

Compose commandline for this tool and the given input file.

15.299.3.10 resolveDependencies()

```
std::vector<std::string> benchmax::Tool::resolveDependencies
( ) const [inline], [inherited]
```

Get dependencies of binary required to run it (via ldd)

15.299.4 Field Documentation

15.299.4.1 mArguments

```
std::string benchmax::Tool::mArguments [protected], [inherited]
```

Command line arguments that should be passed to the binary.

15.299.4.2 mAttributes

```
std::map<std::string,std::string> benchmax::Tool::mAttributes [protected],
[inherited]
```

Attributes of the tool obtained by introspection of the binary.

15.299.4.3 mBinary

```
fs::path benchmax::Tool::mBinary [protected], [inherited]
```

Path to the binary.

15.299.4.4 mName

```
std::string benchmax::Tool::mName [protected], [inherited]
```

(Non-unique) identifier for the tool.

15.300 smtrat::mcsat::fm::MinSizeComparator Struct Reference

This heuristic chooses the explanation excluding the smallest interval.

```
#include <ConflictGenerator.h>
```

Public Member Functions

- bool operator() (const Bound &b1, const Bound &b2) const

Data Fields

- bool symmetric = true

15.300.1 Detailed Description This heuristic chooses the explanation excluding the smallest interval.

15.300.2 Member Function Documentation

15.300.2.1 operator()()

```
bool smtrat::mcsat::fm::MinSizeComparator::operator() (
    const Bound & b1,
    const Bound & b2 ) const  [inline]
```

15.300.3 Field Documentation

15.300.3.1 symmetric

```
bool smtrat::mcsat::fm::MinSizeComparator::symmetric = true
```

15.301 smtrat::mcsat::fm::MinVarCountComparator Struct Reference

This heuristic tries to minimize the number of variables occuring in the explanation.

```
#include <ConflictGenerator.h>
```

Public Member Functions

- bool operator() (const Bound &b1, const Bound &b2) const

Data Fields

- bool symmetric = false

15.301.1 Detailed Description This heuristic tries to minimize the number of variables occuring in the explanation.

It is a 2-approximation to the lowest possible number of variables in an explanation.

15.301.2 Member Function Documentation

15.301.2.1 operator()()

```
bool smtrat::mcsat::fm::MinVarCountComparator::operator() (
    const Bound & b1,
    const Bound & b2 ) const  [inline]
```

15.301.3 Field Documentation

15.301.3.1 symmetric

```
bool smtrat::mcsat::fm::MinVarCountComparator::symmetric = false
```

15.303 smtrat::MixedSignEncoder Class Reference

```
#include <MixedSignEncoder.h>
```

Public Member Functions

- MixedSignEncoder ()
- bool canEncode (const ConstraintT &constraint)
- Rational encodingSize (const ConstraintT &constraint)
- std::string name ()
- boost::optional< FormulaT > encode (const ConstraintT &constraint)

  Encodes an arbitrary constraint.

Data Fields

- std::size_t problem_size

Protected Member Functions

- boost::optional< FormulaT > doEncode (const ConstraintT &constraint)
- FormulaT generateVarChain (const std::set< carl::Variable > &vars, carl::FormulaType type)

15.303.1 Constructor & Destructor Documentation

15.303.1.1 MixedSignEncoder() smtrat::MixedSignEncoder::MixedSignEncoder ( ) [inline]

15.303.2 Member Function Documentation

15.303.2.1 canEncode() bool smtrat::MixedSignEncoder::canEncode (

```
            const ConstraintT & constraint ) [virtual]
```

Implements smtrat::PseudoBoolEncoder.

15.303.2.2 doEncode() boost::optional< FormulaT > smtrat::MixedSignEncoder::doEncode (

```
            const ConstraintT & constraint ) [protected], [virtual]
```

Implements smtrat::PseudoBoolEncoder.

15.303.2.3 encode() boost::optional< FormulaT > smtrat::PseudoBoolEncoder::encode (

```
            const ConstraintT & constraint ) [inherited]
```

Encodes an arbitrary constraint.

Returns encoded formula

15.303.2.4 encodingSize() Rational smtrat::MixedSignEncoder::encodingSize (

```
            const ConstraintT & constraint ) [virtual]
```

Reimplemented from smtrat::PseudoBoolEncoder.

15.303.2.5 generateVarChain()

```
FormulaT smtrat::PseudoBoolEncoder::generateVarChain (
    const std::set< carl::Variable > & vars,
    carl::FormulaType type ) [protected], [inherited]
```

15.303.2.6 name()

```
std::string smtrat::MixedSignEncoder::name ( ) [inline], [virtual]
```

Reimplemented from smtrat::PseudoBoolEncoder.

15.303.3 Field Documentation

15.303.3.1 problem_size

```
std::size_t smtrat::PseudoBoolEncoder::problem_size [inherited]
```

15.304 smtrat::cad::ModelBasedProjection< incrementality, backtracking, Settings > Class Template Reference

```
#include <Projection.h>
```

Public Member Functions

- std::size_t dim () const

  Returns the dimension of the projection.
- const auto & vars () const

  Returns the variables used for projection.
- void reset ()

  Resets all datastructures, use the given variables from now on.
- template<typename F >
  void setRemoveCallback (F &&f)

  Sets a callback that is called whenever polynomials are removed.
- carl::Bitset addPolynomial (const Poly &p, std::size_t cid, bool isBound)

  Adds the given polynomial to the projection. Converts to a UPoly and calls the appropriate overload.
- virtual carl::Bitset addPolynomial (const UPoly &p, std::size_t cid, bool isBound)=0

  Adds the given polynomial to the projection.
- carl::Bitset addEqConstraint (const Poly &p, std::size_t cid, bool isBound)

  Adds the given polynomial of an equational constraint to the projection. Converts to a UPoly and calls the appropriate overload.
- virtual carl::Bitset addEqConstraint (const UPoly &p, std::size_t cid, bool isBound)

  Adds the given polynomial of an equational constraint to the projection.
- void removePolynomial (const Poly &p, std::size_t cid, bool isBound)

  Removes the given polynomial from the projection. Converts to a UPoly and calls the appropriate overload.
- virtual void removePolynomial (const UPoly &p, std::size_t cid, bool isBound)=0

  Removes the given polynomial from the projection.
- virtual std::size_t size (std::size_t level) const =0
- std::size_t size () const
- virtual bool empty (std::size_t level) const =0
- virtual bool empty ()
- OptionalID getPolyForLifting (std::size_t level, SampleLiftedWith &slw)

  Get a polynomial from this level suited for lifting.
- virtual bool hasPolynomialById (std::size_t level, std::size_t id) const =0
- virtual const UPoly & getPolynomialById (std::size_t level, std::size_t id) const =0

  Retrieves a polynomial from its id.
- virtual void exportAsDot (std::ostream &) const
- virtual Origin getOrigin (std::size_t level, std::size_t id) const

Protected Types

- using Constraints = CADConstraints< Settings::backtracking >

Protected Member Functions

- void callRemoveCallback (std::size_t level, const SampleLiftedWith &slw) const
- std::size_t getID (std::size_t level)

  Returns a fresh polynomial id for the given level.
- void freeID (std::size_t level, std::size_t id)

  Frees a currently used polynomial id for the given level.
- carl::Variable var (std::size_t level) const

  Returns the variable that corresponds to the given level, that is the variable eliminated in this level.
- bool canBePurgedByBounds (const UPoly &p) const

  Checks whether a polynomial can safely be ignored due to the bounds.
- bool isPurged (std::size_t level, std::size_t id)

Protected Attributes

- const Constraints & mConstraints
- std::vector< PolynomialLiftingQueue< BaseProjection > > mLiftingQueues

  List of lifting queues that can be used for incremental projection.
- ProjectionInformation mInfo

  Additional info on projection, projection levels and projection polynomials.
- ProjectionOperator mOperator

  The projection operator.
- std::function< void(std::size_t, const SampleLiftedWith &)> mRemoveCallback

  Callback to be called when polynomials are removed. The arguments are the projection level and a bitset that indicate which polynomials were removed in this level.

15.304.1 Member Typedef Documentation

15.304.1.1 Constraints `template<typename Settings>`

```
using smtrat::cad::BaseProjection< Settings >::Constraints = CADConstraints<Settings::backtracking>
[protected], [inherited]
```

15.304.2 Member Function Documentation

15.304.2.1 addEqConstraint() [1/2] `template<typename Settings>`

```
carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Adds the given polynomial of an equational constraint to the projection. Converts to a UPoly and calls the appropriate overload.

15.304.2.2 addEqConstraint() [2/2] `template<typename Settings>`

```
virtual carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [inline], [virtual], [inherited]
```

Adds the given polynomial of an equational constraint to the projection.

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >.

15.304.2.3 addPolynomial() [1/2] template<typename Settings>

```
carl::Bitset smtrat::cad::BaseProjection< Settings >::addPolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound ) [inline], [inherited]
```

Adds the given polynomial to the projection. Converts to a UPoly and calls the appropriate overload.

15.304.2.4 addPolynomial() [2/2] template<typename Settings>

```
virtual carl::Bitset smtrat::cad::BaseProjection< Settings >::addPolynomial (
            const UPoly & p,
            std::size_t cid,
            bool isBound ) [pure virtual], [inherited]
```

Adds the given polynomial to the projection.

Implemented in smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Incrementality::NONE smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, smtrat::cad::Projection< Incrementality::FULL, BT, S and smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings >.

15.304.2.5 callRemoveCallback() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::callRemoveCallback (
            std::size_t level,
            const SampleLiftedWith & slw ) const [inline], [protected], [inherited]
```

15.304.2.6 canBePurgedByBounds() template<typename Settings>

```
bool smtrat::cad::BaseProjection< Settings >::canBePurgedByBounds (
            const UPoly & p ) const [inline], [protected], [inherited]
```

Checks whether a polynomial can safely be ignored due to the bounds.

15.304.2.7 dim() template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::dim ( ) const [inline], [inherited]
```

Returns the dimension of the projection.

15.304.2.8 empty() [1/2] template<typename Settings>

```
virtual bool smtrat::cad::BaseProjection< Settings >::empty ( ) [inline], [virtual], [inherited]
```

15.304.2.9 empty() [2/2] template<typename Settings>

```
virtual bool smtrat::cad::BaseProjection< Settings >::empty (
            std::size_t level ) const [pure virtual], [inherited]
```

Implemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, smtrat::cad::Projection< Incremental smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Increme smtrat::qe::cad::Projection< Settings >, smtrat::qe::cad::Projection< smtrat::qe::cad::CADSettings >, and smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.304.2.10 exportAsDot() template<typename Settings>

```
virtual void smtrat::cad::BaseProjection< Settings >::exportAsDot (
            std::ostream &  ) const  [inline], [virtual], [inherited]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, and smtrat::cad::Projection< Incre

15.304.2.11 freeID() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::freeID (
            std::size_t level,
            std::size_t id )  [inline], [protected], [inherited]
```

Frees a currently used polynomial id for the given level.

15.304.2.12 getID() template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::getID (
            std::size_t level )  [inline], [protected], [inherited]
```

Returns a fresh polynomial id for the given level.

15.304.2.13 getOrigin() template<typename Settings>

```
virtual Origin smtrat::cad::BaseProjection< Settings >::getOrigin (
            std::size_t level,
            std::size_t id ) const  [inline], [virtual], [inherited]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, BT, Settings >.

15.304.2.14 getPolyForLifting() template<typename Settings>

```
OptionalID smtrat::cad::BaseProjection< Settings >::getPolyForLifting (
            std::size_t level,
            SampleLiftedWith & slw )  [inline], [inherited]
```

Get a polynomial from this level suited for lifting.

15.304.2.15 getPolynomialById() template<typename Settings>

```
virtual const UPoly& smtrat::cad::BaseProjection< Settings >::getPolynomialById (
            std::size_t level,
            std::size_t id ) const  [pure virtual], [inherited]
```

Retrieves a polynomial from its id.

Implemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, smtrat::cad::Projection< Incremental smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Increme smtrat::qe::cad::Projection< Settings >, smtrat::qe::cad::Projection< smtrat::qe::cad::CADSettings >, and smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.304.2.16 hasPolynomialById()

```
template<typename Settings>
virtual bool smtrat::cad::BaseProjection< Settings >::hasPolynomialById (
            std::size_t level,
            std::size_t id ) const  [pure virtual], [inherited]
```

Implemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, smtrat::cad::Projection< Incremental smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Increme smtrat::qe::cad::Projection< Settings >, smtrat::qe::cad::Projection< smtrat::qe::cad::CADSettings >, and smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.304.2.17 isPurged()

```
template<typename Settings>
bool smtrat::cad::BaseProjection< Settings >::isPurged (
            std::size_t level,
            std::size_t id )  [inline], [protected], [inherited]
```

15.304.2.18 removePolynomial() [1/2]

```
template<typename Settings>
void smtrat::cad::BaseProjection< Settings >::removePolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Removes the given polynomial from the projection. Converts to a UPoly and calls the appropriate overload.

15.304.2.19 removePolynomial() [2/2]

```
template<typename Settings>
virtual void smtrat::cad::BaseProjection< Settings >::removePolynomial (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [pure virtual], [inherited]
```

Removes the given polynomial from the projection.

Implemented in smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Incrementality::FULL smtrat::cad::Projection< Incrementality::FULL, BT, Settings >, smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings >, and smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.304.2.20 reset()

```
template<typename Settings>
void smtrat::cad::BaseProjection< Settings >::reset ( )  [inline], [inherited]
```

Resets all datastructures, use the given variables from now on.

15.304.2.21 setRemoveCallback()

```
template<typename Settings>
template<typename F >
void smtrat::cad::BaseProjection< Settings >::setRemoveCallback (
            F && f )  [inline], [inherited]
```

Sets a callback that is called whenever polynomials are removed.

15.304.2.22 size() [1/2] template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::size ( ) const [inline], [inherited]
```

15.304.2.23 size() [2/2] template<typename Settings>

```
virtual std::size_t smtrat::cad::BaseProjection< Settings >::size (
            std::size_t level ) const [pure virtual], [inherited]
```

Implemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, smtrat::cad::Projection< Incremental smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Increme smtrat::qe::cad::Projection< Settings >, smtrat::qe::cad::Projection< smtrat::qe::cad::CADSettings >, and smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.304.2.24 var() template<typename Settings>

```
carl::Variable smtrat::cad::BaseProjection< Settings >::var (
            std::size_t level ) const [inline], [protected], [inherited]
```

Returns the variable that corresponds to the given level, that is the variable eliminated in this level.

15.304.2.25 vars() template<typename Settings>

```
const auto& smtrat::cad::BaseProjection< Settings >::vars ( ) const [inline], [inherited]
```

Returns the variables used for projection.

15.304.3 Field Documentation

15.304.3.1 mConstraints template<typename Settings>

```
const Constraints& smtrat::cad::BaseProjection< Settings >::mConstraints [protected], [inherited]
```

15.304.3.2 mInfo template<typename Settings>

```
ProjectionInformation smtrat::cad::BaseProjection< Settings >::mInfo [protected], [inherited]
```

Additional info on projection, projection levels and projection polynomials.

15.304.3.3 mLiftingQueues template<typename Settings>

```
std::vector<PolynomialLiftingQueue<BaseProjection> > smtrat::cad::BaseProjection< Settings
>::mLiftingQueues [protected], [inherited]
```

List of lifting queues that can be used for incremental projection.

15.304.3.4 mOperator template<typename Settings>

```
ProjectionOperator smtrat::cad::BaseProjection< Settings >::mOperator [protected], [inherited]
```

The projection operator.

15.304.3.5 mRemoveCallback

`template<typename Settings> std::function<void(std::size_t, const SampleLiftedWith&)> smtrat::cad::BaseProjection< Settings >::mRemoveCallback [protected], [inherited]`

Callback to be called when polynomials are removed. The arguments are the projection level and a bitset that indicate which polynomials were removed in this level.

15.305 smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings > Class Template Reference

This class implements a projection that supports no incrementality and expects backtracking to be in order.

`#include <Projection_Model.h>`

Public Member Functions

- ModelBasedProjection (const Constraints &c, const Model &model)
- void reset ()

  Resets all datastructures, use the given variables from now on.
- carl::Bitset addPolynomial (const UPoly &p, std::size_t cid, bool) override

  Adds the given polynomial to the projection with the given constraint id as origin.
- void removePolynomial (const UPoly &p, std::size_t cid, bool) override

  Removed the given polynomial from the projection.
- void projectNextLevel (std::size_t level)

  Performs the projection model-based for one level, using only polynomials with closest roots.
- std::size_t size (std::size_t level) const override

  Returns the number of polynomials in this level.
- bool empty (std::size_t level) const override

  Returns whether the number of polynomials in this level is zero.
- carl::Bitset projectNewPolynomial (const ConstraintSelection &=carl::Bitset(true))

  Returns false, as the projection is not incremental.
- bool hasPolynomialById (std::size_t level, std::size_t id) const override
- const UPoly & getPolynomialById (std::size_t level, std::size_t id) const override

  Get the polynomial from this level with the given id.
- std::size_t dim () const

  Returns the dimension of the projection.
- virtual std::size_t size (std::size_t level) const=0
- std::size_t size () const
- std::size_t dim () const

  Returns the dimension of the projection.
- const auto & vars () const

  Returns the variables used for projection.
- template<typename F >
  void setRemoveCallback (F &&f)

  Sets a callback that is called whenever polynomials are removed.
- carl::Bitset addPolynomial (const Poly &p, std::size_t cid, bool isBound)

  Adds the given polynomial to the projection. Converts to a UPoly and calls the appropriate overload.
- carl::Bitset addEqConstraint (const Poly &p, std::size_t cid, bool isBound)

  Adds the given polynomial of an equational constraint to the projection. Converts to a UPoly and calls the appropriate overload.
- virtual carl::Bitset addEqConstraint (const UPoly &p, std::size_t cid, bool isBound)

  Adds the given polynomial of an equational constraint to the projection.

- void removePolynomial (const Poly &p, std::size_t cid, bool isBound)

  Removes the given polynomial from the projection. Converts to a UPoly and calls the appropriate overload.
- std::size_t size () const
- virtual bool empty ()
- OptionalID getPolyForLifting (std::size_t level, SampleLiftedWith &slw)

  Get a polynomial from this level suited for lifting.
- virtual void exportAsDot (std::ostream &) const
- virtual Origin getOrigin (std::size_t level, std::size_t id) const

Protected Member Functions

- std::size_t getID (std::size_t level)

  Returns a fresh polynomial id for the given level.
- void freeID (std::size_t level, std::size_t id)

  Frees a currently used polynomial id for the given level.
- carl::Variable var (std::size_t level) const

  Returns the variable that corresponds to the given level, that is the variable eliminated in this level.
- bool canBePurgedByBounds (const UPoly &p) const

  Checks whether a polynomial can safely be ignored due to the bounds.
- bool isPurged (std::size_t level, std::size_t id)

Protected Attributes

- const Constraints & mConstraints
- ProjectionInformation mInfo

  Additional info on projection, projection levels and projection polynomials.
- std::function< void(std::size_t, const SampleLiftedWith &)> mRemoveCallback

  Callback to be called when polynomials are removed. The arguments are the projection level and a bitset that indicate which polynomials were removed in this level.

Friends

- template<typename S >
  std::ostream & operator<< (std::ostream &os, const ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, S > &p)

15.305.1 Detailed Description

template<typename Settings>
class smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >

This class implements a projection that supports no incrementality and expects backtracking to be in order.

It is based on the following data structures:

- mPolynomialIDs: maps polynomials to a (per level) unique id
- mPolynomials: stores polynomials as a list (per level) with their origin

The origin of a polynomial in level zero is the id of the corresponding constraint. For all other levels, it is the id of some polynomial from level zero such that the polynomial must be removed if the origin is removed. For a single projection operation, the resulting origin is the largest of the participating polynomials. If a polynomial is derived from multiple projection operations, the origin is the earliest and thus smallest, at least for this non-incremental setting.

15.305.2 Constructor & Destructor Documentation

15.305.2.1 ModelBasedProjection()

```
template<typename Settings >
smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >↩
::ModelBasedProjection (
            const Constraints & c,
            const Model & model )  [inline]
```

15.305.3 Member Function Documentation

15.305.3.1 addEqConstraint() [1/2]

```
template<typename Settings>
carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Adds the given polynomial of an equational constraint to the projection. Converts to a UPoly and calls the appropriate overload.

15.305.3.2 addEqConstraint() [2/2]

```
template<typename Settings>
virtual carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [inline], [virtual], [inherited]
```

Adds the given polynomial of an equational constraint to the projection.

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >.

15.305.3.3 addPolynomial() [1/2]

```
template<typename Settings>
carl::Bitset smtrat::cad::BaseProjection< Settings >::addPolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Adds the given polynomial to the projection. Converts to a UPoly and calls the appropriate overload.

15.305.3.4 addPolynomial() [2/2]

```
template<typename Settings >
carl::Bitset smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED,
Settings >::addPolynomial (
            const UPoly & p,
            std::size_t cid,
            bool  )  [inline], [override], [virtual]
```

Adds the given polynomial to the projection with the given constraint id as origin.

Asserts that the main variable of the polynomial is the first variable.

Implements smtrat::cad::BaseProjection< Settings >.

15.305.3.5 callRemoveCallback() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::callRemoveCallback (
            std::size_t level,
            const SampleLiftedWith & slw ) const [inline], [protected], [inherited]
```

15.305.3.6 canBePurgedByBounds() template<typename Settings>

```
bool smtrat::cad::BaseProjection< Settings >::canBePurgedByBounds (
            const UPoly & p ) const [inline], [protected], [inherited]
```

Checks whether a polynomial can safely be ignored due to the bounds.

15.305.3.7 dim() [1/2] template<typename Settings >

```
std::size_t smtrat::cad::BaseProjection< Settings >::dim [inline]
```

Returns the dimension of the projection.

15.305.3.8 dim() [2/2] template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::dim ( ) const [inline], [inherited]
```

Returns the dimension of the projection.

15.305.3.9 empty() [1/2] template<typename Settings>

```
virtual bool smtrat::cad::BaseProjection< Settings >::empty ( ) [inline], [virtual], [inherited]
```

15.305.3.10 empty() [2/2] template<typename Settings >

```
bool smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings
>::empty (
            std::size_t level ) const [inline], [override], [virtual]
```

Returns whether the number of polynomials in this level is zero.

Implements smtrat::cad::BaseProjection< Settings >.

15.305.3.11 exportAsDot() template<typename Settings>

```
virtual void smtrat::cad::BaseProjection< Settings >::exportAsDot (
            std::ostream & ) const [inline], [virtual], [inherited]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, and smtrat::cad::Projection< Incre

15.305.3.12 freeID() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::freeID (
            std::size_t level,
            std::size_t id ) [inline], [protected], [inherited]
```

Frees a currently used polynomial id for the given level.

15.305.3.13 getID() template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::getID (
            std::size_t level )  [inline], [protected], [inherited]
```

Returns a fresh polynomial id for the given level.

15.305.3.14 getOrigin() template<typename Settings>

```
virtual Origin smtrat::cad::BaseProjection< Settings >::getOrigin (
            std::size_t level,
            std::size_t id ) const  [inline], [virtual], [inherited]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, BT, Settings >.

15.305.3.15 getPolyForLifting() template<typename Settings>

```
OptionalID smtrat::cad::BaseProjection< Settings >::getPolyForLifting (
            std::size_t level,
            SampleLiftedWith & slw )  [inline], [inherited]
```

Get a polynomial from this level suited for lifting.

15.305.3.16 getPolynomialById() template<typename Settings >

```
const UPoly& smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED,
Settings >::getPolynomialById (
            std::size_t level,
            std::size_t id ) const  [inline], [override], [virtual]
```

Get the polynomial from this level with the given id.

Implements smtrat::cad::BaseProjection< Settings >.

15.305.3.17 hasPolynomialById() template<typename Settings >

```
bool smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings
>::hasPolynomialById (
            std::size_t level,
            std::size_t id ) const  [inline], [override], [virtual]
```

Implements smtrat::cad::BaseProjection< Settings >.

15.305.3.18 isPurged() template<typename Settings>

```
bool smtrat::cad::BaseProjection< Settings >::isPurged (
            std::size_t level,
            std::size_t id )  [inline], [protected], [inherited]
```

15.305.3.19 projectNewPolynomial()

```
template<typename Settings >
carl::Bitset smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED,
Settings >::projectNewPolynomial (
            const ConstraintSelection &  = carl::Bitset(true) )  [inline]
```

Returns false, as the projection is not incremental.

15.305.3.20 projectNextLevel()

```
template<typename Settings >
void smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings
>::projectNextLevel (
            std::size_t level )  [inline]
```

Performs the projection model-based for one level, using only polynomials with closest roots.

15.305.3.21 removePolynomial() [1/2]

```
template<typename Settings>
void smtrat::cad::BaseProjection< Settings >::removePolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Removes the given polynomial from the projection. Converts to a UPoly and calls the appropriate overload.

15.305.3.22 removePolynomial() [2/2]

```
template<typename Settings >
void smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings
>::removePolynomial (
            const UPoly & p,
            std::size_t cid,
            bool  )  [inline], [override], [virtual]
```

Removed the given polynomial from the projection.

Asserts that this polynomial was the one added last and has the given constraint id as origin. Calls the callback function for every level with a mask designating the polynomials removed from this level.

Implements smtrat::cad::BaseProjection< Settings >.

15.305.3.23 reset()

```
template<typename Settings >
void smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings
>::reset ( )  [inline]
```

Resets all datastructures, use the given variables from now on.

15.305.3.24 setRemoveCallback()

```
template<typename Settings>
template<typename F >
void smtrat::cad::BaseProjection< Settings >::setRemoveCallback (
            F && f )  [inline], [inherited]
```

Sets a callback that is called whenever polynomials are removed.

15.305.3.25 size() [1/4] template<typename Settings >

```
std::size_t smtrat::cad::BaseProjection< Settings >::size [inline]
```

15.305.3.26 size() [2/4] template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::size ( ) const [inline], [inherited]
```

15.305.3.27 size() [3/4] template<typename Settings >

```
std::size_t smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED,
Settings >::size (
            std::size_t level ) const [inline], [override], [virtual]
```

Returns the number of polynomials in this level.

Implements smtrat::cad::BaseProjection< Settings >.

15.305.3.28 size() [4/4] template<typename Settings >

```
virtual std::size_t smtrat::cad::BaseProjection< Settings >::size
```

15.305.3.29 var() template<typename Settings>

```
carl::Variable smtrat::cad::BaseProjection< Settings >::var (
            std::size_t level ) const [inline], [protected], [inherited]
```

Returns the variable that corresponds to the given level, that is the variable eliminated in this level.

15.305.3.30 vars() template<typename Settings>

```
const auto& smtrat::cad::BaseProjection< Settings >::vars ( ) const [inline], [inherited]
```

Returns the variables used for projection.

15.305.4 Friends And Related Function Documentation

15.305.4.1 operator<< template<typename Settings >

```
template<typename S >
std::ostream& operator<< (
            std::ostream & os,
            const ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, S > & p
) [friend]
```

15.305.5 Field Documentation

15.305.5.1 mConstraints template<typename Settings>

```
const Constraints& smtrat::cad::BaseProjection< Settings >::mConstraints [protected], [inherited]
```

15.305.5.2 mInfo `template<typename Settings>`

`ProjectionInformation smtrat::cad::BaseProjection< Settings >::mInfo [protected], [inherited]`

Additional info on projection, projection levels and projection polynomials.

15.305.5.3 mRemoveCallback `template<typename Settings>`

`std::function<void(std::size_t, const SampleLiftedWith&)> smtrat::cad::BaseProjection< Settings >::mRemoveCallback [protected], [inherited]`

Callback to be called when polynomials are removed. The arguments are the projection level and a bitset that indicate which polynomials were removed in this level.

15.306 smtrat::Module Class Reference

A base class for all kind of theory solving methods.

`#include <Module.h>`

Data Structures

- struct Lemma
- struct ModuleStatistics
- struct TheoryPropagation

Public Types

- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- Module (const ModuleInput *_formula, Conditionals &_foundAnswer, Manager *_manager=nullptr, std::string module_name="Module")

  Constructs a module.
- virtual ~Module ()

  Destructs a module.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateModel () const

  Updates the model, if the solver has detected the consistency of the received formula, beforehand.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.

- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore (ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer checkCore ()

  Checks the received formula for consistency.
- virtual void removeCore (ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

Gets the origins of the passed formula at the given position.

- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩ _premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩ Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩ ::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩ AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩ CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.

- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.

- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.

- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.306.1 Detailed Description

A base class for all kind of theory solving methods.

15.306.2 Member Enumeration Documentation

15.306.2.1 LemmaType

`enum smtrat::Module::LemmaType : unsigned [strong]`

Enumerator

NORMAL	
PERMANENT	

15.306.3 Constructor & Destructor Documentation

15.306.3.1 Module()

```
smtrat::Module::Module (
    const ModuleInput * _formula,
    Conditionals & _foundAnswer,
    Manager * _manager = nullptr,
    std::string module_name = "Module" )
```

Constructs a module.

Parameters

_formula	The formula passed to this module, called received formula.
_foundAnswer	Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
_manager	A reference to the manager of the solver using this module.
module_name	Name of this module as string for printing.

15.306.3.2 ~Module() `smtrat::Module::~Module ( ) [virtual]`

Destructs a module.

15.306.4 Member Function Documentation

15.306.4.1 add() `bool smtrat::Module::add ( ModuleInput::const_iterator _subformula )`

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.306.4.2 addConstraintToInform() `void smtrat::Module::addConstraintToInform ( const FormulaT & _constraint ) [protected], [virtual]`

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.306.4.3 addCore() `virtual bool smtrat::Module::addCore ( ModuleInput::const_iterator formula ) [inline], [protected], [virtual]`

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >,

smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.306.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.306.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.306.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.306.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.306.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula )  [inline], [protected]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.306.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.306.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.306.4.11 allModels() `const std::vector<Model>& smtrat::Module::allModels ( ) const [inline]`

Returns All satisfying assignments, if existent.

15.306.4.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.306.4.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.306.4.14 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.306.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected]
```

15.306.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected]
```

15.306.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected]
```

15.306.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.306.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P
>> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
```

```
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() )  [inline],
[protected]
```

15.306.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P
>> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [inline], [protected]
```

15.306.4.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.306.4.22 checkCore()

```
Answer smtrat::Module::checkCore ( )  [protected], [virtual]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::SATModule< Settings >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRAS smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::VSModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::GBModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, smtrat::LVEModule< Settings >, smtrat::ESModule< Settings >, smtrat::GBPPModule< Settings >, smtrat::CNFerModule, smtrat::BEModule< Settings >, smtrat::MCBModule< Settings >, smtrat::PFEModule< Settings >, smtrat::SplitSOSModule< Setti smtrat::EMModule< Settings >, and smtrat::SymmetryModule< Settings >.

15.306.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.306.4.24 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected]
```

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.306.4.25 cleanModel()

```
void smtrat::Module::cleanModel ( ) const [inline], [protected]
```

Substitutes variable occurrences by its model value in the model values of other variables.

15.306.4.26 clearLemmas()

```
void smtrat::Module::clearLemmas ( ) [inline]
```

Deletes all yet found lemmas.

15.306.4.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected]`

Clears the assignment, if any was found.

15.306.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected]`

Clears all assignments, if any was found.

15.306.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected]`

15.306.4.30 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const
```

15.306.4.31 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.306.4.32 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( )`

15.306.4.33 constraintsToInform()

```
const carl::FastSet<FormulaT>& smtrat::Module::constraints↩
ToInform ( ) const [inline]
```

Returns The constraints which the backends must be informed about.

15.306.4.34 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.306.4.35 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.306.4.36 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint )
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.306.4.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint )  [inline], [protected], [virtual]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.306.4.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const  [protected]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.306.4.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
            ModuleInput::iterator _subformula,
            bool _ignoreOrigins = false ) [protected], [virtual]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.306.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const
```

Excludes all variables from the current model, which do not occur in the received formula.

15.306.4.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
            const std::vector< FormulaT > & _origins ) const [protected]
```

Parameters

_origins	

Returns

15.306.4.42 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.306.4.43 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.306.4.44 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static]`

15.306.4.45 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected]`

Stores the trivial infeasible subset being the set of received formulas.

15.306.4.46 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected]`

Stores all models of a backend in the list of all models of this module.

15.306.4.47 getBackendsModel()

`void smtrat::Module::getBackendsModel ( ) const [protected]`

15.306.4.48 getInfeasibleSubsets() [1/2]

`void smtrat::Module::getInfeasibleSubsets ( ) [protected]`

Copies the infeasible subsets of the passed formula.

15.306.4.49 getInfeasibleSubsets() [2/2]

`std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.306.4.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.306.4.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.306.4.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected]
```

Parameters

_formula	
_origins	

15.306.4.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected]
```

Parameters

_formula	
_origins	

15.306.4.54 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.306.4.55 getReceivedFormulaSimplified() `std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual]`

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.306.4.56 hasLemmas() `bool smtrat::Module::hasLemmas ( ) [inline]`

Checks whether this module or any of its backends provides any lemmas.

15.306.4.57 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.306.4.58 id() `std::size_t smtrat::Module::id ( ) const [inline]`

Returns A unique ID to identify this module instance.

15.306.4.59 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.306.4.60 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint )`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.306.4.61 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.306.4.62 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.306.4.63 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline]
```

Returns The position of the first constraint of which no backend has been informed about.

15.306.4.64 init() `void smtrat::Module::init ( ) [virtual]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.306.4.65 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline]`

15.306.4.66 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.306.4.67 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.306.4.68 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.306.4.69 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.306.4.70 model() `const Model& smtrat::Module::model ( ) const [inline]`

Returns The assignment of the current satisfiable result, if existent.

15.306.4.71 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.306.4.72 moduleName() `virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual]`

Returns The name of the given module type as name.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::VSModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::GBModule< Settings >, smtrat::IntEqModule< Setti smtrat::CubeLIAModule< Settings >, smtrat::CurryModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IncWidthModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::BEModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::SplitSOSModule< Settings >.

15.306.4.73 objective() `carl::Variable smtrat::Module::objective ( ) const [inline]`

15.306.4.74 originInReceivedFormula() `bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected]`

15.306.4.75 passedFormulaBegin() `ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.306.4.76 passedFormulaEnd() `ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected]`

Returns An iterator to the end of the passed formula.

15.306.4.77 pPassedFormula() `const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline]`

Returns A pointer to the formula passed to the backends of this module.

15.306.4.78 pReceivedFormula() `const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline]`

Returns A pointer to the formula passed to this module.

15.306.4.79 print() `void smtrat::Module::print ( const std::string & _initiation = "***" ) const`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.306.4.80 printAllModels() `void smtrat::Module::printAllModels ( std::ostream & _out = std::cout )`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.306.4.81 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.306.4.82 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.306.4.83 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.306.4.84 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.306.4.85 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.306.4.86 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline]
```

Notifies that the received formulas has been checked.

15.306.4.87 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩
InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected]
```

Stores an infeasible subset consisting only of the given received formula.

15.306.4.88 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline]
```

15.306.4.89 remove()

```
void smtrat::Module::remove (
    ModuleInput::const_iterator _subformula ) [virtual]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.306.4.90 removeCore()

```
virtual void smtrat::Module::removeCore (
    ModuleInput::const_iterator formula ) [inline], [protected], [virtual]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.306.4.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected]
```

15.306.4.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected]
```

15.306.4.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline]
```

Returns A reference to the formula passed to the backends of this module.

15.306.4.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline]
```

Returns A reference to the formula passed to this module.

15.306.4.95 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( ) [inline],
[protected], [virtual]
```

Reimplemented in smtrat::PModule.

15.306.4.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.306.4.97 setId()

```
void smtrat::Module::setId ( std::size_t _id ) [inline]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.306.4.98 setThreadPriority()

```
void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.306.4.99 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline]
```

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.306.4.100 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.306.4.101 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline]`

Returns The priority of this module to get a thread for running its check procedure.

15.306.4.102 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.306.4.103 updateLemmas() `void smtrat::Module::updateLemmas ( )`

Stores all lemmas of any backend of this module in its own lemma vector.

15.306.4.104 updateModel() `void smtrat::Module::updateModel ( ) const [virtual]`

Updates the model, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::SATModule< Settings >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRAS smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::PModule, smtrat::VSModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, smtrat::LVEModule< Settings >, smtrat::MCBModule< Settings >, smtrat::ESModule< Settings >, and smtrat::GBPPModule< Settings >.

15.306.4.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.306.5 Field Documentation

15.306.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected]`

The backends of this module which have been used.

15.306.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected]`

Stores all satisfying assignments.

15.306.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.306.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected]`

Stores the constraints which the backends must be informed about.

15.306.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.306.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static]`

The beginning of the cyclic buffer storing the last branches.

15.306.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.306.5.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module::m↩FirstUncheckedReceivedSubformula [protected]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.306.5.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.306.5.10 mFullCheck `bool smtrat::Module::mFullCheck [protected]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.306.5.11 mInfeasibleSubsets `std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected]`

Stores the infeasible subsets.

15.306.5.12 mInformedConstraints `carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected]`

Stores the position of the first constraint of which no backend has been informed about.

15.306.5.13 mLastBranches `std::vector< Branching > smtrat::Module::mLastBranches = std↩ ::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static]`

Stores the last branches in a cycle buffer.

15.306.5.14 mLemmas `std::vector<Lemma> smtrat::Module::mLemmas [protected]`

Stores the lemmas being valid formulas this module or its backends made.

15.306.5.15 mModel `Model smtrat::Module::mModel [mutable], [protected]`

Stores the assignment of the current satisfiable result, if existent.

15.306.5.16 mModelComputed `bool smtrat::Module::mModelComputed [mutable], [protected]`

True, if the model has already been computed.

15.306.5.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static]`

The number of different variables to consider for a probable infinite loop of branchings.

15.306.5.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.306.5.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static]`

Reusable splitting variables.

15.306.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected]`

A reference to the manager.

15.306.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.306.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.306.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected]`

15.306.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.306.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected]`

Maps variables to the number of their occurrences.

15.308.1 Detailed Description

The input formula a module has to consider for it's satisfiability check.

It is a list of formulas and semantically considered as their conjunction.

15.308.2 Member Typedef Documentation

15.308.2.1 const_iterator

`typedef super::const_iterator smtrat::ModuleInput::const_iterator`

Passing through the list::const_iterator.

15.308.2.2 iterator

`typedef super::iterator smtrat::ModuleInput::iterator`

Passing through the list::iterator.

15.308.3 Constructor & Destructor Documentation

15.308.3.1 ModuleInput()

`smtrat::ModuleInput::ModuleInput ( ) [inline]`

Constructs a module input.

15.308.4 Member Function Documentation

15.308.4.1 add() [1/4]

```
std::pair<iterator,bool> smtrat::ModuleInput::add (
    const FormulaT & _formula,
    bool _hasSingleOrigin,
    const FormulaT & _origin,
    const std::shared_ptr< FormulasT > & _origins,
    bool _mightBeConjunction = true )
```

15.308.4.2 add() [2/4]

```
std::pair<iterator,bool> smtrat::ModuleInput::add (
    const FormulaT & _formula,
    bool _mightBeConjunction = true ) [inline]
```

15.308.4.3 add() [3/4]

```
std::pair<iterator,bool> smtrat::ModuleInput::add (
    const FormulaT & _formula,
    const FormulaT & _origins,
    bool _mightBeConjunction = true ) [inline]
```

15.308.4.4 add() [4/4]

```
std::pair<iterator,bool> smtrat::ModuleInput::add (
    const FormulaT & _formula,
    const std::shared_ptr< FormulasT > & _origins,
    bool _mightBeConjunction = true ) [inline]
```

15.308.4.5 addOrigin()

```
void smtrat::ModuleInput::addOrigin (
    iterator _formula,
    const FormulaT & _origin ) [inline]
```

15.308.4.6 back()

```
const auto& smtrat::ModuleInput::back ( ) const [inline]
```

15.308.4.7 begin() [1/2]

```
iterator smtrat::ModuleInput::begin ( ) [inline]
```

15.308.4.8 begin() [2/2]

```
const_iterator smtrat::ModuleInput::begin ( ) const [inline]
```

15.308.4.9 clearOrigins()

```
void smtrat::ModuleInput::clearOrigins (
    iterator _formula ) [inline]
```

15.308.4.10 contains()

```
bool smtrat::ModuleInput::contains (
    const FormulaT & _subformula ) const [inline]
```

Parameters

_subformula	The formula for which to check whether it is one of the stored formulas.

Returns true, if the given formula is one of the stored formulas; false, otherwise.

15.308.4.11 containsBitVectorConstraints() `bool smtrat::ModuleInput::containsBitVectorConstraints ( ) const [inline]`

Returns true, if this formula contains bit vector constraints; false, otherwise.

15.308.4.12 containsBooleanVariables() `bool smtrat::ModuleInput::containsBooleanVariables ( ) const [inline]`

Returns true, if this formula contains Boolean variables; false, otherwise.

15.308.4.13 containsIntegerVariables() `bool smtrat::ModuleInput::containsIntegerVariables ( ) const [inline]`

Returns true, if this formula contains Boolean variables; false, otherwise.

15.308.4.14 containsRealVariables() `bool smtrat::ModuleInput::containsRealVariables ( ) const [inline]`

Returns true, if this formula contains Boolean variables; false, otherwise.

15.308.4.15 containsUninterpretedEquations() `bool smtrat::ModuleInput::containsUninterpreted↩ Equations ( ) const [inline]`

Returns true, if this formula contains uninterpreted equations; false, otherwise.

15.308.4.16 empty() `bool smtrat::ModuleInput::empty ( ) const [inline]`

15.308.4.17 end() [1/2] `iterator smtrat::ModuleInput::end ( ) [inline]`

15.308.4.18 end() [2/2] `const_iterator smtrat::ModuleInput::end ( ) const [inline]`

15.308.4.19 erase() `ModuleInput::iterator smtrat::ModuleInput::erase ( iterator _formula )`

15.308.4.20 find() [1/4]

```
ModuleInput::iterator smtrat::ModuleInput::find (
    const FormulaT & _formula )
```

15.308.4.21 find() [2/4]

```
ModuleInput::const_iterator smtrat::ModuleInput::find (
    const FormulaT & _formula ) const
```

15.308.4.22 find() [3/4]

```
ModuleInput::iterator smtrat::ModuleInput::find (
    const_iterator _hint,
    const FormulaT & _formula )
```

15.308.4.23 find() [4/4]

```
ModuleInput::const_iterator smtrat::ModuleInput::find (
    const_iterator _hint,
    const FormulaT & _formula ) const
```

15.308.4.24 gatherVariables()

```
void smtrat::ModuleInput::gatherVariables (
    carl::carlVariables & vars ) const [inline]
```

15.308.4.25 isConstraintConjunction()

```
bool smtrat::ModuleInput::isConstraintConjunction ( )
const [inline]
```

Returns true, if this formula is a conjunction of constraints; false, otherwise.

15.308.4.26 isConstraintLiteralConjunction()

```
bool smtrat::ModuleInput::isConstraintLiteral↩
Conjunction ( ) const [inline]
```

Returns true, if this formula is a conjunction of literals of constraints; false, otherwise.

15.308.4.27 isIntegerConstraintConjunction()

```
bool smtrat::ModuleInput::isIntegerConstraint↩
Conjunction ( ) const [inline]
```

Returns true, if this formula is a conjunction of integer constraints; false, otherwise.

15.308.4.28 isIntegerConstraintLiteralConjunction()

```
bool smtrat::ModuleInput::isIntegerConstraint↩
LiteralConjunction ( ) const [inline]
```

Returns true, if this formula is a conjunction of literals of integer constraints; false, otherwise.

15.308.4.29 isOnlyPropositional() `bool smtrat::ModuleInput::isOnlyPropositional ( ) const [inline]`

Returns true, if this formula is propositional; false, otherwise.

15.308.4.30 isRealConstraintConjunction() `bool smtrat::ModuleInput::isRealConstraintConjunction ( ) const [inline]`

Returns true, if this formula is a conjunction of real constraints; false, otherwise.

15.308.4.31 isRealConstraintLiteralConjunction() `bool smtrat::ModuleInput::isRealConstraint↩ LiteralConjunction ( ) const [inline]`

Returns true, if this formula is a conjunction of literals of real constraints; false, otherwise.

15.308.4.32 operator FormulaT() `smtrat::ModuleInput::operator FormulaT ( ) const [inline], [explicit]`

15.308.4.33 properties() `carl::Condition smtrat::ModuleInput::properties ( ) const [inline]`

Returns All known properties of the underlying formula of this module input.

15.308.4.34 rbegin() `auto smtrat::ModuleInput::rbegin ( ) const [inline]`

15.308.4.35 removeOrigin()

```
bool smtrat::ModuleInput::removeOrigin (
    iterator _formula,
    const FormulaT & _origin )
```

15.308.4.36 removeOrigins()

```
bool smtrat::ModuleInput::removeOrigins (
    iterator _formula,
    const std::shared_ptr< FormulasT > & _origins )
```

15.308.4.37 rend() `auto smtrat::ModuleInput::rend ( ) const [inline]`

15.308.4.38 satisfiedBy() [1/2]

```
unsigned smtrat::ModuleInput::satisfiedBy (
    const EvalRationalMap & _assignment ) const
```

Parameters

_assignment	The assignment to check conjunction of the stored formulas against.

Returns 1, if the conjunction of the stored formulas is satisfied by the given assignment; 0, if the given assignment conflicts the conjunction of the stored formulas; 2, if it cannot be determined cheaply, whether the given assignment conflicts or satisfies the conjunction of the stored formulas.

15.308.4.39 satisfiedBy() [2/2]

```
unsigned smtrat::ModuleInput::satisfiedBy (
    const Model & _assignment ) const
```

Parameters

_assignment	The model to check conjunction of the stored formulas against.

Returns 1, if the conjunction of the stored formulas is satisfied by the given model; 0, if the given model conflicts the conjunction of the stored formulas; 2, if it cannot be determined cheaply, whether the given model conflicts or satisfies the conjunction of the stored formulas.

15.308.4.40 size()

```
size_t smtrat::ModuleInput::size (
    void ) const [inline]
```

15.308.4.41 updateProperties()

```
void smtrat::ModuleInput::updateProperties ( )
```

Updates all properties of the formula underlying this module input.

            const NaryExpression & expr ) const  [inline], [inherited]
```

15.314.1.6 operator()() [6/7]

```
const ExpressionContent* smtrat::expression::simplifier::BaseSimplifier::operator() (
            const QuantifierExpression & expr ) const  [inline], [inherited]
```

15.314.1.7 operator()() [7/7]

```
const ExpressionContent* smtrat::expression::simplifier::BaseSimplifier::operator() (
            const UnaryExpression & expr ) const  [inline], [inherited]
```

15.314.1.8 simplify() [1/6]

```
virtual const ExpressionContent* smtrat::expression::simplifier::BaseSimplifier::simplify (
            const BinaryExpression &  ) const  [inline], [protected], [virtual], [inherited]
```

15.314.1.9 simplify() [2/6]

```
virtual const ExpressionContent* smtrat::expression::simplifier::BaseSimplifier::simplify (
            const carl::Variable &  ) const  [inline], [protected], [virtual], [inherited]
```

15.314.1.10 simplify() [3/6]

```
virtual const ExpressionContent* smtrat::expression::simplifier::BaseSimplifier::simplify (
            const ITEExpression &  ) const  [inline], [protected], [virtual], [inherited]
```

15.314.1.11 simplify() [4/6]

```
virtual const ExpressionContent* smtrat::expression::simplifier::BaseSimplifier::simplify (
            const NaryExpression &  ) const  [inline], [protected], [virtual], [inherited]
```

Reimplemented in smtrat::expression::simplifier::DuplicateSimplifier, smtrat::expression::simplifier::MergeSimplifier, and smtrat::expression::simplifier::SingletonSimplifier.

15.314.1.12 simplify() [5/6]

```
virtual const ExpressionContent* smtrat::expression::simplifier::↩
BaseSimplifier::simplify (
            const QuantifierExpression &  ) const  [inline], [protected], [virtual], [inherited]
```

15.314.1.13 simplify() [6/6]

```
const ExpressionContent* smtrat::expression::simplifier::Negation↩
Simplifier::simplify (
            const UnaryExpression & expr ) const  [inline], [virtual]
```

Reimplemented from smtrat::expression::simplifier::BaseSimplifier.

15.315 smtrat::NewCADModule< Settings > Class Template Reference

```
#include <NewCADModule.h>
```

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- NewCADModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- ~NewCADModule ()
- bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const

- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())

- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.315.4 Member Function Documentation

15.315.4.1 add() `bool smtrat::Module::add (`

```
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.315.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.315.4.3 addCore()

```
template<class Settings >
bool smtrat::NewCADModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.315.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.315.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.315.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.315.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.315.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.315.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.315.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.315.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const  [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.315.4.12 anAnswerFound()

`bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.315.4.13 answerFound()

`const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.315.4.14 backendsModel()

`const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.315.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.315.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.315.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.315.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
            const Poly & _polynomial,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.315.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P
>> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.315.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P
>> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.315.4.21 check()

```
Answer smtrat::Module::check (
    bool _final = false,
    bool _full = true,
    carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.315.4.22 checkCore()

```
template<class Settings >
Answer smtrat::NewCADModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Parameters

_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.315.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.315.4.24 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.315.4.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.315.4.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.315.4.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.315.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.315.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.315.4.30 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

15.315.4.31 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.315.4.32 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.315.4.33 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.315.4.34 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.315.4.35 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.315.4.36 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.315.4.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.315.4.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.315.4.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.315.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.315.4.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.315.4.42 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.315.4.43 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.315.4.44 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.315.4.45 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.315.4.46 getBackendsAllModels()

```
void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]
```

Stores all models of a backend in the list of all models of this module.

15.315.4.47 getBackendsModel()

```
void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]
```

15.315.4.48 getInfeasibleSubsets() [1/2]

```
void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]
```

Copies the infeasible subsets of the passed formula.

15.315.4.49 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets (
    const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.315.4.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.315.4.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.315.4.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.315.4.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.315.4.54 getOrigins() [3/3]

`const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.315.4.55 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.315.4.56 hasLemmas()

`bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.315.4.57 hasValidInfeasibleSubset()

`bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.315.4.58 id()

`std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.315.4.59 infeasibleSubsets()

`const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.315.4.60 inform()

`bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.315.4.61 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.315.4.62 informCore()

```
template<class Settings >
bool smtrat::NewCADModule< Settings >::informCore (
    const FormulaT & _constraint ) [virtual]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented from smtrat::Module.

15.315.4.63 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.315.4.64 init()

```
template<class Settings >
void smtrat::NewCADModule< Settings >::init ( ) [virtual]
```

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not and will not be called more than once and only before the first runBackends call.

Reimplemented from smtrat::Module.

15.315.4.65 is_minimizing()

`bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.315.4.66 isLemmaLevel()

`bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.315.4.67 isPreprocessor()

`bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.315.4.68 lemmas()

`const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.315.4.69 merge()

`std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.315.4.70 model()

`const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.315.4.71 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.315.4.72 moduleName()

```
template<typename Settings >
std::string smtrat::NewCADModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.315.4.73 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

15.315.4.74 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.315.4.75 passedFormulaBegin()

```
ModuleInput::iterator smtrat::Module::passedFormulaBegin ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula. TODO: disable this method

15.315.4.76 passedFormulaEnd()

```
ModuleInput::iterator smtrat::Module::passedFormulaEnd ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula.

15.315.4.77 pPassedFormula()

```
const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline],
[inherited]
```

Returns A pointer to the formula passed to the backends of this module.

15.315.4.78 pReceivedFormula()

```
const ModuleInput* smtrat::Module::pReceivedFormula ( ) const
[inline], [inherited]
```

Returns A pointer to the formula passed to this module.

15.315.4.79 print()

```
void smtrat::Module::print (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.315.4.80 printAllModels()

```
void smtrat::Module::printAllModels (
    std::ostream & _out = std::cout ) [inherited]
```

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.315.4.81 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.315.4.82 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.315.4.83 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.315.4.84 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.315.4.85 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.315.4.86 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.315.4.87 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.315.4.88 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.315.4.89 remove()

```
void smtrat::Module::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.315.4.90 removeCore()

```
template<class Settings >
void smtrat::NewCADModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula ) [virtual]
```

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Reimplemented from smtrat::Module.

15.315.4.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
            ModuleInput::iterator _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.315.4.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.315.4.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.315.4.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.315.4.95 runBackends() [1/2] virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]

Reimplemented in smtrat::PModule.

15.315.4.96 runBackends() [2/2] Answer smtrat::Module::runBackends (bool _final, bool _full, carl::Variable _objective) [protected], [virtual], [inherited]

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.315.4.97 setId() void smtrat::Module::setId (std::size_t _id) [inline], [inherited]

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.315.4.98 setThreadPriority() void smtrat::Module::setThreadPriority (thread_priority _threadPriority) [inline], [inherited]

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.315.4.99 solverState() Answer smtrat::Module::solverState ( ) const [inline], [inherited]

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.315.4.100 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.315.4.101 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.315.4.102 updateAllModels()

`void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.315.4.103 updateLemmas()

`void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.315.4.104 updateModel()

`template<class Settings >`
`void smtrat::NewCADModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.315.4.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.315.5 Field Documentation

15.315.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.315.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.315.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.315.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.315.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.315.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.315.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.315.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.315.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.315.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.315.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.315.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.315.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.315.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.315.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.315.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.315.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.315.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.315.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

15.315.5.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.315.5.21 mSmallerMusesCheckCounter

`unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.315.5.22 mSolverState

`std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.315.5.23 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheoryPropagations [protected], [inherited]`

15.315.5.24 mUsedBackends

`std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.315.5.25 mVariableCounters

`std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.316 smtrat::NewCoveringModule< Settings > Class Template Reference

```
#include <NewCoveringModule.h>
```

Public Types

- using SettingsType = Settings
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- NewCoveringModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- ~NewCoveringModule ()
- bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- size_t addConstraintsSAT ()

  Adds the given constraint to the backend.
- void removeConstraintsSAT ()

  Removes the given constraints from the backend.
- void addConstraintsUNSAT ()

  Adds the given constraint to the backend.
- bool removeConstraintsUNSAT ()

  Removes the given constraints from the backend Also removes all stored information about the removed constraints.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const

- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)

- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.

- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.

- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

smtrat::NewCoveringModule< Settings >::~NewCoveringModule ( )
```

15.316.4 Member Function Documentation

15.316.4.1 add()

```
bool smtrat::Module::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.316.4.2 addConstraintsSAT()

```
template<class Settings >
size_t smtrat::NewCoveringModule< Settings >::addConstraintsSAT ( )
```

Adds the given constraint to the backend.

Returns the lowest level with an unsatisfied new constraint

Note returns mVariableOrdering.size()+1 if all new constraints are satisfied
If not all new constraints are satisfied the

15.316.4.3 addConstraintsUNSAT()

```
template<class Settings >
void smtrat::NewCoveringModule< Settings >::addConstraintsUNSAT ( )
```

Adds the given constraint to the backend.

15.316.4.4 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.316.4.5 addCore()

```
template<class Settings >
bool smtrat::NewCoveringModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.316.4.6 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.316.4.7 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.316.4.8 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.316.4.9 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.316.4.10 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.316.4.11 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.316.4.12 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.316.4.13 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]
```

Returns All satisfying assignments, if existent.

15.316.4.14 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.316.4.15 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]
```

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.316.4.16 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.316.4.17 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.316.4.18 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.316.4.19 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.316.4.20 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.316.4.21 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.316.4.22 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.316.4.23 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.316.4.24 checkCore()

```
template<typename Settings >
Answer smtrat::NewCoveringModule< Settings >::checkCore ( )  [virtual]
```

Checks the received formula for consistency.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.316.4.25 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
            std::vector< FormulaSetT >::const_iterator _infsubset,
            const std::string & _filename = "smaller_muses",
            unsigned _maxSizeDifference = 1 ) const  [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.316.4.26 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.316.4.27 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.316.4.28 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.316.4.29 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.316.4.30 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.316.4.31 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.316.4.32 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

15.316.4.33 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.316.4.34 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.316.4.35 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.316.4.36 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.316.4.37 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.316.4.38 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.316.4.39 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.316.4.40 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.316.4.41 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.316.4.42 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceived↩
VariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.316.4.43 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.316.4.44 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.316.4.45 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.316.4.46 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.316.4.47 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.316.4.48 getBackendsAllModels()

```
void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]
```

Stores all models of a backend in the list of all models of this module.

15.316.4.49 getBackendsModel()

```
void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]
```

15.316.4.50 getInfeasibleSubsets() [1/2]

```
void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]
```

Copies the infeasible subsets of the passed formula.

15.316.4.51 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets (
    const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.316.4.52 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.316.4.53 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.316.4.54 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.316.4.55 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.316.4.56 getOrigins() [3/3] const FormulaT& smtrat::Module::getOrigins (ModuleInput::const_iterator _formula) const [inline], [protected], [inherited]

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.316.4.57 getReceivedFormulaSimplified() std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.316.4.58 hasLemmas() bool smtrat::Module::hasLemmas ( ) [inline], [inherited]

Checks whether this module or any of its backends provides any lemmas.

15.316.4.59 hasValidInfeasibleSubset() bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.316.4.60 id() std::size_t smtrat::Module::id ( ) const [inline], [inherited]

Returns A unique ID to identify this module instance.

15.316.4.61 infeasibleSubsets() const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.316.4.62 inform() bool smtrat::Module::inform (const FormulaT & _constraint) [inherited]

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.316.4.63 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.316.4.64 informCore()

```
template<class Settings >
bool smtrat::NewCoveringModule< Settings >::informCore (
    const FormulaT & _constraint ) [virtual]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented from smtrat::Module.

15.316.4.65 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.316.4.66 init()

```
template<class Settings >
void smtrat::NewCoveringModule< Settings >::init ( ) [virtual]
```

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not and will not be called more than once and only before the first runBackends call.

Reimplemented from smtrat::Module.

15.316.4.67 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.316.4.68 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.316.4.69 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.316.4.70 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.316.4.71 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.316.4.72 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.316.4.73 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.316.4.74 moduleName()

```
virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]
```

Returns The name of the given module type as name.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::VSModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::GBModule< Settings >, smtrat::IntEqModule< Setti smtrat::CubeLIAModule< Settings >, smtrat::CurryModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IncWidthModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::BEModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::SplitSOSModule< Settings >.

15.316.4.75 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

15.316.4.76 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.316.4.77 passedFormulaBegin()

```
ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula. TODO: disable this method

15.316.4.78 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.316.4.79 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.316.4.80 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.316.4.81 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.316.4.82 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.316.4.83 printInfeasibleSubsets()

`void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.316.4.84 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.316.4.85 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.316.4.86 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.316.4.87 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.316.4.88 receivedFormulaChecked() `void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

15.316.4.89 receivedFormulasAsInfeasibleSubset() `void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

15.316.4.90 receivedVariable() `bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

15.316.4.91 remove() `void smtrat::Module::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.316.4.92 removeConstraintsSAT() `template<class Settings > void smtrat::NewCoveringModule< Settings >::removeConstraintsSAT ( )`

Removes the given constraints from the backend.

Note This also removes all stored information about the removed constraints

15.316.4.93 removeConstraintsUNSAT() `template<class Settings > bool smtrat::NewCoveringModule< Settings >::removeConstraintsUNSAT ( )`

Removes the given constraints from the backend Also removes all stored information about the removed constraints.

Returns True: If the model is still unsat after removing the constraints False: If the model might needs recomputation for the higher levels

15.316.4.94 removeCore()

```
template<class Settings >
void smtrat::NewCoveringModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula )  [virtual]
```

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Reimplemented from smtrat::Module.

15.316.4.95 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
            ModuleInput::iterator _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

15.316.4.96 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

15.316.4.97 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const  [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.316.4.98 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.316.4.99 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( )  [inline],
[protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

15.316.4.100 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
            bool _final,
            bool _full,
            carl::Variable _objective )  [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.316.4.101 setId() `void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]`

Sets this modules unique ID to identify itself.

Parameters

↩ ↩ *id*	The id to set this module's id to.

15.316.4.102 setThreadPriority() `void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]`

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.316.4.103 solverState() `Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.316.4.104 splitUnequalConstraint() `void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.316.4.105 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.316.4.106 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.316.4.107 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.316.4.108 updateModel() `template<class Settings > void smtrat::NewCoveringModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.316.4.109 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.316.5 Field Documentation

15.316.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.316.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.316.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.316.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.316.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.316.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.316.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.316.5.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module::m↩FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.316.5.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.316.5.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.316.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.316.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.316.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.316.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.316.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.316.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.316.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.316.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.316.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplitting↩Variables [static], [inherited]`

Reusable splitting variables.

15.316.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.316.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.316.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.316.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.316.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.316.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.319 benchmax::ssh::Node Struct Reference

Specification of a compuation node for the SSH backend.

```
#include <Node.h>
```

Data Fields

- std::string hostname

  Hostname to connect to.
- std::string username

  Username.
- std::string password

  Password (only used if public key authentication fails).
- int port

  Port (default is 22)
- unsigned long cores

  Number of cores we use per connection (default is 1)
- std::size_t connections

  Number of concurrent connections (default is 1)

15.319.1 Detailed Description

Specification of a compuation node for the SSH backend.

15.319.2 Field Documentation

15.319.2.1 connections `std::size_t benchmax::ssh::Node::connections`

Number of concurrent connections (default is 1)

15.319.2.2 cores `unsigned long benchmax::ssh::Node::cores`

Number of cores we use per connection (default is 1)

15.319.2.3 hostname `std::string benchmax::ssh::Node::hostname`

Hostname to connect to.

15.319.2.4 password `std::string benchmax::ssh::Node::password`

Password (only used if public key authentication fails).

15.319.2.5 port `int benchmax::ssh::Node::port`

Port (default is 22)

15.319.2.6 username `std::string benchmax::ssh::Node::username`

Username.

15.320 delta::Node Struct Reference

This class represents a node in a SMTLIB file.

`#include <Node.h>`

Public Member Functions

- Node ()

  Create an empty node.
- Node (const std::string &name, bool brackets=true)

  Create a node with a name.
- Node (const std::tuple< std::string, bool > &data)

  Create a node with a name.
- Node (const std::tuple< std::vector< Node >, bool > &data)

  Create a node with children.
- Node (const std::tuple< std::string, std::vector< Node >, bool > &data)

  Create a node with a name and children.
- Node (const std::string &name, const std::initializer_list< Node > &children, bool brackets=true)
- void recalculateSize ()
- std::size_t complexity () const

  Calculates the number of nodes.
- bool immutable () const

  Checks if this node is immutable.
- std::string repr (bool longRepr=false) const

  Returns a string representation of this node.
- Node clone (const Node *from, const Node *to) const

  Clone this node recursively.
- Node clone (const std::string &from, const Node *to) const

  Clone this node recursively.
- void collectNames (std::set< std::string > &names) const
- void eliminateDefineFuns ()

Data Fields

- std::string name

  Name of the node.
- std::vector< Node > children

  Children of the node.
- bool brackets

  Flag if the node was contained in brackets.
- std::size_t size

15.320.1 Detailed Description

This class represents a node in a SMTLIB file.

Every syntactical constructor is represented by a node. A node may have a name and may have several children. In a file, this corresponds to `(<name> <child> <child>...)`.

Note that these nodes are constructed by a parser that has no semantic knowledge of the smtlib format. Hence, the data representable by these nodes is only a very rough overapproximation of the actual smtlib format.

15.320.2 Constructor & Destructor Documentation

15.320.2.1 Node() [1/6]

```
delta::Node::Node ( ) [inline], [explicit]
```

Create an empty node.

15.320.2.2 Node() [2/6]

```
delta::Node::Node (
    const std::string & name,
    bool brackets = true ) [inline], [explicit]
```

Create a node with a name.

Parameters

name	Name of the node.
brackets	If not is contained in brackets.

15.320.2.3 Node() [3/6]

```
delta::Node::Node (
    const std::tuple< std::string, bool > & data ) [inline], [explicit]
```

Create a node with a name.

Parameters

data	Tuple containing the name and the brackets flag.

15.320.2.4 Node() [4/6]

```
delta::Node::Node (
    const std::tuple< std::vector< Node >, bool > & data ) [inline], [explicit]
```

Create a node with children.

Parameters

data	Tuple containing the children and the brackets flag.

15.320.2.5 Node() [5/6]

```
delta::Node::Node (
    const std::tuple< std::string, std::vector< Node >, bool > & data ) [inline], [explicit]
```

Create a node with a name and children.

Parameters

data	Tuple containing the name, the children and the brackets flag.

15.320.2.6 Node() [6/6]

```
delta::Node::Node (
    const std::string & name,
    const std::initializer_list< Node > & children,
    bool brackets = true ) [inline], [explicit]
```

15.320.3 Member Function Documentation

15.320.3.1 clone() [1/2]

```
Node delta::Node::clone (
    const Node * from,
    const Node * to ) const [inline]
```

Clone this node recursively.

If the node `from` is encountered, replace it with `to`. If `to` is a nullptr, remove it instead.

Parameters

from	Node to replace.
to	Node to replace with.

Returns Cloned node.

15.320.3.2 clone() [2/2]

```
Node delta::Node::clone (
    const std::string & from,
    const Node * to ) const [inline]
```

Clone this node recursively.

If a node with name `from` without children is enountered, replace it with `to`.

Parameters

from	Node name to replace.
to	Node to replace with.

Returns Cloned node.

15.320.3.3 collectNames()

```
void delta::Node::collectNames (
    std::set< std::string > & names ) const [inline]
```

15.320.3.4 complexity()

```
std::size_t delta::Node::complexity ( ) const [inline]
```

Calculates the number of nodes.

Returns Number of nodes.

15.320.3.5 eliminateDefineFuns()

```
void delta::Node::eliminateDefineFuns ( ) [inline]
```

15.320.3.6 immutable()

```
bool delta::Node::immutable ( ) const [inline]
```

Checks if this node is immutable.

This method implements simple checks to prevent unnecessary solver errors if essential parts of the smtlib file are removed, for example the `set-logic` statement.

Returns If node may be removed.

15.320.3.7 recalculateSize()

```
void delta::Node::recalculateSize ( ) [inline]
```

15.320.3.8 repr()

```
std::string delta::Node::repr (
    bool longRepr = false ) const [inline]
```

Returns a string representation of this node.

Returns String of the node.

15.320.4 Field Documentation

15.320.4.1 brackets `bool delta::Node::brackets`

Flag if the node was contained in brackets.

15.320.4.2 children `std::vector<Node> delta::Node::children`

Children of the node.

15.320.4.3 name `std::string delta::Node::name`

Name of the node.

15.320.4.4 size `std::size_t delta::Node::size`

15.321 delta::NodePrinter< pretty > Struct Template Reference

`#include <Explanation.h>`

Static Public Attributes

- static constexpr int heuristic = 0

15.322.1 Field Documentation

15.322.1.1 heuristic `constexpr int smtrat::mcsat::onecellcad::recursive::NoHeuristic::heuristic = 0 [static], [constexpr]`

15.323 smtrat::NRAILModule< Settings > Class Template Reference

`#include <NRAILModule.h>`

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- NRAILModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- ~NRAILModule ()
- bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const

- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())

- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.323.3.1 NRAILModule()

```
template<class Settings >
smtrat::NRAILModule< Settings >::NRAILModule (
            const ModuleInput * _formula,
            Conditionals & _conditionals,
            Manager * _manager = nullptr )
```

15.323.3.2 ~NRAILModule()

```
template<class Settings >
smtrat::NRAILModule< Settings >::~NRAILModule ( )
```

15.323.4 Member Function Documentation

15.323.4.1 add()

```
bool smtrat::Module::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.323.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.323.4.3 addCore()

```
template<class Settings >
bool smtrat::NRAILModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.323.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.323.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.323.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.323.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.323.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.323.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.323.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.323.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const  [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.323.4.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.323.4.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.323.4.14 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.323.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.323.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.323.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.323.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.323.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.323.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.323.4.21 check()

```
Answer smtrat::Module::check (
    bool _final = false,
    bool _full = true,
    carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.323.4.22 checkCore()

```
template<class Settings >
Answer smtrat::NRAILModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.323.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.323.4.24 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.323.4.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.323.4.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.323.4.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.323.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.323.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.323.4.30 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.323.4.31 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.323.4.32 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.323.4.33 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.323.4.34 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.323.4.35 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.323.4.36 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.323.4.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.323.4.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.323.4.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.323.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceived↩
VariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.323.4.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.323.4.42 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.323.4.43 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.323.4.44 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.323.4.45 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.323.4.46 getBackendsAllModels()

```
void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]
```

Stores all models of a backend in the list of all models of this module.

15.323.4.47 getBackendsModel()

```
void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]
```

15.323.4.48 getInfeasibleSubsets() [1/2]

```
void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]
```

Copies the infeasible subsets of the passed formula.

15.323.4.49 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets (
    const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.323.4.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.323.4.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.323.4.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.323.4.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.323.4.54 getOrigins() [3/3] const FormulaT& smtrat::Module::getOrigins (ModuleInput::const_iterator _formula) const [inline], [protected], [inherited]

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.323.4.55 getReceivedFormulaSimplified() std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.323.4.56 hasLemmas() bool smtrat::Module::hasLemmas ( ) [inline], [inherited]

Checks whether this module or any of its backends provides any lemmas.

15.323.4.57 hasValidInfeasibleSubset() bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.323.4.58 id() std::size_t smtrat::Module::id ( ) const [inline], [inherited]

Returns A unique ID to identify this module instance.

15.323.4.59 infeasibleSubsets() const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.323.4.60 inform() bool smtrat::Module::inform (const FormulaT & _constraint) [inherited]

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.323.4.61 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.323.4.62 informCore()

```
template<class Settings >
bool smtrat::NRAILModule< Settings >::informCore (
    const FormulaT & _constraint ) [virtual]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented from smtrat::Module.

15.323.4.63 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.323.4.64 init()

```
template<class Settings >
void smtrat::NRAILModule< Settings >::init ( ) [virtual]
```

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not and will not be called more than once and only before the first runBackends call.

Reimplemented from smtrat::Module.

15.323.4.65 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.323.4.66 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.323.4.67 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.323.4.68 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.323.4.69 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.323.4.70 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.323.4.71 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.323.4.72 moduleName()

```
template<typename Settings >
std::string smtrat::NRAILModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.323.4.73 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

15.323.4.74 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.323.4.75 passedFormulaBegin()

```
ModuleInput::iterator smtrat::Module::passedFormulaBegin ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula. TODO: disable this method

15.323.4.76 passedFormulaEnd()

```
ModuleInput::iterator smtrat::Module::passedFormulaEnd ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula.

15.323.4.77 pPassedFormula()

```
const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline],
[inherited]
```

Returns A pointer to the formula passed to the backends of this module.

15.323.4.78 pReceivedFormula()

```
const ModuleInput* smtrat::Module::pReceivedFormula ( ) const
[inline], [inherited]
```

Returns A pointer to the formula passed to this module.

15.323.4.79 print()

```
void smtrat::Module::print (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.323.4.80 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.323.4.81 printInfeasibleSubsets()

`void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.323.4.82 printModel()

`void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.323.4.83 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.323.4.84 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.323.4.85 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.323.4.86 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.323.4.87 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.323.4.88 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.323.4.89 remove()

```
void smtrat::Module::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.323.4.90 removeCore()

```
template<class Settings >
void smtrat::NRAILModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula ) [virtual]
```

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Reimplemented from smtrat::Module.

15.323.4.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
            ModuleInput::iterator _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.323.4.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.323.4.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.323.4.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.323.4.95 runBackends() [1/2]

`virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]`

Reimplemented in smtrat::PModule.

15.323.4.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.323.4.97 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.323.4.98 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.323.4.99 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.323.4.100 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.323.4.101 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.323.4.102 updateAllModels()

`void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.323.4.103 updateLemmas()

`void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.323.4.104 updateModel()

`template<class Settings >`
`void smtrat::NRAILModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.323.4.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.323.5 Field Documentation

15.323.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.323.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.323.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.323.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.323.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.323.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.323.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.323.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.323.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.323.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.323.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.323.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.323.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.323.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.323.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.323.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.323.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.323.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.323.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

15.323.5.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.323.5.21 mSmallerMusesCheckCounter

`unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.323.5.22 mSolverState

`std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.323.5.23 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheoryPropagations [protected], [inherited]`

15.323.5.24 mUsedBackends

`std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.323.5.25 mVariableCounters

`std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.324 smtrat::parser::NumeralParser Struct Reference

Parses numerals: `(0 | [1-9][0-9]*)`

```
#include <Lexicon.h>
```

15.324.1 Detailed Description Parses numerals: `(0 | [1-9][0-9]*)`

15.325 smtrat::lra::Numeric Class Reference

15.325.1 Constructor & Destructor Documentation

15.325.1.1 Numeric() [1/8] `smtrat::lra::Numeric::Numeric ( )`

Default constructor.

15.325.1.2 Numeric() [2/8] `smtrat::lra::Numeric::Numeric ( const Rational & _value )`

Constructing from a Rational.

Parameters

The	Rational.

15.325.1.3 Numeric() [3/8] `smtrat::lra::Numeric::Numeric ( int _value )`

Constructing from an integer.

Parameters

_value	The integer.

15.325.1.4 Numeric() [4/8] `smtrat::lra::Numeric::Numeric ( unsigned int _value )`

Constructing from an unsigned integer.

Parameters

_value	The unsigned integer

15.325.1.5 Numeric() [5/8] smtrat::lra::Numeric::Numeric (long _value)

Constructing from a long integer.

Parameters

_value	The unsigned long integer.

15.325.1.6 Numeric() [6/8] smtrat::lra::Numeric::Numeric (unsigned long _value)

Constructing from an unsigned long integer.

Parameters

_value	The unsigned long integer.

15.325.1.7 Numeric() [7/8] smtrat::lra::Numeric::Numeric (const char * _value)

Constructing from a char array.

Parameters

_value	The char array.

15.325.1.8 Numeric() [8/8] smtrat::lra::Numeric::Numeric (const Numeric & _value)

Copy constructor.

Parameters

_value	The Numeric to copy.

15.325.1.9 ~Numeric() smtrat::lra::Numeric::~Numeric ( )

15.325.2 Member Function Documentation

15.325.2.1 content() const Rational& smtrat::lra::Numeric::content ( ) const [inline]

15.325.2.2 denom() `Numeric smtrat::lra::Numeric::denom ( ) const`

Returns The denominator of this Numeric.

15.325.2.3 floor() `Numeric smtrat::lra::Numeric::floor ( ) const`

Returns The next smaller integer to this Numeric.

15.325.2.4 isInteger() `bool smtrat::lra::Numeric::isInteger ( ) const`

Returns true, if this Numeric is integer; false, otherwise.

15.325.2.5 isNegative() `bool smtrat::lra::Numeric::isNegative ( ) const`

Returns true, if this Numeric corresponds to a positive rational number; false, otherwise.

15.325.2.6 isPositive() `bool smtrat::lra::Numeric::isPositive ( ) const`

Checks whether this Numeric corresponds to a positive rational number.

Returns True, if this Numeric corresponds to a positive rational number; False, otherwise.

15.325.2.7 isZero() `bool smtrat::lra::Numeric::isZero ( ) const`

Returns true, if this Numeric corresponds to zero; false, otherwise.

15.325.2.8 numer() `Numeric smtrat::lra::Numeric::numer ( ) const`

Returns The enumerator of this Numeric.

15.325.2.9 operator"!=() `bool smtrat::lra::Numeric::operator!= ( const Numeric & _value ) const`

Compares whether this Numeric and the given one are not equal.

Parameters

_value	The Numeric to compare with.

Returns True, if the two Numerics are not equal; False, otherwise.

15.325.2.10 operator<() `bool smtrat::lra::Numeric::operator< ( const Numeric & _value ) const`

Compares whether this Numeric is less than the given one.

Parameters

_value	The Numeric to compare with.

Returns True, if this Numeric is less than the given one; False, otherwise.

15.325.2.11 operator<=() `bool smtrat::lra::Numeric::operator<= ( const Numeric & _value ) const`

Compares whether this Numeric is less or equal than the given one.

Parameters

_value	The Numeric to compare with.

Returns True, if this Numeric is less or equal than the given one; False, otherwise.

15.325.2.12 operator=() [1/6] `Numeric & smtrat::lra::Numeric::operator= ( const char * _value )`

Cast from a char array.

Parameters

_value	The char array.

Returns The corresponding Numeric.

15.325.2.13 operator=() [2/6]

```
Numeric & smtrat::lra::Numeric::operator= (
    const Numeric & _value )
```

Cast from a char array.

Parameters

_value	The char array.

Returns The corresponding Numeric.

15.325.2.14 operator=() [3/6]

```
Numeric & smtrat::lra::Numeric::operator= (
    int _value )
```

Cast from an integer.

Parameters

_value	The integer.

Returns The corresponding Numeric.

15.325.2.15 operator=() [4/6]

```
Numeric & smtrat::lra::Numeric::operator= (
    long _value )
```

Cast from a long integer.

Parameters

_value	The long integer.

Returns The corresponding Numeric.

15.325.2.16 operator=() [5/6]

```
Numeric & smtrat::lra::Numeric::operator= (
    unsigned int _value )
```

Cast from an unsigned inteeger.

Parameters

_value	The unsigned integer.

Returns The corresponding Numeric.

15.325.2.17 operator=() [6/6] Numeric & smtrat::lra::Numeric::operator= (unsigned long _value)

Cast from an unsigned long integer.

Parameters

_value	The unsigned long integer.

Returns The corresponding Numeric.

15.325.2.18 operator==() bool smtrat::lra::Numeric::operator== (const Numeric & _value) const

Compares whether this Numeric and the given one are equal.

Parameters

_value	The Numeric to compare with.

Returns True, if the two Numerics are equal; False, otherwise.

15.325.2.19 operator>() bool smtrat::lra::Numeric::operator> (const Numeric & _value) const

Compares whether this Numeric is greater than the given one.

Parameters

_value	The Numeric to compare with.

Returns True, if this Numeric is greater than the given one; False, otherwise.

15.325.2.20 operator>=() bool smtrat::lra::Numeric::operator>= (const Numeric & _value) const

Compares whether this Numeric is greater or equal than the given one.

Parameters

_value	The Numeric to compare with.

Returns True, if this Numeric is greater or equal than the given one; False, otherwise.

15.325.2.21 rContent() `Rational& smtrat::lra::Numeric::rContent ( ) [inline]`

15.335.1 Detailed Description

This class represents one or more origins of some object.

An origin is a single id or a pair of ids (where a single id is represented as a pair of the same id).

As an object can have multiple origins, this class stores a list of such pairs. This class makes sure that the pairs are unique.

15.335.2 Constructor & Destructor Documentation

15.337 smtrat::OrPathShortener Struct Reference

A rewriter that checks every (X)OR that only contains ANDs and UEQs as children for equalities that hold for every alternative, and adds such equalities explicitly.

```
#include <OrPathShortener.h>
```

Public Member Functions

- OrPathShortener (ModuleWrapper< EQModule< EQSettingsForPreprocessing >> &facts)
- FormulaT rewrite_or (const FormulaT &formula, FormulaSetT &&subformulas)
- FormulaT rewrite_xor (const FormulaT &formula, FormulasMultiT &&subformulas)
- void enter_default (const FormulaT &formula)
- FormulaT rewrite_default (const FormulaT &formula, const FormulaT &default_result)

15.337.1 Detailed Description

A rewriter that checks every (X)OR that only contains ANDs and UEQs as children for equalities that hold for every alternative, and adds such equalities explicitly.

This should run after NNF transformation (but clearly before CNF transformation). This defeats eq_diamond examples (and also more general cases where the paths are longer or irregular).

15.337.2 Constructor & Destructor Documentation

15.337.2.1 OrPathShortener()

```
smtrat::OrPathShortener::OrPathShortener (
    ModuleWrapper< EQModule< EQSettingsForPreprocessing >> & facts ) [inline]
```

15.337.3 Member Function Documentation

```

15.343 delta::Parser Class Reference

This class parses a whole smtlib file into a hierarchy of Node objects.

```
#include <Parser.h>
```

Public Member Functions

- Parser ()

  Constructs the parsing rules.

- bool parseFile (const std::string &filename, Node &node)

  Parses a file into a node.

Static Public Member Functions

- static bool parse (const std::string &filename, Node &node)

  Parses a file into a node.

15.343.1 Detailed Description This class parses a whole smtlib file into a hierarchy of Node objects.

15.343.2 Constructor & Destructor Documentation

15.343.2.1 Parser() `delta::Parser::Parser ( ) [inline]`

Constructs the parsing rules.

15.343.3 Member Function Documentation

15.343.3.1 parse()

```
static bool delta::Parser::parse (
    const std::string & filename,
    Node & node ) [inline], [static]
```

Parses a file into a node.

Parameters

filename	Filename of the input file.

Returns Node object produced by the parser.

15.343.3.2 parseFile()

```
bool delta::Parser::parseFile (
    const std::string & filename,
    Node & node ) [inline]
```

Parses a file into a node.

Parameters

filename	Filename of the input file.

Returns Node object produced by the parser.

  Checks the received formula for consistency.
- FormulaT gaussAlgorithm ()
- FormulaT reconstructEqSystem (const MatrixT &m, const VectorT &b, const carl::Variables &vars, const std::vector< carl::Relation > &rels)
- FormulaT reduce (const MatrixT &u, const VectorT &b, const carl::Variables vars)
- std::vector< Rational > lookForReductionRow (const MatrixT &uMatrix, const VectorT &ineqRow, long column)
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const

- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void conservativeResize (VectorT &v, long newSize)

  Convenience wrapper for Eigen::conservativeResizeLike with a zero vector.
- static void conservativeResize (MatrixT &m, long newRows, long newCols)

  Convenience wrapper for Eigen::conservativeResizeLike with a zero matrix.
- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.

- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.

- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.346.1 Member Typedef Documentation

15.346.1.1 MatrixT

```
template<typename Settings >
using smtrat::PBGaussModule< Settings >::MatrixT = Eigen::Matrix<Rational, Eigen::Dynamic,
Eigen::Dynamic>
```

15.346.4 Member Function Documentation

15.346.4.1 add()

```
bool smtrat::Module::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.346.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.346.4.3 addCore()

```
template<class Settings >
bool smtrat::PBGaussModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.346.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.346.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.346.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.346.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.346.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.346.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
```

```
const FormulaT & _formula,
const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.346.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.346.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.346.4.12 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.346.4.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.346.4.14 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.346.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.346.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.346.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.346.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.346.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.346.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.346.4.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.346.4.22 checkCore()

```
template<class Settings >
Answer smtrat::PBGaussModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.346.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.346.4.24 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.346.4.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.346.4.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.346.4.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.346.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.346.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.346.4.30 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

15.346.4.31 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.346.4.32 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.346.4.33 conservativeResize() [1/2]

```
template<typename Settings >
static void smtrat::PBGaussModule< Settings >::conservativeResize (
            MatrixT & m,
            long newRows,
            long newCols ) [inline], [static]
```

Convenience wrapper for Eigen::conservativeResizeLike with a zero matrix.

15.346.4.34 conservativeResize() [2/2]

```
template<typename Settings >
static void smtrat::PBGaussModule< Settings >::conservativeResize (
            VectorT & v,
            long newSize ) [inline], [static]
```

Convenience wrapper for Eigen::conservativeResizeLike with a zero vector.

15.346.4.35 constraintsToInform()

```
const carl::FastSet<FormulaT>& smtrat::Module::constraints↩
ToInform ( ) const [inline], [inherited]
```

Returns The constraints which the backends must be informed about.

15.346.4.36 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
            const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.346.4.37 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
            const FormulaT & _formula ) const [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.346.4.38 deinform()

```
void smtrat::Module::deinform (
            const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.346.4.39 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.346.4.40 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.346.4.41 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.346.4.42 excludeNotReceivedVariablesFromModel()

`void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]`

Excludes all variables from the current model, which do not occur in the received formula.

15.346.4.43 findBestOrigin()

`std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin ( const std::vector< FormulaT > & _origins ) const [protected], [inherited]`

Parameters

_origins	

Returns

15.346.4.44 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.346.4.45 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.346.4.46 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

15.346.4.47 gaussAlgorithm()

`template<class Settings > FormulaT smtrat::PBGaussModule< Settings >::gaussAlgorithm ( )`

15.346.4.48 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.346.4.49 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.346.4.50 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.346.4.51 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.346.4.52 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::getInfeasible↩ Subsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.346.4.53 getInformationRelevantFormulas() `const std::set< FormulaT > & smtrat::Module::get↩ InformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.346.4.54 getModelEqualities() `std::list< std::vector< carl::Variable > > smtrat::Module↩ ::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.346.4.55 getOrigins() [1/3] `void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

15.346.4.56 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.346.4.57 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.346.4.58 getReceivedFormulaSimplified()

```
std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]
```

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.346.4.59 hasLemmas()

```
bool smtrat::Module::hasLemmas ( ) [inline], [inherited]
```

Checks whether this module or any of its backends provides any lemmas.

15.346.4.60 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.346.4.61 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.346.4.62 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.346.4.63 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.346.4.64 informBackends() `void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.346.4.65 informCore() template<class Settings >

```
bool smtrat::PBGaussModule< Settings >::informCore (
            const FormulaT & _constraint )  [virtual]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented from smtrat::Module.

15.346.4.66 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const  [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.346.4.67 init() template<class Settings >

```
void smtrat::PBGaussModule< Settings >::init ( )  [virtual]
```

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not and will not be called more than once and only before the first runBackends call.

Reimplemented from smtrat::Module.

15.346.4.68 is_minimizing()

```
bool smtrat::Module::is_minimizing ( ) const  [inline], [inherited]
```

15.346.4.69 isLemmaLevel()

```
bool smtrat::Module::isLemmaLevel (
            LemmaLevel level )  [protected], [inherited]
```

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.346.4.70 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.346.4.71 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.346.4.72 lookForReductionRow()

```
template<typename Settings >
std::vector<Rational> smtrat::PBGaussModule< Settings >::lookForReductionRow (
            const MatrixT & uMatrix,
            const VectorT & ineqRow,
            long column )
```

15.346.4.73 merge()

```
std::vector< FormulaT > smtrat::Module::merge (
            const std::vector< FormulaT > & _vecSetA,
            const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]
```

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.346.4.74 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.346.4.75 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
            const Model & _modelA,
            const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.346.4.76 moduleName()

`template<typename Settings >`
`std::string smtrat::PBGaussModule< Settings >::moduleName ( ) const [inline], [virtual]`

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.346.4.77 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.346.4.78 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

15.346.4.79 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.346.4.80 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.346.4.81 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.346.4.82 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.346.4.83 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.346.4.84 printAllModels()

```
void smtrat::Module::printAllModels (
    std::ostream & _out = std::cout ) [inherited]
```

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.346.4.85 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.346.4.86 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.346.4.87 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.346.4.88 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.346.4.89 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.346.4.90 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.346.4.91 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.346.4.92 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.346.4.93 reconstructEqSystem()

```
template<class Settings >
FormulaT smtrat::PBGaussModule< Settings >::reconstructEqSystem (
    const MatrixT & m,
    const VectorT & b,
    const carl::Variables & vars,
    const std::vector< carl::Relation > & rels )
```

15.346.4.94 reduce()

```
template<class Settings >
FormulaT smtrat::PBGaussModule< Settings >::reduce (
            const MatrixT & u,
            const VectorT & b,
            const carl::Variables vars )
```

15.346.4.95 remove()

```
void smtrat::Module::remove (
            ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.346.4.96 removeCore()

```
template<class Settings >
void smtrat::PBGaussModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula ) [virtual]
```

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Reimplemented from smtrat::Module.

15.346.4.97 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
            ModuleInput::iterator _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.346.4.98 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.346.4.99 rPassedFormula() `const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]`

Returns A reference to the formula passed to the backends of this module.

15.346.4.100 rReceivedFormula() `const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]`

Returns A reference to the formula passed to this module.

15.346.4.101 runBackends() [1/2] `virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]`

Reimplemented in smtrat::PModule.

15.346.4.102 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.346.4.103 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ _↩ *id*	The id to set this module's id to.

15.346.4.104 setThreadPriority()

`void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]`

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.346.4.105 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.346.4.106 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.346.4.107 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.346.4.108 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.346.4.109 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.346.4.110 updateModel() `template<class Settings > void smtrat::PBGaussModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.346.4.111 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.346.5 Field Documentation

15.346.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.346.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.346.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.346.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.346.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.346.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.346.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩ Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.346.5.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module::m↩ FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.346.5.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.346.5.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.346.5.11 mInfeasibleSubsets `std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.346.5.12 mInformedConstraints `carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.346.5.13 mLastBranches `std::vector< Branching > smtrat::Module::mLastBranches = std↩ ::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.346.5.14 mLemmas `std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.346.5.15 mModel `Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.346.5.16 mModelComputed `bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.346.5.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.346.5.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.346.5.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

15.346.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.346.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.346.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.346.5.23 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheoryPropagations [protected], [inherited]`

15.346.5.24 mUsedBackends

`std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.346.5.25 mVariableCounters

`std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.347 smtrat::PBPPModule< Settings > Class Template Reference

`#include <PBPPModule.h>`

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- PBPPModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- ~PBPPModule ()
- bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.

- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.

- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_↩ ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩ Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩ _premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩ Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩ ::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩ AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩ CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.347.4 Member Function Documentation

15.347.4.1 add() `bool smtrat::Module::add (`

```
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.347.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.347.4.3 addCore()

```
template<class Settings >
bool smtrat::PBPPModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.347.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.347.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline], [inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.347.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.347.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.347.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.347.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.347.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.347.4.11 allModels() `const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns All satisfying assignments, if existent.

15.347.4.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.347.4.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.347.4.14 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.347.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.347.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.347.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.347.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.347.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.347.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.347.4.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.347.4.22 checkCore()

```
template<class Settings >
Answer smtrat::PBPPModule< Settings >::checkCore ( )  [virtual]
```

Checks the received formula for consistency.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.347.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
            std::vector< FormulaSetT >::const_iterator _infsubset,
            const std::string & _filename = "smaller_muses",
            unsigned _maxSizeDifference = 1 ) const  [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.347.4.24 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.347.4.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.347.4.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.347.4.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.347.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.347.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.347.4.30 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.347.4.31 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.347.4.32 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.347.4.33 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.347.4.34 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.347.4.35 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.347.4.36 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.347.4.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.347.4.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.347.4.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.347.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.347.4.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.347.4.42 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.347.4.43 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.347.4.44 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.347.4.45 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.347.4.46 getBackendsAllModels()

```
void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]
```

Stores all models of a backend in the list of all models of this module.

15.347.4.47 getBackendsModel()

```
void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]
```

15.347.4.48 getInfeasibleSubsets() [1/2]

```
void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]
```

Copies the infeasible subsets of the passed formula.

15.347.4.49 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets (
    const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.347.4.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.347.4.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.347.4.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.347.4.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.347.4.54 getOrigins() [3/3] const FormulaT& smtrat::Module::getOrigins (ModuleInput::const_iterator _formula) const [inline], [protected], [inherited]

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.347.4.55 getReceivedFormulaSimplified() std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.347.4.56 hasLemmas() bool smtrat::Module::hasLemmas ( ) [inline], [inherited]

Checks whether this module or any of its backends provides any lemmas.

15.347.4.57 hasValidInfeasibleSubset() bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.347.4.58 id() std::size_t smtrat::Module::id ( ) const [inline], [inherited]

Returns A unique ID to identify this module instance.

15.347.4.59 infeasibleSubsets() const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.347.4.60 inform() bool smtrat::Module::inform (const FormulaT & _constraint) [inherited]

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.347.4.61 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.347.4.62 informCore()

```
template<class Settings >
bool smtrat::PBPPModule< Settings >::informCore (
    const FormulaT & _constraint ) [virtual]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented from smtrat::Module.

15.347.4.63 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.347.4.64 init()

```
template<class Settings >
void smtrat::PBPPModule< Settings >::init ( ) [virtual]
```

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not and will not be called more than once and only before the first runBackends call.

Reimplemented from smtrat::Module.

15.347.4.65 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.347.4.66 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.347.4.67 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.347.4.68 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.347.4.69 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.347.4.70 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.347.4.71 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.347.4.72 moduleName()

```
template<typename Settings >
std::string smtrat::PBPPModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.347.4.73 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

15.347.4.74 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.347.4.75 passedFormulaBegin()

```
ModuleInput::iterator smtrat::Module::passedFormulaBegin ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula. TODO: disable this method

15.347.4.76 passedFormulaEnd()

```
ModuleInput::iterator smtrat::Module::passedFormulaEnd ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula.

15.347.4.77 pPassedFormula()

```
const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline],
[inherited]
```

Returns A pointer to the formula passed to the backends of this module.

15.347.4.78 pReceivedFormula()

```
const ModuleInput* smtrat::Module::pReceivedFormula ( ) const
[inline], [inherited]
```

Returns A pointer to the formula passed to this module.

15.347.4.79 print()

```
void smtrat::Module::print (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.347.4.80 printAllModels()

```
void smtrat::Module::printAllModels (
    std::ostream & _out = std::cout ) [inherited]
```

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.347.4.81 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.347.4.82 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.347.4.83 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.347.4.84 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.347.4.85 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.347.4.86 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.347.4.87 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.347.4.88 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.347.4.89 remove()

```
void smtrat::Module::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.347.4.90 removeCore()

```
template<class Settings >
void smtrat::PBPPModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula )  [virtual]
```

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Reimplemented from smtrat::Module.

15.347.4.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
            ModuleInput::iterator _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

15.347.4.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

15.347.4.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const  [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.347.4.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.347.4.95 runBackends() [1/2]

`virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]`

Reimplemented in smtrat::PModule.

15.347.4.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.347.4.97 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.347.4.98 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.347.4.99 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.347.4.100 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.347.4.101 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.347.4.102 updateAllModels()

`void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.347.4.103 updateLemmas()

`void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.347.4.104 updateModel()

`template<class Settings > void smtrat::PBPPModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.347.4.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.347.5 Field Documentation

15.347.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.347.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.347.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.347.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.347.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.347.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.347.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.347.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.347.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.347.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.347.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.347.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.347.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.347.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.347.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.347.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.347.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.347.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.347.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

15.347.5.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.347.5.21 mSmallerMusesCheckCounter

`unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.347.5.22 mSolverState

`std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.347.5.23 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheoryPropagations [protected], [inherited]`

15.347.5.24 mUsedBackends

`std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.347.5.25 mVariableCounters

`std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.348 smtrat::PersistentUnionFind Struct Reference

`#include <UnionFind.h>`

Public Member Functions

- PFEModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=NULL)
- ~PFEModule ()
- bool addCore (ModuleInput::const_iterator)

  The module has to take the given sub-formula of the received formula into account.
- Answer checkCore ()

  Checks the received formula for consistency.
- void removeCore (ModuleInput::const_iterator)

  Removes everything related to the given sub-formula of the received formula.
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void updateModel () const

  Updates the current assignment into the model.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const

- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.

- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.

- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions
- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes
- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.349.3.1 PFEModule()

```
template<class Settings >
smtrat::PFEModule< Settings >::PFEModule (
            const ModuleInput * _formula,
            Conditionals & _conditionals,
            Manager * _manager = NULL )
```

15.349.3.2 ~PFEModule()

```
template<class Settings >
smtrat::PFEModule< Settings >::~PFEModule ( )
```

15.349.4 Member Function Documentation

15.349.4.1 add()

```
bool smtrat::PModule::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.349.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
            const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.349.4.3 addCore()

```
template<typename Settings >
bool smtrat::PFEModule< Settings >::addCore (
            ModuleInput::const_iterator formula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.349.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
            const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.349.4.5 addLemma()

```
void smtrat::Module::addLemma (
            const FormulaT & _lemma,
            const LemmaType & _lt = LemmaType::NORMAL,
            const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.349.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
            ModuleInput::iterator _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.349.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
            ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.349.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.349.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.349.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.349.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.349.4.12 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.349.4.13 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const
[inline], [inherited]
```

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.349.4.14 appliedPreprocessing()

```
bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]
```

Returns true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

15.349.4.15 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.349.4.16 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.349.4.17 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.349.4.18 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.349.4.19 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.349.4.20 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.349.4.21 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.349.4.22 check()

```
Answer smtrat::PModule::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.349.4.23 checkCore()

```
template<class Settings >
Answer smtrat::PFEModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.349.4.24 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.349.4.25 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.349.4.26 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.349.4.27 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.349.4.28 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.349.4.29 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.349.4.30 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.349.4.31 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

15.349.4.32 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.349.4.33 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.349.4.34 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraintsToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.349.4.35 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.349.4.36 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.349.4.37 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.349.4.38 deinformCore()

`virtual void smtrat::Module::deinformCore ( const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.349.4.39 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.349.4.40 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.349.4.41 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceived↩
VariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.349.4.42 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBest↩
Origin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.349.4.43 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.349.4.44 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.349.4.45 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

15.349.4.46 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.349.4.47 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.349.4.48 getBackendsModel()

`void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.349.4.49 getInfeasibleSubsets() [1/2]

`void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.349.4.50 getInfeasibleSubsets() [2/2]

`std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.349.4.51 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.349.4.52 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.349.4.53 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.349.4.54 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.349.4.55 getOrigins() [3/3]

`const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.349.4.56 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

15.349.4.57 hasLemmas()

`bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.349.4.58 hasValidInfeasibleSubset()

`bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.349.4.59 id()

`std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.349.4.60 infeasibleSubsets()

`const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.349.4.61 inform()

`bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.349.4.62 informBackends()

`void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.349.4.63 informCore()

`virtual bool smtrat::Module::informCore ( const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.349.4.64 informedConstraints()

`const carl::FastSet<FormulaT>& smtrat::Module::informedConstraints ( ) const [inline], [inherited]`

Returns The position of the first constraint of which no backend has been informed about.

15.349.4.65 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.349.4.66 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.349.4.67 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.349.4.68 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.349.4.69 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.349.4.70 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.349.4.71 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.349.4.72 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.349.4.73 moduleName() `virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns The name of the given module type as name.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::VSModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::GBModule< Settings >, smtrat::IntEqModule< Setti smtrat::CubeLIAModule< Settings >, smtrat::CurryModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IncWidthModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::BEModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::SplitSOSModule< Settings >.

15.349.4.74 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.349.4.75 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

15.349.4.76 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.349.4.77 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.349.4.78 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.349.4.79 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.349.4.80 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.349.4.81 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.349.4.82 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.349.4.83 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.349.4.84 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.349.4.85 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.349.4.86 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.349.4.87 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.349.4.88 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.349.4.89 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.349.4.90 remove()

```
void smtrat::PModule::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.349.4.91 removeCore()

```
template<typename Settings >
void smtrat::PFEModule< Settings >::removeCore (
            ModuleInput::const_iterator formula ) [virtual]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.349.4.92 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
            ModuleInput::iterator _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.349.4.93 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.349.4.94 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.349.4.95 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.349.4.96 runBackends() [1/2]

```
virtual Answer smtrat::PModule::runBackends ( ) [inline],
[virtual], [inherited]
```

Reimplemented from smtrat::Module.

15.349.4.97 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
            bool _final,
            bool _full,
            carl::Variable _objective ) [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.349.4.98 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.349.4.99 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.349.4.100 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.349.4.101 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint (
    const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.349.4.102 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.349.4.103 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.349.4.104 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.349.4.105 updateModel() `void smtrat::PModule::updateModel ( ) const [virtual], [inherited]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.349.4.106 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.349.5 Field Documentation

15.349.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.349.5.2 mAllModels

`std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.349.5.3 mBackendsFoundAnswer

`std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.349.5.4 mConstraintsToInform

`carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.349.5.5 mFinalCheck

`bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.349.5.6 mFirstPosInLastBranches

`std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.349.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.349.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::m↩FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.349.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.349.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.349.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.349.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.349.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.349.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.349.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.349.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.349.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.349.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.349.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplitting↩Variables [static], [inherited]`

Reusable splitting variables.

15.349.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.349.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.349.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.349.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.349.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.349.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.350 smtrat::PModule Class Reference

`#include <PModule.h>`

Public Types

- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- PModule (const ModuleInput *_formula, Conditionals &_foundAnswer, Manager *_manager=nullptr, std::string module_name="PModule")
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void updateModel () const

  Updates the current assignment into the model.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- virtual bool addCore (ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.

- virtual Answer checkCore ()

  Checks the received formula for consistency.

- virtual void removeCore (ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩ Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩ _premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩ Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩ ::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩ AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩ CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.

- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.

- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.

- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.

- Manager *const mpManager

  A reference to the manager.

- Model mModel

  Stores the assignment of the current satisfiable result, if existent.

- std::vector< Model > mAllModels

  Stores all satisfying assignments.

- bool mModelComputed

  True, if the model has already been computed.

- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.

- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.

- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.

- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.

- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.350.1 Member Enumeration Documentation

15.350.1.1 LemmaType `enum smtrat::Module::LemmaType : unsigned [strong], [inherited]`

Enumerator

NORMAL	
PERMANENT	

15.350.2 Constructor & Destructor Documentation

15.350.2.1 PModule()

```
smtrat::PModule::PModule (
    const ModuleInput * _formula,
    Conditionals & _foundAnswer,
    Manager * _manager = nullptr,
    std::string module_name = "PModule" )
```

15.350.3 Member Function Documentation

15.350.3.1 add()

```
bool smtrat::PModule::add (
    ModuleInput::const_iterator _subformula )
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.350.3.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint )  [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.350.3.3 addCore()

```
virtual bool smtrat::Module::addCore (
    ModuleInput::const_iterator formula )  [inline], [protected], [virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.350.3.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.350.3.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.350.3.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.350.3.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
            ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.350.3.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.350.3.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.350.3.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.350.3.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.350.3.12 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.350.3.13 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const
[inline], [inherited]
```

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.350.3.14 appliedPreprocessing()

```
bool smtrat::PModule::appliedPreprocessing ( ) const [inline]
```

Returns true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

15.350.3.15 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.350.3.16 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.350.3.17 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.350.3.18 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.350.3.19 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.

Parameters

_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.350.3.20 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.350.3.21 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.350.3.22 check()

```
Answer smtrat::PModule::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.350.3.23 checkCore()

```
Answer smtrat::Module::checkCore ( ) [protected], [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::SATModule< Settings >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRAS smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::VSModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::GBModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, smtrat::LVEModule< Settings >, smtrat::ESModule< Settings >, smtrat::GBPPModule< Settings >, smtrat::CNFerModule, smtrat::BEModule< Settings >, smtrat::MCBModule< Settings >, smtrat::PFEModule< Settings >, smtrat::SplitSOSModule< Setti smtrat::EMModule< Settings >, and smtrat::SymmetryModule< Settings >.

15.350.3.24 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.350.3.25 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.350.3.26 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.350.3.27 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.350.3.28 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.350.3.29 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.350.3.30 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.350.3.31 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.350.3.32 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.350.3.33 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.350.3.34 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.350.3.35 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.350.3.36 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.350.3.37 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.350.3.38 deinformCore()

`virtual void smtrat::Module::deinformCore ( const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.350.3.39 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.350.3.40 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.350.3.41 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceived↩
VariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.350.3.42 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBest↩
Origin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.350.3.43 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.350.3.44 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.350.3.45 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

15.350.3.46 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.350.3.47 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.350.3.48 getBackendsModel()

`void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.350.3.49 getInfeasibleSubsets() [1/2]

`void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.350.3.50 getInfeasibleSubsets() [2/2]

`std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.350.3.51 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.350.3.52 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.350.3.53 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.350.3.54 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.350.3.55 getOrigins() [3/3]

`const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.350.3.56 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual]`

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

15.350.3.57 hasLemmas()

`bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.350.3.58 hasValidInfeasibleSubset()

`bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.350.3.59 id()

`std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.350.3.60 infeasibleSubsets()

`const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.350.3.61 inform()

`bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.350.3.62 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.350.3.63 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.350.3.64 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.350.3.65 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.350.3.66 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.350.3.67 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.350.3.68 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.350.3.69 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.350.3.70 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.350.3.71 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.350.3.72 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.350.3.73 moduleName() `virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns The name of the given module type as name.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::VSModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::GBModule< Settings >, smtrat::IntEqModule< Setti smtrat::CubeLIAModule< Settings >, smtrat::CurryModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IncWidthModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::BEModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::SplitSOSModule< Settings >.

15.350.3.74 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.350.3.75 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

15.350.3.76 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.350.3.77 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.350.3.78 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.350.3.79 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.350.3.80 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.350.3.81 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.350.3.82 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.350.3.83 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.350.3.84 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.350.3.85 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.350.3.86 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.350.3.87 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.350.3.88 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.350.3.89 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.350.3.90 remove()

```
void smtrat::PModule::remove (
    ModuleInput::const_iterator _subformula ) [virtual]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.350.3.91 removeCore()

`virtual void smtrat::Module::removeCore ( ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.350.3.92 removeOrigin()

`std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin ( ModuleInput::iterator _formula, const FormulaT & _origin ) [inline], [protected], [inherited]`

15.350.3.93 removeOrigins()

`std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩ Origins ( ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected], [inherited]`

15.350.3.94 rPassedFormula()

`const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]`

Returns A reference to the formula passed to the backends of this module.

15.350.3.95 rReceivedFormula()

`const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]`

Returns A reference to the formula passed to this module.

15.350.3.96 runBackends() [1/2] `virtual Answer smtrat::PModule::runBackends ( ) [inline], [virtual]`

Reimplemented from smtrat::Module.

15.350.3.97 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [virtual]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.350.3.98 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.350.3.99 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.350.3.100 solverState() `Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.350.3.101 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.350.3.102 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.350.3.103 updateAllModels()

`void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.350.3.104 updateLemmas()

`void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.350.3.105 updateModel()

`void smtrat::PModule::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.350.3.106 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.350.4 Field Documentation

15.350.4.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.350.4.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.350.4.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.350.4.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.350.4.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.350.4.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.350.4.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.350.4.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.350.4.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.350.4.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.350.4.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.350.4.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.350.4.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.350.4.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.350.4.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.350.4.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.350.4.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.350.4.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.350.4.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

15.350.4.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.350.4.21 mSmallerMusesCheckCounter

`unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.350.4.22 mSolverState

`std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.350.4.23 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheoryPropagations [protected], [inherited]`

15.350.4.24 mUsedBackends

`std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.350.4.25 mVariableCounters

`std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

- const Poly & get (const PolyRef &ref) const
- const Poly & operator() (const PolyRef &ref) const
- bool known (const Poly &poly) const
- void clear_levels (size_t level)

15.358.1 Detailed Description

A pool for polynomials.

The polynomials are stored in a table, that is, a list of lists of polynomials of a given level.

15.358.2 Constructor & Destructor Documentation

15.358.2.1 PolyPool()

```
smtrat::cadcells::datastructures::PolyPool::PolyPool (
            const VariableOrdering & var_order )  [inline]
```

Constructs a polynomial pool with respect to a variable ordering.

Parameters

var_order	The variable ordering determining polynomial levels.

15.358.3 Member Function Documentation

15.358.3.1 clear_levels()

```
void smtrat::cadcells::datastructures::PolyPool::clear_levels (

15.360 smtrat::cadcells::datastructures::PolyRef Struct Reference

Refers to a polynomial.

```
#include <polynomials.h>
```

Data Fields

- size_t level

  The level of the polynomial.
- size_t id

  The id of the polynomial with respect to its level.

15.360.1 Detailed Description

Refers to a polynomial.

15.360.2 Field Documentation

15.360.2.1 id `size_t smtrat::cadcells::datastructures::PolyRef::id`

The id of the polynomial with respect to its level.

15.360.2.2 level `size_t smtrat::cadcells::datastructures::PolyRef::level`

The level of the polynomial.

15.361 smtrat::PolyTree Class Reference

```
#include <PolyTree.h>
```

Public Types

- enum Type : unsigned { Type::VARIABLE, Type::CONSTANT, Type::SUM, Type::PRODUCT }

Public Member Functions

- PolyTree (const Poly &_poly)
- const PolyTree & left () const
- const PolyTree & right () const
- carl::Variable::Arg variable () const
- const Integer & constant () const
- Type type () const
- const Poly & poly () const

15.361.1 Member Enumeration Documentation

15.361.1.1 Type `enum smtrat::PolyTree::Type : unsigned [strong]`

Enumerator

VARIABLE	
CONSTANT	
SUM	
PRODUCT	

15.361.2 Constructor & Destructor Documentation

15.361.2.1 PolyTree()

```
smtrat::PolyTree::PolyTree (
    const Poly & _poly )
```

15.361.3 Member Function Documentation

15.361.3.1 constant()

```
const Integer & smtrat::PolyTree::constant ( ) const
```

15.361.3.2 left()

```
const PolyTree & smtrat::PolyTree::left ( ) const

15.365 smtrat::cad::PreprocessorSettings Struct Reference

```
#include <Preprocessor.h>
```

Static Public Member Functions

- static void register_settings (SettingsParser &parser)
- static bool register_hook ()

Data Fields

- bool disable_variable_elimination = false
- bool disable_resultants = false

Static Public Attributes

- static const bool dummy

15.365.1 Member Function Documentation

15.365.1.1 register_hook()

```
static bool smtrat::cad::PreprocessorSettings::register_hook ( ) [inline], [static]
```

15.365.1.2 register_settings()

```
static void smtrat::cad::PreprocessorSettings::register_settings (
    SettingsParser & parser ) [inline], [static]
```

15.365.2 Field Documentation

15.365.2.1 disable_resultants

```
bool smtrat::cad::PreprocessorSettings::disable_resultants = false
```

15.365.2.2 disable_variable_elimination

```
bool smtrat::cad::PreprocessorSettings::disable_variable↩
_elimination = false
```

15.365.2.3 dummy

```
const bool smtrat::cad::PreprocessorSettings::dummy [static]
```

15.366 benchmax::settings::PresetSettings Struct Reference

```
#include <PresetSettings.h>
```

Data Fields

- bool rwth_slurm

  Use slurm on the RWTH HPC cluster.

- std::string rwth_slurm_name

  Name for this job.

15.366.1 Field Documentation

15.366.1.1 rwth_slurm `bool benchmax::settings::PresetSettings::rwth_slurm`

Use slurm on the RWTH HPC cluster.

15.366.1.2 rwth_slurm_name `std::string benchmax::settings::PresetSettings::rwth_slurm_name`

Name for this job.

15.367 smtrat::PriorityQueue< T, Compare > Class Template Reference

`#include <DynamicPriorityQueue.h>`

Public Member Functions

- PriorityQueue ()
- PriorityQueue (const Compare &comp)
- const auto & data () const
- auto & data ()
- auto find (const T &t) const
- auto begin () const
- auto begin ()
- auto end () const
- auto end ()

auto smtrat::PriorityQueue< T, Compare >::end ( ) const [inline]
```

15.367.2.8 erase() [1/2]

```
template<typename T, typename Compare = std::less<T>>
auto smtrat::PriorityQueue< T, Compare >::erase (
            typename std::vector< T >::const_iterator it ) [inline]
```

15.367.2.9 erase() [2/2]

```
template<typename T, typename Compare = std::less<T>>
auto smtrat::PriorityQueue< T, Compare >::erase (
            typename std::vector< T >::const_iterator it,
            typename std::vector< T >::const_iterator end ) [inline]
```

15.367.2.10 find()

```
template<typename T, typename Compare = std::less<T>>
auto smtrat::PriorityQueue< T, Compare >::find (
            const T & t ) const [inline]
```

15.367.2.11 fix()

```
template<typename T, typename Compare = std::less<T>>
void smtrat::PriorityQueue< T, Compare >::fix ( ) [inline]
```

15.367.2.12 removeIf()

```
template<typename T, typename Compare = std::less<T>>
template<typename F >
void smtrat::PriorityQueue< T, Compare >::removeIf (
            F && f ) [inline]
```

15.367.3 Field Documentation

15.367.3.1 elements

```
T std::priority_queue< T >::elements [inherited]
```

STL member.

15.368 delta::Producer Class Reference

This class iteratively applies the operators to a smtlib file until no further simplifications can be performed.

```
#include <Producer.h>
```

Public Member Functions

- Producer (const Checker &checker, const Settings &settings)

  Create a new manager that uses the given checker.
- void interrupt () const
- std::size_t operator() (Node &root)

  Apply simplifications to the given node.

15.368.1 Detailed Description This class iteratively applies the operators to a smtlib file until no further simplifications can be performed.

15.368.2 Constructor & Destructor Documentation

15.368.2.1 Producer()

```
delta::Producer::Producer (
    const Checker & checker,
    const Settings & settings ) [inline]
```

Create a new manager that uses the given checker.

Parameters

checker	Checker to call the solver.
settings	Settings object.

15.368.3 Member Function Documentation

15.368.3.1 interrupt()

```
void delta::Producer::interrupt ( ) const [inline]
```

15.368.3.2 operator()()

```
std::size_t delta::Producer::operator() (
    Node & root ) [inline]
```

Apply simplifications to the given node.

Parameters

root	Node to simplify.

15.369 delta::ProgressBar Class Reference

This class provides a simple way to show progress bars on the command line.

```
#include <utils.h>
```

Public Member Functions

- void operator() ()

  Increase progress by one and show progress bar.

- void operator() (std::size_t steps)

  Increase progress by number of steps and show progress bar.
- void operator() (const std::pair< std::size_t, std::size_t > &p)

  Print a progress bar for a progress of `progress / total`.
- void operator() (std::size_t progress, std::size_t total)

  Print a progress bar for a progress of `progress / total`.

15.369.1 Detailed Description This class provides a simple way to show progress bars on the command line.

15.369.2 Member Function Documentation

15.369.2.1 operator()() [1/4] `void delta::ProgressBar::operator() ( ) [inline]`

Increase progress by one and show progress bar.

15.369.2.2 operator()() [2/4] `void delta::ProgressBar::operator() ( const std::pair< std::size_t, std::size_t > & p ) [inline]`

Print a progress bar for a progress of `progress / total`.

Parameters

p	Progress.

15.369.2.3 operator()() [3/4] `void delta::ProgressBar::operator() ( std::size_t progress, std::size_t total ) [inline]`

Print a progress bar for a progress of `progress / total`.

Parameters

progress	Progress.
total	Total.

15.369.2.4 operator()() [4/4] `void delta::ProgressBar::operator() ( std::size_t steps ) [inline]`

Increase progress by number of steps and show progress bar.

Parameters

steps	Steps to move forward.

15.370 smtrat::cad::Projection< incrementality, backtracking, Settings > Class Template Reference

```
#include <Projection.h>
```

Public Member Functions

- std::size_t dim () const

  Returns the dimension of the projection.

- const auto & vars () const

  Returns the variables used for projection.

- void reset ()

  Resets all datastructures, use the given variables from now on.

- template<typename F >
  void setRemoveCallback (F &&f)

  Sets a callback that is called whenever polynomials are removed.

- carl::Bitset addPolynomial (const Poly &p, std::size_t cid, bool isBound)

  Adds the given polynomial to the projection. Converts to a UPoly and calls the appropriate overload.

- virtual carl::Bitset addPolynomial (const UPoly &p, std::size_t cid, bool isBound)=0

  Adds the given polynomial to the projection.

- carl::Bitset addEqConstraint (const Poly &p, std::size_t cid, bool isBound)

  Adds the given polynomial of an equational constraint to the projection. Converts to a UPoly and calls the appropriate overload.

- virtual carl::Bitset addEqConstraint (const UPoly &p, std::size_t cid, bool isBound)

  Adds the given polynomial of an equational constraint to the projection.

- void removePolynomial (const Poly &p, std::size_t cid, bool isBound)

  Removes the given polynomial from the projection. Converts to a UPoly and calls the appropriate overload.

- virtual void removePolynomial (const UPoly &p, std::size_t cid, bool isBound)=0

  Removes the given polynomial from the projection.

- virtual std::size_t size (std::size_t level) const =0
- std::size_t size () const
- virtual bool empty (std::size_t level) const =0
- virtual bool empty ()
- OptionalID getPolyForLifting (std::size_t level, SampleLiftedWith &slw)

  Get a polynomial from this level suited for lifting.

- virtual bool hasPolynomialById (std::size_t level, std::size_t id) const =0
- virtual const UPoly & getPolynomialById (std::size_t level, std::size_t id) const =0

  Retrieves a polynomial from its id.

- virtual void exportAsDot (std::ostream &) const
- virtual Origin getOrigin (std::size_t level, std::size_t id) const

Protected Types

- using Constraints = CADConstraints< Settings::backtracking >

Protected Member Functions

- void callRemoveCallback (std::size_t level, const SampleLiftedWith &slw) const
- std::size_t getID (std::size_t level)

  Returns a fresh polynomial id for the given level.

- void freeID (std::size_t level, std::size_t id)

  Frees a currently used polynomial id for the given level.

- carl::Variable var (std::size_t level) const

  Returns the variable that corresponds to the given level, that is the variable eliminated in this level.

- bool canBePurgedByBounds (const UPoly &p) const

  Checks whether a polynomial can safely be ignored due to the bounds.

- bool isPurged (std::size_t level, std::size_t id)

Protected Attributes

- const Constraints & mConstraints
- std::vector< PolynomialLiftingQueue< BaseProjection > > mLiftingQueues

  List of lifting queues that can be used for incremental projection.

- ProjectionInformation mInfo

  Additional info on projection, projection levels and projection polynomials.

- ProjectionOperator mOperator

  The projection operator.

- std::function< void(std::size_t, const SampleLiftedWith &)> mRemoveCallback

  Callback to be called when polynomials are removed. The arguments are the projection level and a bitset that indicate which polynomials were removed in this level.

15.370.1 Member Typedef Documentation

15.370.1.1 Constraints

```
template<typename Settings>
using smtrat::cad::BaseProjection< Settings >::Constraints = CADConstraints<Settings::backtracking>
[protected], [inherited]
```

15.370.2 Member Function Documentation

15.370.2.1 addEqConstraint() [1/2]

```
template<typename Settings>
carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Adds the given polynomial of an equational constraint to the projection. Converts to a UPoly and calls the appropriate overload.

15.370.2.2 addEqConstraint() [2/2]

```
template<typename Settings>
virtual carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [inline], [virtual], [inherited]
```

Adds the given polynomial of an equational constraint to the projection.

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >.

15.370.2.3 addPolynomial() [1/2]

```
template<typename Settings>
carl::Bitset smtrat::cad::BaseProjection< Settings >::addPolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Adds the given polynomial to the projection. Converts to a UPoly and calls the appropriate overload.

15.370.2.4 addPolynomial() [2/2] template<typename Settings>

```
virtual carl::Bitset smtrat::cad::BaseProjection< Settings >::addPolynomial (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [pure virtual], [inherited]
```

Adds the given polynomial to the projection.

Implemented in smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Incrementality::NONE smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, smtrat::cad::Projection< Incrementality::FULL, BT, S and smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings >.

15.370.2.5 callRemoveCallback() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::callRemoveCallback (
            std::size_t level,
            const SampleLiftedWith & slw ) const  [inline], [protected], [inherited]
```

15.370.2.6 canBePurgedByBounds() template<typename Settings>

```
bool smtrat::cad::BaseProjection< Settings >::canBePurgedByBounds (
            const UPoly & p ) const  [inline], [protected], [inherited]
```

Checks whether a polynomial can safely be ignored due to the bounds.

15.370.2.7 dim() template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::dim ( ) const  [inline], [inherited]
```

Returns the dimension of the projection.

15.370.2.8 empty() [1/2] template<typename Settings>

```
virtual bool smtrat::cad::BaseProjection< Settings >::empty ( )  [inline], [virtual], [inherited]
```

15.370.2.9 empty() [2/2] template<typename Settings>

```
virtual bool smtrat::cad::BaseProjection< Settings >::empty (
            std::size_t level ) const  [pure virtual], [inherited]
```

Implemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, smtrat::cad::Projection< Incremental smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Increme smtrat::qe::cad::Projection< Settings >, smtrat::qe::cad::Projection< smtrat::qe::cad::CADSettings >, and smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.370.2.10 exportAsDot() template<typename Settings>

```
virtual void smtrat::cad::BaseProjection< Settings >::exportAsDot (
            std::ostream &  ) const  [inline], [virtual], [inherited]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, and smtrat::cad::Projection< Incre

15.370.2.11 freeID() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::freeID (
            std::size_t level,
            std::size_t id )  [inline], [protected], [inherited]
```

Frees a currently used polynomial id for the given level.

15.370.2.12 getID() template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::getID (
            std::size_t level )  [inline], [protected], [inherited]
```

Returns a fresh polynomial id for the given level.

15.370.2.13 getOrigin() template<typename Settings>

```
virtual Origin smtrat::cad::BaseProjection< Settings >::getOrigin (
            std::size_t level,
            std::size_t id ) const  [inline], [virtual], [inherited]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, BT, Settings >.

15.370.2.14 getPolyForLifting() template<typename Settings>

```
OptionalID smtrat::cad::BaseProjection< Settings >::getPolyForLifting (
            std::size_t level,
            SampleLiftedWith & slw )  [inline], [inherited]
```

Get a polynomial from this level suited for lifting.

15.370.2.15 getPolynomialById() template<typename Settings>

```
virtual const UPoly& smtrat::cad::BaseProjection< Settings >::getPolynomialById (
            std::size_t level,
            std::size_t id ) const  [pure virtual], [inherited]
```

Retrieves a polynomial from its id.

Implemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, smtrat::cad::Projection< Incremental smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Increme smtrat::qe::cad::Projection< Settings >, smtrat::qe::cad::Projection< smtrat::qe::cad::CADSettings >, and smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.370.2.16 hasPolynomialById() template<typename Settings>

```
virtual bool smtrat::cad::BaseProjection< Settings >::hasPolynomialById (
            std::size_t level,
            std::size_t id ) const  [pure virtual], [inherited]
```

Implemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, smtrat::cad::Projection< Incremental smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Increme smtrat::qe::cad::Projection< Settings >, smtrat::qe::cad::Projection< smtrat::qe::cad::CADSettings >, and smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.370.2.17 isPurged() template<typename Settings>

```
bool smtrat::cad::BaseProjection< Settings >::isPurged (
            std::size_t level,
            std::size_t id )  [inline], [protected], [inherited]
```

15.370.2.18 removePolynomial() [1/2] template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::removePolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Removes the given polynomial from the projection. Converts to a UPoly and calls the appropriate overload.

15.370.2.19 removePolynomial() [2/2] template<typename Settings>

```
virtual void smtrat::cad::BaseProjection< Settings >::removePolynomial (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [pure virtual], [inherited]
```

Removes the given polynomial from the projection.

Implemented in smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Incrementality::FULL smtrat::cad::Projection< Incrementality::FULL, BT, Settings >, smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings >, and smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.370.2.20 reset() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::reset ( )  [inline], [inherited]
```

Resets all datastructures, use the given variables from now on.

15.370.2.21 setRemoveCallback() template<typename Settings>

```
template<typename F >
void smtrat::cad::BaseProjection< Settings >::setRemoveCallback (
            F && f )  [inline], [inherited]
```

Sets a callback that is called whenever polynomials are removed.

15.370.2.22 size() [1/2] template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::size ( ) const  [inline], [inherited]
```

15.370.2.23 size() [2/2] template<typename Settings>

```
virtual std::size_t smtrat::cad::BaseProjection< Settings >::size (
            std::size_t level ) const  [pure virtual], [inherited]
```

Implemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, smtrat::cad::Projection< Incremental smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Increme smtrat::qe::cad::Projection< Settings >, smtrat::qe::cad::Projection< smtrat::qe::cad::CADSettings >, and smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.370.2.24 var() template<typename Settings>

```
carl::Variable smtrat::cad::BaseProjection< Settings >::var (
            std::size_t level ) const [inline], [protected], [inherited]
```

Returns the variable that corresponds to the given level, that is the variable eliminated in this level.

15.370.2.25 vars() template<typename Settings>

```
const auto& smtrat::cad::BaseProjection< Settings >::vars ( ) const [inline], [inherited]
```

Returns the variables used for projection.

15.370.3 Field Documentation

15.370.3.1 mConstraints template<typename Settings>

```
const Constraints& smtrat::cad::BaseProjection< Settings >::mConstraints [protected], [inherited]
```

15.370.3.2 mInfo template<typename Settings>

```
ProjectionInformation smtrat::cad::BaseProjection< Settings >::mInfo [protected], [inherited]
```

Additional info on projection, projection levels and projection polynomials.

15.370.3.3 mLiftingQueues template<typename Settings>

```
std::vector<PolynomialLiftingQueue<BaseProjection> > smtrat::cad::BaseProjection< Settings
>::mLiftingQueues [protected], [inherited]
```

List of lifting queues that can be used for incremental projection.

15.370.3.4 mOperator template<typename Settings>

```
ProjectionOperator smtrat::cad::BaseProjection< Settings >::mOperator [protected], [inherited]
```

The projection operator.

15.370.3.5 mRemoveCallback template<typename Settings>

```
std::function<void(std::size_t, const SampleLiftedWith&)> smtrat::cad::BaseProjection< Settings
>::mRemoveCallback [protected], [inherited]
```

Callback to be called when polynomials are removed. The arguments are the projection level and a bitset that indicate which polynomials were removed in this level.

15.371 smtrat::qe::cad::Projection< Settings > Class Template Reference

```
#include <Projection.h>
```

15.371.1 Constructor & Destructor Documentation

15.371.1.1 Projection()

```
template<typename Settings>
smtrat::qe::cad::Projection< Settings >::Projection (
            const Constraints & c )  [inline]
```

15.371.2 Member Function Documentation

15.371.2.1 addEqConstraint() [1/2]

```
template<typename Settings>
carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Adds the given polynomial of an equational constraint to the projection. Converts to a UPoly and calls the appropriate overload.

15.371.2.2 addEqConstraint() [2/2]

```
template<typename Settings>
virtual carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [inline], [virtual], [inherited]
```

Adds the given polynomial of an equational constraint to the projection.

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >.

15.371.2.3 addPolynomial() [1/3]

```
template<typename Settings>
carl::Bitset smtrat::cad::BaseProjection< Settings >::addPolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Adds the given polynomial to the projection. Converts to a UPoly and calls the appropriate overload.

15.371.2.4 addPolynomial() [2/3] template<typename Settings>

```
virtual carl::Bitset smtrat::cad::BaseProjection< Settings >::addPolynomial (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [pure virtual], [inherited]
```

Adds the given polynomial to the projection.

Implemented in smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Incrementality::NONE smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, smtrat::cad::Projection< Incrementality::FULL, BT, S and smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings >.

15.371.2.5 addPolynomial() [3/3] template<typename Settings>

```
carl::Bitset smtrat::qe::cad::Projection< Settings >::addPolynomial (
            const UPoly & p,
            std::size_t cid,
            bool  )  [inline], [override]
```

15.371.2.6 callRemoveCallback() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::callRemoveCallback (
            std::size_t level,
            const SampleLiftedWith & slw ) const  [inline], [protected], [inherited]
```

15.371.2.7 canBePurgedByBounds() template<typename Settings>

```
bool smtrat::cad::BaseProjection< Settings >::canBePurgedByBounds (
            const UPoly & p ) const  [inline], [protected], [inherited]
```

Checks whether a polynomial can safely be ignored due to the bounds.

15.371.2.8 dim() [1/2] template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::dim  [inline]
```

Returns the dimension of the projection.

15.371.2.9 dim() [2/2] template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::dim ( ) const  [inline], [inherited]
```

Returns the dimension of the projection.

15.371.2.10 empty() [1/2] template<typename Settings>

```
virtual bool smtrat::cad::BaseProjection< Settings >::empty ( )  [inline], [virtual], [inherited]
```

15.371.2.11 empty() [2/2] template<typename Settings>

```
bool smtrat::qe::cad::Projection< Settings >::empty (
            std::size_t level ) const [inline], [override], [virtual]
```

Implements smtrat::cad::BaseProjection< Settings >.

15.371.2.12 exportAsDot() template<typename Settings>

```
virtual void smtrat::cad::BaseProjection< Settings >::exportAsDot (
            std::ostream & ) const [inline], [virtual], [inherited]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, and smtrat::cad::Projection< Incre

15.371.2.13 freeID() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::freeID (
            std::size_t level,
            std::size_t id ) [inline], [protected], [inherited]
```

Frees a currently used polynomial id for the given level.

15.371.2.14 getID() template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::getID (
            std::size_t level ) [inline], [protected], [inherited]
```

Returns a fresh polynomial id for the given level.

15.371.2.15 getOrigin() template<typename Settings>

```
virtual Origin smtrat::cad::BaseProjection< Settings >::getOrigin (
            std::size_t level,
            std::size_t id ) const [inline], [virtual], [inherited]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, BT, Settings >.

15.371.2.16 getPolyForLifting() template<typename Settings>

```
OptionalID smtrat::cad::BaseProjection< Settings >::getPolyForLifting (
            std::size_t level,
            SampleLiftedWith & slw ) [inline], [inherited]
```

Get a polynomial from this level suited for lifting.

15.371.2.17 getPolynomialById() template<typename Settings>

```
const UPoly& smtrat::qe::cad::Projection< Settings >::getPolynomialById (
            std::size_t level,
            std::size_t id ) const [inline], [override], [virtual]
```

Retrieves a polynomial from its id.

Implements smtrat::cad::BaseProjection< Settings >.

15.371.2.18 hasPolynomialById() template<typename Settings>

```
bool smtrat::qe::cad::Projection< Settings >::hasPolynomialById (
            std::size_t level,
            std::size_t id ) const [inline], [override], [virtual]
```

Implements smtrat::cad::BaseProjection< Settings >.

15.371.2.19 isPurged() template<typename Settings>

```
bool smtrat::cad::BaseProjection< Settings >::isPurged (
            std::size_t level,
            std::size_t id ) [inline], [protected], [inherited]
```

15.371.2.20 removePolynomial() [1/3] template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::removePolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound ) [inline], [inherited]
```

Removes the given polynomial from the projection. Converts to a UPoly and calls the appropriate overload.

15.371.2.21 removePolynomial() [2/3] template<typename Settings>

```
void smtrat::qe::cad::Projection< Settings >::removePolynomial (
            const UPoly & ,
            std::size_t cid,
            bool ) [inline], [override]
```

15.371.2.22 removePolynomial() [3/3] template<typename Settings>

```
virtual void smtrat::cad::BaseProjection< Settings >::removePolynomial (
            const UPoly & p,
            std::size_t cid,
            bool isBound ) [pure virtual], [inherited]
```

Removes the given polynomial from the projection.

Implemented in smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Incrementality::FULL smtrat::cad::Projection< Incrementality::FULL, BT, Settings >, smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings >, and smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.371.2.23 removeProjectionFactor() template<typename Settings>

```
void smtrat::qe::cad::Projection< Settings >::removeProjectionFactor (
            std::size_t level,
            std::size_t id ) [inline]
```

15.371.2.24 reset() template<typename Settings>

```
void smtrat::qe::cad::Projection< Settings >::reset ( ) [inline]
```

15.371.2.25 setRemoveCallback() template<typename Settings>

```
template<typename F >
void smtrat::cad::BaseProjection< Settings >::setRemoveCallback (
            F && f ) [inline], [inherited]
```

Sets a callback that is called whenever polynomials are removed.

15.371.2.26 size() [1/4] template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::size [inline]
```

15.371.2.27 size() [2/4] template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::size ( ) const [inline], [inherited]
```

15.371.2.28 size() [3/4] template<typename Settings>

```
std::size_t smtrat::qe::cad::Projection< Settings >::size (
            std::size_t level ) const [inline], [override], [virtual]
```

Implements smtrat::cad::BaseProjection< Settings >.

15.371.2.29 size() [4/4] template<typename Settings>

```
virtual std::size_t smtrat::cad::BaseProjection< Settings >::size
```

15.371.2.30 testProjectionFactor() template<typename Settings>

```
bool smtrat::qe::cad::Projection< Settings >::testProjectionFactor (
            std::size_t level,
            std::size_t id ) const [inline]
```

15.371.2.31 var() template<typename Settings>

```
carl::Variable smtrat::cad::BaseProjection< Settings >::var (
            std::size_t level ) const [inline], [protected], [inherited]
```

Returns the variable that corresponds to the given level, that is the variable eliminated in this level.

15.371.2.32 vars() template<typename Settings>

```
const auto& smtrat::cad::BaseProjection< Settings >::vars ( ) const [inline], [inherited]
```

Returns the variables used for projection.

15.371.3 Friends And Related Function Documentation

15.371.3.1 operator<< template<typename Settings>

```
template<typename S >
std::ostream& operator<< (
            std::ostream & os,
            const Projection< S > & p ) [friend]
```

15.371.4 Field Documentation

15.371.4.1 mConstraints template<typename Settings>

`const Constraints& smtrat::cad::BaseProjection< Settings >::mConstraints [protected], [inherited]`

15.371.4.2 mInfo template<typename Settings>

`ProjectionInformation smtrat::cad::BaseProjection< Settings >::mInfo [protected], [inherited]`

Additional info on projection, projection levels and projection polynomials.

15.371.4.3 mRemoveCallback template<typename Settings>

`std::function<void(std::size_t, const SampleLiftedWith&)> smtrat::cad::BaseProjection< Settings >::mRemoveCallback [protected], [inherited]`

Callback to be called when polynomials are removed. The arguments are the projection level and a bitset that indicate which polynomials were removed in this level.

15.372 smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings > Class Template Reference

`#include <Projection_EC.h>`

15.372.1 Constructor & Destructor Documentation

15.372.1.1 Projection() `template<typename Settings >`

```
smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >::Projection (
            const Constraints & c )  [inline]
```

15.372.2 Member Function Documentation

15.372.2.1 addEqConstraint() [1/2] `template<typename Settings>`

```
carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Adds the given polynomial of an equational constraint to the projection. Converts to a UPoly and calls the appropriate overload.

15.372.2.2 addEqConstraint() [2/2] template<typename Settings >

```
carl::Bitset smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >↩
::addEqConstraint (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [inline], [override], [virtual]
```

Adds the given polynomial of an equational constraint to the projection.

Polynomial already exists.

Reimplemented from smtrat::cad::BaseProjection< Settings >.

15.372.2.3 addPolynomial() [1/2] template<typename Settings>

```
carl::Bitset smtrat::cad::BaseProjection< Settings >::addPolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Adds the given polynomial to the projection. Converts to a UPoly and calls the appropriate overload.

15.372.2.4 addPolynomial() [2/2] template<typename Settings >

```
carl::Bitset smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >↩
::addPolynomial (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [inline], [override], [virtual]
```

Adds the given polynomial to the projection.

Implements smtrat::cad::BaseProjection< Settings >.

15.372.2.5 callRemoveCallback() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::callRemoveCallback (
            std::size_t level,
            const SampleLiftedWith & slw ) const  [inline], [protected], [inherited]
```

15.372.2.6 canBePurgedByBounds() template<typename Settings>

```
bool smtrat::cad::BaseProjection< Settings >::canBePurgedByBounds (
            const UPoly & p ) const  [inline], [protected], [inherited]
```

Checks whether a polynomial can safely be ignored due to the bounds.

15.372.2.7 dim() [1/2] template<typename Settings >

```
std::size_t smtrat::cad::BaseProjection< Settings >::dim  [inline]
```

Returns the dimension of the projection.

15.372.2.8 dim() [2/2] template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::dim ( ) const [inline], [inherited]
```

Returns the dimension of the projection.

15.372.2.9 empty() [1/2] template<typename Settings>

```
virtual bool smtrat::cad::BaseProjection< Settings >::empty ( ) [inline], [virtual], [inherited]
```

15.372.2.10 empty() [2/2] template<typename Settings >

```
bool smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >::empty (
            std::size_t level ) const [inline], [override], [virtual]
```

Implements smtrat::cad::BaseProjection< Settings >.

15.372.2.11 exportAsDot() template<typename Settings >

```
void smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >::exportAs↩
Dot (
            std::ostream & out ) const [inline], [override], [virtual]
```

Reimplemented from smtrat::cad::BaseProjection< Settings >.

15.372.2.12 freeID() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::freeID (
            std::size_t level,
            std::size_t id ) [inline], [protected], [inherited]
```

Frees a currently used polynomial id for the given level.

15.372.2.13 getID() template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::getID (
            std::size_t level ) [inline], [protected], [inherited]
```

Returns a fresh polynomial id for the given level.

15.372.2.14 getOrigin() template<typename Settings>

```
virtual Origin smtrat::cad::BaseProjection< Settings >::getOrigin (
            std::size_t level,
            std::size_t id ) const [inline], [virtual], [inherited]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, BT, Settings >.

15.372.2.15 getPolyForLifting() template<typename Settings>

```
OptionalID smtrat::cad::BaseProjection< Settings >::getPolyForLifting (
            std::size_t level,
            SampleLiftedWith & slw )  [inline], [inherited]
```

Get a polynomial from this level suited for lifting.

15.372.2.16 getPolynomialById() template<typename Settings >

```
const UPoly& smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >↩
::getPolynomialById (
            std::size_t level,
            std::size_t id ) const  [inline], [override], [virtual]
```

Retrieves a polynomial from its id.

Implements smtrat::cad::BaseProjection< Settings >.

15.372.2.17 hasPolynomialById() template<typename Settings >

```
bool smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >::has↩
PolynomialById (
            std::size_t level,
            std::size_t id ) const  [inline], [override], [virtual]
```

Implements smtrat::cad::BaseProjection< Settings >.

15.372.2.18 isPurged() template<typename Settings>

```
bool smtrat::cad::BaseProjection< Settings >::isPurged (
            std::size_t level,
            std::size_t id )  [inline], [protected], [inherited]
```

15.372.2.19 printPolynomialIDs() template<typename Settings >

```
void smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >::print↩
PolynomialIDs ( ) const  [inline]
```

15.372.2.20 projectNewPolynomial() template<typename Settings >

```
carl::Bitset smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >↩
::projectNewPolynomial (
            const ConstraintSelection & cs = carl::Bitset(true) )  [inline]
```

15.372.2.21 removePolynomial() [1/2] template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::removePolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Removes the given polynomial from the projection. Converts to a UPoly and calls the appropriate overload.

15.372.2.22 removePolynomial() [2/2]

```
template<typename Settings >
void smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >::remove↩
Polynomial (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [inline], [override], [virtual]
```

Removes the given polynomial from the projection.

Implements smtrat::cad::BaseProjection< Settings >.

15.372.2.23 reset()

```
template<typename Settings >
void smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >::reset ( )
[inline]
```

15.372.2.24 setRemoveCallback()

```
template<typename Settings>
template<typename F >
void smtrat::cad::BaseProjection< Settings >::setRemoveCallback (
            F && f )  [inline], [inherited]
```

Sets a callback that is called whenever polynomials are removed.

15.372.2.25 size() [1/4]

```
template<typename Settings >
std::size_t smtrat::cad::BaseProjection< Settings >::size  [inline]
```

15.372.2.26 size() [2/4]

```
template<typename Settings>
std::size_t smtrat::cad::BaseProjection< Settings >::size ( ) const  [inline], [inherited]
```

15.372.2.27 size() [3/4]

```
template<typename Settings >
std::size_t smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >↩
::size (
            std::size_t level ) const  [inline], [override], [virtual]
```

Implements smtrat::cad::BaseProjection< Settings >.

15.372.2.28 size() [4/4]

```
template<typename Settings >
virtual std::size_t smtrat::cad::BaseProjection< Settings >::size
```

15.372.2.29 var()

```
template<typename Settings>
carl::Variable smtrat::cad::BaseProjection< Settings >::var (
            std::size_t level ) const  [inline], [protected], [inherited]
```

Returns the variable that corresponds to the given level, that is the variable eliminated in this level.

15.372.2.30 vars() template<typename Settings>

```
const auto& smtrat::cad::BaseProjection< Settings >::vars ( ) const [inline], [inherited]
```

Returns the variables used for projection.

15.372.3 Friends And Related Function Documentation

15.372.3.1 operator<< template<typename Settings >

```
template<typename S >
std::ostream& operator<< (
            std::ostream & os,
            const Projection< Incrementality::FULL, Backtracking::HIDE, S > & p ) [friend]
```

15.372.4 Field Documentation

15.372.4.1 mRemoveCallback template<typename Settings>

```
std::function<void(std::size_t, const SampleLiftedWith&)> smtrat::cad::BaseProjection< Settings
>::mRemoveCallback [protected], [inherited]
```

Callback to be called when polynomials are removed. The arguments are the projection level and a bitset that indicate which polynomials were removed in this level.

15.373 smtrat::cad::Projection< Incrementality::FULL, BT, Settings > Class Template Reference

```
#include <Projection_F.h>
```

Public Member Functions

```

15.373.2.19 projectNewPolynomial()

```
template<typename Settings , Backtracking BT>
carl::Bitset smtrat::cad::Projection< Incrementality::FULL, BT, Settings >::projectNewPolynomial
(
            const ConstraintSelection & cs = carl::Bitset(true) )  [inline]
```

15.373.2.20 removePolynomial() [1/2]

```
template<typename Settings>
void smtrat::cad::BaseProjection< Settings >::removePolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Removes the given polynomial from the projection. Converts to a UPoly and calls the appropriate overload.

15.373.2.21 removePolynomial() [2/2]

```
template<typename Settings , Backtracking BT>
void smtrat::cad::Projection< Incrementality::FULL, BT, Settings >::removePolynomial (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [inline], [override], [virtual]
```

Removes the given polynomial from the projection.

Implements smtrat::cad::BaseProjection< Settings >.

15.373.2.22 reset()

```
template<typename Settings , Backtracking BT>
void smtrat::cad::Projection< Incrementality::FULL, BT, Settings >::reset ( ) [inline]
```

15.373.2.23 setRemoveCallback()

```
template<typename Settings>
template<typename F >
void smtrat::cad::BaseProjection< Settings >::setRemoveCallback (
            F && f ) [inline], [inherited]
```

Sets a callback that is called whenever polynomials are removed.

15.373.2.24 size() [1/4]

```
template<typename Settings , Backtracking BT>
std::size_t smtrat::cad::BaseProjection< Settings >::size [inline]

15.374.1 Detailed Description

template<typename Settings>
class smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >

This class implements a projection that supports no incrementality and expects backtracking to be in order.

It is based on the following data structures:

- mPolynomialIDs: maps polynomials to a (per level) unique id
- mPolynomials: stores polynomials as a list (per level) with their origin

The origin of a polynomial in level zero is the id of the corresponding constraint. For all other levels, it is the id of some polynomial from level zero such that the polynomial must be removed if the origin is removed. For a single projection operation, the resulting origin is the largest of the participating polynomials. If a polynomial is derived from multiple projection operations, the origin is the earliest and thus smallest, at least for this non-incremental setting.

15.374.2 Constructor & Destructor Documentation

15.374.2.1 Projection()

```
template<typename Settings >
smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >::Projection (
            const Constraints & c )  [inline]
```

15.374.3 Member Function Documentation

15.374.3.1 addEqConstraint() [1/2]

```
template<typename Settings>
carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Adds the given polynomial of an equational constraint to the projection. Converts to a UPoly and calls the appropriate overload.

15.374.3.2 addEqConstraint() [2/2]

```
template<typename Settings>
virtual carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [inline], [virtual], [inherited]
```

Adds the given polynomial of an equational constraint to the projection.

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >.

15.374.3.3 addPolynomial() [1/2]

```
template<typename Settings>
carl::Bitset smtrat::cad::BaseProjection< Settings >::addPolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Adds the given polynomial to the projection. Converts to a UPoly and calls the appropriate overload.

15.374.3.4 addPolynomial() [2/2]

```
template<typename Settings >
carl::Bitset smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings
>::addPolynomial (
            const UPoly & p,
            std::size_t cid,
            bool  )  [inline], [override], [virtual]
```

Adds the given polynomial to the projection with the given constraint id as origin.

Asserts that the main variable of the polynomial is the first variable.

Implements smtrat::cad::BaseProjection< Settings >.

15.374.3.5 callRemoveCallback() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::callRemoveCallback (
            std::size_t level,
            const SampleLiftedWith & slw ) const [inline], [protected], [inherited]
```

15.374.3.6 canBePurgedByBounds() template<typename Settings>

```
bool smtrat::cad::BaseProjection< Settings >::canBePurgedByBounds (
            const UPoly & p ) const [inline], [protected], [inherited]
```

Checks whether a polynomial can safely be ignored due to the bounds.

15.374.3.7 dim() [1/2] template<typename Settings >

```
std::size_t smtrat::cad::BaseProjection< Settings >::dim [inline]
```

Returns the dimension of the projection.

15.374.3.8 dim() [2/2] template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::dim ( ) const [inline], [inherited]
```

Returns the dimension of the projection.

15.374.3.9 empty() [1/2] template<typename Settings>

```
virtual bool smtrat::cad::BaseProjection< Settings >::empty ( ) [inline], [virtual], [inherited]
```

15.374.3.10 empty() [2/2] template<typename Settings >

```
bool smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >::empty (
            std::size_t level ) const [inline], [override], [virtual]
```

Returns whether the number of polynomials in this level is zero.

Implements smtrat::cad::BaseProjection< Settings >.

15.374.3.11 exportAsDot() template<typename Settings>

```
virtual void smtrat::cad::BaseProjection< Settings >::exportAsDot (
            std::ostream & ) const [inline], [virtual], [inherited]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, and smtrat::cad::Projection< Incre

15.374.3.12 freeID() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::freeID (
            std::size_t level,
            std::size_t id ) [inline], [protected], [inherited]
```

Frees a currently used polynomial id for the given level.

15.374.3.13 getID() template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::getID (
            std::size_t level ) [inline], [protected], [inherited]
```

Returns a fresh polynomial id for the given level.

15.374.3.14 getOrigin() template<typename Settings>

```
virtual Origin smtrat::cad::BaseProjection< Settings >::getOrigin (
            std::size_t level,
            std::size_t id ) const [inline], [virtual], [inherited]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, BT, Settings >.

15.374.3.15 getPolyForLifting() template<typename Settings>

```
OptionalID smtrat::cad::BaseProjection< Settings >::getPolyForLifting (
            std::size_t level,
            SampleLiftedWith & slw ) [inline], [inherited]
```

Get a polynomial from this level suited for lifting.

15.374.3.16 getPolynomialById() template<typename Settings >

```
const UPoly& smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings
>::getPolynomialById (
            std::size_t level,
            std::size_t id ) const [inline], [override], [virtual]
```

Get the polynomial from this level with the given id.

Implements smtrat::cad::BaseProjection< Settings >.

15.374.3.17 hasPolynomialById() template<typename Settings >

```
bool smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >::has↩
PolynomialById (
            std::size_t level,
            std::size_t id ) const [inline], [override], [virtual]
```

Implements smtrat::cad::BaseProjection< Settings >.

15.374.3.18 isPurged() template<typename Settings>

```
bool smtrat::cad::BaseProjection< Settings >::isPurged (
            std::size_t level,
            std::size_t id ) [inline], [protected], [inherited]
```

15.374.3.19 projectNewPolynomial()

```
template<typename Settings >
carl::Bitset smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings
>::projectNewPolynomial (
            const ConstraintSelection &  = carl::Bitset(true) )  [inline]
```

Returns false, as the projection is not incremental.

15.374.3.20 removePolynomial() [1/2]

```
template<typename Settings>
void smtrat::cad::BaseProjection< Settings >::removePolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Removes the given polynomial from the projection. Converts to a UPoly and calls the appropriate overload.

15.374.3.21 removePolynomial() [2/2]

```
template<typename Settings >
void smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >::remove↩
Polynomial (
            const UPoly & p,
            std::size_t cid,
            bool  )  [inline], [override], [virtual]
```

Removed the given polynomial from the projection.

Asserts that this polynomial was the one added last and has the given constraint id as origin. Calls the callback function for every level with a mask designating the polynomials removed from this level.

Implements smtrat::cad::BaseProjection< Settings >.

15.374.3.22 reset()

```
template<typename Settings >
void smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >::reset (
)  [inline]
```

Resets all datastructures, use the given variables from now on.

15.374.3.23 setRemoveCallback()

```
template<typename Settings>
template<typename F >
void smtrat::cad::BaseProjection< Settings >::setRemoveCallback (
            F && f )  [inline], [inherited]
```

Sets a callback that is called whenever polynomials are removed.

15.374.3.24 size() [1/4]

```
template<typename Settings >
std::size_t smtrat::cad::BaseProjection< Settings >::size  [inline]
```

15.374.3.25 size() [2/4] template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::size ( ) const [inline], [inherited]
```

15.374.3.26 size() [3/4] template<typename Settings >

```
std::size_t smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >↩
::size (
            std::size_t level ) const [inline], [override], [virtual]
```

Returns the number of polynomials in this level.

Implements smtrat::cad::BaseProjection< Settings >.

15.374.3.27 size() [4/4] template<typename Settings >

```
virtual std::size_t smtrat::cad::BaseProjection< Settings >::size
```

15.374.3.28 var() template<typename Settings>

```
carl::Variable smtrat::cad::BaseProjection< Settings >::var (
            std::size_t level ) const [inline], [protected], [inherited]
```

Returns the variable that corresponds to the given level, that is the variable eliminated in this level.

15.374.3.29 vars() template<typename Settings>

```
const auto& smtrat::cad::BaseProjection< Settings >::vars ( ) const [inline], [inherited]
```

Returns the variables used for projection.

15.374.4 Friends And Related Function Documentation

15.374.4.1 operator<< template<typename Settings >

```
template<typename S >
std::ostream& operator<< (
            std::ostream & os,
            const Projection< Incrementality::NONE, Backtracking::ORDERED, S > & p ) [friend]
```

15.374.5 Field Documentation

15.374.5.1 mConstraints template<typename Settings>

```
const Constraints& smtrat::cad::BaseProjection< Settings >::mConstraints [protected], [inherited]
```

15.374.5.2 mInfo template<typename Settings>

```
ProjectionInformation smtrat::cad::BaseProjection< Settings >::mInfo [protected], [inherited]
```

Additional info on projection, projection levels and projection polynomials.

15.374.5.3 mRemoveCallback `template<typename Settings>`

`std::function<void(std::size_t, const SampleLiftedWith&)> smtrat::cad::BaseProjection< Settings >::mRemoveCallback [protected], [inherited]`

Callback to be called when polynomials are removed. The arguments are the projection level and a bitset that indicate which polynomials were removed in this level.

15.375 smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings > Class Template Reference

This class implements a projection that supports no incrementality and allows backtracking to be out of order.

`#include <Projection_NU.h>`

Public Member Functions

- Projection (const Constraints &c)
- void reset ()
- carl::Bitset addPolynomial (const UPoly &p, std::size_t cid, bool) override

  Adds the given polynomial to the projection.

15.375.1 Detailed Description

template<typename Settings>
class smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >

This class implements a projection that supports no incrementality and allows backtracking to be out of order.

15.375.2 Constructor & Destructor Documentation

15.375.2.1 Projection()

```
template<typename Settings >
smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >::Projection
(
            const Constraints & c )  [inline]
```

15.375.3 Member Function Documentation

15.375.3.1 addEqConstraint() [1/2]

```
template<typename Settings>
carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Adds the given polynomial of an equational constraint to the projection. Converts to a UPoly and calls the appropriate overload.

15.375.3.2 addEqConstraint() [2/2] template<typename Settings>

```
virtual carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const UPoly & p,
            std::size_t cid,
            bool isBound ) [inline], [virtual], [inherited]
```

Adds the given polynomial of an equational constraint to the projection.

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >.

15.375.3.3 addPolynomial() [1/2] template<typename Settings>

```
carl::Bitset smtrat::cad::BaseProjection< Settings >::addPolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound ) [inline], [inherited]
```

Adds the given polynomial to the projection. Converts to a UPoly and calls the appropriate overload.

15.375.3.4 addPolynomial() [2/2] template<typename Settings >

```
carl::Bitset smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings
>::addPolynomial (
            const UPoly & p,
            std::size_t cid,
            bool isBound ) [inline], [override], [virtual]
```

Adds the given polynomial to the projection.

Implements smtrat::cad::BaseProjection< Settings >.

Reimplemented in smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings >.

15.375.3.5 callRemoveCallback() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::callRemoveCallback (
            std::size_t level,
            const SampleLiftedWith & slw ) const [inline], [protected], [inherited]
```

15.375.3.6 canBePurgedByBounds() template<typename Settings>

```
bool smtrat::cad::BaseProjection< Settings >::canBePurgedByBounds (
            const UPoly & p ) const [inline], [protected], [inherited]
```

Checks whether a polynomial can safely be ignored due to the bounds.

15.375.3.7 dim() [1/2] template<typename Settings >

```
std::size_t smtrat::cad::BaseProjection< Settings >::dim [inline]
```

Returns the dimension of the projection.

15.375.3.8 dim() [2/2] template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::dim ( ) const [inline], [inherited]
```

Returns the dimension of the projection.

15.375.3.9 empty() [1/2] template<typename Settings>

```
virtual bool smtrat::cad::BaseProjection< Settings >::empty ( ) [inline], [virtual], [inherited]
```

15.375.3.10 empty() [2/2] template<typename Settings >

```
bool smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >::empty
(
            std::size_t level ) const [inline], [override], [virtual]
```

Implements smtrat::cad::BaseProjection< Settings >.

15.375.3.11 exportAsDot() template<typename Settings>

```
virtual void smtrat::cad::BaseProjection< Settings >::exportAsDot (
            std::ostream & ) const [inline], [virtual], [inherited]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, and smtrat::cad::Projection< Incre

15.375.3.12 freeID() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::freeID (
            std::size_t level,
            std::size_t id ) [inline], [protected], [inherited]
```

Frees a currently used polynomial id for the given level.

15.375.3.13 getID() template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::getID (
            std::size_t level ) [inline], [protected], [inherited]
```

Returns a fresh polynomial id for the given level.

15.375.3.14 getOrigin() template<typename Settings>

```
virtual Origin smtrat::cad::BaseProjection< Settings >::getOrigin (
            std::size_t level,
            std::size_t id ) const [inline], [virtual], [inherited]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, BT, Settings >.

15.375.3.15 getPolyForLifting()

```
template<typename Settings>
OptionalID smtrat::cad::BaseProjection< Settings >::getPolyForLifting (
            std::size_t level,
            SampleLiftedWith & slw )  [inline], [inherited]
```

Get a polynomial from this level suited for lifting.

15.375.3.16 getPolynomialById()

```
template<typename Settings >
const UPoly& smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings
>::getPolynomialById (
            std::size_t level,
            std::size_t id ) const  [inline], [override], [virtual]
```

Retrieves a polynomial from its id.

Implements smtrat::cad::BaseProjection< Settings >.

15.375.3.17 hasPolynomialById()

```
template<typename Settings >
bool smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >::has↩
PolynomialById (
            std::size_t level,
            std::size_t id ) const  [inline], [override], [virtual]
```

Implements smtrat::cad::BaseProjection< Settings >.

15.375.3.18 isPurged()

```
template<typename Settings>
bool smtrat::cad::BaseProjection< Settings >::isPurged (
            std::size_t level,
            std::size_t id )  [inline], [protected], [inherited]
```

15.375.3.19 projectNewPolynomial()

```
template<typename Settings >
carl::Bitset smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings
>::projectNewPolynomial (
            const ConstraintSelection &  = carl::Bitset(true) )  [inline]
```

15.375.3.20 removePolynomial() [1/2]

```
template<typename Settings>
void smtrat::cad::BaseProjection< Settings >::removePolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Removes the given polynomial from the projection. Converts to a UPoly and calls the appropriate overload.

15.375.3.21 removePolynomial() [2/2]

```
template<typename Settings >
void smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >↩
::removePolynomial (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [inline], [override], [virtual]
```

Removes the given polynomial from the projection.

Implements smtrat::cad::BaseProjection< Settings >.

Reimplemented in smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings >.

15.375.3.22 reset()

```
template<typename Settings >
void smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >::reset
( )  [inline]
```

15.375.3.23 setRemoveCallback()

```
template<typename Settings>
template<typename F >
void smtrat::cad::BaseProjection< Settings >::setRemoveCallback (
            F && f )  [inline], [inherited]
```

Sets a callback that is called whenever polynomials are removed.

15.375.3.24 size() [1/4]

```
template<typename Settings >
std::size_t smtrat::cad::BaseProjection< Settings >::size  [inline]
```

15.375.3.25 size() [2/4]

```
template<typename Settings>
std::size_t smtrat::cad::BaseProjection< Settings >::size ( ) const  [inline], [inherited]
```

15.375.3.26 size() [3/4]

```
template<typename Settings >
std::size_t smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings
>::size (
            std::size_t level ) const  [inline], [override], [virtual]
```

Implements smtrat::cad::BaseProjection< Settings >.

15.375.3.27 size() [4/4]

```
template<typename Settings >
virtual std::size_t smtrat::cad::BaseProjection< Settings >::size
```

15.375.3.28 var()

```
template<typename Settings>
carl::Variable smtrat::cad::BaseProjection< Settings >::var (
            std::size_t level ) const  [inline], [protected], [inherited]
```

Returns the variable that corresponds to the given level, that is the variable eliminated in this level.

15.375.3.29 vars() template<typename Settings>

```
const auto& smtrat::cad::BaseProjection< Settings >::vars ( ) const  [inline], [inherited]
```

Returns the variables used for projection.

15.375.4 Friends And Related Function Documentation

15.375.4.1 operator<< template<typename Settings >

```
template<typename S >
std::ostream& operator<< (
            std::ostream & os,
            const Projection< Incrementality::NONE, Backtracking::UNORDERED, S > & p )  [friend]
```

15.375.5 Field Documentation

15.375.5.1 mConstraints template<typename Settings>

```
const Constraints& smtrat::cad::BaseProjection< Settings >::mConstraints  [protected], [inherited]
```

15.375.5.2 mInfo template<typename Settings>

```
ProjectionInformation smtrat::cad::BaseProjection< Settings >::mInfo  [protected], [inherited]
```

Additional info on projection, projection levels and projection polynomials.

15.375.5.3 mRemoveCallback template<typename Settings>

```
std::function<void(std::size_t, const SampleLiftedWith&)> smtrat::cad::BaseProjection< Settings
>::mRemoveCallback  [protected], [inherited]
```

Callback to be called when polynomials are removed. The arguments are the projection level and a bitset that indicate which polynomials were removed in this level.

15.376 smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings > Class Template Reference

```
#include <Projection_S.h>
```

Public Member Functions

- virtual Origin getOrigin (std::size_t level, std::size_t id) const

Protected Member Functions

- void callRemoveCallback (std::size_t level, const SampleLiftedWith &slw) const
- std::size_t getID (std::size_t level)

  Returns a fresh polynomial id for the given level.
- void freeID (std::size_t level, std::size_t id)

  Frees a currently used polynomial id for the given level.
- carl::Variable var (std::size_t level) const

  Returns the variable that corresponds to the given level, that is the variable eliminated in this level.
- bool canBePurgedByBounds (const UPoly &p) const

  Checks whether a polynomial can safely be ignored due to the bounds.
- bool isPurged (std::size_t level, std::size_t id)

Protected Attributes

- const Constraints & mConstraints
- ProjectionInformation mInfo

  Additional info on projection, projection levels and projection polynomials.
- std::function< void(std::size_t, const SampleLiftedWith &)> mRemoveCallback

  Callback to be called when polynomials are removed. The arguments are the projection level and a bitset that indicate which polynomials were removed in this level.

Friends

- template<typename S , Backtracking B>
  std::ostream & operator<< (std::ostream &os, const Projection< Incrementality::SIMPLE, B, S > &p)

15.376.1 Constructor & Destructor Documentation

15.376.1.1 Projection()

```
template<typename Settings , Backtracking BT>
template<typename ... Args>
smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings >::Projection (
            Args &&... args ) [inline]
```

15.376.2 Member Function Documentation

15.376.2.1 addEqConstraint() [1/2] template<typename Settings>

```
carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Adds the given polynomial of an equational constraint to the projection. Converts to a UPoly and calls the appropriate overload.

15.376.2.2 addEqConstraint() [2/2] template<typename Settings>

```
virtual carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [inline], [virtual], [inherited]
```

Adds the given polynomial of an equational constraint to the projection.

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >.

15.376.2.3 addPolynomial() [1/2] template<typename Settings>

```
carl::Bitset smtrat::cad::BaseProjection< Settings >::addPolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Adds the given polynomial to the projection. Converts to a UPoly and calls the appropriate overload.

15.376.2.4 addPolynomial() [2/2] template<typename Settings , Backtracking BT>

```
carl::Bitset smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings >::addPolynomial (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [inline], [virtual]
```

Adds the given polynomial to the projection.

Reimplemented from smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.376.2.5 callRemoveCallback() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::callRemoveCallback (
            std::size_t level,
            const SampleLiftedWith & slw ) const  [inline], [protected], [inherited]
```

15.376.2.6 canBePurgedByBounds() template<typename Settings>

```
bool smtrat::cad::BaseProjection< Settings >::canBePurgedByBounds (
            const UPoly & p ) const  [inline], [protected], [inherited]
```

Checks whether a polynomial can safely be ignored due to the bounds.

15.376.2.7 dim() [1/2] template<typename Settings >

```
std::size_t smtrat::cad::BaseProjection< Settings >::dim [inline], [inherited]
```

Returns the dimension of the projection.

15.376.2.8 dim() [2/2] template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::dim ( ) const [inline], [inherited]
```

Returns the dimension of the projection.

15.376.2.9 empty() [1/2] template<typename Settings>

```
virtual bool smtrat::cad::BaseProjection< Settings >::empty ( ) [inline], [virtual], [inherited]
```

15.376.2.10 empty() [2/2] template<typename Settings >

```
bool smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >::empty
(
            std::size_t level ) const [inline], [override], [virtual], [inherited]
```

Implements smtrat::cad::BaseProjection< Settings >.

15.376.2.11 exportAsDot() template<typename Settings>

```
virtual void smtrat::cad::BaseProjection< Settings >::exportAsDot (
            std::ostream & ) const [inline], [virtual], [inherited]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, and smtrat::cad::Projection< Incre

15.376.2.12 freeID() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::freeID (
            std::size_t level,
            std::size_t id ) [inline], [protected], [inherited]
```

Frees a currently used polynomial id for the given level.

15.376.2.13 getID() template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::getID (
            std::size_t level ) [inline], [protected], [inherited]
```

Returns a fresh polynomial id for the given level.

15.376.2.14 getOrigin() template<typename Settings>

```
virtual Origin smtrat::cad::BaseProjection< Settings >::getOrigin (
            std::size_t level,
            std::size_t id ) const [inline], [virtual], [inherited]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, BT, Settings >.

15.376.2.15 getPolyForLifting()

```
template<typename Settings>
OptionalID smtrat::cad::BaseProjection< Settings >::getPolyForLifting (
            std::size_t level,
            SampleLiftedWith & slw )  [inline], [inherited]
```

Get a polynomial from this level suited for lifting.

15.376.2.16 getPolynomialById()

```
template<typename Settings >
const UPoly& smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings
>::getPolynomialById (
            std::size_t level,
            std::size_t id ) const  [inline], [override], [virtual], [inherited]
```

Retrieves a polynomial from its id.

Implements smtrat::cad::BaseProjection< Settings >.

15.376.2.17 hasPolynomialById()

```
template<typename Settings >
bool smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >::has↩
PolynomialById (
            std::size_t level,
            std::size_t id ) const  [inline], [override], [virtual], [inherited]
```

Implements smtrat::cad::BaseProjection< Settings >.

15.376.2.18 isPurged()

```
template<typename Settings>
bool smtrat::cad::BaseProjection< Settings >::isPurged (
            std::size_t level,
            std::size_t id )  [inline], [protected], [inherited]
```

15.376.2.19 projectNewPolynomial()

```
template<typename Settings , Backtracking BT>
carl::Bitset smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings >::projectNew↩
Polynomial (
            const ConstraintSelection &  = carl::Bitset(true) )  [inline]
```

15.376.2.20 removePolynomial() [1/2]

```
template<typename Settings>
void smtrat::cad::BaseProjection< Settings >::removePolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline], [inherited]
```

Removes the given polynomial from the projection. Converts to a UPoly and calls the appropriate overload.

15.376.2.21 removePolynomial() [2/2]

```
template<typename Settings , Backtracking BT>
void smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings >::removePolynomial (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [inline], [virtual]
```

Removes the given polynomial from the projection.

Reimplemented from smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.376.2.22 reset()

```
template<typename Settings , Backtracking BT>
void smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings >::reset ( )  [inline]
```

15.376.2.23 setRemoveCallback()

```
template<typename Settings>
template<typename F >
void smtrat::cad::BaseProjection< Settings >::setRemoveCallback (
            F && f )  [inline], [inherited]
```

Sets a callback that is called whenever polynomials are removed.

15.376.2.24 size() [1/4]

```
template<typename Settings >
std::size_t smtrat::cad::BaseProjection< Settings >::size  [inline], [inherited]
```

15.376.2.25 size() [2/4]

```
template<typename Settings>
std::size_t smtrat::cad::BaseProjection< Settings >::size ( ) const  [inline], [inherited]
```

15.376.2.26 size() [3/4]

```
template<typename Settings >
std::size_t smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings
>::size (
            std::size_t level ) const  [inline], [override], [virtual], [inherited]
```

Implements smtrat::cad::BaseProjection< Settings >.

15.376.2.27 size() [4/4]

```
template<typename Settings >
virtual std::size_t smtrat::cad::BaseProjection< Settings >::size  [inherited]
```

15.376.2.28 var()

```
template<typename Settings>
carl::Variable smtrat::cad::BaseProjection< Settings >::var (
            std::size_t level ) const  [inline], [protected], [inherited]
```

Returns the variable that corresponds to the given level, that is the variable eliminated in this level.

15.376.2.29 vars() template<typename Settings>

```
const auto& smtrat::cad::BaseProjection< Settings >::vars ( ) const  [inline], [inherited]
```

Returns the variables used for projection.

15.376.3 Friends And Related Function Documentation

15.376.3.1 operator<< template<typename Settings , Backtracking BT>

```
template<typename S , Backtracking B>
std::ostream& operator<< (
            std::ostream & os,
            const Projection< Incrementality::SIMPLE, B, S > & p )  [friend]
```

15.376.4 Field Documentation

15.376.4.1 mConstraints template<typename Settings>

```
const Constraints& smtrat::cad::BaseProjection< Settings >::mConstraints  [protected], [inherited]
```

15.376.4.2 mInfo template<typename Settings>

```
ProjectionInformation smtrat::cad::BaseProjection< Settings >::mInfo  [protected], [inherited]
```

Additional info on projection, projection levels and projection polynomials.

15.376.4.3 mRemoveCallback template<typename Settings>

```
std::function<void(std::size_t, const SampleLiftedWith&)> smtrat::cad::BaseProjection< Settings
>::mRemoveCallback  [protected], [inherited]
```

Callback to be called when polynomials are removed. The arguments are the projection level and a bitset that indicate which polynomials were removed in this level.

15.377 smtrat::cad::projection_compare::ProjectionComparator< Strategy > Struct Template Reference

15.392 smtrat::cadcells::datastructures::PropertiesT< Ts > Struct Template Reference

Set of properties.

`#include <properties.h>`

15.392.1 Detailed Description

template<typename... Ts>
struct smtrat::cadcells::datastructures::PropertiesT< Ts >

Set of properties.

This is a recursive template. The list of template parameters specifies the type of properties which can be hold by this set.

Note that only properties of the same level should be stored within this datastructure.

Properties have the following requirements:

- They need to implement level().
- They need to implement hash_on_level(), operator< and operator== for comparing with properties of the same type and level.
- They need to have a member `static constexpr bool is_flag`. If set to `true`, this indicates that there is only one property of this kind per level and thus, it is not stored in a set but only a Boolean flag is stored.
- They need to implement operator<<.

15.398 smtrat::PseudoBoolEncoder Class Reference

Base class for a PseudoBoolean Encoder.

```
#include <PseudoBoolEncoder.h>
```

Public Member Functions

- boost::optional< FormulaT > encode (const ConstraintT &constraint)

  Encodes an arbitrary constraint.
- virtual Rational encodingSize (const ConstraintT &constraint)
- virtual bool canEncode (const ConstraintT &constraint)=0
- virtual std::string name ()

Data Fields

- std::size_t problem_size

Protected Member Functions

- virtual boost::optional< FormulaT > doEncode (const ConstraintT &constraint)=0
- FormulaT generateVarChain (const std::set< carl::Variable > &vars, carl::FormulaType type)

15.398.1 Detailed Description

Base class for a PseudoBoolean Encoder.

It takes a arithmetic constraint and converts it to a boolean Formula

15.398.2 Member Function Documentation

15.398.2.1 canEncode()

```
virtual bool smtrat::PseudoBoolEncoder::canEncode (
    const ConstraintT & constraint ) [pure virtual]
```

Implemented in smtrat::TotalizerEncoder, smtrat::ExactlyOneCommanderEncoder, smtrat::MixedSignEncoder, smtrat::RNSEncoder, smtrat::CardinalityEncoder, smtrat::LongFormulaEncoder, and smtrat::ShortFormulaEncoder.

15.398.2.2 doEncode()

```
virtual boost::optional<FormulaT> smtrat::PseudoBoolEncoder::doEncode (
    const ConstraintT & constraint ) [protected], [pure virtual]
```

Implemented in smtrat::TotalizerEncoder, smtrat::ExactlyOneCommanderEncoder, smtrat::MixedSignEncoder, smtrat::CardinalityEncoder, smtrat::ShortFormulaEncoder, smtrat::LongFormulaEncoder, and smtrat::RNSEncoder.

15.398.2.3 encode()

```
boost::optional< FormulaT > smtrat::PseudoBoolEncoder::encode (
    const ConstraintT & constraint )
```

Encodes an arbitrary constraint.

Returns encoded formula

15.398.2.4 encodingSize()

```
Rational smtrat::PseudoBoolEncoder::encodingSize (
    const ConstraintT & constraint ) [virtual]
```

Reimplemented in smtrat::TotalizerEncoder, smtrat::ExactlyOneCommanderEncoder, smtrat::MixedSignEncoder, smtrat::ShortFormulaEncoder, smtrat::LongFormulaEncoder, and smtrat::CardinalityEncoder.

15.398.2.5 generateVarChain()

```
FormulaT smtrat::PseudoBoolEncoder::generateVarChain (
    const std::set< carl::Variable > & vars,
    carl::FormulaType type ) [protected]
```

15.398.2.6 name()

```
virtual std::string smtrat::PseudoBoolEncoder::name ( ) [inline], [virtual]
```

Reimplemented in smtrat::TotalizerEncoder, smtrat::ExactlyOneCommanderEncoder, smtrat::MixedSignEncoder, smtrat::CardinalityEncoder, smtrat::ShortFormulaEncoder, and smtrat::LongFormulaEncoder.

15.398.3 Field Documentation

15.398.3.1 problem_size `std::size_t smtrat::PseudoBoolEncoder::problem_size`

15.399 smtrat::PseudoBoolNormalizer Class Reference

`#include <PseudoBoolNormalizer.h>`

Public Member Functions

- std::pair< boost::optional< FormulaT >, ConstraintT > normalize (const ConstraintT &constraint)

  Modifies the constraint in-place and returns an additional boolean formula.
- std::map< carl::Variable, carl::Variable > & substitutedVariables ()

  returns all variable substitutions done by this normalizer instance.
- ConstraintT trim (const ConstraintT &constraint)

15.399.1 Member Function Documentation

15.399.1.1 normalize()

```
std::pair< boost::optional< FormulaT >, ConstraintT > smtrat::PseudoBoolNormalizer::normalize (
            const ConstraintT & constraint )
```

Modifies the constraint in-place and returns an additional boolean formula.

Consider -4x <= 2

This is equivalent to -4∗(1 - not x) <= 2 iff. -4 + 4 not x <= 2 iff 4 not x <= 6 Since we can not represent this negation in the constraint itself we add a variable y and get y <-> not x and 4 y <= 6

In this particular case we can later on remove y again since the constraint is trivially satisfied.

15.399.1.2 substitutedVariables()

```
std::map<carl::Variable, carl::Variable>& smtrat::PseudoBoolNormalizer::substitutedVariables ( ) [inline]
```

returns all variable substitutions done by this normalizer instance.

An entry {x: y} correlates to the boolean expression y <-> not x

Useful if all occurences of the substituted variable should be substituted as well or in general when the correlation is needed.

15.399.1.3 trim()

```
ConstraintT smtrat::PseudoBoolNormalizer::trim (
            const ConstraintT & constraint )
```

Provides iteration over a given std::vector in a pseudo-randomized order.

`#include <Jobs.h>`

Data Structures

- struct iterator

Public Member Functions

- RandomizationAdaptor (const std::vector< T > &data)

  Construct a randomized view on the given vector.
- auto begin () const

  Return begin of the randomized range.
- auto end () const

  Return end of the randomized range.

15.406.1 Detailed Description

template<typename T>
class benchmax::RandomizationAdaptor< T >

Provides iteration over a given std::vector in a pseudo-randomized order.

Internally, it computes a factor that is coprime to the number of jobs (and thus generates all indices). We choose the factor in the order of the square root of the number of jobs.

15.406.2 Constructor & Destructor Documentation

15.406.2.1 RandomizationAdaptor()

```
template<typename T >
benchmax::RandomizationAdaptor< T >::RandomizationAdaptor (
            const std::vector< T > & data ) [inline]
```

Construct a randomized view on the given vector.

15.406.3 Member Function Documentation

15.406.3.1 begin()

```
template<typename T >
auto benchmax::RandomizationAdaptor< T >::begin ( ) const [inline]
```

Return begin of the randomized range.

15.406.3.2 end()

```
template<typename T >
auto benchmax::RandomizationAdaptor< T >::end ( ) const [inline]
```

Return end of the randomized range.

`#include <OneCellCAD.h>`

Public Member Functions

- bool isAlreadyProcessed (const TagPoly &poly)
- void shrinkSingleComponent (const std::size_t polyLevel, const Poly &poly, CADCell &cell)

  Shrink the component of the 'cell' at the 'boundCandidate's level around the given point if the 'boundCandidate' is a tighter bound.

- std::vector< Poly > partialDerivativesLayerWithSomeNonEarlyVanishingPoly (const TagPoly &mainPoly)

  Find the smallest index m such that in the set S of all m-th partial derivatives of the given poly, such that there is a derivative that does not vanish early [brown15].

- ShrinkResult refineNull (const TagPoly &boundCandidate, CADCell &cell)
- ShrinkResult shrinkCellWithEarlyVanishingPoly (const TagPoly &boundCandidate, CADCell &cell)
- ShrinkResult shrinkCellWithIrreducibleFactorsOfPoly (const TagPoly &poly, CADCell &cell)
- ShrinkResult refineNonNull (const TagPoly &boundCandidate, CADCell &cell)
- ShrinkResult shrinkCellWithPolyHavingPointAsRoot (const TagPoly &boundCandidate, CADCell &cell)
- bool hasPolyLastVariableRootWithinBounds (const RAN &low, const RAN &high, const Poly &poly, const std::size_t polyLevel)

  Check if there is a root of the given polynomial—that becomes univariate after pluggin in all but the last variable wrt.

- ShrinkResult shrinkCellWithNonRootPoint (const TagPoly &boundCandidate, CADCell &cell)
- ShrinkResult shrinkCell (const TagPoly &boundCandidate, CADCell &cell)

  Merge the given open OpenCADCell 'cell' that contains the given 'point' (called "alpha" in [brown15]) with a polynomial 'poly'.

- std::optional< CADCell > pointEnclosingCADCell (const std::vector< std::vector< onecellcad::TagPoly >> &polys)

  Construct a single CADCell that contains the given 'point' and is sign-invariant for the given polynomials in 'polys'.

- OneCellCAD (const std::vector< carl::Variable > &variableOrder, const carl::RealAlgebraicPoint< Rational > &point)
- std::map< carl::Variable, RAN > prefixPointToStdMap (const std::size_t componentCount)

  Create a mapping from the first variables (with index 0 to 'componentCount') in the 'variableOrder' to the first components of the given 'point'.

- std::vector< RAN > isolateLastVariableRoots (const std::size_t polyLevel, const Poly &poly)

  src/lib/datastructures/mcsat/onecellcad/OneCellCAD.h Given a poly p(x1,..,xn), return all roots of the univariate poly p(a1,..,an-1, xn), where a1,..an-1 are the first algebraic real components from 'point' (SORTED!).

- bool vanishesEarly (const std::size_t polyLevel, const Poly &poly)

  Check if an n-variate 'poly' p(x1,..,xn) with n>=1 already becomes the zero poly after plugging in p(a1,..,an-1, xn), where a1,..an-1 are the first n-1 algebraic real components from 'point'.

- bool isPointRootOfPoly (const std::size_t polyLevel, const Poly &poly)
- bool isPointRootOfPoly (const TagPoly &poly)
- std::optional< Poly > coeffNonNull (const TagPoly &boundCandidate)
- bool isMainPointInsideCell (const CADCell &cell)

Data Fields

- const std::vector< carl::Variable > & variableOrder

  Variables can also be indexed by level.

- const carl::RealAlgebraicPoint< Rational > & point

15.410.1 Member Function Documentation

15.410.1.1 coeffNonNull()

```
std::optional<Poly> smtrat::mcsat::onecellcad::OneCellCAD::coeff↩
NonNull (
            const TagPoly & boundCandidate ) [inline], [inherited]
```

15.410.1.2 hasPolyLastVariableRootWithinBounds()

```
bool smtrat::mcsat::onecellcad::recursive::RecursiveCAD::hasPolyLastVariableRootWithinBounds (
            const RAN & low,
            const RAN & high,
            const Poly & poly,
            const std::size_t polyLevel ) [inline]
```

Check if there is a root of the given polynomial—that becomes univariate after pluggin in all but the last variable wrt.

the given variableOrder—, that lies between the given 'low' and 'high' bounds.

15.410.1.3 isAlreadyProcessed()

```
bool smtrat::mcsat::onecellcad::recursive::RecursiveCAD::isAlreadyProcessed (
            const TagPoly & poly ) [inline]
```

15.410.1.4 isMainPointInsideCell()

```
bool smtrat::mcsat::onecellcad::OneCellCAD::isMainPointInsideCell (
            const CADCell & cell ) [inline], [inherited]
```

15.410.1.5 isolateLastVariableRoots()

```
std::vector<RAN> smtrat::mcsat::onecellcad::OneCellCAD::isolateLastVariableRoots (
            const std::size_t polyLevel,
            const Poly & poly ) [inline], [inherited]
```

src/lib/datastructures/mcsat/onecellcad/OneCellCAD.h Given a poly p(x1,..,xn), return all roots of the univariate poly p(a1,..,an-1, xn), where a1,..an-1 are the first algebraic real components from 'point' (SORTED!).

15.410.1.6 isPointRootOfPoly() [1/2]

```
bool smtrat::mcsat::onecellcad::OneCellCAD::isPointRootOfPoly (
            const std::size_t polyLevel,
            const Poly & poly ) [inline], [inherited]
```

15.410.1.7 isPointRootOfPoly() [2/2]

```
bool smtrat::mcsat::onecellcad::OneCellCAD::isPointRootOfPoly (
            const TagPoly & poly ) [inline], [inherited]
```

15.410.1.8 OneCellCAD()

```
smtrat::mcsat::onecellcad::OneCellCAD::OneCellCAD [inline]
```

15.410.1.9 partialDerivativesLayerWithSomeNonEarlyVanishingPoly()

```
std::vector<Poly> smtrat::mcsat::onecellcad::recursive::RecursiveCAD::partialDerivativesLayerWithSomeNonEarlyVanishingPoly (
            const TagPoly & mainPoly ) [inline]
```

Find the smallest index m such that in the set S of all m-th partial derivatives of the given poly, such that there is a derivative that does not vanish early [brown15].

Note that m $>$ 0 i.e, this function never just returns the given poly, which is the 0th partial derivative of itself.

Parameters

poly	must not be a const-poly like 2, otherwise this function does not terminate.

Returns Actually only returns the set S

15.410.1.10 pointEnclosingCADCell()

```
std::optional<CADCell> smtrat::mcsat::onecellcad::recursive↩
::RecursiveCAD::pointEnclosingCADCell (
            const std::vector< std::vector< onecellcad::TagPoly >> & polys ) [inline]
```

Construct a single CADCell that contains the given 'point' and is sign-invariant for the given polynomials in 'polys'.

The construction fails if 'polys' are not well-oriented [mccallum84]. Note that this cell is cylindrical only with respect to the given 'variableOrder'.

Parameters

variableOrder	must contain unique variables and at least one, because constant polynomials (without a variable) are prohibited.
point	point.size() >= variables.size().
polys	must contain only non-constant, irreducible polynomials that mention only variables that appear in 'variableOrder'.

15.410.1.11 prefixPointToStdMap()

```
std::map<carl::Variable, RAN> smtrat::mcsat::onecellcad::↩
OneCellCAD::prefixPointToStdMap (
            const std::size_t componentCount ) [inline], [inherited]
```

Create a mapping from the first variables (with index 0 to 'componentCount') in the 'variableOrder' to the first components of the given 'point'.

15.410.1.12 refineNonNull()

```
ShrinkResult smtrat::mcsat::onecellcad::recursive::RecursiveCAD↩
::refineNonNull (
            const TagPoly & boundCandidate,
            CADCell & cell ) [inline]
```

15.410.1.13 refineNull()

```
ShrinkResult smtrat::mcsat::onecellcad::recursive::RecursiveCAD::refine↩
Null (
            const TagPoly & boundCandidate,
            CADCell & cell ) [inline]
```

15.410.1.14 shrinkCell()

```
ShrinkResult smtrat::mcsat::onecellcad::recursive::RecursiveCAD::shrink↩
Cell (
            const TagPoly & boundCandidate,
            CADCell & cell ) [inline]
```

Merge the given open OpenCADCell 'cell' that contains the given 'point' (called ”alpha” in [brown15]) with a polynomial 'poly'.

Before the merge 'cell' represents a region that is sign-invariant on other (previously merged) polynomials (all signs are non-zero). The returned cell represents a region that is additionally sign-invariant on 'poly' (also with non-zero sign).

Returns either an OpenCADCell or nothing (representing a failed construction)

15.410.1.15 shrinkCellWithEarlyVanishingPoly()

```
ShrinkResult smtrat::mcsat::onecellcad::recursive↩
::RecursiveCAD::shrinkCellWithEarlyVanishingPoly (
            const TagPoly & boundCandidate,
            CADCell & cell ) [inline]
```

15.410.1.16 shrinkCellWithIrreducibleFactorsOfPoly()

```
ShrinkResult smtrat::mcsat::onecellcad↩
::recursive::RecursiveCAD::shrinkCellWithIrreducibleFactorsOfPoly (
            const TagPoly & poly,
            CADCell & cell ) [inline]
```

15.410.1.17 shrinkCellWithNonRootPoint()

```
ShrinkResult smtrat::mcsat::onecellcad::recursive::↩
RecursiveCAD::shrinkCellWithNonRootPoint (
            const TagPoly & boundCandidate,
            CADCell & cell ) [inline]
```

15.410.1.18 shrinkCellWithPolyHavingPointAsRoot()

```
ShrinkResult smtrat::mcsat::onecellcad↩
::recursive::RecursiveCAD::shrinkCellWithPolyHavingPointAsRoot (
            const TagPoly & boundCandidate,
            CADCell & cell ) [inline]
```

15.410.1.19 shrinkSingleComponent()

```
void smtrat::mcsat::onecellcad::recursive::RecursiveCAD↩
::shrinkSingleComponent (
            const std::size_t polyLevel,
            const Poly & poly,
            CADCell & cell ) [inline]
```

Shrink the component of the 'cell' at the 'boundCandidate's level around the given point if the 'boundCandidate' is a tighter bound.

Don't recursively shrink lower level components of the cell. Note that a cell's sector may collapse into a section, which is why we need to pass in a cell and not only its sector. Note that this shrink function is always ”successful”, even if the cell was not shrunk.

Parameters

boundCandidate	Must be a non-const irreducible polynomial that does not vanish early.

15.410.1.20 vanishesEarly()

```
bool smtrat::mcsat::onecellcad::OneCellCAD::vanishesEarly (
    const std::size_t polyLevel,
    const Poly & poly ) [inline], [inherited]
```

Check if an n-variate 'poly' p(x1,..,xn) with n>=1 already becomes the zero poly after plugging in p(a1,..,an-1, xn), where a1,..an-1 are the first n-1 algebraic real components from 'point'.

15.410.2 Field Documentation

15.410.2.1 point

```
const carl::RealAlgebraicPoint<Rational>& smtrat::mcsat::onecellcad::OneCellCAD::point [inherited]
```

15.410.2.2 variableOrder

```
const std::vector<carl::Variable>& smtrat::mcsat::onecellcad::OneCellCAD::variableOrder [inherited]
```

Variables can also be indexed by level.

Polys with mathematical level 1 contain the variable in variableOrder[0]

15.411 smtrat::cad::projection::Reducta< Poly > Struct Template Reference

Construct the set of reducta of the given polynomial.

```
#include <utils.h>
```

Public Member Functions

- Reducta (const Poly &p)

Data Fields

- T **elements**

  STL member.

15.411.1 Detailed Description

template<typename Poly>
struct smtrat::cad::projection::Reducta< Poly >

Construct the set of reducta of the given polynomial.

This only adds a custom constructor to a std::

15.411.2 Constructor & Destructor Documentation

15.411.2.1 Reducta()

```
template<typename Poly>
smtrat::cad::projection::Reducta< Poly >::Reducta (
    const Poly & p ) [inline]
```

15.411.3 Field Documentation

15.411.3.1 elements `T std::vector< T >::elements [inherited]`

STL member.

15.412 Minisat::RegionAllocator< T > Class Template Reference

15.418 benchmax::Results Class Reference

Stores results for for whole benchmax run.

`#include <Results.h>`

Public Member Functions

- std::optional< std::reference_wrapper< const BenchmarkResult > > get (const Tool *tool, const fs::path &file) const
- const auto & data () const
- void addResult (const Tool *tool, const fs::path &file, BenchmarkResult &&results)

  Add a new result.
- void store (Database &db)

  Store all results to some database.
- void store (XMLWriter &xml, const Jobs &jobs) const

  Store all results to a xml file.

15.418.1 Detailed Description

Stores results for for whole benchmax run.

Allows for (concurrent) insertion of the individual results via addResult(). Eventually results can be stored to a database (if enabled) or to a xml file.

15.418.2 Member Function Documentation

15.418.2.1 addResult()

```
void benchmax::Results::addResult (
    const Tool * tool,
    const fs::path & file,
    BenchmarkResult && results ) [inline]
```

Add a new result.

15.418.2.2 data()

```
const auto& benchmax::Results::data ( ) const [inline]
```

15.418.2.3 get()

```
std::optional<std::reference_wrapper<const BenchmarkResult> > benchmax::↩
Results::get (
    const Tool * tool,
    const fs::path & file ) const [inline]
```

15.418.2.4 store() [1/2]

```
void benchmax::Results::store (
    Database & db ) [inline]
```

Store all results to some database.

15.418.2.5 store() [2/2]

```
void benchmax::Results::store (
    XMLWriter & xml,
    const Jobs & jobs ) const [inline]
```

Store all results to a xml file.

15.419 smtrat::RNSEncoder Class Reference

```
#include <RNSEncoder.h>
```

Public Member Functions

- RNSEncoder ()
- bool canEncode (const ConstraintT &constraint)
- boost::optional< FormulaT > encode (const ConstraintT &constraint)

  Encodes an arbitrary constraint.
- virtual Rational encodingSize (const ConstraintT &constraint)
- virtual std::string name ()

Data Fields

- std::size_t problem_size

Protected Member Functions

- boost::optional< FormulaT > doEncode (const ConstraintT &constraint)
- FormulaT generateVarChain (const std::set< carl::Variable > &vars, carl::FormulaType type)

15.419.1 Constructor & Destructor Documentation

15.419.1.1 RNSEncoder()

```
smtrat::RNSEncoder::RNSEncoder ( ) [inline]
```

15.419.2 Member Function Documentation

15.419.2.1 canEncode()

```
bool smtrat::RNSEncoder::canEncode (
    const ConstraintT & constraint ) [virtual]
```

Implements smtrat::PseudoBoolEncoder.

15.419.2.2 doEncode()

```
boost::optional< FormulaT > smtrat::RNSEncoder::doEncode (
    const ConstraintT & constraint ) [protected], [virtual]
```

Implements smtrat::PseudoBoolEncoder.

15.419.2.3 encode()

```
boost::optional< FormulaT > smtrat::PseudoBoolEncoder::encode (
    const ConstraintT & constraint ) [inherited]
```

Encodes an arbitrary constraint.

Returns encoded formula

15.419.2.4 encodingSize()

```
Rational smtrat::PseudoBoolEncoder::encodingSize (
    const ConstraintT & constraint ) [virtual], [inherited]
```

Reimplemented in smtrat::TotalizerEncoder, smtrat::ExactlyOneCommanderEncoder, smtrat::MixedSignEncoder, smtrat::ShortFormulaEncoder, smtrat::LongFormulaEncoder, and smtrat::CardinalityEncoder.

15.419.2.5 generateVarChain()

```
FormulaT smtrat::PseudoBoolEncoder::generateVarChain (
    const std::set< carl::Variable > & vars,
    carl::FormulaType type ) [protected], [inherited]
```

15.419.2.6 name()

```
virtual std::string smtrat::PseudoBoolEncoder::name ( ) [inline], [virtual],
[inherited]
```

Reimplemented in smtrat::TotalizerEncoder, smtrat::ExactlyOneCommanderEncoder, smtrat::MixedSignEncoder, smtrat::CardinalityEncoder, smtrat::ShortFormulaEncoder, and smtrat::LongFormulaEncoder.

15.419.3 Field Documentation

15.419.3.1 problem_size

```
std::size_t smtrat::PseudoBoolEncoder::problem_size [inherited]
```

15.438.1 Detailed Description

template<typename Properties>
class smtrat::cadcells::datastructures::SampledDerivation< Properties >

A SampledDerivation is a DelineatedDerivation with a sample and an DelineationInterval w.r.t.

to this sample.

Template Parameters

Properties	Set of properties

15.438.2 Constructor & Destructor Documentation

15.438.2.1 SampledDerivation()

```
template<typename Properties>
smtrat::cadcells::datastructures::SampledDerivation< Properties >::SampledDerivation (
            DelineatedDerivationRef< Properties > base,
            RAN main_sample )  [inline]
```

15.438.3 Member Function Documentation

15.438.3.1 base() [1/2]

```
template<typename Properties>

Static Public Member Functions

- template<typename T >
  static size_t sample_outside (cadcells::RAN &sample, const std::set< cadcells::datastructures::SampledDerivationRef< T >, SampledDerivationRefCompare > &derivationsSet)

15.442.1 Member Function Documentation

15.442.1.1 sample_outside()

```
template<typename T >
static size_t smtrat::sampling< SamplingAlgorithm::LOWER_UPPER_BETWEEN_SAMPLING >::sample_↩
outside (
            cadcells::RAN & sample,
            const std::set< cadcells::datastructures::SampledDerivationRef< T >, SampledDerivationRefCompare
> & derivationsSet )  [inline], [static]
```

15.443 smtrat::SATModule< Settings > Class Template Reference

Implements a module performing DPLL style SAT checking.

```
#include <SATModule.h>
```

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- SATModule (const ModuleInput *_formula, Conditionals &_foundAnswer, Manager *const _manager=nullptr)

  Constructs a SATModule.
- ~SATModule ()

  Destructs this SATModule.
- bool addCore (ModuleInput::const_iterator)

  The module has to take the given sub-formula of the received formula into account.
- Answer checkCore ()

  Checks the received formula for consistency.
- void removeCore (ModuleInput::const_iterator)

  Removes everything related to the given sub-formula of the received formula.
- void updateModel () const

  Updates the model, if the solver has detected the consistency of the received formula, beforehand.
- void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- void updateInfeasibleSubset ()

  Updates the infeasible subset found by the SATModule, if the received formula is unsatisfiable.
- void cleanUpAfterOptimizing (const std::vector< Minisat::CRef > &_excludedAssignments)
- void removeUpperBoundOnMinimal ()
- void addConstraintToInform (const FormulaT &)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- void addConstraintToInform_ (const FormulaT &_formula)
- void addBooleanAssignments (EvalRationalMap &_rationalAssignment) const

  Adds the Boolean assignments to the given assignments, which were determined by the Minisat procedure.
- void print (std::ostream &_out=std::cout, const std::string &_init="") const

  Prints everything.
- void printCurrentAssignment (std::ostream &=std::cout, const std::string &="") const

  Prints the current assignment of the SAT solver.
- void printConstraintLiteralMap (std::ostream &_out=std::cout, const std::string &_init="") const

  Prints the constraints to literal map.
- void printFormulaCNFInfosMap (std::ostream &_out=std::cout, const std::string &_init="") const

  Prints the formulas to clauses map.
- void printClauseInformation (std::ostream &_out=std::cout, const std::string &_init="") const

  Prints the clause information.
- void printBooleanVarMap (std::ostream &_out=std::cout, const std::string &_init="") const

  Prints map of the Boolean within the SAT solver to the given Booleans.
- void printBooleanConstraintMap (std::ostream &_out=std::cout, const std::string &_init="") const

  Prints the literal to constraint map.
- void printClause (Minisat::CRef _clause, bool _withAssignment=false, std::ostream &_out=std::cout, const std::string &_init="") const

  Prints the clause at the given reference.
- void printClause (const Minisat::vec< Minisat::Lit > &, bool _withAssignment=false, std::ostream &_out=std↩ ::cout, const std::string &_init="") const

  Prints the clause resulting from the given vector of literals.
- void printClauses (const Minisat::vec< Minisat::CRef > &_clauses, const std::string _name, std::ostream &_out=std::cout, const std::string &_init="", int=0, bool _withAssignment=false, bool _onlyNotSatisfied=false) const

  Prints all given clauses.
- void printDecisions (std::ostream &_out=std::cout, const std::string &_init="") const

Prints the decisions the SAT solver has made.

- void printPropagatedLemmas (std::ostream &_out=std::cout, const std::string &_init="") const

  Prints the propagated lemmas for each variables which influence its value.

- void printLiteralsActiveOccurrences (std::ostream &_out=std::cout, const std::string &_init="") const

  Prints the literals' active occurrences in all clauses.

- void collectStats ()

  Collects the taken statistics.

- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.

- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.

- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.

- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.

- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.

- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.

- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.

- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.

- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.

- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.

- Manager *const mpManager

  A reference to the manager.

- Model mModel

  Stores the assignment of the current satisfiable result, if existent.

- std::vector< Model > mAllModels

  Stores all satisfying assignments.

- bool mModelComputed

  True, if the model has already been computed.

- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.

- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.

- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.

- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.443.1 Detailed Description

template<class Settings>
class smtrat::SATModule< Settings >

Implements a module performing DPLL style SAT checking.

It is mainly based on Minisat 2.0 and extends it by enabling the SMT-RAT module interfaces and some optimizations.

15.443.2 Member Typedef Documentation

15.443.2.1 SettingsType `template<class Settings >`

```
typedef Settings smtrat::SATModule< Settings >::SettingsType
```

15.443.3 Member Enumeration Documentation

15.443.3.1 LemmaType `enum smtrat::Module::LemmaType : unsigned [strong], [inherited]`

Enumerator

NORMAL	
PERMANENT	

15.443.4 Constructor & Destructor Documentation

15.443.4.1 SATModule() `template<class Settings >`

```
smtrat::SATModule< Settings >::SATModule (
            const ModuleInput * _formula,
            Conditionals & _foundAnswer,
            Manager *const _manager = nullptr )
```

Constructs a SATModule.

Parameters

_type	The type of this module being SATModule.
_formula	The formula passed to this module, called received formula.
_settings	[Not yet used.]
_foundAnswer	Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
_manager	A reference to the manager of the solver using this module.

15.443.4.2 ~SATModule() `template<class Settings >`

```
smtrat::SATModule< Settings >::~SATModule ( )
```

Destructs this SATModule.

15.443.5 Member Function Documentation

15.443.5.1 add() `bool smtrat::Module::add (`

```
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.443.5.2 addBooleanAssignments()

```
template<class Settings >
void smtrat::SATModule< Settings >::addBooleanAssignments (
            EvalRationalMap & _rationalAssignment ) const
```

Adds the Boolean assignments to the given assignments, which were determined by the Minisat procedure.

Note: Assignments in the given map are not overwritten.

Parameters

_rationalAssignment	The assignments to add the Boolean assignments to.

15.443.5.3 addConstraintToInform()

```
template<class Settings >
void smtrat::SATModule< Settings >::addConstraintToInform (
            const FormulaT & _constraint )  [inline], [virtual]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented from smtrat::Module.

15.443.5.4 addConstraintToInform_()

```
template<class Settings >
void smtrat::SATModule< Settings >::addConstraintToInform_ (
            const FormulaT & _formula )  [inline]
```

15.443.5.5 addCore()

```
template<class Settings >
bool smtrat::SATModule< Settings >::addCore (
            ModuleInput::const_iterator _subformula )  [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.443.5.6 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.443.5.7 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.443.5.8 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.443.5.9 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
            ModuleInput::const_iterator _subformula )  [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.443.5.10 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.443.5.11 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.443.5.12 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.443.5.13 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.443.5.14 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.443.5.15 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const
[inline], [inherited]
```

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.443.5.16 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected],
[inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.443.5.17 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.443.5.18 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.443.5.19 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.443.5.20 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.443.5.21 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.443.5.22 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.443.5.23 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.443.5.24 checkCore() template<class Settings >

Answer smtrat::SATModule< Settings >::checkCore ( ) [virtual]

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.443.5.25 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
std::vector< FormulaSetT >::const_iterator _infsubset,
const std::string & _filename = "smaller_muses",
unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.443.5.26 checkModel()

unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.443.5.27 cleanModel()

void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]

Substitutes variable occurrences by its model value in the model values of other variables.

15.443.5.28 cleanUpAfterOptimizing() template<class Settings >

```
void smtrat::SATModule< Settings >::cleanUpAfterOptimizing (
const std::vector< Minisat::CRef > & _excludedAssignments )
```

15.443.5.29 clearLemmas()

void smtrat::Module::clearLemmas ( ) [inline], [inherited]

Deletes all yet found lemmas.

15.443.5.30 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.443.5.31 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.443.5.32 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.443.5.33 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.443.5.34 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.443.5.35 collectStats()

```
template<class Settings >
void smtrat::SATModule< Settings >::collectStats ( )
```

Collects the taken statistics.

15.443.5.36 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.443.5.37 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraintsToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.443.5.38 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.443.5.39 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.443.5.40 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.443.5.41 deinformCore()

`virtual void smtrat::Module::deinformCore ( const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.443.5.42 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.443.5.43 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.443.5.44 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceived↩
VariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.443.5.45 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBest↩
Origin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.443.5.46 firstSubformulaToPass() ModuleInput::const_iterator smtrat::Module::firstSubformula↩ ToPass ( ) const [inline], [inherited]

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.443.5.47 firstUncheckedReceivedSubformula() ModuleInput::const_iterator smtrat::Module↩ ::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.443.5.48 freeSplittingVariable() static void smtrat::Module::freeSplittingVariable (const FormulaT & *_splittingVariable*) [inline], [static], [inherited]

15.443.5.49 generateTrivialInfeasibleSubset() void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]

Stores the trivial infeasible subset being the set of received formulas.

15.443.5.50 getBackendsAllModels() void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]

Stores all models of a backend in the list of all models of this module.

15.443.5.51 getBackendsModel() void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]

15.443.5.52 getInfeasibleSubsets() [1/2] void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]

Copies the infeasible subsets of the passed formula.

15.443.5.53 getInfeasibleSubsets() [2/2] std::vector< FormulaSetT > smtrat::Module::getInfeasible↩ Subsets (const Module & *_backend*) const [protected], [inherited]

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.443.5.54 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.443.5.55 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.443.5.56 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.443.5.57 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.443.5.58 getOrigins() [3/3] const FormulaT& smtrat::Module::getOrigins (ModuleInput::const_iterator _formula) const [inline], [protected], [inherited]

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.443.5.59 getReceivedFormulaSimplified() std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.443.5.60 hasLemmas() bool smtrat::Module::hasLemmas ( ) [inline], [inherited]

Checks whether this module or any of its backends provides any lemmas.

15.443.5.61 hasValidInfeasibleSubset() bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.443.5.62 id() std::size_t smtrat::Module::id ( ) const [inline], [inherited]

Returns A unique ID to identify this module instance.

15.443.5.63 infeasibleSubsets() const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.443.5.64 inform() bool smtrat::Module::inform (const FormulaT & _constraint) [inherited]

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.443.5.65 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.443.5.66 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.443.5.67 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.443.5.68 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.443.5.69 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.443.5.70 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.443.5.71 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.443.5.72 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.443.5.73 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.443.5.74 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.443.5.75 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.443.5.76 moduleName() `virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns The name of the given module type as name.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::VSModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::GBModule< Settings >, smtrat::IntEqModule< Setti smtrat::CubeLIAModule< Settings >, smtrat::CurryModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IncWidthModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::BEModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::SplitSOSModule< Settings >.

15.443.5.77 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.443.5.78 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

15.443.5.79 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.443.5.80 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.443.5.81 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.443.5.82 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.443.5.83 print() [1/2]

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.443.5.84 print() [2/2]

`template<class Settings > void smtrat::SATModule< Settings >::print (`

```
std::ostream & _out = std::cout,
const std::string & _init = "" ) const
```

Prints everything.

Parameters

_out	The output stream where the answer should be printed.
_init	The line initiation.

15.443.5.85 printAllModels()

```
void smtrat::Module::printAllModels (
std::ostream & _out = std::cout ) [inherited]
```

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.443.5.86 printBooleanConstraintMap()

```
template<class Settings >
void smtrat::SATModule< Settings >::printBooleanConstraintMap (
std::ostream & _out = std::cout,
const std::string & _init = "" ) const
```

Prints the literal to constraint map.

Parameters

_out	The output stream where the answer should be printed.
_init	The line initiation.

15.443.5.87 printBooleanVarMap()

```
template<class Settings >
void smtrat::SATModule< Settings >::printBooleanVarMap (
std::ostream & _out = std::cout,
const std::string & _init = "" ) const
```

Prints map of the Boolean within the SAT solver to the given Booleans.

Parameters

_out	The output stream where the answer should be printed.
_init	The line initiation.

15.443.5.88 printClause() [1/2] template<class Settings >

```
void smtrat::SATModule< Settings >::printClause (
            const Minisat::vec< Minisat::Lit > & _clause,
            bool _withAssignment = false,
            std::ostream & _out = std::cout,
            const std::string & _init = "" ) const
```

Prints the clause resulting from the given vector of literals.

Parameters

_clause	The reference of the clause.
_withAssignment	A flag indicating if true, that the assignments should be printed too.
_out	The output stream where the answer should be printed.
_init	The prefix of each printed line.

15.443.5.89 printClause() [2/2] template<class Settings >

```
void smtrat::SATModule< Settings >::printClause (
            Minisat::CRef _clause,
            bool _withAssignment = false,
            std::ostream & _out = std::cout,
            const std::string & _init = "" ) const
```

Prints the clause at the given reference.

Parameters

_clause	The reference of the clause.
_withAssignment	A flag indicating if true, that the assignments should be printed too.
_out	The output stream where the answer should be printed.
_init	The prefix of each printed line.

15.443.5.90 printClauseInformation() template<class Settings >

```
void smtrat::SATModule< Settings >::printClauseInformation (
            std::ostream & _out = std::cout,
            const std::string & _init = "" ) const
```

Prints the clause information.

Parameters

_out	The output stream where the answer should be printed.
_init	The line initiation.

15.443.5.91 printClauses() template<class Settings >

```
void smtrat::SATModule< Settings >::printClauses (
            const Minisat::vec< Minisat::CRef > & _clauses,
```

```
const std::string _name,
std::ostream & _out = std::cout,
const std::string & _init = "",
int _from = 0,
bool _withAssignment = false,
bool _onlyNotSatisfied = false ) const
```

Prints all given clauses.

Parameters

_clauses	The clauses to print.
_name	The name of the clauses to print. (e.g. learnts, clauses, ..)
_out	The output stream where the answer should be printed.
_init	The prefix of each printed line.
_from	The position of the first clause to print within the given vector of clauses.
_withAssignment	A flag indicating if true, that the assignments should be printed too.

15.443.5.92 printConstraintLiteralMap()

```
template<class Settings >
void smtrat::SATModule< Settings >::printConstraintLiteralMap (
            std::ostream & _out = std::cout,
            const std::string & _init = "" ) const
```

Prints the constraints to literal map.

Parameters

_out	The output stream where the answer should be printed.
_init	The line initiation.

15.443.5.93 printCurrentAssignment()

```
template<class Settings >
void smtrat::SATModule< Settings >::printCurrentAssignment (
            std::ostream & _out = std::cout,
            const std::string & _init = "" ) const
```

Prints the current assignment of the SAT solver.

Parameters

_out	The output stream where the answer should be printed.
_init	The line initiation.

15.443.5.94 printDecisions()

```
template<class Settings >
void smtrat::SATModule< Settings >::printDecisions (
            std::ostream & _out = std::cout,
            const std::string & _init = "" ) const
```

Prints the decisions the SAT solver has made.

Parameters

_out	The output stream where the answer should be printed.
_init	The line initiation.

15.443.5.95 printFormulaCNFInfosMap()

```
template<class Settings >
void smtrat::SATModule< Settings >::printFormulaCNFInfosMap (
            std::ostream & _out = std::cout,
            const std::string & _init = "" ) const
```

Prints the formulas to clauses map.

Parameters

_out	The output stream where the answer should be printed.
_init	The line initiation.

15.443.5.96 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
            const std::string & _initiation = "***" ) const  [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.443.5.97 printLiteralsActiveOccurrences()

```
template<class Settings >
void smtrat::SATModule< Settings >::printLiteralsActiveOccurrences (
            std::ostream & _out = std::cout,
            const std::string & _init = "" ) const
```

Prints the literals' active occurrences in all clauses.

Parameters

_out	The output stream where the answer should be printed.
_init	The line initiation.

15.443.5.98 printModel()

```
void smtrat::Module::printModel (
            std::ostream & _out = std::cout ) const  [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.443.5.99 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.443.5.100 printPropagatedLemmas()

```
template<class Settings >
void smtrat::SATModule< Settings >::printPropagatedLemmas (
    std::ostream & _out = std::cout,
    const std::string & _init = "" ) const
```

Prints the propagated lemmas for each variables which influence its value.

Parameters

_out	The output stream where the answer should be printed.
_init	The line initiation.

15.443.5.101 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.443.5.102 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.443.5.103 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

15.443.5.104 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

15.443.5.105 receivedVariable()

`bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

15.443.5.106 remove()

`void smtrat::Module::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.443.5.107 removeCore()

`template<class Settings > void smtrat::SATModule< Settings >::removeCore ( ModuleInput::const_iterator _subformula ) [virtual]`

Removes everything related to the given sub-formula of the received formula.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.443.5.108 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.443.5.109 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected], [inherited]
```

15.443.5.110 removeUpperBoundOnMinimal()

```
template<class Settings >
void smtrat::SATModule< Settings >::removeUpperBoundOnMinimal ( )
```

15.443.5.111 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.443.5.112 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.443.5.113 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

15.443.5.114 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.443.5.115 setId() `void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]`

Sets this modules unique ID to identify itself.

Parameters

↩ _id	The id to set this module's id to.

15.443.5.116 setThreadPriority() `void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]`

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.443.5.117 solverState() `Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.443.5.118 splitUnequalConstraint() `void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.443.5.119 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.443.5.120 updateAllModels() `template<class Settings > void smtrat::SATModule< Settings >::updateAllModels ( ) [virtual]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented from smtrat::Module.

15.443.5.121 updateInfeasibleSubset() `template<class Settings > void smtrat::SATModule< Settings >::updateInfeasibleSubset ( )`

Updates the infeasible subset found by the SATModule, if the received formula is unsatisfiable.

15.443.5.122 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.443.5.123 updateModel() `template<class Settings > void smtrat::SATModule< Settings >::updateModel ( ) const [virtual]`

Updates the model, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented from smtrat::Module.

15.443.5.124 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.443.6 Friends And Related Function Documentation

15.443.6.1 VarSchedulerBase `template<class Settings > friend class VarSchedulerBase [friend]`

15.443.6.2 VarSchedulerMcsatBase `template<class Settings > friend class VarSchedulerMcsatBase [friend]`

15.443.7 Field Documentation

15.443.7.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.443.7.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.443.7.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.443.7.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.443.7.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.443.7.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.443.7.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩ Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.443.7.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module::m↩ FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.443.7.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.443.7.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.443.7.11 mInfeasibleSubsets `std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.443.7.12 mInformedConstraints `carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.443.7.13 mLastBranches `std::vector< Branching > smtrat::Module::mLastBranches = std↩ ::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.443.7.14 mModel `Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.443.7.15 mModelComputed `bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.443.7.16 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.443.7.17 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.443.7.18 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

15.443.7.19 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.443.7.20 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.443.7.21 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.443.7.22 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.443.7.23 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.443.7.24 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.447 smtrat::onecellcad::recursive::Section Struct Reference

Represent a cell's closed-interval-boundary object along one single axis by an irreducible, multivariate polynomial of level k.

```
#include <OpenCAD.h>
```

Data Fields

- MultiPoly poly
- RAN cachedPoint

  A single, special bound after having plugged a specific point of level k-1 can be cached for performance (needed for [1]).

15.447.1 Detailed Description

Represent a cell's closed-interval-boundary object along one single axis by an irreducible, multivariate polynomial of level k.

A section is an algebraic/"moving" boundary, because it's basically a function f: algReal^{k-1} -> algReal; from a multi-dimensional input point of level k-1 (whose components are algebraic reals) to an algebraic real (the bound along k-th axis that changes depending on the input point).

15.447.2 Field Documentation

15.447.2.1 cachedPoint `RAN smtrat::onecellcad::recursive::Section::cachedPoint`

A single, special bound after having plugged a specific point of level k-1 can be cached for performance (needed for [1]).

15.447.2.2 poly `MultiPoly smtrat::onecellcad::recursive::Section::poly`

15.448 smtrat::mcsat::onecellcad::Section Struct Reference

Represent a cell's (closed-interval-boundary) component along th k-th axis.

```
#include <utils.h>
```

Data Fields

- MultivariateRootT boundFunction
- RAN isolatedRoot

  For performance we cache the isolated root from 'boundFunction' that lies closest along this section's level to the main point.

15.448.1 Detailed Description

Represent a cell's (closed-interval-boundary) component along th k-th axis.

A section is a function f: algReal^{k-1} -> algReal; from a multi-dimensional input point of level k-1 (whose components are algebraic reals) to an algebraic real. We use a root-expression with an irreducible, multivariate polynomial of level k.

15.448.2 Field Documentation

15.453 smtrat::mcsat::onecellcad::Sector Struct Reference

Represent a cell's open-interval boundary object along one single axis by two irreducible, multivariate polynomials of level k.

```
#include <utils.h>
```

Data Fields

- std::optional< Section > lowBound

  A std::nullopt lowBound represents negative infinity.

- std::optional< Section > highBound

  A std:nullopt highBound represents infinity.

15.453.1 Detailed Description

Represent a cell's open-interval boundary object along one single axis by two irreducible, multivariate polynomials of level k.

A sector is an algebraic/"moving" boundary, because it's basically a function f: algReal^{k-1} -> (algReal,algReal); from a multi-dimensional input point of level k-1 (whose components are algebraic reals) to a pair of algebraic reals (the lower and upper bound for an open interval along k-th axis that changes depending on the input point). Note that if 'lowBound' or 'highBound' is not defined, then this represents negative and positive infinity, respectively.

15.453.2 Field Documentation

15.453.2.1 highBound `std::optional<Section> smtrat::mcsat::onecellcad::Sector::highBound`

A std:nullopt highBound represents infinity.

15.453.2.2 lowBound `std::optional<Section> smtrat::mcsat::onecellcad::Sector::lowBound`

A std::nullopt lowBound represents negative infinity.

15.454 smtrat::onecellcad::recursive::Sector Struct Reference

15.460 delta::Settings Class Reference

This class loads and checks the command line options with help of `boost::program_options`.

`#include <Settings.h>`

Public Member Functions

- Settings (const std::string &executable)

  Constructor.

- bool load (int argc, char *argv[])

  Load options from command line.

- template<typename T >
  const T & as (const std::string &s) const

  Get option with given name as a given type.

- template<typename T >
  void set (const std::string &s, const T &t)

  Set option with given name as a given type.

- bool has (const std::string &s) const

  Checks if there is an option with this name.

- bool isDefault (const std::string &s) const

  Check if the option with the given name was set due to its default value.

Friends

- std::ostream & operator<< (std::ostream &os, const Settings &s)

  Streaming operator.

15.460.1 Detailed Description

This class loads and checks the command line options with help of `boost↩ ::program_options`.

15.460.2 Constructor & Destructor Documentation

15.460.2.1 Settings()

```
delta::Settings::Settings (
    const std::string & executable ) [inline]
```

Constructor.

Parameters

executable	Name of this binary.

15.460.3 Member Function Documentation

15.460.3.1 as()

```
template<typename T >
const T& delta::Settings::as (
            const std::string & s ) const  [inline]
```

Get option with given name as a given type.

If there is no such option of it has a different type, exceptions may be thrown.

Parameters

s	Name of the option.

Returns Value of the option as type T.

15.460.3.2 has()

```
bool delta::Settings::has (
            const std::string & s ) const  [inline]
```

Checks if there is an option with this name.

Parameters

s	Name of the option.

Returns If option was set.

15.460.3.3 isDefault()

```
bool delta::Settings::isDefault (
            const std::string & s ) const  [inline]
```

Check if the option with the given name was set due to its default value.

If there is no such option exceptions may be thrown.

Parameters

s	Name of the option.

Returns Whether it's value was set as the default.

15.460.3.4 load()

```
bool delta::Settings::load (
    int argc,
    char * argv[] ) [inline]
```

Load options from command line.

Parameters

argc	Number of arguments.
argv	Content of arguments.

15.460.3.5 set()

```
template<typename T >
void delta::Settings::set (
    const std::string & s,
    const T & t ) [inline]
```

Set option with given name as a given type.

If there is no such option exceptions may be thrown.

Parameters

s	Name of the option.
t	New value.

15.460.4 Friends And Related Function Documentation

15.460.4.1 operator<<

```
std::ostream& operator<< (
    std::ostream & os,
    const Settings & s ) [friend]
```

Streaming operator.

Parameters

os	Output stream.
s	Settings.

Returns os.

15.461 benchmax::settings::Settings Struct Reference

Generic class to manage runtime settings.

```
#include <Settings.h>
```

15.461.1 Detailed Description

Generic class to manage runtime settings.

Essentially stores all (named) settings in a map<string,any> and retrieves settings classes when requested.

15.462 smtrat::settings::Settings Struct Reference

```
#include <Settings.h>
```

15.463 smtrat::SettingsComponents Class Reference

```
#include <SettingsComponents.h>
```

Public Member Functions

- void add (std::function< void(SettingsParser &)> &&f)
- void add_to_parser (SettingsParser &parser) const

15.463.1 Member Function Documentation

15.463.1.1 add()

```
void smtrat::SettingsComponents::add (
    std::function< void(SettingsParser &)> && f ) [inline]
```

15.463.1.2 add_to_parser()

```
void smtrat::SettingsComponents::add_to_parser (
    SettingsParser & parser ) const [inline]
```

15.464 benchmax::SettingsParser Class Reference

Generic class to manage settings parsing using boost::program_options.

```
#include <SettingsParser.h>
```

15.464.1 Detailed Description

Generic class to manage settings parsing using boost::program_options.

Allows to register dynamically add new options_description object and manages parsing them from command line and config file. When everything is registed finalize() has to be called to construct the full option description.

15.465 smtrat::SettingsParser Class Reference

```
#include <SettingsParser.h>
```

15.466 smtrat::CNFerModule::SettingsType Struct Reference

```
#include <CNFerModule.h>
```

Static Public Attributes

- static constexpr auto moduleName = "CNFerModule"

15.466.1 Field Documentation

15.466.1.1 moduleName

```
constexpr auto smtrat::CNFerModule::SettingsType::moduleName = "CN↩
FerModule" [static], [constexpr]
```

15.467 smtrat::parser::SExpressionParser Struct Reference

```
#include <SExpression.h>
```

Public Member Functions

- SExpressionParser ()

Data Fields

`#include <Common.h>`

Public Member Functions

- SExpressionSequence (const std::vector< SExpression< T >> &v)
- SExpressionSequence (std::vector< SExpression< T >> &&v)

Data Fields

- T **elements**

  STL member.

15.468.1 Constructor & Destructor Documentation

15.468.1.1 SExpressionSequence() [1/2]

```
template<typename T>
smtrat::parser::SExpressionSequence< T >::SExpressionSequence (
            const std::vector< SExpression< T >> & v ) [inline]
```

15.468.1.2 SExpressionSequence() [2/2]

```
template<typename T>
smtrat::parser::SExpressionSequence< T >::SExpressionSequence (
            std::vector< SExpression< T >> && v ) [inline]
```

15.468.2 Field Documentation

15.468.2.1 elements `T std::vector< T >::elements [inherited]`

STL member.

15.469 smtrat::ShortFormulaEncoder Class Reference

```
#include <ShortFormulaEncoder.h>
```

Public Member Functions

- ShortFormulaEncoder ()
- bool canEncode (const ConstraintT &constraint)
- Rational encodingSize (const ConstraintT &constraint)
- std::string name ()
- boost::optional< FormulaT > encode (const ConstraintT &constraint)

  Encodes an arbitrary constraint.

Data Fields

- std::size_t problem_size

Protected Member Functions

- boost::optional< FormulaT > doEncode (const ConstraintT &constraint)
- FormulaT generateVarChain (const std::set< carl::Variable > &vars, carl::FormulaType type)

15.469.1 Constructor & Destructor Documentation

15.469.1.1 ShortFormulaEncoder() `smtrat::ShortFormulaEncoder::ShortFormulaEncoder ( ) [inline]`

15.469.2 Member Function Documentation

15.469.2.1 canEncode() `bool smtrat::ShortFormulaEncoder::canEncode ( const ConstraintT & constraint ) [virtual]`

Implements smtrat::PseudoBoolEncoder.

15.469.2.2 doEncode() `boost::optional< FormulaT > smtrat::ShortFormulaEncoder::doEncode ( const ConstraintT & constraint ) [protected], [virtual]`

Implements smtrat::PseudoBoolEncoder.

15.469.2.3 encode() `boost::optional< FormulaT > smtrat::PseudoBoolEncoder::encode ( const ConstraintT & constraint ) [inherited]`

Encodes an arbitrary constraint.

Returns encoded formula

15.469.2.4 encodingSize() `Rational smtrat::ShortFormulaEncoder::encodingSize ( const ConstraintT & constraint ) [virtual]`

Reimplemented from smtrat::PseudoBoolEncoder.

15.469.2.5 generateVarChain()

```
FormulaT smtrat::PseudoBoolEncoder::generateVarChain (
    const std::set< carl::Variable > & vars,
    carl::FormulaType type ) [protected], [inherited]
```

15.469.2.6 name()

```
std::string smtrat::ShortFormulaEncoder::name ( ) [inline], [virtual]
```

Reimplemented from smtrat::PseudoBoolEncoder.

15.469.3 Field Documentation

15.469.3.1 problem_size

```
std::size_t smtrat::PseudoBoolEncoder::problem_size [inherited]
```

15.470 benchmax::simple_parser Class Reference

```
#include <SMTRAT.h>

15.480 benchmax::SlurmBackend Class Reference

Backend for the Slurm workload manager.

```
#include <SlurmBackend.h>
```

Public Member Functions

- bool suspendable () const
- void run (const Jobs &jobs, bool wait_for_termination)

  Run all tools on all benchmarks using Slurm.
- void process_results (const Jobs &jobs, bool check_finished)
- void addResult (const Tool *tool, const fs::path &file, BenchmarkResult &&result)

  Add a result.

Protected Member Functions

- virtual void startTool (const Tool ∗)

  Hook for every tool at the beginning.
- virtual void finalize ()

  Hook to allow for asynchronous backends to wait for jobs to terminate.
- virtual void execute (const Tool ∗, const fs::path &)

  Execute a single pair of tool and benchmark.
- void madeProgress (std::size_t files=1)

  Can be called to give information about the current progress, if available.
- void sanitize_results (const Jobs &jobs) const
- void write_results (const Jobs &jobs) const

Protected Attributes

- std::size_t mExpectedJobs

  Number of jobs that should be run.
- std::atomic< std::size_t > mFinishedJobs

  Number of jobs that are finished.
- std::atomic< std::size_t > mLastPercent

  Percentage of finished jobs when madeProgress() was last called.

15.480.1 Detailed Description

Backend for the Slurm workload manager.

The execution model is as follows: We create multiple jobs that each consists of multiple array jobs that each execute one slice of the task list. One array job executes Settings::slice_size entries of the task list. One job consists of Settings::array_size array jobs. We start as many jobs as necessary.

15.480.2 Member Function Documentation

15.480.2.1 addResult()

```
void benchmax::Backend::addResult (
    const Tool * tool,
    const fs::path & file,
    BenchmarkResult && result ) [inline], [inherited]
```

Add a result.

15.480.2.2 execute()

```
virtual void benchmax::Backend::execute (
    const Tool * ,
    const fs::path & ) [inline], [protected], [virtual], [inherited]
```

Execute a single pair of tool and benchmark.

Reimplemented in benchmax::LocalBackend, and benchmax::CondorBackend.

15.480.2.3 finalize()

```
virtual void benchmax::Backend::finalize ( ) [inline], [protected], [virtual],
[inherited]
```

Hook to allow for asynchronous backends to wait for jobs to terminate.

15.480.2.4 madeProgress()

```
void benchmax::Backend::madeProgress (
    std::size_t files = 1 ) [inline], [protected], [inherited]
```

Can be called to give information about the current progress, if available.

15.480.2.5 process_results()

```
void benchmax::Backend::process_results (
    const Jobs & jobs,
    bool check_finished ) [inline], [inherited]
```

15.480.2.6 run()

```
void benchmax::SlurmBackend::run (
    const Jobs & jobs,
    bool wait_for_termination ) [inline]
```

Run all tools on all benchmarks using Slurm.

15.480.2.7 sanitize_results()

```
void benchmax::Backend::sanitize_results (
    const Jobs & jobs ) const [inline], [protected], [inherited]
```

15.480.2.8 startTool()

```
virtual void benchmax::Backend::startTool (
    const Tool * ) [inline], [protected], [virtual], [inherited]
```

Hook for every tool at the beginning.

Can be used to upload the tool to some remote system.

15.480.2.9 suspendable()

```
bool benchmax::SlurmBackend::suspendable ( ) const [inline]
```

15.480.2.10 write_results()

```
void benchmax::Backend::write_results (
    const Jobs & jobs ) const [inline], [protected], [inherited]
```

15.480.3 Field Documentation

15.480.3.1 mExpectedJobs

```
std::size_t benchmax::Backend::mExpectedJobs [protected], [inherited]
```

Number of jobs that should be run.

15.480.3.2 mFinishedJobs

```
std::atomic<std::size_t> benchmax::Backend::mFinishedJobs [protected],
[inherited]
```

Number of jobs that are finished.

15.480.3.3 mLastPercent

```
std::atomic<std::size_t> benchmax::Backend::mLastPercent [protected],
[inherited]
```

Percentage of finished jobs when madeProgress() was last called.

15.481 benchmax::settings::SlurmBackendSettings Struct Reference

Settings for the Slurm backend.

```
#include <SlurmSettings.h>
```

Data Fields

- std::size_t array_size

  Number of array jobs within one job.
- std::size_t slice_size

  Size of one slice that is handled in one array job.
- std::string tmp_dir

  Temporary directory for output files.
- bool keep_logs

  Do not remove logs from file system if set to true.
- std::string archive_log_file

  Puts logs to some archive.
- std::string sbatch_options

  Additional options passed on to slurm.
- carl::settings::duration submission_delay

  Delay between job submissions.

15.481.1 Detailed Description

Settings for the Slurm backend.

15.481.2 Field Documentation

15.481.2.1 archive_log_file `std::string benchmax::settings::SlurmBackendSettings::archive_log_file`

Puts logs to some archive.

15.481.2.2 array_size `std::size_t benchmax::settings::SlurmBackendSettings::array_size`

Number of array jobs within one job.

15.481.2.3 keep_logs `bool benchmax::settings::SlurmBackendSettings::keep_logs`

Do not remove logs from file system if set to true.

15.481.2.4 sbatch_options `std::string benchmax::settings::SlurmBackendSettings::sbatch_options`

Additional options passed on to slurm.

15.481.2.5 slice_size `std::size_t benchmax::settings::SlurmBackendSettings::slice_size`

Size of one slice that is handled in one array job.

15.481.2.6 submission_delay `carl::settings::duration benchmax::settings::SlurmBackendSettings::submission_delay`

Delay between job submissions.

15.481.2.7 tmp_dir `std::string benchmax::settings::SlurmBackendSettings::tmp_dir`

Temporary directory for output files.

15.483 benchmax::SMTRAT Class Reference

Tool wrapper for SMT-RAT for SMT-LIB.

```
#include <SMTRAT.h>
```

Public Member Functions

- SMTRAT (const fs::path &binary, const std::string &arguments)

  New SMT-RAT tool.
- virtual bool canHandle (const fs::path &path) const override

  Only handle .smt2 files.
- std::string getStatusFromOutput (const BenchmarkResult &result) const

  Try to parse memouts from stderr.
- bool parse_stats (BenchmarkResult &result) const
- virtual void additionalResults (const fs::path &, BenchmarkResult &result) const override

  Computes the answer string from the exit code and parses statistics output.
- std::string name () const

  Common name of this tool.
- fs::path binary () const

  Full path to the binary.
- const std::map< std::string, std::string > & attributes () const

  A set of attributes, for example compilation options.
- std::vector< std::string > resolveDependencies () const

  Get dependencies of binary required to run it (via ldd)
- std::size_t attributeHash () const

  Hash of the attributes.
- virtual std::string getCommandline (const std::string &file) const

  Compose commandline for this tool and the given input file.
- virtual std::string getCommandline (const std::string &file, const std::string &localBinary) const

  Compose commandline for this tool with another binary name and the given input file.
- virtual std::optional< std::string > parseCommandline (const std::string &cmdline) const

  Compose commandline for this tool and the given input file.

Protected Attributes

- std::string mName

  (Non-unique) identifier for the tool.
- fs::path mBinary

  Path to the binary.
- std::string mArguments

  Command line arguments that should be passed to the binary.
- std::map< std::string, std::string > mAttributes

  Attributes of the tool obtained by introspection of the binary.

15.483.1 Detailed Description

Tool wrapper for SMT-RAT for SMT-LIB.

15.483.2 Constructor & Destructor Documentation

15.483.2.1 SMTRAT()

```
benchmax::SMTRAT::SMTRAT (
    const fs::path & binary,
    const std::string & arguments ) [inline]
```

New SMT-RAT tool.

15.483.3 Member Function Documentation

15.483.3.1 additionalResults()

```
virtual void benchmax::SMTRAT::additionalResults (
    const fs::path & ,
    BenchmarkResult & result ) const [inline], [override], [virtual]
```

Computes the answer string from the exit code and parses statistics output.

Reimplemented from benchmax::Tool.

15.483.3.2 attributeHash()

```
std::size_t benchmax::Tool::attributeHash ( ) const [inline], [inherited]
```

Hash of the attributes.

15.483.3.3 attributes()

```
const std::map<std::string,std::string>& benchmax::Tool::attributes ( )
const [inline], [inherited]
```

A set of attributes, for example compilation options.

15.483.3.4 binary()

```
fs::path benchmax::Tool::binary ( ) const [inline], [inherited]
```

Full path to the binary.

15.483.3.5 canHandle()

```
virtual bool benchmax::SMTRAT::canHandle (
    const fs::path & path ) const [inline], [override], [virtual]
```

Only handle .smt2 files.

Reimplemented from benchmax::Tool.

Reimplemented in benchmax::SMTRAT_OPB.

15.483.3.6 getCommandline() [1/2]

```
virtual std::string benchmax::Tool::getCommandline (
    const std::string & file ) const [inline], [virtual], [inherited]
```

Compose commandline for this tool and the given input file.

15.483.3.7 getCommandline() [2/2]

```
virtual std::string benchmax::Tool::getCommandline (
    const std::string & file,
    const std::string & localBinary ) const [inline], [virtual], [inherited]
```

Compose commandline for this tool with another binary name and the given input file.

15.483.3.8 getStatusFromOutput()

```
std::string benchmax::SMTRAT::getStatusFromOutput (
    const BenchmarkResult & result ) const [inline]
```

Try to parse memouts from stderr.

15.483.3.9 name() `std::string benchmax::Tool::name ( ) const [inline], [inherited]`

Common name of this tool.

15.483.3.10 parse_stats() `bool benchmax::SMTRAT::parse_stats ( BenchmarkResult & result ) const [inline]`

15.483.3.11 parseCommandline() `virtual std::optional<std::string> benchmax::Tool::parse↩ Commandline ( const std::string & cmdline ) const [inline], [virtual], [inherited]`

Compose commandline for this tool and the given input file.

15.483.3.12 resolveDependencies() `std::vector<std::string> benchmax::Tool::resolveDependencies ( ) const [inline], [inherited]`

Get dependencies of binary required to run it (via ldd)

15.483.4 Field Documentation

15.483.4.1 mArguments `std::string benchmax::Tool::mArguments [protected], [inherited]`

Command line arguments that should be passed to the binary.

15.483.4.2 mAttributes `std::map<std::string,std::string> benchmax::Tool::mAttributes [protected], [inherited]`

Attributes of the tool obtained by introspection of the binary.

15.483.4.3 mBinary `fs::path benchmax::Tool::mBinary [protected], [inherited]`

Path to the binary.

15.483.4.4 mName `std::string benchmax::Tool::mName [protected], [inherited]`

(Non-unique) identifier for the tool.

15.484 benchmax::SMTRAT_Analyzer Class Reference

Tool wrapper for SMT-RAT for SMT-LIB.

```
#include <SMTRAT_Analyzer.h>
```

Public Member Functions

- SMTRAT_Analyzer (const fs::path &binary, const std::string &arguments)

  New SMT-RAT tool.
- virtual bool canHandle (const fs::path &path) const override

  Only handle .smt2 files.
- virtual void additionalResults (const fs::path &, BenchmarkResult &result) const override

  Computes the answer string from the exit code and parses statistics output.
- std::string name () const

  Common name of this tool.
- fs::path binary () const

  Full path to the binary.
- const std::map< std::string, std::string > & attributes () const

  A set of attributes, for example compilation options.
- std::vector< std::string > resolveDependencies () const

  Get dependencies of binary required to run it (via ldd)
- std::size_t attributeHash () const

  Hash of the attributes.
- virtual std::string getCommandline (const std::string &file) const

  Compose commandline for this tool and the given input file.
- virtual std::string getCommandline (const std::string &file, const std::string &localBinary) const

  Compose commandline for this tool with another binary name and the given input file.
- virtual std::optional< std::string > parseCommandline (const std::string &cmdline) const

  Compose commandline for this tool and the given input file.

Protected Attributes

- std::string mName

  (Non-unique) identifier for the tool.
- fs::path mBinary

  Path to the binary.
- std::string mArguments

  Command line arguments that should be passed to the binary.
- std::map< std::string, std::string > mAttributes

  Attributes of the tool obtained by introspection of the binary.

15.484.1 Detailed Description

Tool wrapper for SMT-RAT for SMT-LIB.

15.484.2 Constructor & Destructor Documentation

15.484.2.1 SMTRAT_Analyzer()

```
benchmax::SMTRAT_Analyzer::SMTRAT_Analyzer (
    const fs::path & binary,
    const std::string & arguments ) [inline]
```

New SMT-RAT tool.

15.484.3 Member Function Documentation

15.484.3.1 additionalResults()

```
virtual void benchmax::SMTRAT_Analyzer::additionalResults (
    const fs::path & ,
    BenchmarkResult & result ) const [inline], [override], [virtual]
```

Computes the answer string from the exit code and parses statistics output.

Reimplemented from benchmax::Tool.

15.484.3.2 attributeHash() `std::size_t benchmax::Tool::attributeHash ( ) const [inline], [inherited]`

Hash of the attributes.

15.484.3.3 attributes() `const std::map<std::string,std::string>& benchmax::Tool::attributes ( ) const [inline], [inherited]`

A set of attributes, for example compilation options.

15.484.3.4 binary() `fs::path benchmax::Tool::binary ( ) const [inline], [inherited]`

Full path to the binary.

15.484.3.5 canHandle() `virtual bool benchmax::SMTRAT_Analyzer::canHandle ( const fs::path & path ) const [inline], [override], [virtual]`

Only handle .smt2 files.

Reimplemented from benchmax::Tool.

15.484.3.6 getCommandline() [1/2] `virtual std::string benchmax::Tool::getCommandline ( const std::string & file ) const [inline], [virtual], [inherited]`

Compose commandline for this tool and the given input file.

15.484.3.7 getCommandline() [2/2] `virtual std::string benchmax::Tool::getCommandline ( const std::string & file, const std::string & localBinary ) const [inline], [virtual], [inherited]`

Compose commandline for this tool with another binary name and the given input file.

15.484.3.8 name() `std::string benchmax::Tool::name ( ) const [inline], [inherited]`

Common name of this tool.

15.484.3.9 parseCommandline() `virtual std::optional<std::string> benchmax::Tool::parse↩ Commandline ( const std::string & cmdline ) const [inline], [virtual], [inherited]`

Compose commandline for this tool and the given input file.

15.484.3.10 resolveDependencies() `std::vector<std::string> benchmax::Tool::resolveDependencies ( ) const [inline], [inherited]`

Get dependencies of binary required to run it (via ldd)

15.484.4 Field Documentation

15.484.4.1 mArguments `std::string benchmax::Tool::mArguments [protected], [inherited]`

Command line arguments that should be passed to the binary.

15.484.4.2 mAttributes `std::map<std::string,std::string> benchmax::Tool::mAttributes [protected], [inherited]`

Attributes of the tool obtained by introspection of the binary.

15.484.4.3 mBinary `fs::path benchmax::Tool::mBinary [protected], [inherited]`

Path to the binary.

15.484.4.4 mName `std::string benchmax::Tool::mName [protected], [inherited]`

(Non-unique) identifier for the tool.

15.485 benchmax::SMTRAT_OPB Class Reference

Adapts the SMTRAT solver for OPB files.

`#include <SMTRAT_OPB.h>`

Public Member Functions

- SMTRAT_OPB (const fs::path &binary, const std::string &arguments)

  Adds "-opb" to instruct SMT-RAT to parse .opb files.
- virtual bool canHandle (const fs::path &path) const override

  Only handles .opb files.
- std::string getStatusFromOutput (const BenchmarkResult &result) const

  Try to parse memouts from stderr.
- bool parse_stats (BenchmarkResult &result) const
- virtual void additionalResults (const fs::path &, BenchmarkResult &result) const override

  Computes the answer string from the exit code and parses statistics output.
- std::string name () const

  Common name of this tool.
- fs::path binary () const

  Full path to the binary.
- const std::map< std::string, std::string > & attributes () const

  A set of attributes, for example compilation options.
- std::vector< std::string > resolveDependencies () const

  Get dependencies of binary required to run it (via ldd)
- std::size_t attributeHash () const

  Hash of the attributes.
- virtual std::string getCommandline (const std::string &file) const

  Compose commandline for this tool and the given input file.
- virtual std::string getCommandline (const std::string &file, const std::string &localBinary) const

  Compose commandline for this tool with another binary name and the given input file.
- virtual std::optional< std::string > parseCommandline (const std::string &cmdline) const

  Compose commandline for this tool and the given input file.

Protected Attributes

- std::string mName

  (Non-unique) identifier for the tool.
- fs::path mBinary

  Path to the binary.
- std::string mArguments

  Command line arguments that should be passed to the binary.
- std::map< std::string, std::string > mAttributes

  Attributes of the tool obtained by introspection of the binary.

15.485.1 Detailed Description

Adapts the SMTRAT solver for OPB files.

15.485.2 Constructor & Destructor Documentation

15.485.2.1 SMTRAT_OPB()

```
benchmax::SMTRAT_OPB::SMTRAT_OPB (
    const fs::path & binary,
    const std::string & arguments ) [inline]
```

Adds "-opb" to instruct SMT-RAT to parse .opb files.

15.485.3 Member Function Documentation

15.485.3.1 additionalResults()

```
virtual void benchmax::SMTRAT::additionalResults (
    const fs::path & ,
    BenchmarkResult & result ) const [inline], [override], [virtual], [inherited]
```

Computes the answer string from the exit code and parses statistics output.

Reimplemented from benchmax::Tool.

15.485.3.2 attributeHash()

```
std::size_t benchmax::Tool::attributeHash ( ) const [inline], [inherited]
```

Hash of the attributes.

15.485.3.3 attributes()

```
const std::map<std::string,std::string>& benchmax::Tool::attributes ( )
const [inline], [inherited]
```

A set of attributes, for example compilation options.

15.485.3.4 binary()

```
fs::path benchmax::Tool::binary ( ) const [inline], [inherited]
```

Full path to the binary.

15.485.3.5 canHandle()

```
virtual bool benchmax::SMTRAT_OPB::canHandle (
    const fs::path & path ) const [inline], [override], [virtual]
```

Only handles .opb files.

Reimplemented from benchmax::SMTRAT.

15.485.3.6 getCommandline() [1/2]

```
virtual std::string benchmax::Tool::getCommandline (
    const std::string & file ) const [inline], [virtual], [inherited]
```

Compose commandline for this tool and the given input file.

15.485.3.7 getCommandline() [2/2]

```
virtual std::string benchmax::Tool::getCommandline (
    const std::string & file,
    const std::string & localBinary ) const [inline], [virtual], [inherited]
```

Compose commandline for this tool with another binary name and the given input file.

15.485.3.8 getStatusFromOutput()

```
std::string benchmax::SMTRAT::getStatusFromOutput (
    const BenchmarkResult & result ) const [inline], [inherited]
```

Try to parse memouts from stderr.

15.485.3.9 name()

```
std::string benchmax::Tool::name ( ) const [inline], [inherited]
```

Common name of this tool.

15.485.3.10 parse_stats()

```
bool benchmax::SMTRAT::parse_stats (
    BenchmarkResult & result ) const [inline], [inherited]
```

15.485.3.11 parseCommandline()

```
virtual std::optional<std::string> benchmax::Tool::parse↩
Commandline (
    const std::string & cmdline ) const [inline], [virtual], [inherited]
```

Compose commandline for this tool and the given input file.

15.485.3.12 resolveDependencies()

```
std::vector<std::string> benchmax::Tool::resolveDependencies
( ) const [inline], [inherited]
```

Get dependencies of binary required to run it (via ldd)

15.485.4 Field Documentation

15.485.4.1 mArguments

```
std::string benchmax::Tool::mArguments [protected], [inherited]
```

Command line arguments that should be passed to the binary.

15.485.4.2 mAttributes

```
std::map<std::string,std::string> benchmax::Tool::mAttributes [protected],
[inherited]
```

Attributes of the tool obtained by introspection of the binary.

15.485.4.3 mBinary `fs::path benchmax::Tool::mBinary [protected], [inherited]`

Path to the binary.

15.485.4.4 mName `std::string benchmax::Tool::mName [protected], [inherited]`

(Non-unique) identifier for the tool.

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- SplitSOSModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=NULL)
- ~SplitSOSModule ()
- Answer checkCore ()

  Checks the received formula for consistency.
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void updateModel () const

  Updates the current assignment into the model.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const

- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const

- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore (ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore (ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())

- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.491.4 Member Function Documentation

15.491.4.1 add()

```
bool smtrat::PModule::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.491.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.491.4.3 addCore()

```
virtual bool smtrat::Module::addCore (
    ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.491.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.491.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.491.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.491.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.491.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.491.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.491.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.491.4.11 allModels() `const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns All satisfying assignments, if existent.

15.491.4.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.491.4.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.491.4.14 appliedPreprocessing() `bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]`

Returns true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

15.491.4.15 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.491.4.16 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.491.4.17 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.491.4.18 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() )  [inline],
[protected], [inherited]
```

15.491.4.19 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false )  [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.491.4.20 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P
>> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
```

```
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() )  [inline],
[protected], [inherited]
```

15.491.4.21 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P
>> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.491.4.22 check()

```
Answer smtrat::PModule::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.491.4.23 checkCore()

```
template<class Settings >
Answer smtrat::SplitSOSModule< Settings >::checkCore ( )  [virtual]
```

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.491.4.24 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.491.4.25 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.491.4.26 cleanModel()

```
void smtrat::Module::cleanModel ( ) const [inline], [protected],
[inherited]
```

Substitutes variable occurrences by its model value in the model values of other variables.

15.491.4.27 clearLemmas()

```
void smtrat::Module::clearLemmas ( ) [inline], [inherited]
```

Deletes all yet found lemmas.

15.491.4.28 clearModel()

```
void smtrat::Module::clearModel ( ) const [inline], [protected],
[inherited]
```

Clears the assignment, if any was found.

15.491.4.29 clearModels()

```
void smtrat::Module::clearModels ( ) const [inline], [protected],
[inherited]
```

Clears all assignments, if any was found.

15.491.4.30 clearPassedFormula()

```
void smtrat::Module::clearPassedFormula ( ) [protected],
[inherited]
```

15.491.4.31 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.491.4.32 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.491.4.33 collectTheoryPropagations()

```
void smtrat::Module::collectTheoryPropagations ( ) [inherited]
```

15.491.4.34 constraintsToInform()

```
const carl::FastSet<FormulaT>& smtrat::Module::constraints↩
ToInform ( ) const [inline], [inherited]
```

Returns The constraints which the backends must be informed about.

15.491.4.35 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.491.4.36 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.491.4.37 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.491.4.38 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.491.4.39 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.491.4.40 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.491.4.41 excludeNotReceivedVariablesFromModel()

`void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]`

Excludes all variables from the current model, which do not occur in the received formula.

15.491.4.42 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.491.4.43 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.491.4.44 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.491.4.45 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.491.4.46 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.491.4.47 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.491.4.48 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.491.4.49 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.491.4.50 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::getInfeasible↩ Subsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.491.4.51 getInformationRelevantFormulas() `const std::set< FormulaT > & smtrat::Module::get↩ InformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.491.4.52 getModelEqualities() `std::list< std::vector< carl::Variable > > smtrat::Module↩ ::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.491.4.53 getOrigins() [1/3] `void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

15.491.4.54 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.491.4.55 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.491.4.56 getReceivedFormulaSimplified()

```
std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]
```

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

15.491.4.57 hasLemmas()

```
bool smtrat::Module::hasLemmas ( ) [inline], [inherited]
```

Checks whether this module or any of its backends provides any lemmas.

15.491.4.58 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.491.4.59 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.491.4.60 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.491.4.61 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.491.4.62 informBackends() `void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.491.4.63 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.491.4.64 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.491.4.65 init()

```
void smtrat::Module::init ( ) [virtual], [inherited]
```

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.491.4.66 is_minimizing()

```
bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]
```

15.491.4.67 isLemmaLevel()

```
bool smtrat::Module::isLemmaLevel (
    LemmaLevel level ) [protected], [inherited]
```

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.491.4.68 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.491.4.69 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.491.4.70 merge()

```
std::vector< FormulaT > smtrat::Module::merge (
    const std::vector< FormulaT > & _vecSetA,
    const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]
```

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.491.4.71 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.491.4.72 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.491.4.73 moduleName()

```
template<typename Settings >
std::string smtrat::SplitSOSModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.491.4.74 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

15.491.4.75 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.491.4.76 passedFormulaBegin()

```
ModuleInput::iterator smtrat::Module::passedFormulaBegin ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula. TODO: disable this method

15.491.4.77 passedFormulaEnd()

```
ModuleInput::iterator smtrat::Module::passedFormulaEnd ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula.

15.491.4.78 pPassedFormula()

```
const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline],
[inherited]
```

Returns A pointer to the formula passed to the backends of this module.

15.491.4.79 pReceivedFormula()

```
const ModuleInput* smtrat::Module::pReceivedFormula ( ) const
[inline], [inherited]
```

Returns A pointer to the formula passed to this module.

15.491.4.80 print()

```
void smtrat::Module::print (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.491.4.81 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.491.4.82 printInfeasibleSubsets()

`void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.491.4.83 printModel()

`void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.491.4.84 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.491.4.85 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.491.4.86 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.491.4.87 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.491.4.88 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.491.4.89 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.491.4.90 remove()

```
void smtrat::PModule::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.491.4.91 removeCore()

```
virtual void smtrat::Module::removeCore (
    ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.491.4.92 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.491.4.93 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.491.4.94 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.491.4.95 rReceivedFormula() `const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]`

Returns A reference to the formula passed to this module.

15.491.4.96 runBackends() [1/2] `virtual Answer smtrat::PModule::runBackends ( ) [inline], [virtual], [inherited]`

Reimplemented from smtrat::Module.

15.491.4.97 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.491.4.98 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.491.4.99 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.491.4.100 solverState() `Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.491.4.101 splitUnequalConstraint() `void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.491.4.102 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.491.4.103 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.491.4.104 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.491.4.105 updateModel() `void smtrat::PModule::updateModel ( ) const [virtual], [inherited]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.491.4.106 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.491.5 Field Documentation

15.491.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.491.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.491.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.491.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.491.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.491.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.491.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaToPass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.491.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.491.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.491.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.491.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.491.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.491.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.491.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.491.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.491.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.491.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.491.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.491.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

15.491.5.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.491.5.21 mSmallerMusesCheckCounter

`unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.491.5.22 mSolverState

`std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.491.5.23 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.491.5.24 mUsedBackends

`std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.491.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.492 benchmax::SSHBackend Class Reference

`#include <SSHBackend.h>`

Public Member Functions

- SSHBackend ()
- ~SSHBackend ()
- void run (const Jobs &, bool)

  Dummy if SSH is disabled.
- bool suspendable () const
- void process_results (const Jobs &jobs, bool check_finished)
- void addResult (const Tool *tool, const fs::path &file, BenchmarkResult &&result)

  Add a result.

Protected Member Functions

- virtual void startTool (const Tool *)

  Hook for every tool at the beginning.
- virtual void finalize ()

  Hook to allow for asynchronous backends to wait for jobs to terminate.
- virtual void execute (const Tool *, const fs::path &)

  Execute a single pair of tool and benchmark.
- void madeProgress (std::size_t files=1)

  Can be called to give information about the current progress, if available.
- virtual bool collect_results (const Jobs &, bool)
- void sanitize_results (const Jobs &jobs) const
- void write_results (const Jobs &jobs) const

Protected Attributes

- std::size_t mExpectedJobs

  Number of jobs that should be run.
- std::atomic< std::size_t > mFinishedJobs

  Number of jobs that are finished.
- std::atomic< std::size_t > mLastPercent

  Percentage of finished jobs when madeProgress() was last called.

15.492.1 Constructor & Destructor Documentation

15.492.1.1 SSHBackend() `benchmax::SSHBackend::SSHBackend ( ) [inline]`

15.492.1.2 ~SSHBackend() `benchmax::SSHBackend::~SSHBackend ( ) [inline]`

15.492.2 Member Function Documentation

15.492.2.1 addResult()

```
void benchmax::Backend::addResult (
    const Tool * tool,
    const fs::path & file,
    BenchmarkResult && result ) [inline], [inherited]
```

Add a result.

15.492.2.2 collect_results()

```
virtual bool benchmax::Backend::collect_results (
    const Jobs & ,
    bool ) [inline], [protected], [virtual], [inherited]
```

15.492.2.3 execute()

```
virtual void benchmax::Backend::execute (
    const Tool * ,
    const fs::path & ) [inline], [protected], [virtual], [inherited]
```

Execute a single pair of tool and benchmark.

Reimplemented in benchmax::LocalBackend, and benchmax::CondorBackend.

15.492.2.4 finalize()

```
virtual void benchmax::Backend::finalize ( ) [inline], [protected], [virtual],
[inherited]
```

Hook to allow for asynchronous backends to wait for jobs to terminate.

15.492.2.5 madeProgress()

```
void benchmax::Backend::madeProgress (
    std::size_t files = 1 ) [inline], [protected], [inherited]
```

Can be called to give information about the current progress, if available.

15.492.2.6 process_results()

```
void benchmax::Backend::process_results (
    const Jobs & jobs,
    bool check_finished ) [inline], [inherited]
```

15.492.2.7 run()

```
void benchmax::SSHBackend::run (
    const Jobs & ,
    bool ) [inline]
```

Dummy if SSH is disabled.

15.492.2.8 sanitize_results()

```
void benchmax::Backend::sanitize_results (
    const Jobs & jobs ) const [inline], [protected], [inherited]
```

15.492.2.9 startTool() `virtual void benchmax::Backend::startTool ( const Tool * ) [inline], [protected], [virtual], [inherited]`

Hook for every tool at the beginning.

Can be used to upload the tool to some remote system.

15.492.2.10 suspendable() `bool benchmax::Backend::suspendable ( ) const [inline], [inherited]`

15.492.2.11 write_results() `void benchmax::Backend::write_results ( const Jobs & jobs ) const [inline], [protected], [inherited]`

15.492.3 Field Documentation

15.492.3.1 mExpectedJobs `std::size_t benchmax::Backend::mExpectedJobs [protected], [inherited]`

Number of jobs that should be run.

15.492.3.2 mFinishedJobs `std::atomic<std::size_t> benchmax::Backend::mFinishedJobs [protected], [inherited]`

Number of jobs that are finished.

15.492.3.3 mLastPercent `std::atomic<std::size_t> benchmax::Backend::mLastPercent [protected], [inherited]`

Percentage of finished jobs when madeProgress() was last called.

15.493 benchmax::settings::SSHBackendSettings Struct Reference

Settings for SSH backend.

```
#include <SSHSettings.h>
```

Data Fields

- std::vector< std::string > nodes

  List of nodes to connect to.
- std::string basedir

  Base directory for solvers.
- std::string tmpdir

  Temporary directory for benchmarks and output files.
- bool use_wallclock

  Use wallclock timeouts instead of CPU time.
- bool resolve_deps

  Resolve and upload dependencies of binary.

15.493.1 Detailed Description

Settings for SSH backend.

15.493.2 Field Documentation

15.493.2.1 basedir `std::string benchmax::settings::SSHBackendSettings::basedir`

Base directory for solvers.

15.493.2.2 nodes `std::vector<std::string> benchmax::settings::SSHBackendSettings::nodes`

List of nodes to connect to.

15.493.2.3 resolve_deps `bool benchmax::settings::SSHBackendSettings::resolve_deps`

Resolve and upload dependencies of binary.

15.493.2.4 tmpdir `std::string benchmax::settings::SSHBackendSettings::tmpdir`

Temporary directory for benchmarks and output files.

15.493.2.5 use_wallclock `bool benchmax::settings::SSHBackendSettings::use_wallclock`

Use wallclock timeouts instead of CPU time.

15.494 benchmax::ssh::SSHConnection Class Reference

A wrapper class that manages a single SSH connection as specified in a Node object (with all its channels).

`#include <SSHConnection.h>`

Public Member Functions

- SSHConnection (const Node &n)

  Create a new connection for the given node.
- ~SSHConnection ()

  Wait for all channels to terminate.
- const Node & getNode () const

  Return the node.
- bool jobFree ()

  Check if a new job could be started.
- void newJob ()

  Increase job counter.
- void finishJob ()

  Decrease job counter.
- std::size_t jobs () const

  Current number of jobs.
- bool busy ()

  Check if all channels are busy.
- std::string createTmpDir (const std::string &folder)

  Create a temporary directory on the remote.
- void removeDir (const std::string &folder)

  Remove a (temporary) directory on the remote.
- bool uploadFile (const fs::path &local, const std::string &base, const std::string &remote, int mode=S_IRU↩SR|S_IWUSR)

  Upload a file to the remote.
- bool executeCommand (const std::string &cmd, BenchmarkResult &result)

  Execute a command on the remote.

15.494.1 Detailed Description A wrapper class that manages a single SSH connection as specified in a Node object (with all its channels).

15.494.2 Constructor & Destructor Documentation

15.494.2.1 SSHConnection()

```
benchmax::ssh::SSHConnection::SSHConnection (
    const Node & n ) [inline]
```

Create a new connection for the given node.

15.494.2.2 ~SSHConnection()

```
benchmax::ssh::SSHConnection::~SSHConnection ( ) [inline]
```

Wait for all channels to terminate.

15.494.3 Member Function Documentation

15.494.3.1 busy()

```
bool benchmax::ssh::SSHConnection::busy ( ) [inline]
```

Check if all channels are busy.

15.494.3.2 createTmpDir()

```
std::string benchmax::ssh::SSHConnection::createTmpDir (
    const std::string & folder ) [inline]
```

Create a temporary directory on the remote.

15.494.3.3 executeCommand()

```
bool benchmax::ssh::SSHConnection::executeCommand (
    const std::string & cmd,
    BenchmarkResult & result ) [inline]
```

Execute a command on the remote.

15.494.3.4 finishJob()

```
void benchmax::ssh::SSHConnection::finishJob ( ) [inline]
```

Decrease job counter.

15.494.3.5 getNode()

```
const Node& benchmax::ssh::SSHConnection::getNode ( ) const [inline]
```

Return the node.

15.494.3.6 jobFree()

```
bool benchmax::ssh::SSHConnection::jobFree ( ) [inline]
```

Check if a new job could be started.

15.494.3.7 jobs() `std::size_t benchmax::ssh::SSHConnection::jobs ( ) const [inline]`

Current number of jobs.

15.494.3.8 newJob() `void benchmax::ssh::SSHConnection::newJob ( ) [inline]`

Increase job counter.

15.494.3.9 removeDir() `void benchmax::ssh::SSHConnection::removeDir ( const std::string & folder ) [inline]`

Remove a (temporary) directory on the remote.

15.494.3.10 uploadFile() `bool benchmax::ssh::SSHConnection::uploadFile ( const fs::path & local, const std::string & base, const std::string & remote, int mode = S_IRUSR | S_IWUSR ) [inline]`

Upload a file to the remote.

15.495 smtrat::vs::State Class Reference

`#include <State.h>`

Public Types

- enum Type { TEST_CANDIDATE_TO_GENERATE, SUBSTITUTION_TO_APPLY, COMBINE_SUBRESULTS }
- typedef carl::FastPointerMapB< Substitution, ConditionSetSetSet > ConflictSets
- typedef std::vector< std::pair< ConditionList, bool > > SubstitutionResult
- typedef std::vector< SubstitutionResult > SubstitutionResults
- typedef std::vector< std::pair< unsigned, unsigned > > SubResultCombination
- typedef smtrat::vb::VariableBounds< const Condition * > VariableBoundsCond

Public Member Functions

- State (carl::IDPool *_conditionIdAllocator, bool _withVariableBounds)

  Constructs an empty state (no conditions yet) being the root (hence neither a substitution) of the state tree which is going to be formed when applying the satisfiability check based on virtual substitution.

- State (State *const _father, const Substitution &_substitution, carl::IDPool *_conditionIdAllocator, bool _with↩ VariableBounds)

  Constructs a state being a child of the given state and containing the given substitution, which maps from the index variable of the given state.

- State (const State &)=delete
- ~State ()

  Destructor.

- bool isRoot () const
- bool cannotBeSolved (bool _lazy) const
- bool & rCannotBeSolved ()
- bool & rCannotBeSolvedLazy ()
- bool markedAsDeleted () const
- bool & rMarkedAsDeleted ()

- bool hasChildrenToInsert () const

- bool unfinished () const
- Type type () const
- Type & rType ()
- const Condition * pOriginalCondition () const
- const Condition & originalCondition () const
- const carl::PointerSet< Condition > & tooHighDegreeConditions () const
- carl::PointerSet< Condition > & rTooHighDegreeConditions ()
- const VariableBoundsCond & variableBounds () const
- VariableBoundsCond & rVariableBounds ()
- void setOriginalCondition (const Condition *_pOCondition)

  Sets the pointer of the original condition of this state to the given pointer to a condition.

- size_t currentRangeSize () const
- void resetCurrentRangeSize ()
- const smtrat::Rational & minIntTestCandidate () const
- const smtrat::Rational & maxIntTestCandidate () const
- bool hasInfinityChild () const
- void resetInfinityChild (const State *_state)
- void setInfinityChild (State *_state)
- void resetCannotBeSolvedLazyFlags ()
- unsigned treeDepth () const
- bool substitutionApplicable () const

  Checks if a substitution can be applied.

- bool substitutionApplicable (const smtrat::ConstraintT &_constraint) const

  Checks if the substitution of this state can be applied to the given constraint.

- bool hasNoninvolvedCondition () const

  Checks whether a condition exists, which was not involved in an elimination step.

- bool allTestCandidatesInvalidated (const Condition *_condition) const
- bool hasChildWithID () const

  Checks whether a child exists, which has no ID (!=0).

- bool containsState (const State *_state) const
- bool hasOnlyInconsistentChildren () const

  Checks whether a child exists, which is not yet marked as inconsistent.

- bool occursInEquation (const carl::Variable &) const

  Checks whether the given variable occurs in a equation.

- bool hasFurtherUncheckedTestCandidates () const

  Checks whether there exist more than one test candidate, which has still not been checked.

- void variables (carl::Variables &_variables) const

  Finds the variables, which occur in this state.

- unsigned numberOfNodes () const

  Determines the number of nodes in the tree with this state as root.

- State & root ()
- bool getNextIntTestCandidate (smtrat::Rational &_nextIntTestCandidate, size_t _maxIntRange)
- bool updateIntTestCandidates ()
- bool unfinishedAncestor (State *&_unfinAnt)

  Determines (if it exists) a ancestor node, which is unfinished, that is it has still substitution results to consider.

- bool bestCondition (const Condition *&_bestCondition, size_t _numberOfAllVariables, bool _preferEquation)

  Determines the most adequate condition and in it the most adequate variable in the state to generate test candidates for.

- ConditionList::iterator constraintExists (const smtrat::ConstraintT &_constraint)

  Checks if the given constraint already exists as condition in the state.

- void simplify (ValuationMap &_ranking)

  Cleans up all conditions in this state according to comparison between the corresponding constraints.

- bool simplify (ConditionList &_conditionVectorToSimplify, ConditionSetSet &_conflictSet, ValuationMap &_↩ ranking, bool _stateConditions=false)

  Simplifies the given conditions according to comparison between the corresponding constraints.

- void setIndex (const carl::Variable &_index)

  Sets the index of this state.

- void addConflictSet (const Substitution *_substitution, ConditionSetSet &&_condSetSet)

  Adds a conflict set to the map of substitutions to conflict sets.

- void addConflicts (const Substitution *_substitution, ConditionSetSet &&_condSetSet)

  Adds all conflicts to all sets of the conflict set of the given substitution.

- void resetConflictSets ()

  Clears the conflict sets.

- bool updateOCondsOfSubstitutions (const Substitution &_substitution, std::vector< State * > &_reactivated↩ States)

  Updates the original conditions of substitutions having the same test candidate as the given.

- void addSubstitutionResults (std::vector< DisjunctionOfConditionConjunctions > &&_disjunctionsOfCond↩ Conj)

  Adds the given substitution results to this state.

- bool extendSubResultCombination ()

  Extends the currently considered combination of conjunctions in the substitution results.

- bool nextSubResultCombination ()

  If the state contains a substitution result, which is a conjunction of disjunctions of conjunctions of conditions, this method sets the current combination to the disjunctions to the next combination.

- size_t getNumberOfCurrentSubresultCombination () const
- ConditionList getCurrentSubresultCombination () const

Gets the current substitution result combination as condition vector.

- bool refreshConditions (ValuationMap &_ranking)

  Determines the condition vector corresponding to the current combination of the conjunctions of conditions.

- void initConditionFlags ()

  Sets all flags of the conditions to true, if it contains the variable given by the states index.

- bool initIndex (const carl::Variables &_allVariables, const smtrat::VariableValuationStrategy &_vvstrat, bool ↩ _preferEquation, bool _tryDifferentVarOrder=false, bool _useFixedVariableOrder=false)

  Sets, if it has not already happened, the index of the state to the name of the most adequate variable.

- void bestConstraintValuation (const std::vector< std::pair< carl::Variable, std::multiset< double >>> &_↩ varVals)
- void averageConstraintValuation (const std::vector< std::pair< carl::Variable, std::multiset< double >>> &_varVals)
- void worstConstraintValuation (const std::vector< std::pair< carl::Variable, std::multiset< double >>> &_↩ varVals)
- void addCondition (const smtrat::ConstraintT &_constraint, const carl::PointerSet< Condition > &_original↩ Conditions, size_t _valutation, bool _recentlyAdded, ValuationMap &_ranking)

  Adds a constraint to the conditions of this state.

- bool checkSubresultCombinations () const

  This is just for debug purpose.

- int deleteOrigins (carl::PointerSet< Condition > &_originsToDelete, ValuationMap &_ranking)

  Removes everything in this state originated by the given vector of conditions.

- void deleteOriginsFromChildren (carl::PointerSet< Condition > &_originsToDelete, ValuationMap &_ranking)

  Deletes everything originated by the given conditions in the children of this state.

- void deleteOriginsFromConflictSets (carl::PointerSet< Condition > &_originsToDelete, bool _originsAre↩ CurrentConditions)

  Deletes everything originated by the given conditions in the conflict sets of this state.

- void deleteOriginsFromSubstitutionResults (carl::PointerSet< Condition > &_originsToDelete)

  Deletes everything originated by the given conditions in the substitution results of this state.

- void deleteConditions (carl::PointerSet< Condition > &_conditionsToDelete, ValuationMap &_ranking)

  Delete everything originated by the given conditions from the entire subtree with this state as root.

- std::vector< State * > addChild (const Substitution &_substitution)

  Adds a state as child to this state with the given substitution.

- void updateValuation (bool _lazy)

  Updates the valuation of this state.

- void updateBackendCallValuation ()

  Valuates the state's currently considered conditions according to a backend call.

- void passConflictToFather (bool _checkConflictForSideCondition, bool _useBackjumping=true, bool _include↩ InconsistentTestCandidates=false)

  Passes the original conditions of the covering set of the conflicts of this state to its father.

- bool hasLocalConflict ()

  Checks whether the currently considered conditions, which have been considered for test candidate construction, form already a conflict.

- bool checkTestCandidatesForBounds ()

  Checks whether the test candidate of this state is valid against the variable intervals in the father of this state.

- std::vector< smtrat::DoubleInterval > solutionSpace (carl::PointerSet< Condition > &_conflictReason) const

  Determines the solution space of the test candidate of this state regarding to the variable bounds of the father.

- bool hasRootsInVariableBounds (const Condition *_condition, bool _useSturmSequence)

  Checks whether there are no zeros for the left-hand side of the constraint of the given condition.

- void print (const std::string _initiation="***", std::ostream &_out=std::cout) const

  Prints the conditions, the substitution and the substitution results of this state and all its children.

- void printAlone (const std::string="***", std::ostream &_out=std::cout) const

  Prints the conditions, the substitution and the substitution results of this state.
- void printConditions (const std::string _initiation="***", std::ostream &_out=std::cout, bool=false) const

  Prints the conditions of this state.
- void printSubstitutionResults (const std::string _initiation="***", std::ostream &_out=std::cout) const

  Prints the substitution results of this state.
- void printSubstitutionResultCombination (const std::string _initiation="***", std::ostream &_out=std::cout) const

  Prints the combination of substitution results used in this state.
- void printSubstitutionResultCombinationAsNumbers (const std::string _initiation="***", std::ostream &_out=std::cout) const

  Prints the combination of substitution results, expressed in numbers, used in this state.
- void printConflictSets (const std::string _initiation="***", std::ostream &_out=std::cout) const

  Prints the conflict sets of this state.

Static Public Member Functions

- static void removeStatesFromRanking (const State &toRemove, ValuationMap &_ranking)
- static size_t coveringSet (const ConditionSetSetSet &_conflictSets, carl::PointerSet< Condition > &_minCovSet, unsigned _currentTreeDepth)

  Finds a covering set of a vector of sets of sets due to some heuristics.

15.495.1 Member Typedef Documentation

15.495.1.1 ConflictSets `typedef carl::FastPointerMapB<Substitution,ConditionSetSetSet> smtrat::vs::State::Conf`

15.495.1.2 SubResultCombination `typedef std::vector<std::pair< unsigned, unsigned> > smtrat::vs::State::Sub`

COMBINE_SUBRESULTS	

15.495.3 Constructor & Destructor Documentation

15.495.3.1 State() [1/3]

```
smtrat::vs::State::State (
    carl::IDPool * _conditionIdAllocator,
    bool _withVariableBounds )
```

Constructs an empty state (no conditions yet) being the root (hence neither a substitution) of the state tree which is going to be formed when applying the satisfiability check based on virtual substitution.

Parameters

_withVariableBounds	A flag that indicates whether to use optimizations based on variable bounds.

15.495.3.2 State() [2/3]

```
smtrat::vs::State::State (
    State *const _father,
    const Substitution & _substitution,
    carl::IDPool * _conditionIdAllocator,
    bool _withVariableBounds )
```

Constructs a state being a child of the given state and containing the given substitution, which maps from the index variable of the given state.

Parameters

_father	The father of the state to be constructed.
_substitution	The substitution of the state to be constructed.
_withVariableBounds	A flag that indicates whether to use optimizations based on variable bounds.

15.495.3.3 State() [3/3]

```
smtrat::vs::State::State (
    const State & ) [delete]
```

15.495.3.4 ~State()

```
smtrat::vs::State::~State ( )
```

Destructor.

15.495.4 Member Function Documentation

15.495.4.1 addChild()

```
std::vector< State * > smtrat::vs::State::addChild (
    const Substitution & _substitution )
```

Adds a state as child to this state with the given substitution.

Parameters

_substitution	The substitution to generate the state for.

Returns true, if a state has been added as child to this state; false, otherwise.

15.495.4.2 addCondition()

```
void smtrat::vs::State::addCondition (
    const smtrat::ConstraintT & _constraint,
    const carl::PointerSet< Condition > & _originalConditions,
    size_t _valutation,
    bool _recentlyAdded,
    ValuationMap & _ranking )
```

Adds a constraint to the conditions of this state.

Parameters

_constraint	The constraint of the condition to add.
_originalConditions	The original conditions of the condition to add.
_valutation	The valuation of the condition to add.
_recentlyAdded	Is the condition a recently added one. @sideeffect The state can obtain a new condition.

15.495.4.3 addConflicts()

```
void smtrat::vs::State::addConflicts (
    const Substitution * _substitution,
    ConditionSetSet && _condSetSet )
```

Adds all conflicts to all sets of the conflict set of the given substitution.

Parameters

_substitution	The corresponding substitution generated the conflict. (NULL in the case a detected conflict without substitution)
_condSetSet	The conflicts to add.

15.495.4.4 addConflictSet()

```
void smtrat::vs::State::addConflictSet (
    const Substitution * _substitution,
    ConditionSetSet && _condSetSet )
```

Adds a conflict set to the map of substitutions to conflict sets.

Parameters

_substitution	The corresponding substitution generated the conflict. (NULL in the case a detected conflict without substitution)
_condSetSet	The conflicts to add.

15.495.4.5 addSubstitutionResults()

```
void smtrat::vs::State::addSubstitutionResults (
    std::vector< DisjunctionOfConditionConjunctions > && _disjunctionsOfCondConj )
```

Adds the given substitution results to this state.

Parameters

_disjunctionsOfCondConj	The substitution results given by a vector of disjunctions of conjunctions of conditions.

15.495.4.6 allTestCandidatesInvalidated()

```
bool smtrat::vs::State::allTestCandidatesInvalidated (
    const Condition * _condition ) const
```

Parameters

A	condition, which is one of the currently considered constraints to check for satisfiability.

Returns true, if all test candidates provided by the given condition are no solution of the currently considered conjunction of constraints to check for satisfiability.

15.495.4.7 averageConstraintValuation()

```
void smtrat::vs::State::averageConstraintValuation (
    const std::vector< std::pair< carl::Variable, std::multiset< double >>> & _varVals )
```

15.495.4.8 backendCallValuation()

```
size_t smtrat::vs::State::backendCallValuation ( ) const [inline]
```

Returns The valuation of the state's considered conditions for a possible backend call.

15.495.4.9 bestCondition()

```
bool smtrat::vs::State::bestCondition (
    const Condition *& _bestCondition,
    size_t _numberOfAllVariables,
    bool _preferEquation )
```

Determines the most adequate condition and in it the most adequate variable in the state to generate test candidates for.

Parameters

_bestCondition	The most adequate condition to be the next test candidate provider.
_numberOfAllVariables	The number of all globally known variables.
_preferEquation	A flag that indicates to prefer equations in the heuristics of this method.

Returns true, if it has a condition and a variable in it to generate test candidates for; false, otherwise.

15.495.4.10 bestConstraintValuation()

```
void smtrat::vs::State::bestConstraintValuation (
    const std::vector< std::pair< carl::Variable, std::multiset< double >>> & _varVals )
```

15.495.4.11 cannotBeSolved()

```
bool smtrat::vs::State::cannotBeSolved (
    bool _lazy ) const [inline]
```

Returns A constant reference to the flag indicating whether a condition with too high degree for the virtual substitution method must be considered.

15.495.4.12 checkSubresultCombinations()

```
bool smtrat::vs::State::checkSubresultCombinations ( ) const
```

This is just for debug purpose.

Returns true, if no subresult combination is illegal.

15.495.4.13 checkTestCandidatesForBounds()

```
bool smtrat::vs::State::checkTestCandidatesForBounds ( )
```

Checks whether the test candidate of this state is valid against the variable intervals in the father of this state.

Returns true, if the test candidate of this state is valid against the variable intervals; false, otherwise.

15.495.4.14 children()

```
const std::list<State*>& smtrat::vs::State::children ( ) const [inline]
```

Returns A constant reference to the vector of the children of this state.

15.495.4.15 conditions()

```
const ConditionList& smtrat::vs::State::conditions ( ) const [inline]
```

Returns A constant reference to the currently considered conditions of this state.

15.495.4.16 conditionsSimplified()

```
bool smtrat::vs::State::conditionsSimplified ( ) const [inline]
```

Returns true, if the considered conditions of this state are already simplified.

15.495.4.17 conflictSets()

```
const ConflictSets& smtrat::vs::State::conflictSets ( ) const [inline]
```

Returns A constant reference to the conflict sets of this state.

15.495.4.18 constraintExists()

```
ConditionList::iterator smtrat::vs::State::constraintExists (
    const smtrat::ConstraintT & _constraint )
```

Checks if the given constraint already exists as condition in the state.

Parameters

_constraint	The constraint, for which we want to know, if it already exists as condition in the state.

Returns An iterator to the condition, which involves the constraint or an iterator to the end of the vector of conditions of this state.

15.495.4.19 containsState()

```
bool smtrat::vs::State::containsState (
    const State * _state ) const
```

Returns true, if the given state is a node in the state tree starting at this node; false, otherwise.

15.495.4.20 coveringSet()

```
size_t smtrat::vs::State::coveringSet (
    const ConditionSetSetSet & _conflictSets,
    carl::PointerSet< Condition > & _minCovSet,
    unsigned _currentTreeDepth )  [static]
```

Finds a covering set of a vector of sets of sets due to some heuristics.

Parameters

_conflictSets	The vector of sets of sets, for which the method finds all minimum covering sets.
_minCovSet	The found mininum covering set.
_currentTreeDepth	The tree depth of the state from which this method is invoked.

Returns The greatest level, where a condition of the covering set has been created.

15.495.4.21 currentRangeSize()

```
size_t smtrat::vs::State::currentRangeSize ( ) const  [inline]
```

15.495.4.22 deleteConditions()

```
void smtrat::vs::State::deleteConditions (
    carl::PointerSet< Condition > & _conditionsToDelete,
    ValuationMap & _ranking )
```

Delete everything originated by the given conditions from the entire subtree with this state as root.

Parameters

_conditionsToDelete	The conditions to delete.

15.495.4.23 deleteOrigins()

```
int smtrat::vs::State::deleteOrigins (
    carl::PointerSet< Condition > & _originsToDelete,
    ValuationMap & _ranking )
```

Removes everything in this state originated by the given vector of conditions.

Parameters

_originsToDelete	The conditions for which everything in this state which has been originated by them must be removed.

Returns 0, if this state got invalid and must be deleted afterwards; -1, if this state got invalid and must be deleted afterwards and made other states unnecessary to consider; 1, otherwise.

15.495.4.24 deleteOriginsFromChildren()

```
void smtrat::vs::State::deleteOriginsFromChildren (
    carl::PointerSet< Condition > & _originsToDelete,
    ValuationMap & _ranking )
```

Deletes everything originated by the given conditions in the children of this state.

Parameters

_originsToDelete	The condition for which to delete everything originated by them.

15.495.4.25 deleteOriginsFromConflictSets()

```
void smtrat::vs::State::deleteOriginsFromConflict↩
Sets (
    carl::PointerSet< Condition > & _originsToDelete,
    bool _originsAreCurrentConditions )
```

Deletes everything originated by the given conditions in the conflict sets of this state.

Parameters

_originsToDelete	The condition for which to delete everything originated by them.
_originsAreCurrentConditions	A flag indicating whether the origins to remove stem from conditions of the currently considered condition vector of the father of this state and not, e.g., from somewhere in its substitution results.

15.495.4.26 deleteOriginsFromSubstitutionResults()

```
void smtrat::vs::State::deleteOriginsFrom↩
SubstitutionResults (
    carl::PointerSet< Condition > & _originsToDelete )
```

Deletes everything originated by the given conditions in the substitution results of this state.

Parameters

_originsToDelete	The conditions for which to delete everything originated by them.

15.495.4.27 extendSubResultCombination() `bool smtrat::vs::State::extendSubResultCombination ( )`

Extends the currently considered combination of conjunctions in the substitution results.

15.495.4.28 father() `const State& smtrat::vs::State::father ( ) const [inline]`

Returns A constant reference to the father of this state. This method fails if this state is the root.

15.495.4.29 getCurrentSubresultCombination() `ConditionList smtrat::vs::State::getCurrent↩SubresultCombination ( ) const`

Gets the current substitution result combination as condition vector.

Returns The current substitution result combination as condition vector.

15.495.4.30 getNextIntTestCandidate() `bool smtrat::vs::State::getNextIntTestCandidate ( smtrat::Rational & _nextIntTestCandidate, size_t _maxIntRange )`

15.495.4.31 getNumberOfCurrentSubresultCombination() `size_t smtrat::vs::State::getNumberOf↩CurrentSubresultCombination ( ) const`

Returns The number of the current substitution result combination.

15.495.4.32 hasChildrenToInsert() `bool smtrat::vs::State::hasChildrenToInsert ( ) const [inline]`

Returns A constant reference to the flag indicating whether there are states that are children of this state and must be still considered in the further progress of finding a solution.

15.495.4.33 hasChildWithID() `bool smtrat::vs::State::hasChildWithID ( ) const`

Checks whether a child exists, which has no ID (!=0).

Returns true, if there exists a child with ID (!=0); false, otherwise.

15.495.4.34 hasFurtherUncheckedTestCandidates() `bool smtrat::vs::State::hasFurtherUnchecked↩ TestCandidates ( ) const`

Checks whether there exist more than one test candidate, which has still not been checked.

Returns true, if there exist more than one test candidate, which has still not been checked; false, otherwise.

15.495.4.35 hasInfinityChild() `bool smtrat::vs::State::hasInfinityChild ( ) const [inline]`

15.495.4.36 hasLocalConflict() `bool smtrat::vs::State::hasLocalConflict ( )`

Checks whether the currently considered conditions, which have been considered for test candidate construction, form already a conflict.

Returns true, if they form a conflict; false, otherwise.

15.495.4.37 hasNoninvolvedCondition() `bool smtrat::vs::State::hasNoninvolvedCondition ( ) const`

Checks whether a condition exists, which was not involved in an elimination step.

Returns true, if there exists a condition in the state, which was not already involved in an elimination step; false, otherwise.

15.495.4.38 hasOnlyInconsistentChildren() `bool smtrat::vs::State::hasOnlyInconsistentChildren ( ) const`

Checks whether a child exists, which is not yet marked as inconsistent.

Returns true, if there exists such a child; false, otherwise.

15.495.4.39 hasRecentlyAddedConditions() `bool smtrat::vs::State::hasRecentlyAddedConditions ( ) const [inline]`

Returns true, if this state has a recently added condition in its considered conditions.

15.495.4.40 hasRootsInVariableBounds()

```
bool smtrat::vs::State::hasRootsInVariableBounds (
    const Condition * _condition,
    bool _useSturmSequence )
```

Checks whether there are no zeros for the left-hand side of the constraint of the given condition.

Parameters

_condition	The condition to check.
A	flag that indicates whether to include Sturm's sequences and root counting in this method.

Returns true, if the constraint of the left-hand side of the given condition has no roots in the variable bounds of this state; false, otherwise.

15.495.4.41 hasSubResultsCombination() `bool smtrat::vs::State::hasSubResultsCombination ( ) const [inline]`

Returns true, if this state has a substitution result combination.

15.495.4.42 hasSubstitutionResults() `bool smtrat::vs::State::hasSubstitutionResults ( ) const [inline]`

Returns true, if this state has substitution results.

15.495.4.43 id() `size_t smtrat::vs::State::id ( ) const [inline]`

Returns The id of this state.

15.495.4.44 index() `carl::Variable::Arg smtrat::vs::State::index ( ) const [inline]`

Returns A constant reference to the variable which is going to be eliminated from this state's considered conditions. Note, if there is no variable decided to be eliminated, this method will fail.

15.495.4.45 initConditionFlags() `void smtrat::vs::State::initConditionFlags ( )`

Sets all flags of the conditions to true, if it contains the variable given by the states index.

15.495.4.46 initIndex()

```
bool smtrat::vs::State::initIndex (
    const carl::Variables & _allVariables,
    const smtrat::VariableValuationStrategy & _vvstrat,
    bool _preferEquation,
    bool _tryDifferentVarOrder = false,
    bool _useFixedVariableOrder = false )
```

Sets, if it has not already happened, the index of the state to the name of the most adequate variable.

Which variable is taken depends on heuristics.

Parameters

_allVariables	All globally known variables.
_vvstrat	The strategy according which we choose the variable.
_preferEquation	A flag that indicates to prefer equations in the heuristics of this method.
_tryDifferentVarOrder	

15.495.4.47 isInconsistent() `bool smtrat::vs::State::isInconsistent ( ) const [inline]`

Returns true if this state's considered conditions are inconsistent; false, otherwise, which does not necessarily mean that this state is consistent.

15.495.4.48 isRoot() `bool smtrat::vs::State::isRoot ( ) const [inline]`

Returns The root of the state tree where this state is part from.

15.495.4.49 markedAsDeleted() `bool smtrat::vs::State::markedAsDeleted ( ) const [inline]`

Returns A constant reference to the flag indicating whether this state is marked as deleted, which means that there is no need to consider it in the further progress of finding a solution.

15.495.4.50 maxIntTestCandidate() `const smtrat::Rational& smtrat::vs::State::maxIntTestCandidate ( ) const [inline]`

15.495.4.51 minIntTestCandidate() `const smtrat::Rational& smtrat::vs::State::minIntTestCandidate ( ) const [inline]`

15.495.4.52 nextSubResultCombination() `bool smtrat::vs::State::nextSubResultCombination ( )`

If the state contains a substitution result, which is a conjunction of disjunctions of conjunctions of conditions, this method sets the current combination to the disjunctions to the next combination.

Returns true, if there is a next combination; false, otherwise.

15.495.4.53 numberOfNodes() `unsigned smtrat::vs::State::numberOfNodes ( ) const`

Determines the number of nodes in the tree with this state as root.

Returns The number of nodes in the tree with this state as root.

15.495.4.54 occursInEquation() `bool smtrat::vs::State::occursInEquation ( const carl::Variable & _variable ) const`

Checks whether the given variable occurs in a equation.

Returns true, if the given variable occurs in a equation; false, otherwise.

15.495.4.55 originalCondition() `const Condition& smtrat::vs::State::originalCondition ( ) const [inline]`

Returns A reference to the original conditions of this state. Note that if there is no such condition, this method fails. For further information see the description of the corresponding member.

15.495.4.56 passConflictToFather() `void smtrat::vs::State::passConflictToFather ( bool _checkConflictForSideCondition, bool _useBackjumping = true, bool _includeInconsistentTestCandidates = false )`

Passes the original conditions of the covering set of the conflicts of this state to its father.

Parameters

_checkConflictForSideCondition	If this flag is set to false it might save some computations but leads to an over-approximative behavior. Recommendation: set it to true.
_includeInconsistentTestCandidates	If this flag is set to true the conflict analysis takes also the invalid test candidates' conflict sets into account. Recommendation: set it to false.
_useBackjumping	If true, we use the backjumping technique.

15.495.4.57 pFather() `State* smtrat::vs::State::pFather ( ) const [inline]`

Returns A pointer to the father of this state. It is NULL if this state is the root.

15.495.4.58 pOriginalCondition()

```
const Condition* smtrat::vs::State::pOriginalCondition ( ) const [inline]
```

Returns A pointer to the original condition of this state or NULL, if there is no such condition. For further information see the description of the corresponding member.

15.495.4.59 print()

```
void smtrat::vs::State::print (
    const std::string _initiation = "***",
    std::ostream & _out = std::cout ) const
```

Prints the conditions, the substitution and the substitution results of this state and all its children.

Parameters

_initiation	A string which is printed in the beginning of every row.
_out	The stream to print on.

15.495.4.60 printAlone()

```
void smtrat::vs::State::printAlone (
    const std::string _initiation = "***",
    std::ostream & _out = std::cout ) const
```

Prints the conditions, the substitution and the substitution results of this state.

Parameters

_initiation	A string which is printed in the beginning of every row.
_out	The stream to print on.

15.495.4.61 printConditions()

```
void smtrat::vs::State::printConditions (
    const std::string _initiation = "***",
    std::ostream & _out = std::cout,
    bool _onlyAsConstraints = false ) const
```

Prints the conditions of this state.

Parameters

_initiation	A string which is printed in the beginning of every row.
_out	The stream to print on.

15.495.4.62 printConflictSets()

```
void smtrat::vs::State::printConflictSets (
    const std::string _initiation = "***",
    std::ostream & _out = std::cout ) const
```

Prints the conflict sets of this state.

Parameters

_initiation	A string which is printed in the beginning of every row.
_out	The stream to print on.

15.495.4.63 printSubstitutionResultCombination()

```
void smtrat::vs::State::printSubstitution↩
ResultCombination (
            const std::string _initiation = "***",
            std::ostream & _out = std::cout ) const
```

Prints the combination of substitution results used in this state.

Parameters

_initiation	A string which is printed in the beginning of every row.
_out	The stream to print on.

15.495.4.64 printSubstitutionResultCombinationAsNumbers()

```
void smtrat::vs::State::printSubstitution↩
ResultCombinationAsNumbers (
            const std::string _initiation = "***",
            std::ostream & _out = std::cout ) const
```

Prints the combination of substitution results, expressed in numbers, used in this state.

Parameters

_initiation	A string which is printed in the beginning of every row.
_out	The stream to print on.

15.495.4.65 printSubstitutionResults()

```
void smtrat::vs::State::printSubstitutionResults (
            const std::string _initiation = "***",
            std::ostream & _out = std::cout ) const
```

Prints the substitution results of this state.

Parameters

_initiation	A string which is printed in the beginning of every row.
_out	The stream to print on.

15.495.4.66 pSubstitution()

```
const Substitution* smtrat::vs::State::pSubstitution ( ) const  [inline]
```

Returns A pointer to the substitution of this state, which is NULL, if this state is the root.

15.495.4.67 rCannotBeSolved() `bool& smtrat::vs::State::rCannotBeSolved ( ) [inline]`

Returns A reference to the flag indicating whether a condition with too high degree for the virtual substitution method must be considered.

15.495.4.68 rCannotBeSolvedLazy() `bool& smtrat::vs::State::rCannotBeSolvedLazy ( ) [inline]`

Returns A reference to the flag indicating whether a condition with too high degree for the virtual substitution method must be considered.

15.495.4.69 rChildren() `std::list<State*>& smtrat::vs::State::rChildren ( ) [inline]`

Returns A reference to the vector of the children of this state.

15.495.4.70 rConditions() `ConditionList& smtrat::vs::State::rConditions ( ) [inline]`

Returns A reference to the currently considered conditions of this state.

15.495.4.71 rConflictSets() `ConflictSets& smtrat::vs::State::rConflictSets ( ) [inline]`

Returns A reference to the conflict sets of this state.

15.495.4.72 refreshConditions() `bool smtrat::vs::State::refreshConditions ( ValuationMap & _ranking )`

Determines the condition vector corresponding to the current combination of the conjunctions of conditions.

Returns true, if there has been a change in the currently considered condition vector. false, otherwise.

15.495.4.73 removeStatesFromRanking() `void smtrat::vs::State::removeStatesFromRanking ( const State & toRemove, ValuationMap & _ranking ) [static]`

15.495.4.74 resetCannotBeSolvedLazyFlags() `void smtrat::vs::State::resetCannotBeSolvedLazy↩ Flags ( )`

15.495.4.75 resetConflictSets() `void smtrat::vs::State::resetConflictSets ( )`

Clears the conflict sets.

15.495.4.76 resetCurrentRangeSize() `void smtrat::vs::State::resetCurrentRangeSize ( ) [inline]`

15.495.4.77 resetInfinityChild() `void smtrat::vs::State::resetInfinityChild ( const State * _state ) [inline]`

15.495.4.78 rFather() `State& smtrat::vs::State::rFather ( ) [inline]`

Returns A reference to the father of this state. This method fails if this state is the root.

15.495.4.79 rHasChildrenToInsert() `bool& smtrat::vs::State::rHasChildrenToInsert ( ) [inline]`

Returns A reference to the flag indicating whether there are states that are children of this state and must be still considered in the further progress of finding a solution.

15.495.4.80 rHasRecentlyAddedConditions() `bool& smtrat::vs::State::rHasRecentlyAddedConditions ( ) [inline]`

Returns A reference to the flag indicating that this state has a recently added condition in its considered conditions.

15.495.4.81 rID() `size_t& smtrat::vs::State::rID ( ) [inline]`

Returns A reference to the id of this state.

15.495.4.82 rInconsistent() `bool& smtrat::vs::State::rInconsistent ( ) [inline]`

Returns A reference to the flag indicating whether this state's considered conditions are inconsistent. Note that if it is false, it does not necessarily mean that this state is consistent.

15.495.4.83 rMarkedAsDeleted() `bool& smtrat::vs::State::rMarkedAsDeleted ( ) [inline]`

Returns A reference to the flag indicating whether this state is marked as deleted, which means that there is no need to consider it in the further progress of finding a solution.

15.495.4.84 root() `State & smtrat::vs::State::root ( )`

Returns The root of the tree, in which this state is located.

15.495.4.85 rSubResultCombination() `SubResultCombination& smtrat::vs::State::rSubResult↩ Combination ( ) [inline]`

Returns A reference to the current combination of conjunction of constraints within the substitution results of this state. Make sure that a substitution result combination exists when calling this method. (using, e.g., hasSubResultsCombination())

15.495.4.86 rSubResultsSimplified() `bool& smtrat::vs::State::rSubResultsSimplified ( ) [inline]`

Returns A reference to the flag indicating whether the substitution results of this state are already simplified.

15.495.4.87 rSubstitution() `Substitution& smtrat::vs::State::rSubstitution ( ) [inline]`

Returns A reference to the substitution this state considers. Note that this method fails, if this state is the root.

15.495.4.88 rSubstitutionResults() `SubstitutionResults& smtrat::vs::State::rSubstitutionResults ( ) [inline]`

Returns A reference to the substitution results of this state. Make sure that the substitution results exist when calling this method. (using, e.g., hasSubstitutionResults())

15.495.4.89 rTakeSubResultCombAgain() `bool& smtrat::vs::State::rTakeSubResultCombAgain ( ) [inline]`

Returns A reference to the flag indicating whether the current substitution result combination has to be consider once again before considering the next one.

15.495.4.90 rTooHighDegreeConditions() `carl::PointerSet<Condition>& smtrat::vs::State::rTooHighDegreeConditions ( ) [inline]`

Returns A reference to the conditions of those this state currently considers, which have a too high degree to be tackled of the virtual substitution method.

15.495.4.91 rType() `Type& smtrat::vs::State::rType ( ) [inline]`

Returns A constant reference to the type of this state: This state has still a substitution to apply or either test candidates shall be generated or a new combination of the substitution results must be found in order to consider it next.

15.495.4.92 rVariableBounds() `VariableBoundsCond& smtrat::vs::State::rVariableBounds ( ) [inline]`

Returns A reference to the object managing and storing the variable's bounds which were extracted from the currently considered conditions of this state.

15.495.4.93 setIndex() `void smtrat::vs::State::setIndex ( const carl::Variable & _index )`

Sets the index of this state.

Parameters

_index	The string to which the index should be set.

15.495.4.94 setInfinityChild() `void smtrat::vs::State::setInfinityChild ( State * _state ) [inline]`

15.495.4.95 setOriginalCondition() `void smtrat::vs::State::setOriginalCondition ( const Condition * _pOCondition ) [inline]`

Sets the pointer of the original condition of this state to the given pointer to a condition.

Parameters

_pOCondition	The pointer to set the original condition to.

15.495.4.96 simplify() [1/2]

```
bool smtrat::vs::State::simplify (
    ConditionList & _conditionVectorToSimplify,
    ConditionSetSet & _conflictSet,
    ValuationMap & _ranking,
    bool _stateConditions = false )
```

Simplifies the given conditions according to comparison between the corresponding constraints.

Parameters

_conditionVectorToSimplify	The conditions to simplify. Note, that this method can change these conditions.
_conflictSet	All conflicts this method detects in the given conditions are stored in here.
_stateConditions	A flag indicating whether the conditions to simplify are from the considered condition vector of this state and not, e.g., from somewhere in its substitution results.

Returns true, if the conditions are not obviously conflicting; false, otherwise.

15.495.4.97 simplify() [2/2]

```
void smtrat::vs::State::simplify (
    ValuationMap & _ranking )
```

Cleans up all conditions in this state according to comparison between the corresponding constraints.

15.495.4.98 solutionSpace()

```
std::vector< smtrat::DoubleInterval > smtrat::vs::State::solution↩
Space (
    carl::PointerSet< Condition > & _conflictReason ) const
```

Determines the solution space of the test candidate of this state regarding to the variable bounds of the father.

The solution space consists of one or two disjoint intervals.

Parameters

_conflictReason	If the solution space is empty, the conditions being responsible for this conflict are stored in here.

Returns The disjoint intervals representing the solution space.

15.495.4.99 subResultCombination()

```
const SubResultCombination& smtrat::vs::State::subResult↩
Combination ( ) const [inline]
```

Returns A constant reference to the current combination of conjunction of constraints within the substitution results of this state. Make sure that a substitution result combination exists when calling this method. (using, e.g., hasSubResultsCombination())

15.495.4.100 subResultsSimplified() `bool smtrat::vs::State::subResultsSimplified ( ) const [inline]`

Returns true, if the substitution results of this state are already simplified.

15.495.4.101 substitution() `const Substitution& smtrat::vs::State::substitution ( ) const [inline]`

Returns A constant reference to the substitution this state considers. Note that this method fails, if this state is the root.

15.495.4.102 substitutionApplicable() [1/2] `bool smtrat::vs::State::substitutionApplicable ( ) const`

Checks if a substitution can be applied.

Returns true, if a substitution can be applied. false, else.

15.495.4.103 substitutionApplicable() [2/2] `bool smtrat::vs::State::substitutionApplicable ( const smtrat::ConstraintT & _constraint ) const`

Checks if the substitution of this state can be applied to the given constraint.

Parameters

_constraint	The constraint, for which we want to know, if the substitution is applicable.

Returns true, if the substitution can be applied; false, otherwise.

15.495.4.104 substitutionResults() `const SubstitutionResults& smtrat::vs::State::substitution↩ Results ( ) const [inline]`

Returns A constant reference to the substitution results of this state. Make sure that the substitution results exist when calling this method. (using, e.g., hasSubstitutionResults())

15.495.4.105 takeSubResultCombAgain() `bool smtrat::vs::State::takeSubResultCombAgain ( ) const [inline]`

Returns true, if the current substitution result combination has to be consider once again before considering the next one.

15.495.4.106 tooHighDegreeConditions()

`const carl::PointerSet<Condition>& smtrat::vs::State↩ ::tooHighDegreeConditions ( ) const [inline]`

Returns A constant reference to the conditions of those this state currently considers, which have a too high degree to be tackled of the virtual substitution method.

15.495.4.107 treeDepth()

`unsigned smtrat::vs::State::treeDepth ( ) const`

Returns The depth of the subtree with this state as root node.

15.495.4.108 tryToRefreshIndex()

`bool smtrat::vs::State::tryToRefreshIndex ( ) const [inline]`

Returns true, if the index variable of this state shall be recalculated.

15.495.4.109 type()

`Type smtrat::vs::State::type ( ) const [inline]`

Returns The type of this state: This state has still a substitution to apply or either test candidates shall be generated or a new combination of the substitution results must be found in order to consider it next.

15.495.4.110 unfinished()

`bool smtrat::vs::State::unfinished ( ) const [inline]`

Returns true, if the currently considered substitution result combination can be extended by taking further substitution results into account.

15.495.4.111 unfinishedAncestor()

`bool smtrat::vs::State::unfinishedAncestor ( State *& _unfinAnt )`

Determines (if it exists) a ancestor node, which is unfinished, that is it has still substitution results to consider.

Parameters

_unfinAnt	The unfinished ancestor node.

Returns true, if it has a unfinished ancestor; false, otherwise.

15.495.4.112 updateBackendCallValuation() `void smtrat::vs::State::updateBackendCallValuation ( )`

Valuates the state's currently considered conditions according to a backend call.

Note: The settings are currently optimized for CAD backend calls.

15.495.4.113 updateIntTestCandidates() `bool smtrat::vs::State::updateIntTestCandidates ( )`

15.495.4.114 updateOCondsOfSubstitutions() `bool smtrat::vs::State::updateOCondsOfSubstitutions (`

```
const Substitution & _substitution,
std::vector< State * > & _reactivatedStates )
```

Updates the original conditions of substitutions having the same test candidate as the given.

Parameters

_substitution	The substitution containing the test candidate to check for.
_reactivatedStates	

Returns true, if the test candidate of the given substitution was already generated; false, otherwise.

15.495.4.115 updateValuation() `void smtrat::vs::State::updateValuation (`

```
bool _lazy )
```

Updates the valuation of this state.

15.495.4.116 valuation() `size_t smtrat::vs::State::valuation ( ) const [inline]`

Returns The heuristically determined valuation of this state (see for the description of the corresponding member).

15.495.4.117 variableBounds() `const VariableBoundsCond& smtrat::vs::State::variableBounds ( ) const [inline]`

Returns A constant reference to the object managing and storing the variable's bounds which were extracted from the currently considered conditions of this state.

15.495.4.118 variables() `void smtrat::vs::State::variables (`

```
carl::Variables & _variables ) const
```

Finds the variables, which occur in this state.

Parameters

_variables	The variables which occur in this state.

15.495.4.119 worstConstraintValuation()

```
void smtrat::vs::State::worstConstraintValuation (
    const std::vector< std::pair< carl::Variable, std::multiset< double >>> & _varVals )
```

15.496 smtrat::StaticUnionFind Struct Reference

15.499 delta::String Class Reference

This class can be used to create `std::string` objects using streaming operators.

`#include <utils.h>`

Public Member Functions

- template<typename T >
  String & operator<< (const T &t)

  Add some data to the string.
- operator std::string () const

  Return data as string.

15.499.1 Detailed Description This class can be used to create `std::string` objects using streaming operators.

15.499.2 Member Function Documentation

15.499.2.1 operator std::string()

```
delta::String::operator std::string ( ) const [inline]
```

Return data as string.

Returns Data as string.

15.499.2.2 operator<<()

```
template<typename T >
String& delta::String::operator<< (
    const T & t ) [inline]
```

Add some data to the string.

Parameters

t	Data.

Returns `*this`

15.500 Minisat::StringOption Class Reference

`#include <Options.h>`

Public Member Functions

- StringOption (const char *c, const char *n, const char *d, const char *def=NULL)
- operator const char * (void) const
- StringOption & operator= (const char *x)
- virtual void help (bool verbose=false)

15.501.3.1 escapes `qi::symbols<char, char> smtrat::parser::StringParser::escapes`

15.501.3.2 main `qi::rule<Iterator, std::string(), Skipper> smtrat::parser::StringParser::main`

15.502 smtrat::STropModule< Settings > Class Template Reference

`#include <STropModule.h>`

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- STropModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.

- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.

- void updateModel () const

  Updates the current assignment into the model.

- Answer checkCore ()

  Checks the received formula for consistency.

- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.

- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.

- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.

- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.

- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.

- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.

- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩ Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩ _premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩ Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩ ::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩ AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩ CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.

- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.

- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.

- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.502.1 Member Typedef Documentation

15.502.1.1 SettingsType `template<typename Settings >`

```
typedef Settings smtrat::STropModule< Settings >::SettingsType
```

15.502.2.1 LemmaType `enum smtrat::Module::LemmaType : unsigned [strong], [inherited]`

Enumerator

NORMAL	
PERMANENT	

15.502.3 Constructor & Destructor Documentation

15.502.3.1 STropModule()

```
template<class Settings >
smtrat::STropModule< Settings >::STropModule (
            const ModuleInput * _formula,
            Conditionals & _conditionals,
            Manager * _manager = nullptr )
```

15.502.4 Member Function Documentation

15.502.4.1 add()

```
bool smtrat::Module::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.502.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
            const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.502.4.3 addCore()

```
template<class Settings >
bool smtrat::STropModule< Settings >::addCore (
            ModuleInput::const_iterator _subformula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns False, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; True, otherwise.

Normalize the left hand side of the constraint and turn the relation accordingly

Store the normalized constraint and mark the separator object as changed

Check if the asserted constraint prohibits the application of this method

Check if the asserted relation trivially conflicts with other asserted relations

Reimplemented from smtrat::Module.

15.502.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.502.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.502.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.502.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
            ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.502.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.502.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.502.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.502.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.502.4.12 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.502.4.13 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const
[inline], [inherited]
```

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.502.4.14 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected],
[inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.502.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.502.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.502.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.502.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.502.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.502.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.502.4.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.502.4.22 checkCore()

```
template<class Settings >
Answer smtrat::STropModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; UNKNOWN, otherwise.

Report unsatisfiability if the already found conflicts are still unresolved

Predicate that decides if the given conflict is a subset of the asserted constraints

Apply the method only if the asserted formula is not trivially undecidable

Update the linearization of all changed separators

Determine the direction that shall be active

Update the linearization if the direction has changed

Restrict the normal vector component of integral variables to positive values

Check the constructed linearization with the LRA solver

Learn the conflicting set of separators to avoid its recheck in the future

Check the asserted formula with the backends

Reimplemented from smtrat::Module.

15.502.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.502.4.24 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.502.4.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.502.4.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.502.4.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.502.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.502.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.502.4.30 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

15.502.4.31 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.502.4.32 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.502.4.33 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraintsToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.502.4.34 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.502.4.35 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.502.4.36 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.502.4.37 deinformCore()

`virtual void smtrat::Module::deinformCore ( const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.502.4.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.502.4.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.502.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceived↩
VariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.502.4.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBest↩
Origin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.502.4.42 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.502.4.43 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.502.4.44 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

15.502.4.45 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.502.4.46 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.502.4.47 getBackendsModel()

`void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.502.4.48 getInfeasibleSubsets() [1/2]

`void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.502.4.49 getInfeasibleSubsets() [2/2]

`std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.502.4.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.502.4.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.502.4.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.502.4.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.502.4.54 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.502.4.55 getReceivedFormulaSimplified()

```
std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]
```

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.502.4.56 hasLemmas()

```
bool smtrat::Module::hasLemmas ( ) [inline], [inherited]
```

Checks whether this module or any of its backends provides any lemmas.

15.502.4.57 hasValidInfeasibleSubset()

```
bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]
```

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.502.4.58 id()

```
std::size_t smtrat::Module::id ( ) const [inline], [inherited]
```

Returns A unique ID to identify this module instance.

15.502.4.59 infeasibleSubsets()

```
const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]
```

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.502.4.60 inform()

```
bool smtrat::Module::inform (
    const FormulaT & _constraint ) [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.502.4.61 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.502.4.62 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.502.4.63 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.502.4.64 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.502.4.65 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.502.4.66 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.502.4.67 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.502.4.68 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.502.4.69 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.502.4.70 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.502.4.71 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.502.4.72 moduleName() `template<typename Settings > std::string smtrat::STropModule< Settings >::moduleName ( ) const [inline], [virtual]`

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.502.4.73 objective() `carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.502.4.74 originInReceivedFormula() `bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

15.502.4.75 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.502.4.76 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.502.4.77 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.502.4.78 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.502.4.79 print()

```
void smtrat::Module::print (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.502.4.80 printAllModels()

```
void smtrat::Module::printAllModels (
    std::ostream & _out = std::cout ) [inherited]
```

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.502.4.81 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.502.4.82 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const  [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.502.4.83 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.502.4.84 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.502.4.85 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const  [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.502.4.86 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

15.502.4.87 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩
InfeasibleSubset (
            ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.502.4.88 receivedVariable()

```
bool smtrat::Module::receivedVariable (
            carl::Variable::Arg _var ) const [inline], [inherited]
```

15.502.4.89 remove()

```
void smtrat::Module::remove (
            ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.502.4.90 removeCore()

```
template<class Settings >
void smtrat::STropModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula ) [virtual]
```

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Normalize the left hand side of the constraint and turn the relation accordingly

Retrieve the normalized constraint and mark the separator object as changed

Check if the removed constraint prohibited the application of this method

Reimplemented from smtrat::Module.

15.502.4.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.502.4.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected], [inherited]
```

15.502.4.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.502.4.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.502.4.95 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

15.502.4.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.502.4.97 setId()

```
void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.502.4.98 setThreadPriority()

```
void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.502.4.99 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.502.4.100 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.502.4.101 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.502.4.102 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.502.4.103 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.502.4.104 updateModel() `template<class Settings > void smtrat::STropModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables. Stores all informations retrieved from the LRA solver to construct the model

Retrieve the sign and exponent for every active variable

Calculate smallest possible integer valued exponents

Find model by increasingly testing the sample base

Reimplemented from smtrat::Module.

15.502.4.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.502.5 Field Documentation

15.502.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.502.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.502.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.502.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.502.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.502.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.502.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.502.5.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module::m↩FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.502.5.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.502.5.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.502.5.11 mInfeasibleSubsets `std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.502.5.12 mInformedConstraints `carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.502.5.13 mLastBranches `std::vector< Branching > smtrat::Module::mLastBranches = std↩ ::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.502.5.14 mLemmas `std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.502.5.15 mModel `Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.502.5.16 mModelComputed `bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.502.5.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.502.5.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.502.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

15.502.5.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.502.5.21 mSmallerMusesCheckCounter

`unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.502.5.22 mSolverState

`std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.502.5.23 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheoryPropagations [protected], [inherited]`

15.502.5.24 mUsedBackends

`std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.502.5.25 mVariableCounters

`std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.503 benchmax::slurm::SubmitfileProperties Struct Reference

All properties needed to create a submit file.

```
#include <SlurmUtilities.h>
```

Data Fields

- std::string file_suffix

  Suffix for job and submit file.
- std::string filename_jobs

  Filename of the job list file.
- std::string tmp_dir

  Temporary directory for log files.
- carl::settings::duration limit_time

  Time limit in seconds.
- carl::settings::duration grace_time

  Grace time in seconds.
- carl::settings::binary_quantity limit_memory

  Memory limit in megabytes.
- std::size_t tasks

  Number of tasks.
- std::size_t slices

  Number of slices.

15.503.1 Detailed Description

All properties needed to create a submit file.

15.503.2 Field Documentation

15.503.2.1 file_suffix `std::string benchmax::slurm::SubmitfileProperties::file_suffix`

Suffix for job and submit file.

15.503.2.2 filename_jobs `std::string benchmax::slurm::SubmitfileProperties::filename_jobs`

Filename of the job list file.

15.503.2.3 grace_time `carl::settings::duration benchmax::slurm::SubmitfileProperties::grace_time`

Grace time in seconds.

15.503.2.4 limit_memory `carl::settings::binary_quantity benchmax::slurm::SubmitfileProperties::limit_memory`

Memory limit in megabytes.

15.503.2.5 limit_time `carl::settings::duration benchmax::slurm::SubmitfileProperties::limit_time`

Time limit in seconds.

15.503.2.6 slices `std::size_t benchmax::slurm::SubmitfileProperties::slices`

Number of slices.

15.503.2.7 tasks `std::size_t benchmax::slurm::SubmitfileProperties::tasks`

Number of tasks.

15.503.2.8 tmp_dir `std::string benchmax::slurm::SubmitfileProperties::tmp_dir`

Temporary directory for log files.

15.504 smtrat::vs::Substitution Class Reference

`#include <Substitution.h>`

Public Types

- enum Type {
  NORMAL, PLUS_EPSILON, MINUS_INFINITY, PLUS_INFINITY,

15.504.1 Member Enumeration Documentation

15.504.1.1 Type `enum smtrat::vs::Substitution::Type`

The type of a substitution.

Enumerator

NORMAL	
PLUS_EPSILON	
MINUS_INFINITY	
PLUS_INFINITY	
INVALID	

15.504.2 Constructor & Destructor Documentation

15.504.2.1 Substitution() [1/3]

```
smtrat::vs::Substitution::Substitution (
    const carl::Variable & _variable,
    const Type & _type,
    carl::PointerSet< Condition > && _oConditions,
    smtrat::ConstraintsT && _sideCondition = smtrat::ConstraintsT() )
```

Constructs a substitution with no square root term to map to.

Parameters

_variable	The variable to substitute of the substitution to construct.
_type	The type of the substitution of the substitution to construct.
_oConditions	The original conditions of the substitution to construct.
_sideCondition	The side conditions of the substitution to construct.

15.504.2.2 Substitution() [2/3]

```
smtrat::vs::Substitution::Substitution (
    const carl::Variable & _variable,
    const smtrat::SqrtEx & _term,
    const Type & _type,
    carl::PointerSet< Condition > && _oConditions,
    smtrat::ConstraintsT && _sideCondition = smtrat::ConstraintsT() )
```

Constructs a substitution with a square root term to map to.

Parameters

_variable	The variable to substitute of the substitution to construct.
_term	The square root term to which the variable maps to.
_type	The type of the substitution of the substitution to construct.
_oConditions	The original conditions of the substitution to construct.
_sideCondition	The side conditions of the substitution to construct.

15.504.2.3 Substitution() [3/3]

```
smtrat::vs::Substitution::Substitution (
    const Substitution & _substitution )
```

Copy constructor.

15.504.2.4 ~Substitution() `smtrat::vs::Substitution::~Substitution ( )`

The destructor.

15.504.3 Member Function Documentation

15.504.3.1 operator==()

```
bool smtrat::vs::Substitution::operator== (
    const Substitution & _substitution ) const
```

Parameters

The	substitution to compare with.

Returns true, if this substitution is equal to the given substitution; false, otherwise.

15.504.3.2 originalConditions()

```
const carl::PointerSet<Condition>& smtrat::vs::Substitution↩
::originalConditions ( ) const [inline]
```

Returns A constant reference to the original conditions of this substitution.

15.504.3.3 print()

```
void smtrat::vs::Substitution::print (
    bool _withOrigins = false,
    bool _withSideConditions = false,
    std::ostream & _out = std::cout,
    const std::string & _init = "" ) const
```

Prints this substitution on the given stream, with some additional information.

Parameters

The	substitution to compare with.

Returns true, if this substitution is less than the given substitution; false, otherwise.

Parameters

_withOrigins	A flag indicating whether to print also the origins of this substitution.
_withSideConditions	A flag indication whether to also the side conditions of this substitution.
_out	The stream to print on.
_init	The string to print at the beginning of every row.

15.504.3.4 rOriginalConditions()

```
carl::PointerSet<Condition>& smtrat::vs::Substitution::r↩
OriginalConditions ( ) [inline]
```

Returns A reference to the original conditions of this substitution.

15.504.3.5 rType() `Type& smtrat::vs::Substitution::rType ( ) [inline]`

Returns A reference to the type of this substitution.

15.504.3.6 setTerm() `void smtrat::vs::Substitution::setTerm ( const smtrat::Rational & _value ) [inline]`

Sets the substitution term to the given rational.

Parameters

_value	The value to set the substitution term to.

15.504.3.7 sideCondition() `const smtrat::ConstraintsT& smtrat::vs::Substitution::sideCondition ( ) const [inline]`

Returns A constant reference to the side condition of this substitution.

15.504.3.8 term() `const smtrat::SqrtEx& smtrat::vs::Substitution::term ( ) const [inline]`

Returns A constant reference to the term this substitution maps its variable to.

15.504.3.9 termVariables() `const carl::Variables& smtrat::vs::Substitution::termVariables ( ) const [inline]`

Returns A constant reference to the variables occurring in the substitution term.

15.504.3.10 type() `const Type& smtrat::vs::Substitution::type ( ) const [inline]`

Returns A constant reference to the type of this substitution.

15.504.3.11 valuate() `unsigned smtrat::vs::Substitution::valuate ( bool _preferMinusInf = true ) const`

Parameters

_preferMinusInf	A flag indicating whether to valuate the substitution type best or otherwise worst.

Returns The valuation of this substitution according to a heuristic.

15.504.3.12 variable() `const carl::Variable& smtrat::vs::Substitution::variable ( ) const [inline]`

Returns A constant reference to the variable this substitution substitutes.

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- SymmetryModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- ~SymmetryModule ()
- Answer checkCore ()

  Checks the received formula for consistency.
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void updateModel () const

  Updates the current assignment into the model.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore (ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore (ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩ Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩ _premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩ Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩ ::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩ AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩ CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

```

15.509.4 Member Function Documentation

15.509.4.1 add() `bool smtrat::PModule::add (`

```
ModuleInput::const_iterator _subformula )  [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.509.4.2 addConstraintToInform() `void smtrat::Module::addConstraintToInform (`

```
const FormulaT & _constraint )  [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.509.4.3 addCore() `virtual bool smtrat::Module::addCore (`

```
ModuleInput::const_iterator formula )  [inline], [protected], [virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.509.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.509.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.509.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.509.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
            ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.509.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.509.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.509.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.509.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.509.4.12 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.509.4.13 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const
[inline], [inherited]
```

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.509.4.14 appliedPreprocessing()

```
bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]
```

Returns true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

15.509.4.15 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.509.4.16 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.509.4.17 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.509.4.18 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.509.4.19 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.509.4.20 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.509.4.21 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.509.4.22 check()

```
Answer smtrat::PModule::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.509.4.23 checkCore()

```
template<class Settings >
Answer smtrat::SymmetryModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.509.4.24 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.509.4.25 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.509.4.26 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.509.4.27 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.509.4.28 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.509.4.29 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.509.4.30 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.509.4.31 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

15.509.4.32 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.509.4.33 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.509.4.34 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.509.4.35 currentlySatisfied() `virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.509.4.36 currentlySatisfiedByBackend() `unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.509.4.37 deinform() `void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.509.4.38 deinformCore() `virtual void smtrat::Module::deinformCore ( const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.509.4.39 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.509.4.40 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.509.4.41 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceived↩
VariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.509.4.42 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBest↩
Origin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.509.4.43 firstSubformulaToPass() `ModuleInput::const_iterator smtrat::Module::firstSubformula↩ ToPass ( ) const [inline], [inherited]`

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.509.4.44 firstUncheckedReceivedSubformula() `ModuleInput::const_iterator smtrat::Module↩ ::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.509.4.45 freeSplittingVariable() `static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

15.509.4.46 generateTrivialInfeasibleSubset() `void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.509.4.47 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.509.4.48 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.509.4.49 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.509.4.50 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::getInfeasible↩ Subsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.509.4.51 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.509.4.52 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.509.4.53 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.509.4.54 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.509.4.55 getOrigins() [3/3] const FormulaT& smtrat::Module::getOrigins (ModuleInput::const_iterator _formula) const [inline], [protected], [inherited]

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.509.4.56 getReceivedFormulaSimplified() std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

15.509.4.57 hasLemmas() bool smtrat::Module::hasLemmas ( ) [inline], [inherited]

Checks whether this module or any of its backends provides any lemmas.

15.509.4.58 hasValidInfeasibleSubset() bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.509.4.59 id() std::size_t smtrat::Module::id ( ) const [inline], [inherited]

Returns A unique ID to identify this module instance.

15.509.4.60 infeasibleSubsets() const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.509.4.61 inform() bool smtrat::Module::inform (const FormulaT & _constraint) [inherited]

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.509.4.62 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.509.4.63 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.509.4.64 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.509.4.65 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.509.4.66 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.509.4.67 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.509.4.68 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.509.4.69 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.509.4.70 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.509.4.71 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.509.4.72 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.509.4.73 moduleName() `virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns The name of the given module type as name.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::VSModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::GBModule< Settings >, smtrat::IntEqModule< Setti smtrat::CubeLIAModule< Settings >, smtrat::CurryModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IncWidthModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::BEModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::SplitSOSModule< Settings >.

15.509.4.74 objective() `carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.509.4.75 originInReceivedFormula() `bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

15.509.4.76 passedFormulaBegin() `ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.509.4.77 passedFormulaEnd() `ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.509.4.78 pPassedFormula() `const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.509.4.79 pReceivedFormula() `const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.509.4.80 print() `void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.509.4.81 printAllModels() `void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.509.4.82 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.509.4.83 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.509.4.84 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.509.4.85 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.509.4.86 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.509.4.87 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.509.4.88 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.509.4.89 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.509.4.90 remove()

```
void smtrat::PModule::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.509.4.91 removeCore()

```
virtual void smtrat::Module::removeCore (
    ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.509.4.92 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.509.4.93 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.509.4.94 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.509.4.95 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.509.4.96 runBackends() [1/2] virtual Answer smtrat::PModule::runBackends ( ) [inline], [virtual], [inherited]

Reimplemented from smtrat::Module.

15.509.4.97 runBackends() [2/2] Answer smtrat::PModule::runBackends (bool _final, bool _full, carl::Variable _objective) [virtual], [inherited]

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.509.4.98 setId() void smtrat::Module::setId (std::size_t _id) [inline], [inherited]

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.509.4.99 setThreadPriority() void smtrat::Module::setThreadPriority (thread_priority _threadPriority) [inline], [inherited]

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.509.4.100 solverState() Answer smtrat::Module::solverState ( ) const [inline], [inherited]

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.509.4.101 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.509.4.102 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.509.4.103 updateAllModels()

`void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.509.4.104 updateLemmas()

`void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.509.4.105 updateModel()

`void smtrat::PModule::updateModel ( ) const [virtual], [inherited]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.509.4.106 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.509.5 Field Documentation

15.509.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.509.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.509.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.509.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.509.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.509.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.509.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩ Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.509.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.509.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.509.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.509.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.509.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.509.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.509.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.509.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.509.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.509.5.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.509.5.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.509.5.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

15.509.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.509.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.509.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.509.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.509.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.509.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.510 smtrat::lra::Tableau< Settings, T1, T2 > Class Template Reference

```
#include <Tableau.h>
```

- bool hasMultilineConflict ()
- std::vector< const Bound< T1, T2 > * > getMultilineConflict ()
- std::pair< EntryID, bool > nextPivotingElement ()
- Value< T1 > violationSum ()

  Method to compute the sum of derivations to the closest bounds.
- Value< T1 > dViolationSum (const Variable< T1, T2 > *nVar, const Value< T1 > &update)

  Computes the change in the violation sum when an the update value is added to the assignment of the nonbassi variable nVar.
- Value< T1 > get_dVioSum ()

Used as assertion-function to check the progress of the tableau.

- std::map< Value< T1 >, Value< T1 > > compute_dVio (const std::vector< std::pair< Value< T1 >, Variable< T1, T2 > * > > &candidates, const Variable< T1, T2 > &nVar, bool positive)

  Updated Method to computed dVio more efficienlty.

- std::pair< EntryID, bool > nextPivotingElementInfeasibilities ()

  Method for next pivoting element according to "Simplex with Sum of Infeasibilities for SMT" by Tim King and Clark Barrett.

- void computeLeavingCandidates (const int &i, std::vector< std::pair< Value< T1 >, Variable< T1, T2 > * > > &leaving_candidates)

  Helper method to compute leavind candidates used in nextPivotingElementInfeasibilities.

- void updateNonbasicVariable (EntryID _pivotingElement)

  Updates a nonbasic variable by the assignment stored in mpTheta and triggers updates of depending basic variables.

- void updateNonbasicVariable (EntryID _pivotingElement, Value< T1 > update)

  Updates a nonbasic variable by the given assignment and triggers updates of depending basic variables.

- std::pair< EntryID, bool > hasConflict ()

  Checks if a conflicting pair exists.

- void printEntries ()
- std::vector< T2 > getInfeasibilityRow ()

  Method to compute the infeasibility row to the current tableau.

- void setInfeasibilityRow ()

  Method to set the initital infeasibility row to avoid recomputation in every round.

- std::pair< EntryID, bool > optimizeIndependentNonbasics (const Variable< T1, T2 > &_objective)
- std::pair< EntryID, bool > nextPivotingElementForOptimizing (const Variable< T1, T2 > &_objective)

15.510.1 Constructor & Destructor Documentation

15.510.1.1 Tableau()

```
template<class Settings, typename T1, typename T2>
smtrat::lra::Tableau< Settings, T1, T2 >::Tableau (
            ModuleInput::iterator _defaultBoundPosition )
```

Parameters

_defaultBoundPosition	

15.510.1.2 ~Tableau()

```
template<class Settings, typename T1, typename T2>
smtrat::lra::Tableau< Settings, T1, T2 >::~Tableau ( )
```

15.510.2 Member Function Documentation

15.510.2.1 activateBasicVar()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::activateBasicVar (
            Variable< T1, T2 > * _var )
```

g

Parameters

_var	

15.510.2.2 activateBound()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::activateBound (
            const Bound< T1, T2 > * _bound,
            const FormulaT & _formula )
```

Parameters

_bound	
_formula	

15.510.2.3 adaptDelta()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::adaptDelta (
            const Variable< T1, T2 > & _variable,
            bool _upperBound,
            T1 & _minDelta ) const
```

15.510.2.4 addToEntry()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::addToEntry (
            const T2 & _toAdd,
            Iterator & _horiIter,
            bool _horiIterLeftFromVertIter,
            Iterator & _vertIter,
            bool _vertIterBelowHoriIter )
```

Adds the given value to the entry being at the position (i,j), where i is the vertical position of the given horizontal iterator and j is the horizontal position of the given vertical iterator.

Note, that the entry might not exist, if its current value is 0. Then the horizontal iterator is located horizontally before or after the entry to change and the vertical iterator is located vertically before or after the entry to add.

Parameters

_toAdd	The value to add to the content of the entry specified by the given iterators and their relative position to each other.
_horiIter	The iterator moving horizontally and, hence, giving the vertical position of the entry to add the given value to.
_horiIterLeftFromVertIter	true, if the horizontally moving iterator is left from or equal to the horizontal position of the iterator moving vertically, and, hence, left from or equal to the position of the entry to add the given value to; false, it is right or equal to this position.
_vertIter	The iterator moving vertically and, hence, giving the horizontal position of the entry to add the given value to.
_vertIterBelowHoriIter	true, if the vertically moving iterator is below or exactly at the vertical position of the iterator moving horizontally, and, hence, below or exactly at the position of the entry to add the given value to; false, it is above or equal to this position. @sideeffect If the entry existed (!=0) and is removed because of becoming 0, the iterators are set according to the given relative positioning.

15.510.2.5 betterEntry()

```
template<class Settings, typename T1, typename T2>
bool smtrat::lra::Tableau< Settings, T1, T2 >::betterEntry (
            EntryID _isBetter,
            EntryID _than ) const
```

Parameters

_isBetter	
_than	

Returns

15.510.2.6 boundedVariables()

```
template<class Settings, typename T1, typename T2>
size_t smtrat::lra::Tableau< Settings, T1, T2 >::boundedVariables (
            const Variable< T1, T2 > & _var,
            size_t _stopCriterium = 0 ) const
```

Parameters

_var	
_stopCriterium	

Returns

15.510.2.7 checkCorrectness()

```
template<class Settings, typename T1, typename T2>
size_t smtrat::lra::Tableau< Settings, T1, T2 >::checkCorrectness ( ) const
```

Returns

15.510.2.8 collect_premises()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::collect_premises (
            const Variable< T1, T2 > * _rowVar,
            FormulasT & premises ) const
```

Collects the premises for branch and bound and stores them in premises.

Parameters

_rowVar	
premises	

15.510.2.9 columns()

```
template<class Settings, typename T1, typename T2>
const std::vector<Variable<T1, T2>*>& smtrat::lra::Tableau< Settings, T1, T2 >::columns ( )
const [inline]
```

Returns

15.510.2.10 compressRows()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::compressRows ( )
```

15.510.2.11 compute_dVio()

```
template<class Settings, typename T1, typename T2>
std::map<Value<T1>, Value<T1> > smtrat::lra::Tableau< Settings, T1, T2 >::compute_dVio (
            const std::vector< std::pair< Value< T1 >, Variable< T1, T2 > * > > & candidates,
            const Variable< T1, T2 > & nVar,
            bool positive )
```

Updated Method to computed dVio more efficienlty.

For this the fact is used, that VioSum is piecewise linear (the proof can be found in the SoI paper).

Parameters

candidates	Update candidates, IMPORTANT: Must be sorted with an stabloe sorting algorithm
nVar	The updated nonbasic variable
positive	Whether the positve or negative update values are checked

15.510.2.12 computeLeavingCandidates()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::computeLeavingCandidates (
            const int & i,
            std::vector< std::pair< Value< T1 >, Variable< T1, T2 > * > > & leaving_↩
candidates )
```

Helper method to compute leavind candidates used in nextPivotingElementInfeasibilities.

Computes for every non-basic variable the breaking points. Updates from non-basic vars of 0 are omitted to prevent loops.

Parameters

i	: Index if entering (nonbasic) variable.
leaving_candidates	: Used as storage object for update candidates.

15.510.2.13 constraintToBound()

```
template<class Settings, typename T1, typename T2>
const carl::FastMap<FormulaT, std::vector<const Bound<T1, T2>*>*>& smtrat::lra::Tableau<
Settings, T1, T2 >::constraintToBound ( ) const  [inline]
```

Returns

15.510.2.14 currentDelta()

```
template<class Settings, typename T1, typename T2>
const T1& smtrat::lra::Tableau< Settings, T1, T2 >::currentDelta ( ) const  [inline]
```

15.510.2.15 deactivateBasicVar()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::deactivateBasicVar (
            Variable< T1, T2 > * _var )
```

Parameters

_var	

15.510.2.16 defaultBoundPosition()

```
template<class Settings, typename T1, typename T2>
auto smtrat::lra::Tableau< Settings, T1, T2 >::defaultBoundPosition ( ) const  [inline]
```

Returns

15.510.2.17 deleteVariable()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::deleteVariable (
            Variable< T1, T2 > * _variable,
            bool _optimizationVar = false )
```

Parameters

_variable	

15.510.2.18 dViolationSum()

```
template<class Settings, typename T1, typename T2>
Value<T1> smtrat::lra::Tableau< Settings, T1, T2 >::dViolationSum (
            const Variable< T1, T2 > * nVar,
            const Value< T1 > & update )
```

Computes the change in the violation sum when an the update value is added to the assignment of the nonbassi variable nVar.

Parameters

nVar	variable to be updated
update	Update value

15.510.2.19 entryIsNegative()

```
template<class Settings, typename T1, typename T2>
bool smtrat::lra::Tableau< Settings, T1, T2 >::entryIsNegative (
            const TableauEntry< T1, T2 > & _entry ) const  [inline]
```

15.510.2.20 entryIsPositive()

```
template<class Settings, typename T1, typename T2>
bool smtrat::lra::Tableau< Settings, T1, T2 >::entryIsPositive (
            const TableauEntry< T1, T2 > & _entry ) const  [inline]
```

15.510.2.21 get_dVioSum()

```
template<class Settings, typename T1, typename T2>
Value<T1> smtrat::lra::Tableau< Settings, T1, T2 >::get_dVioSum ( )  [inline]
```

Used as assertion-function to check the progress of the tableau.

15.510.2.22 getConflict()

```
template<class Settings, typename T1, typename T2>
std::vector< const Bound<T1, T2>* > smtrat::lra::Tableau< Settings, T1, T2 >::getConflict (
            EntryID _rowEntry ) const
```

Parameters

_rowEntry	

Returns

15.510.2.23 getConflictsFrom()

```
template<class Settings, typename T1, typename T2>
std::vector< std::vector< const Bound<T1, T2>* > > smtrat::lra::Tableau< Settings, T1, T2
>::getConflictsFrom (
            EntryID _rowEntry ) const
```

Parameters

_rowEntry	

Returns

15.510.2.24 getInfeasibilityRow()

```
template<class Settings, typename T1, typename T2>
std::vector<T2> smtrat::lra::Tableau< Settings, T1, T2 >::getInfeasibilityRow ( )
```

Method to compute the infeasibility row to the current tableau.

15.510.2.25 getMultilineConflict()

```
template<class Settings, typename T1, typename T2>
std::vector< const Bound<T1, T2>* > smtrat::lra::Tableau< Settings, T1, T2 >::getMultiline↩
Conflict ( )
```

Returns In SUM-Simplex a conflict is possibly created with multiple rows. This function returns the single conflict if possible and otherwise construct the multiline conflict.

15.510.2.26 getNumberOfEntries()

```
template<class Settings, typename T1, typename T2>
size_t smtrat::lra::Tableau< Settings, T1, T2 >::getNumberOfEntries (
            Variable< T1, T2 > * _rowVar )
```

Parameters

_rowVar	

Returns number of entries in the row belonging to _rowVar

15.510.2.27 getObjectiveVariable()

```
template<class Settings, typename T1, typename T2>
Variable<T1,T2>* smtrat::lra::Tableau< Settings, T1, T2 >::getObjectiveVariable (
            const Poly & _lhs )
```

15.510.2.28 getRationalAssignment()

```
template<class Settings, typename T1, typename T2>
EvalRationalMap smtrat::lra::Tableau< Settings, T1, T2 >::getRationalAssignment ( ) const
```

Returns

15.510.2.29 getVariable()

```
template<class Settings, typename T1, typename T2>
Variable<T1,T2>* smtrat::lra::Tableau< Settings, T1, T2 >::getVariable (
            const Poly & _lhs,
            T1 & _factor,
            T1 & _boundValue )
```

15.510.2.30 gomoryCut()

```
template<class Settings, typename T1, typename T2>
const Poly::PolyType* smtrat::lra::Tableau< Settings, T1, T2 >::gomoryCut (
            const T2 & _ass,
            Variable< T1, T2 > * _rowVar )
```

Creates a constraint referring to Gomory Cuts, if possible.

Parameters

_ass	
_rowVar	

Returns NULL, if the cut can´t be constructed; otherwise the valid constraint is returned.

15.510.2.31 hasConflict()

```
template<class Settings, typename T1, typename T2>
std::pair<EntryID,bool> smtrat::lra::Tableau< Settings, T1, T2 >::hasConflict ( )
```

Checks if a conflicting pair exists.

In a conflict is found, the cell and false is returned. If not, LAST_ENTRY_ID and true is returned.

15.510.2.32 hasMultilineConflict()

```
template<class Settings, typename T1, typename T2>
bool smtrat::lra::Tableau< Settings, T1, T2 >::hasMultilineConflict ( )
```

Returns In SUM-Simplex a conflict is possibly created with multiple rows. This function returns true iff the multi-conflict settings occured.

15.510.2.33 isActive()

```
template<class Settings, typename T1, typename T2>
bool smtrat::lra::Tableau< Settings, T1, T2 >::isActive (
            const Variable< T1, T2 > & _var ) const  [inline]
```

15.510.2.34 isConflicting()

```
template<class Settings, typename T1, typename T2>
bool smtrat::lra::Tableau< Settings, T1, T2 >::isConflicting ( ) const
```

15.510.2.35 isSuitable()

```
template<class Settings, typename T1, typename T2>
EntryID smtrat::lra::Tableau< Settings, T1, T2 >::isSuitable (
            const Variable< T1, T2 > & _basicVar,
            bool _forIncreasingAssignment ) const
```

Parameters

_basicVar	
_forIncreasingAssignment	

Returns

15.510.2.36 isSuitableConflictDetection()

```
template<class Settings, typename T1, typename T2>
EntryID smtrat::lra::Tableau< Settings, T1, T2 >::isSuitableConflictDetection (
            const Variable< T1, T2 > & _basicVar,
            bool _forIncreasingAssignment ) const
```

Checks if the basic variable is pivotable.

Returns LAST_ENTRY_ID as EntryID if a conflict was found. In difference to isSuitable returns this function an EntryID as soon as the EntryID bestEntry is unequal to LAST_ENTRY_ID. The assertions are still checked.

Parameters

_basicVar	
_forIncreasingAssignment	

Returns

15.510.2.37 newBasicVariable()

```
template<class Settings, typename T1, typename T2>
Variable<T1, T2>* smtrat::lra::Tableau< Settings, T1, T2 >::newBasicVariable (
            const typename Poly::PolyType * _poly,
            bool _isInteger )
```

Parameters

_poly	
_originalVars	
_isInteger	

Returns

15.510.2.38 newBound()

```
template<class Settings, typename T1, typename T2>
std::pair<const Bound<T1,T2>*, bool> smtrat::lra::Tableau< Settings, T1, T2 >::newBound (
            const FormulaT & _constraint )
```

Parameters

_constraint	

Returns

15.510.2.39 newNonbasicVariable()

```
template<class Settings, typename T1, typename T2>
Variable<T1, T2>* smtrat::lra::Tableau< Settings, T1, T2 >::newNonbasicVariable (
            const typename Poly::PolyType * _poly,
            bool _isInteger )
```

Parameters

_poly	
_isInteger	

Returns

15.510.2.40 newTableauEntry()

```
template<class Settings, typename T1, typename T2>
EntryID smtrat::lra::Tableau< Settings, T1, T2 >::newTableauEntry (
            const T2 & _content )
```

Parameters

_content	

Returns

15.510.2.41 nextPivotingElement()

```
template<class Settings, typename T1, typename T2>
std::pair<EntryID, bool> smtrat::lra::Tableau< Settings, T1, T2 >::nextPivotingElement ( )
```

Returns

15.510.2.42 nextPivotingElementForOptimizing()

```
template<class Settings, typename T1, typename T2>
std::pair<EntryID,bool> smtrat::lra::Tableau< Settings, T1, T2 >::nextPivotingElementFor↩
Optimizing (
            const Variable< T1, T2 > & _objective )
```

Returns

15.510.2.43 nextPivotingElementInfeasibilities()

```
template<class Settings, typename T1, typename T2>
std::pair<EntryID, bool> smtrat::lra::Tableau< Settings, T1, T2 >::nextPivotingElement↩
Infeasibilities ( )
```

Method for next pivoting element according to ”Simplex with Sum of Infeasibilities for SMT” by Tim King and Clark Barrett.

Herefore, one counts the vialation of every bound and searches for elements who minimize the violation sum of the next iteration.

Returns

15.510.2.44 nextZeroPivotingElementForOptimizing()

```
template<class Settings, typename T1, typename T2>
std::pair<EntryID,bool> smtrat::lra::Tableau< Settings, T1, T2 >::nextZeroPivotingElement↩
ForOptimizing (
            const Variable< T1, T2 > & _objective ) const
```

15.510.2.45 numberOfPivotingSteps()

```
template<class Settings, typename T1, typename T2>
size_t smtrat::lra::Tableau< Settings, T1, T2 >::numberOfPivotingSteps ( ) const  [inline]
```

Returns

15.510.2.46 optimizeIndependentNonbasics()

```
template<class Settings, typename T1, typename T2>
std::pair<EntryID,bool> smtrat::lra::Tableau< Settings, T1, T2 >::optimizeIndependentNonbasics
(
            const Variable< T1, T2 > & _objective )
```

Parameters

_objective	

Returns

15.510.2.47 originalVars()

```
template<class Settings, typename T1, typename T2>
const carl::FastMap< carl::Variable, Variable<T1,T2>*>& smtrat::lra::Tableau< Settings, T1,
T2 >::originalVars ( ) const [inline]
```

Returns

15.510.2.48 pivot()

```
template<class Settings, typename T1, typename T2>
Variable<T1, T2>* smtrat::lra::Tableau< Settings, T1, T2 >::pivot (
            EntryID _pivotingElement,
            bool _optimizing = false )
```

Parameters

_pivotingElement	
updateAssignments	

Returns

15.510.2.49 print()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::print (
            EntryID _pivotingElement = LAST_ENTRY_ID,
            std::ostream & _out = std::cout,
            const std::string _init = "",
            bool _friendlyNames = true,
            bool _withZeroColumns = false ) const
```

Parameters

_pivotingElement	
_out	
_init	
_friendlyNames	
_withZeroColumns	

15.510.2.50 printEntries()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::printEntries ( ) [inline]
```

15.510.2.51 printEntry()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::printEntry (
            EntryID _entry,
            std::ostream & _out = std::cout,
            int _maxEntryLength = 20 ) const
```

Parameters

_entry	
_out	
_maxEntryLength	

15.510.2.52 printHeap()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::printHeap (
            std::ostream & _out = std::cout,
            int _maxEntryLength = 30,
            const std::string _init = "" ) const
```

Parameters

_out	
_maxEntryLength	
_init	

15.510.2.53 printLearnedBound()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::printLearnedBound (
            const Variable< T1, T2 > & _var,
            const LearnedBound & _learnedBound,
            const std::string _init = "",
            std::ostream & _out = std::cout ) const
```

Parameters

_var	
_learnedBound	
_init	
_out	

15.510.2.54 printLearnedBounds()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::printLearnedBounds (
            const std::string _init = "",
            std::ostream & _out = std::cout ) const
```

Parameters

_init	
_out	

15.510.2.55 printVariables()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::printVariables (
            bool _allBounds = true,
            std::ostream & _out = std::cout,
            const std::string _init = "" ) const
```

Parameters

_allBounds	
_out	
_init	

15.510.2.56 rConstraintToBound()

```
template<class Settings, typename T1, typename T2>
carl::FastMap<FormulaT, std::vector<const Bound<T1, T2>*>*>& smtrat::lra::Tableau< Settings,
T1, T2 >::rConstraintToBound ( ) [inline]
```

Returns

15.510.2.57 removeBound()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::removeBound (
            const FormulaT & _constraint )
```

15.510.2.58 removeEntry()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::removeEntry (
            EntryID _entryID )
```

Parameters

_entryID	

15.510.2.59 resetAssignment()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::resetAssignment ( )
```

15.510.2.60 resetNumberOfPivotingSteps()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::resetNumberOfPivotingSteps ( ) [inline]
```

15.510.2.61 resetTheta()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::resetTheta ( ) [inline]
```

15.510.2.62 rLearnedLowerBounds()

```
template<class Settings, typename T1, typename T2>
carl::FastPointerMap<Variable<T1,T2>, LearnedBound>& smtrat::lra::Tableau< Settings, T1, T2
>::rLearnedLowerBounds ( ) [inline]
```

Returns

15.510.2.63 rLearnedUpperBounds()

```
template<class Settings, typename T1, typename T2>
carl::FastPointerMap<Variable<T1,T2>, LearnedBound>& smtrat::lra::Tableau< Settings, T1, T2
>::rLearnedUpperBounds ( ) [inline]
```

Returns

15.510.2.64 rNewLearnedBounds()

```
template<class Settings, typename T1, typename T2>
std::vector<typename carl::FastPointerMap<Variable<T1,T2>, LearnedBound>::iterator>& smtrat::lra::Tableau<
Settings, T1, T2 >::rNewLearnedBounds ( ) [inline]
```

Returns

15.510.2.65 rowCorrect()

```
template<class Settings, typename T1, typename T2>
bool smtrat::lra::Tableau< Settings, T1, T2 >::rowCorrect (
            size_t _rowNumber ) const
```

Parameters

_rowNumber	

Returns

15.510.2.66 rowRefinement()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::rowRefinement (
            Variable< T1, T2 > * _basicVar )
```

Tries to refine the supremum and infimum of the given basic variable.

Parameters

_basicVar	The basic variable for which to refine the supremum and infimum.

15.510.2.67 rows()

```
template<class Settings, typename T1, typename T2>
const std::vector<Variable<T1, T2>*>& smtrat::lra::Tableau< Settings, T1, T2 >::rows ( )
const [inline]
```

Returns

15.510.2.68 setBlandsRuleStart()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::setBlandsRuleStart (
            size_t _start ) [inline]
```

15.510.2.69 setInfeasibilityRow()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::setInfeasibilityRow ( )
```

Method to set the initital infeasibility row to avoid recomputation in every round.

15.510.2.70 setSize()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::setSize (
            size_t _expectedHeight,
            size_t _expectedWidth,
            size_t _expectedNumberOfBounds ) [inline]
```

Parameters

_expectedHeight	
_expectedWidth	
_expectedNumberOfBounds	

15.510.2.71 size()

```
template<class Settings, typename T1, typename T2>
size_t smtrat::lra::Tableau< Settings, T1, T2 >::size ( ) const [inline]
```

Returns

15.510.2.72 slackVars()

```
template<class Settings, typename T1, typename T2>
const carl::FastPointerMap<typename Poly::PolyType, Variable<T1,T2>*>& smtrat::lra::Tableau<
Settings, T1, T2 >::slackVars ( ) const [inline]
```

Returns

15.510.2.73 storeAssignment()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::storeAssignment ( )
```

15.510.2.74 unboundedVariables()

```
template<class Settings, typename T1, typename T2>
size_t smtrat::lra::Tableau< Settings, T1, T2 >::unboundedVariables (
            const Variable< T1, T2 > & _var,
            size_t _stopCriterium = 0 ) const
```

Parameters

_var	
_stopCriterium	

Returns

15.510.2.75 update()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::update (
            bool _downwards,
            EntryID _pivotingElement,
            std::vector< Iterator > & _pivotingRowLeftSide,
            std::vector< Iterator > & _pivotingRowRightSide,
            bool _optimizing = false )
```

Updates the tableau according to the new values in the pivoting row containing the given pivoting element.

The updating is applied from the pivoting row downwards, if the given flag _downwards is true, and upwards, otherwise.

Parameters

_downwards	The flag indicating whether to update the tableau downwards or upwards starting from the pivoting row.
_pivotingElement	The id of the current pivoting element.
_pivotingRowLeftSide	For every element in the pivoting row, which is positioned left of the pivoting element, this vector contains an iterator. The closer the element is to the pivoting element, the smaller is the iterator's index in the vector.
_pivotingRowRightSide	For every element in the pivoting row, which is positioned right of the pivoting element, this vector contains an iterator. The closer the element is to the pivoting element, the smaller is the iterator's index in the vector.
_updateAssignments	If true, the assignments of all variables will be updated after pivoting.

15.510.2.76 updateBasicAssignments()

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::updateBasicAssignments (
            size_t _column,
            const Value< T1 > & _change )
```

Parameters

_column	
_change	

15.510.2.77 updateNonbasicVariable() [1/2]

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::updateNonbasicVariable (
            EntryID _pivotingElement )
```

Updates a nonbasic variable by the assignment stored in mpTheta and triggers updates of depending basic variables.

Parameters

_pivotingElement	Element in the row of the nonbasic variable

15.510.2.78 updateNonbasicVariable() [2/2]

```
template<class Settings, typename T1, typename T2>
void smtrat::lra::Tableau< Settings, T1, T2 >::updateNonbasicVariable (
            EntryID _pivotingElement,
            Value< T1 > update )
```

Updates a nonbasic variable by the given assignment and triggers updates of depending basic variables.

Parameters

_pivotingElement	Element in the row of the nonbasic variable
update	Update Value of non-basic var

15.510.2.79 usedBlandsRule()

```
template<class Settings, typename T1, typename T2>
bool smtrat::lra::Tableau< Settings, T1, T2 >::usedBlandsRule ( )
```

Returns true, if the next pivoting element is selected by blands rule.

15.510.2.80 violationSum()

```
template<class Settings, typename T1, typename T2>
Value<T1> smtrat::lra::Tableau< Settings, T1, T2 >::violationSum ( )
```

Method to compute the sum of derivations to the closest bounds.

15.511 smtrat::lra::TableauEntry< T1, T2 > Class Template Reference

```
#include <Tableau.h>
```

Public Member Functions

```

15.511.1.2 TableauEntry() [2/3]

```
template<typename T1, typename T2>
smtrat::lra::TableauEntry< T1, T2 >::TableauEntry (
            EntryID _up,
            EntryID _down,
            EntryID _left,
            EntryID _right,
            Variable< T1, T2 > * _rowVar,
            Variable< T1, T2 > * _columnVar,
            const T2 & _content ) [inline]
```

Parameters

_up	
_down	
_left	
_right	
_rowVar	
_columnVar	
_content	

15.511.1.3 TableauEntry() [3/3]

```
template<typename T1, typename T2>
smtrat::lra::TableauEntry< T1, T2 >::TableauEntry (
            const TableauEntry< T1, T2 > & _entry ) [inline]
```

Parameters

_entry	

15.511.1.4 ~TableauEntry()

```
template<typename T1, typename T2>
smtrat::lra::TableauEntry< T1, T2 >::~TableauEntry ( ) [inline]
```

15.511.2 Member Function Documentation

15.511.2.1 columnVar()

```
template<typename T1, typename T2>
Variable<T1, T2>* smtrat::lra::TableauEntry< T1, T2 >::columnVar ( ) const [inline]
```

Returns

15.511.2.2 content()

```
template<typename T1, typename T2>
const T2& smtrat::lra::TableauEntry< T1, T2 >::content ( ) const [inline]
```

Returns

15.511.2.3 hNext()

```
template<typename T1, typename T2>
EntryID smtrat::lra::TableauEntry< T1, T2 >::hNext (
            bool leftwards ) [inline]
```

Parameters

leftwards	

Returns

15.511.2.4 rContent()

```
template<typename T1, typename T2>
T2& smtrat::lra::TableauEntry< T1, T2 >::rContent ( ) [inline]
```

Returns

15.511.2.5 rowVar()

```
template<typename T1, typename T2>
Variable<T1, T2>* smtrat::lra::TableauEntry< T1, T2 >::rowVar ( ) const [inline]
```

Returns

15.511.2.6 setColumnVar()

```
template<typename T1, typename T2>
void smtrat::lra::TableauEntry< T1, T2 >::setColumnVar (
            Variable< T1, T2 > * _columnVar ) [inline]
```

Parameters

_columnVar	

15.511.2.7 setHNext()

```
template<typename T1, typename T2>
void smtrat::lra::TableauEntry< T1, T2 >::setHNext (
            bool leftwards,
            const EntryID _entryId ) [inline]
```

Parameters

leftwards	
_entryId	

15.511.2.8 setRowVar()

```
template<typename T1, typename T2>
void smtrat::lra::TableauEntry< T1, T2 >::setRowVar (
            Variable< T1, T2 > * _rowVar ) [inline]
```

Parameters

_rowVar	

15.511.2.9 setVNext()

```
template<typename T1, typename T2>
void smtrat::lra::TableauEntry< T1, T2 >::setVNext (
            bool downwards,
            const EntryID _entryId ) [inline]
```

Parameters

downwards	
_entryId	

15.511.2.10 vNext()

```
template<typename T1, typename T2>
EntryID smtrat::lra::TableauEntry< T1, T2 >::vNext (
            bool downwards ) [inline]
```

Parameters

downwards	

Returns

15.512 smtrat::mcsat::onecellcad::TagPoly Struct Reference

Tagged Polynomials.

```
#include <utils.h>
```

Data Fields

15.513.2.5 run() `void smtrat::Task::run ( ) [inline]`

15.514 delta::TempFilenameGenerator Class Reference

This class generates and reuses temporary filenames with a common prefix.

```
#include <utils.h>
```

Public Member Functions

- TempFilenameGenerator (const std::string &prefix)

  Constructor.
- ~TempFilenameGenerator ()

  Destructor.
- std::string get ()

  Retrieve a filename for a temporary file that is not in use.
- void put (const std::string &temp)

  Returns a filename to the pool of available filenames.

15.514.1 Detailed Description

This class generates and reuses temporary filenames with a common prefix.

15.514.2 Constructor & Destructor Documentation

15.514.2.1 TempFilenameGenerator() `delta::TempFilenameGenerator::TempFilenameGenerator ( const std::string & prefix ) [inline]`

Constructor.

Parameters

prefix	Prefix for all filenames.

15.514.2.2 ~TempFilenameGenerator() `delta::TempFilenameGenerator::~TempFilenameGenerator ( ) [inline]`

Destructor.

15.514.3 Member Function Documentation

15.514.3.1 get() `std::string delta::TempFilenameGenerator::get ( ) [inline]`

Retrieve a filename for a temporary file that is not in use.

Returns Temporary filename.

15.514.3.2 put() `void delta::TempFilenameGenerator::put ( const std::string & temp ) [inline]`

Returns a filename to the pool of available filenames.

Parameters

temp	Temporary filename.

15.515 smtrat::parser::TermParser Struct Reference

Static Public Member Functions

- static void addConstants (qi::symbols< char, types::ConstType > &constants)

  Collects constants from all theory modules.
- static void addSimpleSorts (qi::symbols< char, carl::Sort > &sorts)

  Collects simple sorts from all theory modules.

15.517.1 Detailed Description The Theories class combines all implemented theories and provides a single interface to interact with all theories at once.

15.517.2 Member Typedef Documentation

15.517.2.1 Modules `typedef boost::mpl::vector< CoreTheory* , ArithmeticTheory* , BitvectorTheory* , UninterpretedTheory* , BooleanEncodingTheory* >::type smtrat::parser::Theories::Modules`

15.517.3 Constructor & Destructor Documentation

15.517.3.1 Theories()

```
smtrat::parser::Theories::Theories (
    ParserState * state ) [inline]
```

15.517.3.2 ~Theories()

```
smtrat::parser::Theories::~Theories ( ) [inline]
```

15.517.4 Member Function Documentation

15.517.4.1 addConstants()

```
static void smtrat::parser::Theories::addConstants (
    qi::symbols< char, types::ConstType > & constants ) [inline], [static]
```

Collects constants from all theory modules.

15.517.4.2 addGlobalFormulas()

```
void smtrat::parser::Theories::addGlobalFormulas (
    FormulasT & formulas ) [inline]
```

15.517.4.3 addSimpleSorts()

```
static void smtrat::parser::Theories::addSimpleSorts (
    qi::symbols< char, carl::Sort > & sorts ) [inline], [static]
```

Collects simple sorts from all theory modules.

15.517.4.4 annotateTerm()

```
const auto& smtrat::parser::Theories::annotateTerm (
    const types::TermType & term,
    const std::vector< Attribute > & attributes ) [inline]
```

15.517.4.5 declareFunction()

```
void smtrat::parser::Theories::declareFunction (
    const std::string & name,
    const std::vector< carl::Sort > & args,
    const carl::Sort & sort ) [inline]
```

15.517.4.6 declareFunctionArgument()

```
types::VariableType smtrat::parser::Theories::declare↩
FunctionArgument (
    const std::pair< std::string, carl::Sort > & arg ) [inline]
```

15.517.4.7 declareVariable()

```
void smtrat::parser::Theories::declareVariable (
    const std::string & name,
    const carl::Sort & sort ) [inline]
```

15.517.4.8 defineFunction()

```
void smtrat::parser::Theories::defineFunction (
    const std::string & name,
    const std::vector< types::VariableType > & arguments,
    const carl::Sort & sort,
    const types::TermType & definition ) [inline]
```

Todo check that definition matches the sort

15.517.4.9 functionCall()

```
types::TermType smtrat::parser::Theories::functionCall (
    const Identifier & identifier,
    const std::vector< types::TermType > & arguments ) [inline]
```

15.517.4.10 handleDistinct()

```
types::TermType smtrat::parser::Theories::handleDistinct (

```

Data Fields

- carl::Variable variable = carl::Variable::NO_VARIABLE

  Theory variable for this level.
- Minisat::Lit decisionLiteral = Minisat::lit_Undef

  Literal that assigns this theory variable.
- std::vector< Minisat::Var > decidedVariables

  Boolean variables univariate in this theory variable.

15.519.1 Field Documentation

15.519.1.1 decidedVariables `std::vector<Minisat::Var> smtrat::mcsat::TheoryLevel::decidedVariables`

Boolean variables univariate in this theory variable.

15.519.1.2 decisionLiteral `Minisat::Lit smtrat::mcsat::TheoryLevel::decisionLiteral = Minisat::lit_Undef`

Literal that assigns this theory variable.

15.519.1.3 variable `carl::Variable smtrat::mcsat::TheoryLevel::variable = carl::Variable::NO_VARIABLE`

Theory variable for this level.

15.521.1 Detailed Description

template<mcsat::VariableOrdering vot>
class smtrat::TheoryVarSchedulerStatic< vot >

Schedules theory variables statically.

Should not be used directly.

15.521.2 Constructor & Destructor Documentation

15.521.2.1 TheoryVarSchedulerStatic()

```
template<mcsat::VariableOrdering vot>
template<typename BaseModule >
smtrat::TheoryVarSchedulerStatic< vot >::TheoryVarSchedulerStatic (
            BaseModule & baseModule ) [inline], [explicit]
```

15.521.3 Member Function Documentation

15.521.3.1 attachClause()

```
void smtrat::VarSchedulerBase::attachClause (
            Minisat::CRef ) [inline], [inherited]
```

15.521.3.2 decreaseActivity()

```
void smtrat::VarSchedulerBase::decreaseActivity (
            Minisat::Var ) [inline], [inherited]
```

15.521.3.3 detachClause()

```
void smtrat::VarSchedulerBase::detachClause (
            Minisat::CRef ) [inline], [inherited]
```

15.521.3.4 empty()

```
template<mcsat::VariableOrdering vot>
bool smtrat::TheoryVarSchedulerStatic< vot >::empty ( ) [inline]
```

15.521.3.5 increaseActivity()

```
void smtrat::VarSchedulerBase::increaseActivity (
            Minisat::Var ) [inline], [inherited]
```

15.521.3.6 insert()

```
template<mcsat::VariableOrdering vot>
void smtrat::TheoryVarSchedulerStatic< vot >::insert (
            Minisat::Var var ) [inline]
```

15.521.3.7 level()

```
template<mcsat::VariableOrdering vot>
size_t smtrat::TheoryVarSchedulerStatic< vot >::level ( ) [inline]
```

Level of the next theory variable.

15.521.3.8 pop()

```
template<mcsat::VariableOrdering vot>
Minisat::Lit smtrat::TheoryVarSchedulerStatic< vot >::pop ( ) [inline]
```

15.521.3.9 print()

```
template<mcsat::VariableOrdering vot>
void smtrat::TheoryVarSchedulerStatic< vot >::print ( ) const [inline]
```

15.521.3.10 rebuild()

```
void smtrat::VarSchedulerBase::rebuild ( ) [inline], [inherited]
```

Rebuild heap.

15.521.3.11 rebuildActivities()

```
void smtrat::VarSchedulerBase::rebuildActivities ( ) [inline],
[inherited]
```

15.521.3.12 rebuildTheoryVars()

```
template<mcsat::VariableOrdering vot>
template<typename Constraints >
void smtrat::TheoryVarSchedulerStatic< vot >::rebuildTheoryVars (
            const Constraints & c ) [inline]
```

15.521.3.13 relocateClauses()

```
void smtrat::VarSchedulerBase::relocateClauses (
            std::function< void(Minisat::CRef &)> ) [inline], [inherited]
```

15.521.3.14 univariateLevel()

```
template<mcsat::VariableOrdering vot>
size_t smtrat::TheoryVarSchedulerStatic< vot >::univariateLevel (
            Minisat::Var v ) [inline]
```

Returns the level in which the given constraint is univariate.

15.521.4 Field Documentation

Protected Member Functions

- std::string printableID (const std::string &raw, const std::string &prefix, std::map< std::string, std::string > &map) const

Protected Attributes

- std::size_t mStep

15.523.1 Member Function Documentation

15.523.1.1 addEdge()

```
virtual void smtrat::cad::debug::TikzBasePrinter::addEdge (
    const std::string & src,
    const std::string & dst,
    const std::string & data ) [pure virtual]
```

Implemented in smtrat::cad::debug::TikzTreePrinter, and smtrat::cad::debug::TikzDAGPrinter.

15.523.1.2 addNode()

```
virtual void smtrat::cad::debug::TikzBasePrinter::addNode (
    std::size_t level,
    const std::string & parent,
    const std::string & node,
    const std::string & data ) [pure virtual]
```

Implemented in smtrat::cad::debug::TikzTreePrinter, and smtrat::cad::debug::TikzDAGPrinter.

15.523.1.3 layout()

```
virtual void smtrat::cad::debug::TikzBasePrinter::layout ( ) [pure virtual]
```

Implemented in smtrat::cad::debug::TikzTreePrinter, and smtrat::cad::debug::TikzDAGPrinter.

15.523.1.4 printableID()

```
std::string smtrat::cad::debug::TikzBasePrinter::printableID (
    const std::string & raw,
    const std::string & prefix,
    std::map< std::string, std::string > & map ) const  [inline], [protected]
```

15.523.1.5 step()

```
void smtrat::cad::debug::TikzBasePrinter::step ( )  [inline]
```

15.523.1.6 width()

```
virtual std::size_t smtrat::cad::debug::TikzBasePrinter::width ( ) const
[pure virtual]
```

Implemented in smtrat::cad::debug::TikzTreePrinter, and smtrat::cad::debug::TikzDAGPrinter.

15.523.1.7 writeTo()

```
virtual void smtrat::cad::debug::TikzBasePrinter::writeTo (
    std::ostream & os,
    int xBase ) const  [pure virtual]
```

Implemented in smtrat::cad::debug::TikzTreePrinter, and smtrat::cad::debug::TikzDAGPrinter.

15.523.2 Field Documentation

15.523.2.1 mStep

```
std::size_t smtrat::cad::debug::TikzBasePrinter::mStep  [protected]
```

15.524 smtrat::cad::debug::TikzDAGPrinter Class Reference

```
#include <TikzHistoryPrinter.h>
```

Public Member Functions

15.524.1 Member Function Documentation

15.524.1.1 addEdge()

```
void smtrat::cad::debug::TikzDAGPrinter::addEdge (
    const std::string & src,
    const std::string & dst,
    const std::string & data )  [inline], [override], [virtual]
```

Implements smtrat::cad::debug::TikzBasePrinter.

15.524.1.2 addNode()

```
void smtrat::cad::debug::TikzDAGPrinter::addNode (
    std::size_t level,
    const std::string & ,
    const std::string & node,
    const std::string & data ) [inline], [override], [virtual]
```

Implements smtrat::cad::debug::TikzBasePrinter.

15.524.1.3 layout()

```
void smtrat::cad::debug::TikzDAGPrinter::layout ( ) [inline], [override], [virtual]
```

Implements smtrat::cad::debug::TikzBasePrinter.

15.524.1.4 printableID()

```
std::string smtrat::cad::debug::TikzBasePrinter::printableID (
    const std::string & raw,
    const std::string & prefix,
    std::map< std::string, std::string > & map ) const [inline], [protected], [inherited]
```

15.524.1.5 step()

```
void smtrat::cad::debug::TikzBasePrinter::step ( ) [inline], [inherited]
```

15.524.1.6 width()

```
std::size_t smtrat::cad::debug::TikzDAGPrinter::width ( ) const [inline], [override], [virtual]
```

Implements smtrat::cad::debug::TikzBasePrinter.

15.524.1.7 writeTo()

```
void smtrat::cad::debug::TikzDAGPrinter::writeTo (
    std::ostream & os,
    int xBase ) const [inline], [override], [virtual]
```

Implements smtrat::cad::debug::TikzBasePrinter.

15.524.2 Field Documentation

15.524.2.1 mStep

```
std::size_t smtrat::cad::debug::TikzBasePrinter::mStep [protected], [inherited]
```

15.525 smtrat::cad::debug::TikzHistoryPrinter Class Reference

15.527 benchmax::Tool Class Reference

Base class for any tool.

`#include <Tool.h>`

Public Member Functions

- Tool ()=delete
- Tool (const Tool &)=delete
- Tool (Tool &&)=delete
- Tool (const fs::path &binary, const std::string &arguments)

  Creates a generic tool from a binary and command line arguments.
- Tool (const std::string &name, const fs::path &binary, const std::string &arguments)

  Creates a named tool from a binary and command line arguments.
- virtual ~Tool ()=default
- Tool & operator= (const Tool &)=delete
- Tool & operator= (Tool &&)=delete
- std::string name () const

  Common name of this tool.
- fs::path binary () const

  Full path to the binary.
- const std::map< std::string, std::string > & attributes () const

  A set of attributes, for example compilation options.
- std::vector< std::string > resolveDependencies () const

  Get dependencies of binary required to run it (via ldd)
- std::size_t attributeHash () const

  Hash of the attributes.
- virtual std::string getCommandline (const std::string &file) const

  Compose commandline for this tool and the given input file.
- virtual std::string getCommandline (const std::string &file, const std::string &localBinary) const

  Compose commandline for this tool with another binary name and the given input file.
- virtual std::optional< std::string > parseCommandline (const std::string &cmdline) const

  Compose commandline for this tool and the given input file.
- virtual bool canHandle (const fs::path &) const

  Checks whether this cool can handle this file type.
- virtual void additionalResults (const fs::path &, BenchmarkResult &) const

  Recover additional results from the tool output.

Protected Attributes

- std::string mName

  (Non-unique) identifier for the tool.
- fs::path mBinary

  Path to the binary.
- std::string mArguments

  Command line arguments that should be passed to the binary.
- std::map< std::string, std::string > mAttributes

  Attributes of the tool obtained by introspection of the binary.

Friends

- bool operator< (const Tool &lhs, const Tool &rhs)

  Compare two tools.

15.527.1 Detailed Description

Base class for any tool.

A tool represents some executable that can be run with some input file. A tool is responsible for

- deciding it is applicable for a given file extension,
- building a command line to execute it and
- parse additional results from stdout / stderr after it has run.

A tool is not to be copied or moved around but should only exist a single time.

15.527.2 Constructor & Destructor Documentation

15.527.2.1 Tool() [1/5]

```
benchmax::Tool::Tool ( ) [delete]
```

15.527.2.2 Tool() [2/5]

```
benchmax::Tool::Tool (
    const Tool & ) [delete]
```

15.527.2.3 Tool() [3/5]

```
benchmax::Tool::Tool (
    Tool && ) [delete]
```

15.527.2.4 Tool() [4/5]

```
benchmax::Tool::Tool (
    const fs::path & binary,
    const std::string & arguments ) [inline]
```

Creates a generic tool from a binary and command line arguments.

15.527.2.5 Tool() [5/5]

```
benchmax::Tool::Tool (
    const std::string & name,
    const fs::path & binary,
    const std::string & arguments ) [inline]
```

Creates a named tool from a binary and command line arguments.

15.527.2.6 ~Tool()

```
virtual benchmax::Tool::~Tool ( ) [virtual], [default]
```

15.527.3 Member Function Documentation

15.527.3.1 additionalResults()

```
virtual void benchmax::Tool::additionalResults (
    const fs::path & ,
    BenchmarkResult & ) const [inline], [virtual]
```

Recover additional results from the tool output.

Reimplemented in benchmax::SMTRAT, benchmax::Minisatp, benchmax::Minisat, benchmax::MathSAT, benchmax::SMTRAT_Analyzer, and benchmax::Z3.

15.527.3.2 attributeHash()

```
std::size_t benchmax::Tool::attributeHash ( ) const [inline]
```

Hash of the attributes.

15.527.3.3 attributes()

```
const std::map<std::string,std::string>& benchmax::Tool::attributes ( )
const [inline]
```

A set of attributes, for example compilation options.

15.527.3.4 binary()

```
fs::path benchmax::Tool::binary ( ) const [inline]
```

Full path to the binary.

15.527.3.5 canHandle()

```
virtual bool benchmax::Tool::canHandle (
    const fs::path & ) const [inline], [virtual]
```

Checks whether this cool can handle this file type.

Reimplemented in benchmax::SMTRAT, benchmax::Minisatp, benchmax::Minisat, benchmax::MathSAT, benchmax::SMTRAT_Analyzer, benchmax::SMTRAT_OPB, and benchmax::Z3.

15.527.3.6 getCommandline() [1/2]

```
virtual std::string benchmax::Tool::getCommandline (
    const std::string & file ) const [inline], [virtual]
```

Compose commandline for this tool and the given input file.

15.527.3.7 getCommandline() [2/2]

```
virtual std::string benchmax::Tool::getCommandline (
    const std::string & file,
    const std::string & localBinary ) const [inline], [virtual]
```

Compose commandline for this tool with another binary name and the given input file.

15.527.3.8 name() `std::string benchmax::Tool::name ( ) const [inline]`

Common name of this tool.

15.527.3.9 operator=() [1/2] `Tool& benchmax::Tool::operator= ( const Tool & ) [delete]`

15.527.3.10 operator=() [2/2] `Tool& benchmax::Tool::operator= ( Tool && ) [delete]`

15.527.3.11 parseCommandline() `virtual std::optional<std::string> benchmax::Tool::parseCommandline ( const std::string & cmdline ) const [inline], [virtual]`

Compose commandline for this tool and the given input file.

15.527.3.12 resolveDependencies() `std::vector<std::string> benchmax::Tool::resolveDependencies ( ) const [inline]`

Get dependencies of binary required to run it (via ldd)

15.527.4 Friends And Related Function Documentation

15.527.4.1 operator< `bool operator< ( const Tool & lhs, const Tool & rhs ) [friend]`

Compare two tools.

15.527.5 Field Documentation

15.527.5.1 mArguments `std::string benchmax::Tool::mArguments [protected]`

Command line arguments that should be passed to the binary.

15.527.5.2 mAttributes `std::map<std::string,std::string> benchmax::Tool::mAttributes [protected]`

Attributes of the tool obtained by introspection of the binary.

15.527.5.3 mBinary `fs::path benchmax::Tool::mBinary [protected]`

Path to the binary.

15.527.5.4 mName `std::string benchmax::Tool::mName [protected]`

(Non-unique) identifier for the tool.

15.528 benchmax::settings::ToolSettings Struct Reference

Tool-related settings.

`#include <Tools.h>`

Data Fields

- bool collect_statistics

  Whether or not to collect statistics.
- std::vector< std::filesystem::path > tools_generic

  Generic tools.
- std::vector< std::filesystem::path > tools_mathsat

  MathSAT with SMT-LIB interface.
- std::vector< std::filesystem::path > tools_minisat

  Minisat with DIMACS interface.
- std::vector< std::filesystem::path > tools_minisatp

  Minisatp with OPB interface.
- std::vector< std::filesystem::path > tools_smtrat

  SMT-RAT with SMT-LIB interface.
- std::vector< std::filesystem::path > tools_smtrat_opb

  SMT-RAT with OPB interface.
- std::vector< std::filesystem::path > tools_smtrat_analyzer

  SMT-RAT formula analyzer.
- std::vector< std::filesystem::path > tools_z3

  z3 with SMT-LIB interface.
- std::filesystem::path tools_common_prefix

  Common prefix of tool binaries to simplify output.

15.528.1 Detailed Description

Tool-related settings.

15.528.2 Field Documentation

15.528.2.1 collect_statistics `bool benchmax::settings::ToolSettings::collect_statistics`

Whether or not to collect statistics.

15.528.2.2 tools_common_prefix `std::filesystem::path benchmax::settings::ToolSettings::tools_common_prefix`

Common prefix of tool binaries to simplify output.

15.528.2.3 tools_generic `std::vector<std::filesystem::path> benchmax::settings::ToolSettings::tools_generic`

Generic tools.

15.528.2.4 tools_mathsat `std::vector<std::filesystem::path> benchmax::settings::ToolSettings↩ ::tools_mathsat`

MathSAT with SMT-LIB interface.

15.528.2.5 tools_minisat `std::vector<std::filesystem::path> benchmax::settings::ToolSettings↩ ::tools_minisat`

Minisat with DIMACS interface.

15.528.2.6 tools_minisatp `std::vector<std::filesystem::path> benchmax::settings::ToolSettings↩ ::tools_minisatp`

Minisatp with OPB interface.

15.528.2.7 tools_smtrat `std::vector<std::filesystem::path> benchmax::settings::ToolSettings↩ ::tools_smtrat`

SMT-RAT with SMT-LIB interface.

15.528.2.8 tools_smtrat_analyzer `std::vector<std::filesystem::path> benchmax::settings::Tool↩ Settings::tools_smtrat_analyzer`

SMT-RAT formula analyzer.

15.528.2.9 tools_smtrat_opb `std::vector<std::filesystem::path> benchmax::settings::Tool↩ Settings::tools_smtrat_opb`

SMT-RAT with OPB interface.

15.528.2.10 tools_z3 `std::vector<std::filesystem::path> benchmax::settings::ToolSettings↩ ::tools_z3`

z3 with SMT-LIB interface.

15.529 smtrat::TotalizerEncoder Class Reference

TotalizerEncoder implements the Totalizer encoding as described in "Incremental Cardinality Constraints for Max↩ SAT" by Martins et al https://doi.org/10.1007/978-3-319-10428-7_39.

```
#include <TotalizerEncoder.h>
```

Public Member Functions

- TotalizerEncoder ()
- ~TotalizerEncoder ()
- bool canEncode (const ConstraintT &constraint)
- Rational encodingSize (const ConstraintT &constraint)
- std::string name ()
- boost::optional< FormulaT > encode (const ConstraintT &constraint)

  Encodes an arbitrary constraint.

Data Fields

- std::size_t problem_size

Protected Member Functions

- boost::optional< FormulaT > doEncode (const ConstraintT &constraint)
- FormulaT generateVarChain (const std::set< carl::Variable > &vars, carl::FormulaType type)

15.529.1 Detailed Description TotalizerEncoder implements the Totalizer encoding as described in "Incremental Cardinality Constraints for MaxSAT" by Martins et al https://doi.org/10.1007/978-3-319-10428-7_39.

15.529.2 Constructor & Destructor Documentation

15.529.2.1 TotalizerEncoder()

```
smtrat::TotalizerEncoder::TotalizerEncoder ( ) [inline]
```

15.529.2.2 ~TotalizerEncoder()

```
smtrat::TotalizerEncoder::~TotalizerEncoder ( )
```

15.529.3 Member Function Documentation

15.529.3.1 canEncode()

```
bool smtrat::TotalizerEncoder::canEncode (
    const ConstraintT & constraint ) [virtual]
```

Implements smtrat::PseudoBoolEncoder.

15.529.3.2 doEncode()

```
boost::optional< FormulaT > smtrat::TotalizerEncoder::doEncode (
    const ConstraintT & constraint ) [protected], [virtual]
```

Implements smtrat::PseudoBoolEncoder.

15.529.3.3 encode()

```
boost::optional< FormulaT > smtrat::PseudoBoolEncoder::encode (
    const ConstraintT & constraint ) [inherited]
```

Encodes an arbitrary constraint.

Returns encoded formula

15.529.3.4 encodingSize()

```
Rational smtrat::TotalizerEncoder::encodingSize (
    const ConstraintT & constraint ) [virtual]
```

Reimplemented from smtrat::PseudoBoolEncoder.

15.529.3.5 generateVarChain()

```
FormulaT smtrat::PseudoBoolEncoder::generateVarChain (
    const std::set< carl::Variable > & vars,
    carl::FormulaType type ) [protected], [inherited]
```

- void set_rank (std::size_t rank)

15.535.1 Detailed Description

template<bool compression>
class smtrat::uf_impl::uf_rank_and_class< compression >

Wrapper class that contains the rank and parent class of some entry of the UF datastructure.

The compression parameter (default to off, this seems to be faster, can only enabled if sizeof(std::size_t) >= 8) controls whether the rank member is compressed together with the parent class. If this is true, sizeof(uf_rank_↩ and_class<true>) is just sizeof(std::size_t), and the most significant byte of the class is interpreted as rank of the entry.

15.535.2 Constructor & Destructor Documentation

15.535.2.1 uf_rank_and_class() template<bool compression>

```
smtrat::uf_impl::uf_rank_and_class< compression >::uf_rank_and_class (
            std::size_t class_index ) [inline]
```

`#include <UFCegarModule.h>`

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- UFCegarModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- ~UFCegarModule ()
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.

- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_↩ ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩ Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩ _premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩ Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩ ::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩ AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩ CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

```

15.537.4 Member Function Documentation

15.537.4.1 add() `bool smtrat::Module::add (`

```
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.537.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.537.4.3 addCore()

```
template<class Settings >
bool smtrat::UFCegarModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.537.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.537.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline], [inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.537.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.537.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.537.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.537.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.537.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.537.4.11 allModels() `const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns All satisfying assignments, if existent.

15.537.4.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.537.4.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.537.4.14 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.537.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.537.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.537.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
            const Poly & _polynomial,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.537.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
            const Poly & _polynomial,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.537.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P
>> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.537.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.537.4.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.537.4.22 checkCore()

```
template<class Settings >
Answer smtrat::UFCegarModule< Settings >::checkCore ( )  [virtual]
```

Checks the received formula for consistency.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.537.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
            std::vector< FormulaSetT >::const_iterator _infsubset,
            const std::string & _filename = "smaller_muses",
            unsigned _maxSizeDifference = 1 ) const  [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.537.4.24 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.537.4.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.537.4.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.537.4.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.537.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.537.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.537.4.30 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

15.537.4.31 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.537.4.32 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.537.4.33 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.537.4.34 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.537.4.35 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.537.4.36 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.537.4.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.537.4.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.537.4.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.537.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.537.4.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.537.4.42 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.537.4.43 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.537.4.44 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.537.4.45 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.537.4.46 getBackendsAllModels()

```
void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]
```

Stores all models of a backend in the list of all models of this module.

15.537.4.47 getBackendsModel()

```
void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]
```

15.537.4.48 getInfeasibleSubsets() [1/2]

```
void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]
```

Copies the infeasible subsets of the passed formula.

15.537.4.49 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets (
    const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.537.4.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.537.4.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.537.4.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.537.4.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.537.4.54 getOrigins() [3/3]

`const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.537.4.55 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.537.4.56 hasLemmas()

`bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.537.4.57 hasValidInfeasibleSubset()

`bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.537.4.58 id()

`std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.537.4.59 infeasibleSubsets()

`const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.537.4.60 inform()

`bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.537.4.61 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.537.4.62 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.537.4.63 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.537.4.64 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.537.4.65 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.537.4.66 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.537.4.67 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.537.4.68 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.537.4.69 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.537.4.70 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.537.4.71 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.537.4.72 moduleName() `template<typename Settings > std::string smtrat::UFCegarModule< Settings >::moduleName ( ) const [inline], [virtual]`

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.537.4.73 objective() `carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.537.4.74 originInReceivedFormula() `bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

15.537.4.75 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.537.4.76 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.537.4.77 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.537.4.78 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.537.4.79 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.537.4.80 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.537.4.81 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.537.4.82 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const  [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.537.4.83 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.537.4.84 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.537.4.85 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const  [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.537.4.86 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

15.537.4.87 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩
InfeasibleSubset (
            ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.537.4.88 receivedVariable()

```
bool smtrat::Module::receivedVariable (
            carl::Variable::Arg _var ) const [inline], [inherited]
```

15.537.4.89 remove()

```
void smtrat::Module::remove (
            ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.537.4.90 removeCore()

```
template<class Settings >
void smtrat::UFCegarModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula ) [virtual]
```

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Reimplemented from smtrat::Module.

15.537.4.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.537.4.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected], [inherited]
```

15.537.4.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.537.4.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.537.4.95 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

15.537.4.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.537.4.97 setId()

```
void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.537.4.98 setThreadPriority()

```
void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.537.4.99 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.537.4.100 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.537.4.101 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.537.4.102 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.537.4.103 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.537.4.104 updateModel() `template<class Settings > void smtrat::UFCegarModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.537.4.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.537.5 Field Documentation

15.537.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.537.5.2 mAllModels

`std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.537.5.3 mBackendsFoundAnswer

`std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.537.5.4 mConstraintsToInform

`carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.537.5.5 mFinalCheck

`bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.537.5.6 mFirstPosInLastBranches

`std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.537.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.537.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::m↩FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.537.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.537.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.537.5.11 mInfeasibleSubsets `std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.537.5.12 mInformedConstraints `carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.537.5.13 mLastBranches `std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.537.5.14 mLemmas `std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.537.5.15 mModel `Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.537.5.16 mModelComputed `bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.537.5.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.537.5.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.537.5.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩Variables [static], [inherited]`

Reusable splitting variables.

15.537.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.537.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.537.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.537.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.537.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.537.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.542.1 Detailed Description

Implements the theory of equalities and uninterpreted functions.

15.542.2 Constructor & Destructor Documentation

15.542.2.1 UninterpretedTheory()

```
smtrat::parser::UninterpretedTheory::UninterpretedTheory (
    ParserState * state )
```

15.542.3 Member Function Documentation

15.542.3.1 addConstants()

```
static void smtrat::parser::AbstractTheory::addConstants (
    qi::symbols< char, types::ConstType > & ) [inline], [static], [inherited]
```

Initialize the global symbol table for constants.

15.542.3.2 addSimpleSorts()

```
static void smtrat::parser::AbstractTheory::addSimpleSorts (
    qi::symbols< char, carl::Sort > & ) [inline], [static], [inherited]
```

Initialize the global symbol table for simple sorts.

15.542.3.3 coupleBooleanVariables()

```
FormulaT smtrat::parser::UninterpretedTheory::coupleBooleanVariables (
    carl::Variable v,
    carl::UVariable uv ) [inline]
```

15.542.3.4 declareVariable()

```
bool smtrat::parser::UninterpretedTheory::declareVariable (
    const std::string & ,
    const carl::Sort & ,
    types::VariableType & ,
    TheoryError & errors ) [virtual]
```

Declare a new variable with the given name and the given sort.

Reimplemented from smtrat::parser::AbstractTheory.

15.542.3.5 expandDistinct()

```
template<typename T , typename Builder >
FormulaT smtrat::parser::AbstractTheory::expandDistinct (
    const std::vector< T > & values,
    const Builder & neqBuilder ) [inline], [inherited]
```

15.542.3.6 functionCall()

```
bool smtrat::parser::UninterpretedTheory::functionCall (
    const Identifier & ,
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors ) [virtual]
```

Resolve another unknown function call.

Reimplemented from smtrat::parser::AbstractTheory.

15.542.3.7 handleDistinct()

```
bool smtrat::parser::UninterpretedTheory::handleDistinct (
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors )  [virtual]
```

Resolve a distinct operator.

Reimplemented from smtrat::parser::AbstractTheory.

15.542.3.8 handleFunctionInstantiation()

```
bool smtrat::parser::UninterpretedTheory::handleFunction↩
Instantiation (
    const carl::UninterpretedFunction & f,
    const std::vector< types::TermType > & arguments,
    types::TermType & result,
    TheoryError & errors )
```

15.542.3.9 handleITE()

```
bool smtrat::parser::UninterpretedTheory::handleITE (
    const FormulaT & ,
    const types::TermType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors )  [virtual]
```

Resolve an if-then-else operator.

Reimplemented from smtrat::parser::AbstractTheory.

15.542.3.10 instantiate()

```
virtual bool smtrat::parser::AbstractTheory::instantiate (
    const types::VariableType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Instantiate a variable within a term.

Reimplemented in smtrat::parser::BitvectorTheory, and smtrat::parser::ArithmeticTheory.

15.542.3.11 refreshVariable()

```
virtual bool smtrat::parser::AbstractTheory::refreshVariable (
    const types::VariableType & ,
    types::VariableType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Reimplemented in smtrat::parser::BitvectorTheory.

15.542.3.12 resolveSymbol()

```
virtual bool smtrat::parser::AbstractTheory::resolveSymbol (
    const Identifier & ,
    types::TermType & ,
    TheoryError & errors ) [inline], [virtual], [inherited]
```

Resolve a symbol that was not declared within the ParserState.

This might be a symbol that actually uses indices, for example bitvector constants.

Reimplemented in smtrat::parser::BitvectorTheory.

15.542.4 Field Documentation

15.542.4.1 mBoolSort

```
carl::Sort smtrat::parser::UninterpretedTheory::mBoolSort
```

15.542.4.2 mFalse

```

15.543 smtrat::union_find< T, no_compression, MaxTracebackLength > Class Template Reference

Implements a union-find datastructure, a datastructure containing an array of entries.

```
#include <union_find.h>
```

Public Member Functions

- union_find ()

  Construct union-find datastructure with an empty array of entries.
- union_find (std::size_t size_)

  Construct union-find datastructure with an array of size_ default-constructed elements.
- template<typename InputIterator >
  union_find (InputIterator begin_, typename std::enable_if< !std::is_void< T >::value, InputIterator >::type end_)

  Construct union-find datastructure, copying the sequence identified by [begin_,end_) into the array.
- union_find (const union_find &other)
- union_find & operator= (const union_find &other)
- std::size_t find (std::size_t index_) const noexcept

  Find the index of the representative of the entry at index index_.
- bool equivalent (std::size_t index1, std::size_t index2) const noexcept

  Determines if the two entries at positions index1 and index2 are considered equivalent, that is find(index1) == find(index2).
- bool union_ (std::size_t index1, std::size_t index2) noexcept

Make the entries identified by index1 and index2 equivalent.

- std::size_t fast_union (std::size_t rep1, std::size_t rep2)

  As union_, but does NOT compute find(rep1), find(rep2), but assumes both indices are already pointing to representatives.

- template<bool Ignore = true>
  std::enable_if< !std::is_void< T >::value &&Ignore, std::size_t >::type add (const T &value)

  Add a new default-constructed value to the end of this union find array.

- void set_class (std::size_t i, std::size_t c)
- std::size_t rank (std::size_t i)

  The rank (upper bound on the height of the tree rooted at i) of the entry at index i.

- template<bool Ignore = true>
  std::enable_if< !std::is_void< T >::value &&Ignore, T >::type & operator[ ] (std::size_t index_) noexcept

  Access to values (only if T is not void, relies on C++11 feature: default template arguments for template methods).

- template<bool Ignore = true>
  std::enable_if< !std::is_void< T >::value &&Ignore, const T >::type & operator[ ] (std::size_t index_) const noexcept

  Access to values (only if T is not void, relies on C++11 feature: default template arguments for template methods), const.

- std::size_t size () const noexcept

  Returns the number of entries in this union-find datastructure.

- template<bool Ignore = true>
  std::enable_if<!std::is_void< T >::value &&Ignore, void >::type initialize (std::size_t new_size)

  Initialize the union-find datastructure with an array of new_size default-constructed entries, version for T != void.

- template<bool Ignore = true>
  std::enable_if< std::is_void< T >::value &&Ignore, void >::type initialize (std::size_t new_size)

  Initialize the union-find datastructure with an array of new_size default-constructed entries, version for T == void.

- template<typename InputIterator >
  std::enable_if<!std::is_void< T >::value &&!std::is_void< InputIterator >::value, void >::type initialize (Input↩ Iterator begin_, InputIterator end_)

  Initialize the union-find datastructure with an array of entries copied from the sequence [begin_,end_).

15.543.1 Detailed Description

template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
class smtrat::union_find< T, no_compression, MaxTracebackLength >

Implements a union-find datastructure, a datastructure containing an array of entries.

Basically, this is an array of elements of type T with the following extra structure: Every entry is contained in an equivalence class identified by a single representative entry. In order to find this representative, every element has an associated parent entry; if this is the entry itself, the entry is the representative of its equivalence class. Using a rank count (basically a lower bound for the height of the tree below an entry), the height of the trees below the representative entries is ALWAYS less than ceil(log2(#entries)). Moreover, while finding the parent of an entry, all entries on the path to the root are set to directly point to the root element. This improves the amortized number of steps used to find the representative of an entry from O(log2(n)) to O(a(n)) where a(n) is the inverse of the Ackermann function. All this extra structure is embedded directly within the array.

15.543.2 Constructor & Destructor Documentation

15.543.2.1 union_find() [1/4]

```
template<typename T = void, bool no_compression = true, std↩
::size_t MaxTracebackLength = 64>
smtrat::union_find< T, no_compression, MaxTracebackLength >::union_find ( ) [inline]
```

Construct union-find datastructure with an empty array of entries.

15.543.2.2 union_find() [2/4]

```
template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
smtrat::union_find< T, no_compression, MaxTracebackLength >::union_find (
            std::size_t size_ )  [inline], [explicit]
```

Construct union-find datastructure with an array of size_ default-constructed elements.

15.543.2.3 union_find() [3/4]

```
template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
template<typename InputIterator >
smtrat::union_find< T, no_compression, MaxTracebackLength >::union_find (
            InputIterator begin_,
            typename std::enable_if< !std::is_void< T >::value, InputIterator >::type end_ )
[inline]
```

Construct union-find datastructure, copying the sequence identified by [begin_,end_) into the array.

15.543.2.4 union_find() [4/4]

```
template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
smtrat::union_find< T, no_compression, MaxTracebackLength >::union_find (
            const union_find< T, no_compression, MaxTracebackLength > & other )  [inline]
```

15.543.3 Member Function Documentation

15.543.3.1 add()

```
template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
template<bool Ignore = true>
std::enable_if< !std::is_void<T>::value && Ignore, std::size_t>::type smtrat::union_find< T, no_compression, MaxTracebackLength >::add (
            const T & value )  [inline]
```

Add a new default-constructed value to the end of this union find array.

This does not check for the uniqueness of this entry. This method can not be used if T is void. Returns the index associated with the new entry (i.e. the size of the UF structure before the call).

15.543.3.2 equivalent()

```
template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
bool smtrat::union_find< T, no_compression, MaxTracebackLength >::equivalent (
            std::size_t index1,
            std::size_t index2 ) const  [inline], [noexcept]
```

Determines if the two entries at positions index1 and index2 are considered equivalent, that is find(index1) == find(index2).

15.543.3.3 fast_union()

```
template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
std::size_t smtrat::union_find< T, no_compression, MaxTracebackLength >::fast_union (
            std::size_t rep1,
            std::size_t rep2 )  [inline]
```

As union_, but does NOT compute find(rep1), find(rep2), but assumes both indices are already pointing to representatives.

Returns the new representative of both elements after the operation; this will either be rep1 or rep2.

15.543.3.4 find()

```
template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
std::size_t smtrat::union_find< T, no_compression, MaxTracebackLength >::find (
            std::size_t index_ ) const  [inline], [noexcept]
```

Find the index of the representative of the entry at index index_.

Note that this method is const-qualified as it does not change the observable behaviour of this class, but it is not bitwise-const due to the path compression behaviour. Therefore it is not safe to call this method from different threads on the same UF datastructure without external synchronization.

15.543.3.5 initialize() [1/3]

```
template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
template<typename InputIterator >
std::enable_if<!std::is_void<T>::value && !std::is_void<InputIterator>::value, void>::type
smtrat::union_find< T, no_compression, MaxTracebackLength >::initialize (
            InputIterator begin_,
            InputIterator end_ )  [inline]
```

Initialize the union-find datastructure with an array of entries copied from the sequence [begin_,end_).

15.543.3.6 initialize() [2/3]

```
template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
template<bool Ignore = true>
std::enable_if<!std::is_void<T>::value && Ignore, void>::type smtrat::union_find< T, no_compression, MaxTracebackLength >::initialize (
            std::size_t new_size )  [inline]
```

Initialize the union-find datastructure with an array of new_size default-constructed entries, version for T != void.

15.543.3.7 initialize() [3/3]

```
template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
template<bool Ignore = true>
std::enable_if<std::is_void<T>::value && Ignore, void>::type smtrat::union_find< T, no_compression, MaxTracebackLength >::initialize (
            std::size_t new_size )  [inline]
```

Initialize the union-find datastructure with an array of new_size default-constructed entries, version for T == void.

15.543.3.8 operator=()

```
template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
union_find& smtrat::union_find< T, no_compression, MaxTracebackLength >::operator= (
            const union_find< T, no_compression, MaxTracebackLength > & other )  [inline]
```

15.543.3.9 operator[]() [1/2]

```
template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
template<bool Ignore = true>
std::enable_if< !std::is_void<T>::value && Ignore, const T>::type& smtrat::union_find< T, no_compression, MaxTracebackLength >::operator[] (
            std::size_t index_ ) const  [inline], [noexcept]
```

Access to values (only if T is not void, relies on C++11 feature: default template arguments for template methods), const.

15.543.3.10 operator[]() [2/2]

```
template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
template<bool Ignore = true>
std::enable_if< !std::is_void<T>::value && Ignore, T>::type& smtrat::union_find< T, no_compression, MaxTracebackLength >::operator[] (
            std::size_t index_ )  [inline], [noexcept]
```

Access to values (only if T is not void, relies on C++11 feature: default template arguments for template methods).

15.543.3.11 rank()

```
template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
std::size_t smtrat::union_find< T, no_compression, MaxTracebackLength >::rank (
            std::size_t i )  [inline]
```

The rank (upper bound on the height of the tree rooted at i) of the entry at index i.

15.543.3.12 set_class()

```
template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
void smtrat::union_find< T, no_compression, MaxTracebackLength >::set_class (
            std::size_t i,
            std::size_t c )  [inline]
```

15.543.3.13 size()

```
template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
std::size_t smtrat::union_find< T, no_compression, MaxTracebackLength >::size ( ) const  [inline], [noexcept]
```

Returns the number of entries in this union-find datastructure.

15.543.3.14 union_()

```
template<typename T = void, bool no_compression = true, std::size_t MaxTracebackLength = 64>
bool smtrat::union_find< T, no_compression, MaxTracebackLength >::union_ (
            std::size_t index1,
            std::size_t index2 )  [inline], [noexcept]
```

Make the entries identified by index1 and index2 equivalent.

As this is determined by the union-by-rank mechanism, either one of find(index1) or find(index2) can become the index of the new representative of both entries. Returns false when this operation did no changes on the datastructure and true otherwise.

15.544 smtrat::UnionFindInterface< T, Implementation > Struct Template Reference

```
#include <UnionFind.h>
```

15.545 smtrat::UnionFindModule< Settings > Class Template Reference

`#include <UnionFindModule.h>`

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- UnionFindModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- ~UnionFindModule ()
- bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const

- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())

- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.545.3.1 UnionFindModule() `template<class Settings >`

```
smtrat::UnionFindModule< Settings >::UnionFindModule (
            const ModuleInput * _formula,
            Conditionals & _conditionals,
            Manager * _manager = nullptr )
```

15.545.3.2 ~UnionFindModule() `template<class Settings >`

```
smtrat::UnionFindModule< Settings >::~UnionFindModule ( )
```

15.545.4 Member Function Documentation

15.545.4.1 add() `bool smtrat::Module::add (`

```
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.545.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.545.4.3 addCore()

```
template<class Settings >
bool smtrat::UnionFindModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.545.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.545.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.545.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.545.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.545.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.545.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.545.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.545.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const  [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.545.4.12 anAnswerFound()

`bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.545.4.13 answerFound()

`const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.545.4.14 backendsModel()

`const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.545.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.545.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.545.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.545.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
            const Poly & _polynomial,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.545.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P
>> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() )  [inline],
[protected], [inherited]
```

15.545.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P
>> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.545.4.21 check()

```
Answer smtrat::Module::check (
    bool _final = false,
    bool _full = true,
    carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.545.4.22 checkCore()

```
template<class Settings >
Answer smtrat::UnionFindModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.545.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.545.4.24 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.545.4.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.545.4.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.545.4.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.545.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.545.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.545.4.30 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.545.4.31 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.545.4.32 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.545.4.33 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.545.4.34 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.545.4.35 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.545.4.36 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.545.4.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.545.4.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.545.4.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.545.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.545.4.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.545.4.42 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.545.4.43 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.545.4.44 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.545.4.45 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.545.4.46 getBackendsAllModels()

```
void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]
```

Stores all models of a backend in the list of all models of this module.

15.545.4.47 getBackendsModel()

```
void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]
```

15.545.4.48 getInfeasibleSubsets() [1/2]

```
void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]
```

Copies the infeasible subsets of the passed formula.

15.545.4.49 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets (
    const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.545.4.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.545.4.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.545.4.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.545.4.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.545.4.54 getOrigins() [3/3]

`const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.545.4.55 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.545.4.56 hasLemmas()

`bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.545.4.57 hasValidInfeasibleSubset()

`bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.545.4.58 id()

`std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.545.4.59 infeasibleSubsets()

`const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.545.4.60 inform()

`bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.545.4.61 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.545.4.62 informCore()

```
template<class Settings >
bool smtrat::UnionFindModule< Settings >::informCore (
    const FormulaT & _constraint ) [virtual]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented from smtrat::Module.

15.545.4.63 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.545.4.64 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.545.4.65 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.545.4.66 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.545.4.67 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.545.4.68 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.545.4.69 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.545.4.70 model()

`const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.545.4.71 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.545.4.72 moduleName()

```
template<typename Settings >
std::string smtrat::UnionFindModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.545.4.73 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.545.4.74 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.545.4.75 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.545.4.76 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.545.4.77 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.545.4.78 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.545.4.79 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.545.4.80 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.545.4.81 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.545.4.82 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const  [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.545.4.83 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.545.4.84 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.545.4.85 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const  [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.545.4.86 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

15.545.4.87 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
            ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.545.4.88 receivedVariable()

```
bool smtrat::Module::receivedVariable (
            carl::Variable::Arg _var ) const [inline], [inherited]
```

15.545.4.89 remove()

```
void smtrat::Module::remove (
            ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.545.4.90 removeCore()

```
template<class Settings >
void smtrat::UnionFindModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula ) [virtual]
```

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Reimplemented from smtrat::Module.

15.545.4.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.545.4.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected], [inherited]
```

15.545.4.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.545.4.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.545.4.95 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

15.545.4.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.545.4.97 setId()

```
void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.545.4.98 setThreadPriority()

```
void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.545.4.99 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.545.4.100 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.545.4.101 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.545.4.102 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.545.4.103 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.545.4.104 updateModel() `template<class Settings > void smtrat::UnionFindModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.545.4.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.545.5 Field Documentation

15.545.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.545.5.2 mAllModels

`std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.545.5.3 mBackendsFoundAnswer

`std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.545.5.4 mConstraintsToInform

`carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.545.5.5 mFinalCheck

`bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.545.5.6 mFirstPosInLastBranches

`std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.545.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩ Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.545.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::m↩ FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.545.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.545.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.545.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.545.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.545.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.545.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.545.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.545.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.545.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.545.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.545.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplitting↩Variables [static], [inherited]`

Reusable splitting variables.

15.545.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.545.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.545.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.545.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.545.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.545.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

```

Public Member Functions

- UnsatCoreBackend (Solver &s, const FormulasT &fs)
- void processAssignment ()
- Answer compute ()
- std::pair< Answer, FormulasT > run ()

15.549.1 Detailed Description

template<typename Solver>
class smtrat::unsatcore::UnsatCoreBackend< Solver, UnsatCoreStrategy::ModelExclusion >

Implements an easy strategy to obtain an unsatisfiable core.

Essentially it computes a cover that rejects all possible models if we allow the removal of clauses.

- Allow to disable every formula f_i by encoding (y_i <=> f_i)
- Find a satisfying assignment (which will set some f_i to false)
-

15.549.2 Constructor & Destructor Documentation

15.549.2.1 UnsatCoreBackend()

```
template<typename Solver >
smtrat::unsatcore::UnsatCoreBackend< Solver, UnsatCoreStrategy::ModelExclusion >::UnsatCoreBackend
(
            Solver & s,

15.556.2.16 operator/() template<class T>

```
Value<T> smtrat::lra::Value< T >::operator/ (
            const T & _a ) const
```

Parameters

↩	
_↩	
a	

Returns

15.556.2.17 operator/=() template<class T>

```
void smtrat::lra::Value< T >::operator/= (
            const T & _a )
```

Parameters

↩	
_↩	
a	

15.556.2.18 operator<() [1/2] template<class T>

```
bool smtrat::lra::Value< T >::operator< (
            const T & _a ) const
```

Parameters

↩ _↩ *a*	

Returns

15.556.2.19 operator<() [2/2] template<class T>

```
bool smtrat::lra::Value< T >::operator< (
            const Value< T > & _value ) const
```

Parameters

_value	

Returns

15.556.2.20 operator<=() [1/2] template<class T>

```
bool smtrat::lra::Value< T >::operator<= (
            const T & _a ) const
```

Parameters

↩ _↩ *a*	

Returns

15.556.2.21 operator<=() [2/2] template<class T>

```
bool smtrat::lra::Value< T >::operator<= (
            const Value< T > & _value ) const
```

Parameters

_value	

Returns

15.556.2.22 operator=() template<class T>

```
Value<T>& smtrat::lra::Value< T >::operator= (
            const Value< T > & _value )
```

Copy the content of the given value to this one.

Parameters

_value	The value to copy.

Returns This value after copying.

15.556.2.23 operator==() [1/2] template<class T>

```
bool smtrat::lra::Value< T >::operator== (
            const T & _a ) const
```

Parameters

↩	
_↩	
a	

Returns

15.556.2.24 operator==() [2/2] template<class T>

```
bool smtrat::lra::Value< T >::operator== (
            const Value< T > & _value ) const
```

Parameters

_value	

Returns

15.556.2.25 operator>() [1/2] template<class T>

```
bool smtrat::lra::Value< T >::operator> (
            const T & _a ) const
```

Parameters

↩	
_↩	
a	

Returns

15.556.2.26 operator>() [2/2] template<class T>

```
bool smtrat::lra::Value< T >::operator> (
            const Value< T > & _value ) const  [inline]
```

15.556.2.27 operator>=() [1/2] template<class T>

```
bool smtrat::lra::Value< T >::operator>= (
            const T & _a ) const
```

Parameters

↩ _↩ *a*	

Returns

15.556.2.28 operator>=() [2/2] template<class T>

```
bool smtrat::lra::Value< T >::operator>= (
            const Value< T > & _value ) const  [inline]
```

15.556.2.29 print() template<class T>

```
void smtrat::lra::Value< T >::print (
            std::ostream & _out = std::cout ) const
```

Parameters

_out	

15.556.2.30 sign() template<class T>

```
T smtrat::lra::Value< T >::sign ( ) const
```

Computes the sign: 0 if main & delta part are unequal 0.

Else +/- 1 determined by the sign of main part (if set) else delta part.

15.556.2.31 toString() template<class T>

```
const std::string smtrat::lra::Value< T >::toString ( ) const
```

Returns

15.557 smtrat::lra::Variable< T1, T2 > Class Template Reference

```
#include <Bound.h>
```

15.557.1 Constructor & Destructor Documentation

15.557.1.1 Variable() [1/2]

```
template<typename T1, typename T2>
smtrat::lra::Variable< T1, T2 >::Variable (
            size_t _position,
            const typename Poly::PolyType * _expression,
            ModuleInput::iterator _defaultBoundPosition,
            bool _isInteger,
            size_t _id )
```

Parameters

_position	
_expression	
_defaultBoundPosition	
_isInteger	
_id	

15.557.1.2 Variable() [2/2]

```
template<typename T1, typename T2>
smtrat::lra::Variable< T1, T2 >::Variable (
            typename std::list< std::list< std::pair< Variable< T1, T2 > *, T2 >>>::iterator
_positionInNonActives,
            const typename Poly::PolyType * _expression,
            ModuleInput::iterator _defaultBoundPosition,
            bool _isInteger,
            size_t _id )
```

Parameters

_positionInNonActives	
_expression	
_defaultBoundPosition	
_isInteger	
_id	

15.557.1.3 ~Variable()

```
template<typename T1, typename T2>
virtual smtrat::lra::Variable< T1, T2 >::~Variable ( )  [virtual]
```

15.557.2 Member Function Documentation

15.557.2.1 addEqualBound()

```
template<typename T1, typename T2>
std::pair<const Bound<T1, T2>*, bool> smtrat::lra::Variable< T1, T2 >::addEqualBound (
            Value< T1 > *const _val,
            ModuleInput::iterator _position,
            const FormulaT & _constraint )
```

Parameters

_val	
_position	
_constraint	

Returns

15.557.2.2 addLowerBound()

```
template<typename T1, typename T2>
std::pair<const Bound<T1, T2>*, bool> smtrat::lra::Variable< T1, T2 >::addLowerBound (
            Value< T1 > *const _val,
            ModuleInput::iterator _position,
            const FormulaT & _constraint,
            bool _deduced = false )
```

Parameters

_val	
_position	
_constraint	
_deduced	

Returns

15.557.2.3 addUpperBound()

```
template<typename T1, typename T2>
std::pair<const Bound<T1, T2>*, bool> smtrat::lra::Variable< T1, T2 >::addUpperBound (
            Value< T1 > *const _val,
            ModuleInput::iterator _position,
            const FormulaT & _constraint,
            bool _deduced = false )
```

Parameters

_val	
_position	
_constraint	
_deduced	

Returns

15.557.2.4 assignment()

```
template<typename T1, typename T2>
const Value<T1>& smtrat::lra::Variable< T1, T2 >::assignment ( ) const  [inline]
```

Returns

15.557.2.5 conflictActivity()

```
template<typename T1, typename T2>
double smtrat::lra::Variable< T1, T2 >::conflictActivity ( ) const  [inline]
```

Returns

15.557.2.6 deactivateBound()

```
template<typename T1, typename T2>
bool smtrat::lra::Variable< T1, T2 >::deactivateBound (
            const Bound< T1, T2 > * bound,
            ModuleInput::iterator _position )
```

Parameters

bound	
_position	

Returns

15.557.2.7 expression()

```
template<typename T1, typename T2>
const Poly::PolyType& smtrat::lra::Variable< T1, T2 >::expression ( ) const  [inline]
```

Returns

15.557.2.8 factor()

```
template<typename T1, typename T2>
const T2& smtrat::lra::Variable< T1, T2 >::factor ( ) const  [inline]
```

Returns

15.557.2.9 getDefiningOrigins()

```
template<typename T1, typename T2>
FormulasT smtrat::lra::Variable< T1, T2 >::getDefiningOrigins ( ) const
```

Returns

15.557.2.10 getId()

```
template<typename T1, typename T2>
size_t smtrat::lra::Variable< T1, T2 >::getId ( ) const  [inline]
```

15.557.2.11 getVariableBounds()

```
template<typename T1, typename T2>
RationalInterval smtrat::lra::Variable< T1, T2 >::getVariableBounds ( ) const
```

Returns

15.557.2.12 hasBound()

```
template<typename T1, typename T2>
bool smtrat::lra::Variable< T1, T2 >::hasBound ( ) const [inline]
```

Returns

15.557.2.13 inConflictWith()

```
template<typename T1, typename T2>
FormulaT smtrat::lra::Variable< T1, T2 >::inConflictWith (
            const EvalRationalMap & _ass ) const [inline]
```

Parameters

_ass	

Returns

15.557.2.14 infimum()

```
template<typename T1, typename T2>
const Bound<T1, T2>& smtrat::lra::Variable< T1, T2 >::infimum ( ) const [inline]
```

Returns

15.557.2.15 involvesEquation()

```
template<typename T1, typename T2>
bool smtrat::lra::Variable< T1, T2 >::involvesEquation ( ) const [inline]
```

Returns

15.557.2.16 isBasic()

```
template<typename T1, typename T2>
bool smtrat::lra::Variable< T1, T2 >::isBasic ( ) const [inline]
```

Returns

15.557.2.17 isConflicting()

```
template<typename T1, typename T2>
bool smtrat::lra::Variable< T1, T2 >::isConflicting ( ) const  [inline]
```

15.557.2.18 isInteger()

```
template<typename T1, typename T2>
bool smtrat::lra::Variable< T1, T2 >::isInteger ( ) const  [inline]
```

Returns

15.557.2.19 isOriginal()

```
template<typename T1, typename T2>
bool smtrat::lra::Variable< T1, T2 >::isOriginal ( ) const  [inline]
```

Returns

15.557.2.20 isSatisfiedBy()

```
template<typename T1, typename T2>
unsigned smtrat::lra::Variable< T1, T2 >::isSatisfiedBy (
            const EvalRationalMap & _ass ) const  [inline]
```

Parameters

_ass	

Returns

15.557.2.21 lastConsistentAssignment()

```
template<typename T1, typename T2>
const Value<T1>& smtrat::lra::Variable< T1, T2 >::lastConsistentAssignment ( ) const  [inline]
```

Returns

15.557.2.22 lowerbounds()

```
template<typename T1, typename T2>
const Bound<T1, T2>::BoundSet& smtrat::lra::Variable< T1, T2 >::lowerbounds ( ) const  [inline]
```

Returns

15.557.2.23 operator"!=()

```
template<typename T1, typename T2>
bool smtrat::lra::Variable< T1, T2 >::operator!= (
            const Variable< T1, T2 > & _variable ) const  [inline]
```

15.557.2.24 operator<()

```
template<typename T1, typename T2>
bool smtrat::lra::Variable< T1, T2 >::operator< (
            const Variable< T1, T2 > & _variable ) const  [inline]
```

Parameters

_bound	

Returns

15.557.2.25 operator==()

```
template<typename T1, typename T2>
bool smtrat::lra::Variable< T1, T2 >::operator== (
            const Variable< T1, T2 > & _variable ) const  [inline]
```

15.557.2.26 operator>()

```
template<typename T1, typename T2>
bool smtrat::lra::Variable< T1, T2 >::operator> (
            const Variable< T1, T2 > & _variable ) const  [inline]
```

15.557.2.27 pExpression()

```
template<typename T1, typename T2>
const Poly::PolyType* smtrat::lra::Variable< T1, T2 >::pExpression ( ) const  [inline]
```

Returns

15.557.2.28 pInfimum()

```
template<typename T1, typename T2>
const Bound<T1, T2>* smtrat::lra::Variable< T1, T2 >::pInfimum ( ) const  [inline]
```

Returns

15.557.2.29 position()

```
template<typename T1, typename T2>
size_t smtrat::lra::Variable< T1, T2 >::position ( ) const  [inline]
```

Returns

15.557.2.30 positionInNonActives()

```
template<typename T1, typename T2>
std::list<std::list<std::pair<Variable<T1,T2>*,T2> > >::iterator smtrat::lra::Variable< T1,
T2 >::positionInNonActives ( ) const  [inline]
```

Returns

15.557.2.31 print()

```
template<typename T1, typename T2>
void smtrat::lra::Variable< T1, T2 >::print (
            std::ostream & _out = std::cout ) const
```

Parameters

_out	

15.557.2.32 printAllBounds()

```
template<typename T1, typename T2>
void smtrat::lra::Variable< T1, T2 >::printAllBounds (
            std::ostream & _out = std::cout,
            const std::string _init = "" ) const
```

Parameters

_out	
_init	

15.557.2.33 pSupremum()

```
template<typename T1, typename T2>
const Bound<T1, T2>* smtrat::lra::Variable< T1, T2 >::pSupremum ( ) const  [inline]
```

Returns

15.557.2.34 rAssignment()

```
template<typename T1, typename T2>
Value<T1>& smtrat::lra::Variable< T1, T2 >::rAssignment ( )  [inline]
```

Returns

15.557.2.35 removeBound()

```
template<typename T1, typename T2>
void smtrat::lra::Variable< T1, T2 >::removeBound (
            const Bound< T1, T2 > * _bound )
```

Parameters

_bound	

15.557.2.36 rFactor()

```
template<typename T1, typename T2>
T2& smtrat::lra::Variable< T1, T2 >::rFactor ( )  [inline]
```

Returns

15.557.2.37 rLowerbounds()

```
template<typename T1, typename T2>
Bound<T1, T2>::BoundSet& smtrat::lra::Variable< T1, T2 >::rLowerbounds ( ) [inline]
```

Returns

15.557.2.38 rLowerBoundsSize()

```
template<typename T1, typename T2>
size_t smtrat::lra::Variable< T1, T2 >::rLowerBoundsSize ( ) [inline]
```

Returns

15.557.2.39 rPosition()

```
template<typename T1, typename T2>
size_t& smtrat::lra::Variable< T1, T2 >::rPosition ( ) [inline]
```

Returns

15.557.2.40 rSize()

```
template<typename T1, typename T2>
size_t& smtrat::lra::Variable< T1, T2 >::rSize ( ) [inline]
```

Returns

15.557.2.41 rStartEntry()

```
template<typename T1, typename T2>
EntryID& smtrat::lra::Variable< T1, T2 >::rStartEntry ( ) [inline]
```

Returns

15.557.2.42 rUpperbounds()

```
template<typename T1, typename T2>
Bound<T1, T2>::BoundSet& smtrat::lra::Variable< T1, T2 >::rUpperbounds ( ) [inline]
```

Returns

15.557.2.43 rUpperBoundsSize()

```
template<typename T1, typename T2>
size_t smtrat::lra::Variable< T1, T2 >::rUpperBoundsSize ( ) [inline]
```

Returns

15.557.2.44 setBasic()

```
template<typename T1, typename T2>
void smtrat::lra::Variable< T1, T2 >::setBasic (
            bool _basic ) [inline]
```

Parameters

_basic	

15.557.2.45 setInfimum()

```
template<typename T1, typename T2>
void smtrat::lra::Variable< T1, T2 >::setInfimum (
            const Bound< T1, T2 > * _infimum )  [inline]
```

Parameters

_infimum	

15.557.2.46 setPosition()

```
template<typename T1, typename T2>
void smtrat::lra::Variable< T1, T2 >::setPosition (
            size_t _position )  [inline]
```

Parameters

_position	

15.557.2.47 setPositionInNonActives()

```
template<typename T1, typename T2>
void smtrat::lra::Variable< T1, T2 >::setPositionInNonActives (
            typename std::list< std::list< std::pair< Variable< T1, T2 > *, T2 >>>::iterator
_positionInNonActives )  [inline]
```

Parameters

_positionInNonActives	

15.557.2.48 setSupremum()

```
template<typename T1, typename T2>
void smtrat::lra::Variable< T1, T2 >::setSupremum (
            const Bound< T1, T2 > * _supremum )  [inline]
```

Parameters

_supremum	

15.557.2.49 size()

```
template<typename T1, typename T2>
size_t smtrat::lra::Variable< T1, T2 >::size ( ) const  [inline]
```

Returns

15.557.2.50 startEntry() `template<typename T1, typename T2>`

`EntryID smtrat::lra::Variable< T1, T2 >::startEntry ( ) const [inline]`

Returns

15.557.2.51 storeAssignment() `template<typename T1, typename T2>`

`void smtrat::lra::Variable< T1, T2 >::storeAssignment ( ) [inline]`

15.557.2.52 supremum() `template<typename T1, typename T2>`

`const Bound<T1, T2>& smtrat::lra::Variable< T1, T2 >::supremum ( ) const [inline]`

Returns

15.557.2.53 updateConflictActivity() `template<typename T1, typename T2>`

`void smtrat::lra::Variable< T1, T2 >::updateConflictActivity ( ) [inline]`

15.557.2.54 upperbounds() `template<typename T1, typename T2>`

`const Bound<T1, T2>::BoundSet& smtrat::lra::Variable< T1, T2 >::upperbounds ( ) const [inline]`

Returns

15.558 smtrat::vb::Variable< T > Class Template Reference

Class for a variable.

`#include <VariableBounds.h>`

Public Member Functions

- Variable ()

  Constructs this variable.
- ~Variable ()
- bool conflicting () const
- const Bound< T > * addBound (const ConstraintT &_constraint, const carl::Variable &_var, const T &_origin)

  Adds the bound corresponding to the constraint to the given variable.
- bool updateBounds (const Bound< T > &_changedBound)

  Updates the infimum and supremum of this variable.
- bool updatedExactInterval () const
- void exactIntervalHasBeenUpdated () const

  Sets the flag indicating that the stored exact interval representing the variable's bounds is up to date to false.
- bool updatedDoubleInterval () const
- void doubleIntervalHasBeenUpdated () const

  Sets the flag indicating that the stored double interval representing the variable's bounds is up to date to false.
- const Bound< T > * pSupremum () const

15.558.1 Detailed Description

template<typename T>
class smtrat::vb::Variable< T >

Class for a variable.

15.558.2 Constructor & Destructor Documentation

15.558.2.1 Variable()

```
template<typename T>
smtrat::vb::Variable< T >::Variable ( )
```

Constructs this variable.

15.558.2.2 ~Variable()

```
template<typename T>
smtrat::vb::Variable< T >::~Variable ( )
```

15.558.3 Member Function Documentation

15.558.3.1 addBound()

```
template<typename T>
const Bound<T>* smtrat::vb::Variable< T >::addBound (
            const ConstraintT & _constraint,
            const carl::Variable< T > & _var,
            const T & _origin )
```

Adds the bound corresponding to the constraint to the given variable.

The constraint is expected to contain only one variable and this one only linearly.

Parameters

_constraint	A pointer to a constraint of the form ax~b.
_var	Hence, the variable x.
_origin	The origin of the constraint. This is could be the constraint itself or anything else in the data structure which uses this object.
_limit	

Returns The added bound.

15.558.3.2 conflicting()

```
template<typename T>
bool smtrat::vb::Variable< T >::conflicting ( ) const
```

Returns true, if there is a conflict; false, otherwise.

15.558.3.3 doubleIntervalHasBeenUpdated()

```
template<typename T>
void smtrat::vb::Variable< T >::doubleIntervalHasBeenUpdated ( ) const [inline]
```

Sets the flag indicating that the stored double interval representing the variable's bounds is up to date to false.

15.558.3.4 exactIntervalHasBeenUpdated()

```
template<typename T>
void smtrat::vb::Variable< T >::exactIntervalHasBeenUpdated ( ) const [inline]
```

Sets the flag indicating that the stored exact interval representing the variable's bounds is up to date to false.

15.558.3.5 infimum()

```
template<typename T>
const Bound<T>& smtrat::vb::Variable< T >::infimum ( ) const [inline]
```

Returns A constant reference to the infimum of this variable.

15.558.3.6 lowerbounds()

```
template<typename T>
const BoundSet& smtrat::vb::Variable< T >::lowerbounds ( ) const [inline]
```

Returns A constant reference to the set of lower bounds of this variable.

15.558.3.7 pInfimum()

```
template<typename T>
const Bound<T>* smtrat::vb::Variable< T >::pInfimum ( ) const [inline]
```

Returns A pointer to the infimum of this variable.

15.558.3.8 pSupremum()

```
template<typename T>
const Bound<T>* smtrat::vb::Variable< T >::pSupremum ( ) const [inline]
```

Returns A pointer to the supremum of this variable.

15.558.3.9 supremum()

```
template<typename T>
const Bound<T>& smtrat::vb::Variable< T >::supremum ( ) const [inline]
```

Returns A constant reference to the supremum of this variable.

15.558.3.10 updateBounds()

```
template<typename T>
bool smtrat::vb::Variable< T >::updateBounds (
            const Bound< T > & _changedBound )
```

Updates the infimum and supremum of this variable.

Parameters

_changedBound	The bound, for which we certainly know that it got deactivated before.

Returns true, if there is a conflict; false, otherwise.

15.558.3.11 updatedDoubleInterval() `template<typename T>`

`bool smtrat::vb::Variable< T >::updatedDoubleInterval ( ) const [inline]`

Returns true, if the stored double interval representing the variable's bounds is up to date. false, otherwise

15.558.3.12 updatedExactInterval() `template<typename T>`

`bool smtrat::vb::Variable< T >::updatedExactInterval ( ) const [inline]`

Returns true, if the stored exact interval representing the variable's bounds is up to date. false, otherwise

15.558.3.13 upperbounds() `template<typename T>`

`const BoundSet& smtrat::vb::Variable< T >::upperbounds ( ) const [inline]`

Returns A constant reference to the set of upper bounds of this variable.

15.559 smtrat::vb::VariableBounds< T > Class Template Reference

Class to manage the bounds of a variable.

`#include <VariableBounds.h>`

Public Types

- typedef std::map< ConstraintT, const Bound< T > * > ConstraintBoundMap

  A map from Constraint pointers to Bound pointers.

- typedef carl::FastMap< carl::Variable, Variable< T > * > VariableMap

  A hash-map from arithmetic variables to variables managing the bounds.

Public Member Functions

- VariableBounds ()

  Constructs a variable bounds manager.

- ~VariableBounds ()

  Destructs a variable bounds manager.

- void clear ()
- bool empty () const
- bool addBound (const ConstraintT &_constraint, const T &_origin)

  Updates the variable bounds by the given constraint.

- bool addBound (const FormulaT &_formula, const T &_origin)
- unsigned removeBound (const ConstraintT &_constraint, const T &_origin)

  Removes all effects the given constraint has on the variable bounds.

- unsigned removeBound (const FormulaT &_formula, const T &_origin)
- unsigned removeBound (const ConstraintT &_constraint, const T &_origin, carl::Variable *&_changedVariable)

  Removes all effects the given constraint has on the variable bounds.

- const EvalRationalIntervalMap & getEvalIntervalMap () const

  Creates an evalintervalmap corresponding to the variable bounds.

- const RationalInterval & getInterval (const carl::Variable &_var) const

  Creates an interval corresponding to the variable bounds of the given variable.

- RationalInterval getInterval (carl::Monomial::Arg _mon) const

  Creates an interval corresponding to the bounds of the given monomial.

- RationalInterval getInterval (const TermT &_term) const

  Creates an interval corresponding to the bounds of the given term.

- const smtrat::EvalDoubleIntervalMap & getIntervalMap () const

  Creates an interval map corresponding to the variable bounds.

- const carl::Interval< double > & getDoubleInterval (const carl::Variable &_var) const

  Creates a double interval corresponding to the variable bounds of the given variable.

- std::vector< T > getOriginsOfBounds (const carl::Variable &_var) const
- std::set< T > getOriginSetOfBounds (const carl::Variable &_var) const
- std::vector< T > getOriginsOfBounds (const carl::Variables &_variables) const
- std::set< T > getOriginSetOfBounds (const carl::Variables &_variables) const
- std::vector< T > getOriginsOfBounds () const

  Collect the origins to the supremums and infimums of all variables.

- std::set< T > getOriginSetOfBounds () const
- std::vector< std::pair< std::vector< ConstraintT >, ConstraintT > > getBoundDeductions () const
- void print (std::ostream &_out=std::cout, const std::string _init="", bool _printAllBounds=false) const

  Prints the variable bounds.

- bool isConflicting () const
- std::set< T > getConflict () const

15.559.1 Detailed Description

template<typename T>
class smtrat::vb::VariableBounds< T >

Class to manage the bounds of a variable.

15.559.2 Member Typedef Documentation

15.559.2.1 ConstraintBoundMap template<typename T>

```
typedef std::map<ConstraintT,const Bound<T>*> smtrat::vb::VariableBounds< T >::ConstraintBoundMap
```

A map from Constraint pointers to Bound pointers.

15.559.2.2 VariableMap template<typename T>

```
typedef carl::FastMap<carl::Variable, Variable<T>*> smtrat::vb::VariableBounds< T >::VariableMap
```

A hash-map from arithmetic variables to variables managing the bounds.

15.559.3 Constructor & Destructor Documentation

15.559.3.1 VariableBounds() template<typename T>

```
smtrat::vb::VariableBounds< T >::VariableBounds ( )
```

Constructs a variable bounds manager.

15.559.3.2 ~VariableBounds() template<typename T>

```
smtrat::vb::VariableBounds< T >::~VariableBounds ( )
```

Destructs a variable bounds manager.

15.559.4 Member Function Documentation

15.559.4.1 addBound() [1/2] template<typename T>

```
bool smtrat::vb::VariableBounds< T >::addBound (
            const ConstraintT & _constraint,
            const T & _origin )
```

Updates the variable bounds by the given constraint.

Parameters

_constraint	The constraint to consider.
_origin	The origin of the given constraint.

Returns true, if the variable bounds have been changed; false, otherwise.

15.559.4.2 addBound() [2/2] template<typename T>

```
bool smtrat::vb::VariableBounds< T >::addBound (
            const FormulaT & _formula,
            const T & _origin )
```

15.559.4.3 clear() template<typename T>

```
void smtrat::vb::VariableBounds< T >::clear ( )
```

15.559.4.4 empty() template<typename T>

```
bool smtrat::vb::VariableBounds< T >::empty ( ) const [inline]
```

15.559.4.5 getBoundDeductions() template<typename T>

```
std::vector<std::pair<std::vector<ConstraintT>, ConstraintT> > smtrat::vb::VariableBounds< T
>::getBoundDeductions ( ) const
```

Returns The deductions which this variable bounds manager has detected.

15.559.4.6 getConflict() template<typename T>

```
std::set<T> smtrat::vb::VariableBounds< T >::getConflict ( ) const [inline]
```

Returns The origins which cause the conflict. This method can only be called, if there is a conflict.

15.559.4.7 getDoubleInterval() template<typename T>

```
const carl::Interval<double>& smtrat::vb::VariableBounds< T >::getDoubleInterval (
            const carl::Variable & _var ) const
```

Creates a double interval corresponding to the variable bounds of the given variable.

Parameters

_var	The variable to compute the variable bounds as double interval for.

Returns The variable bounds as a double interval.

15.559.4.8 getEvalIntervalMap() template<typename T>

```
const EvalRationalIntervalMap& smtrat::vb::VariableBounds< T >::getEvalIntervalMap ( ) const
```

Creates an evalintervalmap corresponding to the variable bounds.

Returns The variable bounds as an evalintervalmap.

15.559.4.9 getInterval() [1/3] template<typename T>

```
RationalInterval smtrat::vb::VariableBounds< T >::getInterval (
            carl::Monomial::Arg _mon ) const
```

Creates an interval corresponding to the bounds of the given monomial.

Parameters

_mon	The monomial to compute the bounds as interval for.

Returns The monomial bounds as an interval.

15.559.4.10 getInterval() [2/3] template<typename T>

```
const RationalInterval& smtrat::vb::VariableBounds< T >::getInterval (
            const carl::Variable & _var ) const
```

Creates an interval corresponding to the variable bounds of the given variable.

Parameters

_var	The variable to compute the variable bounds as interval for.

Returns The variable bounds as an interval.

15.559.4.11 getInterval() [3/3] template<typename T>

```
RationalInterval smtrat::vb::VariableBounds< T >::getInterval (
            const TermT & _term ) const
```

Creates an interval corresponding to the bounds of the given term.

Parameters

_term	The term to compute the bounds as interval for.

Returns The term bounds as an interval.

15.559.4.12 getIntervalMap() template<typename T>

```
const smtrat::EvalDoubleIntervalMap& smtrat::vb::VariableBounds< T >::getIntervalMap ( ) const
```

Creates an interval map corresponding to the variable bounds.

Returns The variable bounds as an interval map.

15.559.4.13 getOriginSetOfBounds() [1/3] template<typename T>

```
std::set<T> smtrat::vb::VariableBounds< T >::getOriginSetOfBounds ( ) const
```

15.559.4.14 getOriginSetOfBounds() [2/3] template<typename T>

```
std::set<T> smtrat::vb::VariableBounds< T >::getOriginSetOfBounds (
            const carl::Variable & _var ) const
```

15.559.4.15 getOriginSetOfBounds() [3/3] template<typename T>

```
std::set<T> smtrat::vb::VariableBounds< T >::getOriginSetOfBounds (
            const carl::Variables & _variables ) const
```

15.559.4.16 getOriginsOfBounds() [1/3] template<typename T>

```
std::vector<T> smtrat::vb::VariableBounds< T >::getOriginsOfBounds ( ) const
```

Collect the origins to the supremums and infimums of all variables.

Returns A set of origins corresponding to the supremums and infimums of all variables.

15.559.4.17 getOriginsOfBounds() [2/3] template<typename T>

```
std::vector<T> smtrat::vb::VariableBounds< T >::getOriginsOfBounds (
            const carl::Variable & _var ) const
```

Parameters

_var	The variable to get origins of the bounds for.

Returns The origin constraints of the supremum and infimum of the given variable.

15.559.4.18 getOriginsOfBounds() [3/3] template<typename T>

```
std::vector<T> smtrat::vb::VariableBounds< T >::getOriginsOfBounds (
            const carl::Variables & _variables ) const
```

Parameters

_variables	The variables to get origins of the bounds for.

Returns The origin constraints of the supremum and infimum of the given variables.

15.559.4.19 isConflicting() template<typename T>

```
bool smtrat::vb::VariableBounds< T >::isConflicting ( ) const [inline]
```

Returns true, if there is a conflicting variable; false, otherwise.

15.559.4.20 print() template<typename T>

```
void smtrat::vb::VariableBounds< T >::print (
            std::ostream & _out = std::cout,
            const std::string _init = "",
            bool _printAllBounds = false ) const
```

Prints the variable bounds.

Parameters

_out	The output stream to print on.
_init	A string which is displayed at the beginning of every row.
_printAllBounds	A flag that indicates whether to print also the bounds of each variable (=true).

15.559.4.21 removeBound() [1/3] template<typename T>

```
unsigned smtrat::vb::VariableBounds< T >::removeBound (
            const ConstraintT & _constraint,
            const T & _origin )
```

Removes all effects the given constraint has on the variable bounds.

Parameters

_constraint	The constraint, which effects shall be undone for the variable bounds.
_origin	The origin of the given constraint.

Returns 2, if the variables supremum or infimum have been changed; 1, if the constraint was a (not the strictest) bound; 0, otherwise.

15.559.4.22 removeBound() [2/3] template<typename T>

```
unsigned smtrat::vb::VariableBounds< T >::removeBound (
            const ConstraintT & _constraint,
            const T & _origin,
            carl::Variable *& _changedVariable )
```

Removes all effects the given constraint has on the variable bounds.

Parameters

_constraint	The constraint, which effects shall be undone for the variable bounds.
_origin	The origin of the given constraint.
_changedVariable	The variable whose interval domain has been changed, if the return value is 2.

Returns 2, if the variables supremum or infimum have been changed; 1, if the constraint was a (not the strictest) bound; 0, otherwise.

15.559.4.23 removeBound() [3/3]

```
template<typename T>
unsigned smtrat::vb::VariableBounds< T >::removeBound (
            const FormulaT & _formula,
            const T & _origin )
```

15.560 smtrat::VariableCapsule Class Reference

```

15.566 smtrat::VariantMap< Key, Value > Class Template Reference

This class is a specialization of `std::map` where the keys are of arbitrary type and the values are of type `boost::variant`.

```
#include <VariantMap.h>
```

Public Member Functions

- template<typename T , typename Output >
  void assertType (const Key &key, Output out) const

  Asserts that the value that is associated with the given key has a specified type.
- template<typename T >
  bool has (const Key &key) const

  Checks if there is a value of the specified type for the given key.
- template<typename T >
  const T & get (const Key &key) const

  Returns the value associated with the given key as type `T`.

Data Fields

- K **keys**

  STL member.
- T **elements**

  STL member.

15.566.1 Detailed Description

template<typename Key, typename Value>
class smtrat::VariantMap< Key, Value >

This class is a specialization of `std::map` where the keys are of arbitrary type and the values are of type `boost↩::variant`.

There is no point in using this class if the values are no variants. Most probably, it would not compile anyway and fail to do so with a large bunch of compiler errors. To prevent this, we assert that the value type is indeed a `boost::variant`.

Additionally to the standard methods inherited from `std::map`, it implements three additional methods:

- `assertType<T>(key, out)`: Asserts that there is a value for the given key and that it has the type `T`. If this is not the case, an appropriate error is written to `out`.
- `has<T>(key)`: Checks if there is a value for the given key and if this value has the type `T`.
- `get<T>(key)`: Returns the value for the given key as type `T`.

Template Parameters

Key	Type of keys.
Value	Type of values.

15.566.2 Member Function Documentation

15.566.2.1 assertType()

```
template<typename Key, typename Value>
template<typename T , typename Output >
void smtrat::VariantMap< Key, Value >::assertType (
            const Key & key,
            Output out ) const  [inline]
```

Asserts that the value that is associated with the given key has a specified type.

The assertion holds, if

- there is a value in the map for the given key and
- the stored value has the type `T`.

Template Parameters

T	Type that the value should have.
Output	Type of out.

Parameters

key	Key.
out	Functor returning an output stream.

15.566.2.2 get()

```
template<typename Key, typename Value>
template<typename T >
const T& smtrat::VariantMap< Key, Value >::get (
            const Key & key ) const  [inline]
```

Returns the value associated with the given key as type `T`.

Template Parameters

T	Type of the value.

Parameters

key	Key.

Returns Value of key as type `T`.

15.566.2.3 has()

```
template<typename Key, typename Value>
template<typename T >
bool smtrat::VariantMap< Key, Value >::has (
            const Key & key ) const  [inline]
```

Checks if there is a value of the specified type for the given key.

Template Parameters

T	Type that the value should have.

Parameters

key	Key.

Returns If there is a value of this type.

15.566.3 Field Documentation

15.566.3.1 elements `T std::map< K, T >::elements [inherited]`

STL member.

15.566.3.2 keys `K std::map< K, T >::keys [inherited]`

STL member.

15.567 smtrat::parser::conversion::VariantVariantConverter< Res > Struct Template Reference

Converts variants to another variant type not using the Converter class.

```
#include <Conversions.h>
```

15.568 smtrat::VarSchedulerBase Class Reference

Base class for variable schedulers.

```
#include <VarScheduler.h>
```

Public Member Functions

- template<typename BaseModule >
  VarSchedulerBase (BaseModule &baseModule)
- void rebuild ()

  Rebuild heap.
- void insert (Minisat::Var)

  Insert a variable.
- Minisat::Lit pop ()

  Returns the next variable to be decided.
- bool empty ()

  Check if empty.
- void print () const

  Check if variable is contained.
- void increaseActivity (Minisat::Var)
- void decreaseActivity (Minisat::Var)
- void rebuildActivities ()
- template<typename Constraints >
  void rebuildTheoryVars (const Constraints &)
- void attachClause (Minisat::CRef)
- void detachClause (Minisat::CRef)
- void relocateClauses (std::function< void(Minisat::CRef &)>)

Protected Attributes

15.568.1 Detailed Description

Base class for variable schedulers.

Removes the need to implement stubs.

During instantiation, the Scheduler is constructed with a const SATModule& as parameter.

15.568.2 Constructor & Destructor Documentation

15.568.2.1 VarSchedulerBase()

```
template<typename BaseModule >
smtrat::VarSchedulerBase::VarSchedulerBase (
            BaseModule & baseModule ) [inline]
```

15.568.3 Member Function Documentation

15.568.3.1 attachClause()

```
void smtrat::VarSchedulerBase::attachClause (
            Minisat::CRef ) [inline]
```

15.568.3.2 decreaseActivity()

```
void smtrat::VarSchedulerBase::decreaseActivity (
    Minisat::Var ) [inline]
```

15.568.3.3 detachClause()

```
void smtrat::VarSchedulerBase::detachClause (
    Minisat::CRef ) [inline]
```

15.568.3.4 empty()

```
bool smtrat::VarSchedulerBase::empty ( ) [inline]
```

Check if empty.

15.568.3.5 increaseActivity()

```
void smtrat::VarSchedulerBase::increaseActivity (
    Minisat::Var ) [inline]
```

15.568.3.6 insert()

```
void smtrat::VarSchedulerBase::insert (
    Minisat::Var ) [inline]
```

Insert a variable.

If already contained, do nothing.

15.568.3.7 pop()

```
Minisat::Lit smtrat::VarSchedulerBase::pop ( ) [inline]
```

Returns the next variable to be decided.

Returns and removes the next variable to be decided.

15.568.3.8 print()

```
void smtrat::VarSchedulerBase::print ( ) const [inline]
```

Check if variable is contained.

Print.

15.568.3.9 rebuild()

```
void smtrat::VarSchedulerBase::rebuild ( ) [inline]
```

Rebuild heap.

15.568.3.10 rebuildActivities()

```
void smtrat::VarSchedulerBase::rebuildActivities ( ) [inline]
```

15.568.3.11 rebuildTheoryVars()

```
template<typename Constraints >
void smtrat::VarSchedulerBase::rebuildTheoryVars (
    const Constraints & ) [inline]
```

15.568.3.12 relocateClauses()

```
void smtrat::VarSchedulerBase::relocateClauses (
    std::function< void(Minisat::CRef &)> ) [inline]
```

15.571.1 Detailed Description

Base class for all MCSAT variable scheduler.

Should not be used directly.

15.571.2 Constructor & Destructor Documentation

15.571.2.1 VarSchedulerMcsatBase()

```
template<typename BaseModule >
smtrat::VarSchedulerMcsatBase::VarSchedulerMcsatBase (
            BaseModule & baseModule ) [inline]
```

15.571.3 Member Function Documentation

15.571.3.1 attachClause()

```
void smtrat::VarSchedulerBase::attachClause (
            Minisat::CRef ) [inline], [inherited]
```

15.571.3.2 decreaseActivity()

```
void smtrat::VarSchedulerBase::decreaseActivity (
            Minisat::Var ) [inline], [inherited]
```

15.571.3.3 detachClause()

```
void smtrat::VarSchedulerBase::detachClause (
            Minisat::CRef ) [inline], [inherited]
```

15.571.3.4 empty()

```
bool smtrat::VarSchedulerBase::empty ( ) [inline], [inherited]
```

Check if empty.

15.571.3.5 increaseActivity()

```
void smtrat::VarSchedulerBase::increaseActivity (
            Minisat::Var ) [inline], [inherited]
```

15.571.3.6 insert()

```
void smtrat::VarSchedulerBase::insert (
            Minisat::Var ) [inline], [inherited]
```

Insert a variable.

If already contained, do nothing.

15.571.3.7 pop()

```
Minisat::Lit smtrat::VarSchedulerBase::pop ( ) [inline], [inherited]
```

Returns the next variable to be decided.

Returns and removes the next variable to be decided.

15.571.3.8 print()

```
void smtrat::VarSchedulerBase::print ( ) const [inline], [inherited]
```

Check if variable is contained.

Print.

15.571.3.9 rebuild() `void smtrat::VarSchedulerBase::rebuild ( ) [inline], [inherited]`

Rebuild heap.

15.571.3.10 rebuildActivities() `void smtrat::VarSchedulerBase::rebuildActivities ( ) [inline], [inherited]`

15.571.3.11 rebuildTheoryVars() `template<typename Constraints >`
`void smtrat::VarSchedulerBase::rebuildTheoryVars (`
`const Constraints & ) [inline], [inherited]`

15.571.3.12 relocateClauses() `void smtrat::VarSchedulerBase::relocateClauses (`
`std::function< void(Minisat::CRef &)> ) [inline], [inherited]`

15.571.4 Field Documentation

15.571.4.1 abstractLiteral `std::function<const Minisat::Lit(const FormulaT&)> smtrat::VarSchedulerBase::abstractLiteral [protected], [inherited]`

15.572.1 Detailed Description

template<mcsat::VariableOrdering vot>
class smtrat::VarSchedulerMcsatBooleanFirst< vot >

Variable scheduling that all decides Boolean variables first before deciding any theory variable.

15.572.2 Constructor & Destructor Documentation

15.572.2.1 VarSchedulerMcsatBooleanFirst()

```
template<mcsat::VariableOrdering vot>
template<typename BaseModule >
smtrat::VarSchedulerMcsatBooleanFirst< vot >::VarSchedulerMcsatBooleanFirst (
            BaseModule & baseModule ) [inline], [explicit]
```

15.572.3 Member Function Documentation

15.572.3.1 attachClause()

```
void smtrat::VarSchedulerBase::attachClause (
            Minisat::CRef  )  [inline], [inherited]
```

15.572.3.2 decreaseActivity()

```
template<mcsat::VariableOrdering vot>
void smtrat::VarSchedulerMcsatBooleanFirst< vot >::decreaseActivity (
            Minisat::Var var )  [inline]
```

15.572.3.3 detachClause()

```
void smtrat::VarSchedulerBase::detachClause (
            Minisat::CRef  )  [inline], [inherited]
```

15.572.3.4 empty()

```
template<mcsat::VariableOrdering vot>
bool smtrat::VarSchedulerMcsatBooleanFirst< vot >::empty ( )  [inline]
```

15.572.3.5 increaseActivity()

```
template<mcsat::VariableOrdering vot>
void smtrat::VarSchedulerMcsatBooleanFirst< vot >::increaseActivity (
            Minisat::Var var )  [inline]
```

15.572.3.6 insert()

```
template<mcsat::VariableOrdering vot>
void smtrat::VarSchedulerMcsatBooleanFirst< vot >::insert (
            Minisat::Var var )  [inline]
```

15.572.3.7 pop()

```
template<mcsat::VariableOrdering vot>
Minisat::Lit smtrat::VarSchedulerMcsatBooleanFirst< vot >::pop ( )  [inline]
```

15.572.3.8 print()

```
template<mcsat::VariableOrdering vot>
void smtrat::VarSchedulerMcsatBooleanFirst< vot >::print ( ) const  [inline]
```

15.572.3.9 rebuild()

```
template<mcsat::VariableOrdering vot>
void smtrat::VarSchedulerMcsatBooleanFirst< vot >::rebuild ( )  [inline]
```

15.574.1 Detailed Description

template<typename TheoryScheduler, bool respectActivities>
class smtrat::VarSchedulerMcsatUnivariateClausesOnly< TheoryScheduler, respectActivities >

Decides only Constraints occuring in clauses that are univariate in the current theory variable while the theory ordering is static.

This corresponds to the original NLSAT strategy.

15.574.2 Constructor & Destructor Documentation

15.574.2.1 VarSchedulerMcsatUnivariateClausesOnly()

```
template<typename TheoryScheduler , bool
respectActivities>
template<typename BaseModule >
smtrat::VarSchedulerMcsatUnivariateClausesOnly< TheoryScheduler, respectActivities >::VarSchedulerMcsatUnivar
(
            BaseModule & baseModule )  [inline], [explicit]
```

15.574.3 Member Function Documentation

15.574.3.1 attachClause()

```
template<typename TheoryScheduler , bool respectActivities>
void smtrat::VarSchedulerMcsatUnivariateClausesOnly< TheoryScheduler, respectActivities >↩
::attachClause (
            Minisat::CRef cl )  [inline]
```

15.574.3.2 decreaseActivity()

```
template<typename TheoryScheduler , bool respectActivities>
void smtrat::VarSchedulerMcsatUnivariateClausesOnly< TheoryScheduler, respectActivities >↩
::decreaseActivity (
            Minisat::Var var )  [inline]
```

15.574.3.3 detachClause()

```
template<typename TheoryScheduler , bool respectActivities>
void smtrat::VarSchedulerMcsatUnivariateClausesOnly< TheoryScheduler, respectActivities >↩
::detachClause (
            Minisat::CRef cl )  [inline]
```

15.580.1 Detailed Description

template<typename Res>
struct smtrat::parser::conversion::VectorVariantConverter< Res >

Converts a vector of variants to a vector of some type using the Converter class.

15.580.2 Member Typedef Documentation

15.580.2.1 result_type template<typename Res>

```
typedef Res smtrat::parser::conversion::VectorVariantConverter< Res >::result_type
```

15.580.3 Member Function Documentation

15.580.3.1 operator()() [1/2] template<typename Res>

```
template<BOOST_VARIANT_ENUM_PARAMS(typename T) >
bool smtrat::parser::conversion::VectorVariantConverter< Res >::operator() (
            const std::vector< boost::variant< BOOST_VARIANT_ENUM_PARAMS(T)>> & v,
            std::vector< Res > & result ) const  [inline]
```

15.580.3.2 operator()() [2/2] template<typename Res>

```
template<BOOST_VARIANT_ENUM_PARAMS(typename T) >
bool smtrat::parser::conversion::VectorVariantConverter< Res >::operator() (
            const std::vector< boost::variant< BOOST_VARIANT_ENUM_PARAMS(T)>> & v,
            std::vector< Res > & result,
            TheoryError & errors ) const  [inline]
```

15.581 smtrat::VSModule< Settings > Class Template Reference

```
#include <VSModule.h>
```

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- VSModule (const ModuleInput *, Conditionals &, Manager *const =NULL)
- ~VSModule ()
- bool addCore (ModuleInput::const_iterator)

  The module has to take the given sub-formula of the received formula into account.
- Answer checkCore ()

  Checks the received formula for consistency.
- void removeCore (ModuleInput::const_iterator)

  Removes everything related to the given sub-formula of the received formula.
- void updateModel () const

  Updates the model, if the solver has detected the consistency of the received formula, beforehand.
- void printAll (const std::string &_init="", std::ostream &_out=std::cout) const

  Prints the history to the output stream.
- void printFormulaConditionMap (const std::string &_init="", std::ostream &_out=std::cout) const

  Prints the history to the output stream.
- void printRanking (const std::string &_init="", std::ostream &_out=std::cout) const

  Prints the history to the output stream.
- void printAnswer (const std::string &_init="", std::ostream &_out=std::cout) const

  Prints the answer if existent.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())

- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.581.1 Member Typedef Documentation

15.581.1.1 SettingsType `template<class Settings >`

smtrat::VSModule< Settings >::~VSModule ( )
```

15.581.4 Member Function Documentation

15.581.4.1 add() `bool smtrat::Module::add (`

```
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.581.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.581.4.3 addCore()

```
template<class Settings >
bool smtrat::VSModule< Settings >::addCore (
    ModuleInput::const_iterator formula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.581.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.581.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.581.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.581.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.581.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.581.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.581.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.581.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const  [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.581.4.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.581.4.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.581.4.14 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.581.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.581.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.581.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.581.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.581.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.581.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.581.4.21 check()

```
Answer smtrat::Module::check (
    bool _final = false,
    bool _full = true,
    carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.581.4.22 checkCore()

```
template<class Settings >
Answer smtrat::VSModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.581.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.581.4.24 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.581.4.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.581.4.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.581.4.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.581.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.581.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.581.4.30 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.581.4.31 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.581.4.32 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.581.4.33 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.581.4.34 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.581.4.35 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.581.4.36 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.581.4.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.581.4.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.581.4.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.581.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.581.4.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.581.4.42 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.581.4.43 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.581.4.44 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.581.4.45 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.581.4.46 getBackendsAllModels()

```
void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]
```

Stores all models of a backend in the list of all models of this module.

15.581.4.47 getBackendsModel()

```
void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]
```

15.581.4.48 getInfeasibleSubsets() [1/2]

```
void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]
```

Copies the infeasible subsets of the passed formula.

15.581.4.49 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets (
    const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.581.4.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.581.4.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.581.4.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.581.4.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.581.4.54 getOrigins() [3/3] const FormulaT& smtrat::Module::getOrigins (ModuleInput::const_iterator _formula) const [inline], [protected], [inherited]

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.581.4.55 getReceivedFormulaSimplified() std::pair< bool, FormulaT > smtrat::Module::get↩ ReceivedFormulaSimplified ( ) [virtual], [inherited]

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.581.4.56 hasLemmas() bool smtrat::Module::hasLemmas ( ) [inline], [inherited]

Checks whether this module or any of its backends provides any lemmas.

15.581.4.57 hasValidInfeasibleSubset() bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.581.4.58 id() std::size_t smtrat::Module::id ( ) const [inline], [inherited]

Returns A unique ID to identify this module instance.

15.581.4.59 infeasibleSubsets() const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.581.4.60 inform() bool smtrat::Module::inform (const FormulaT & _constraint) [inherited]

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.581.4.61 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.581.4.62 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.581.4.63 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.581.4.64 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.581.4.65 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.581.4.66 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.581.4.67 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.581.4.68 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.581.4.69 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.581.4.70 model()

`const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.581.4.71 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.581.4.72 moduleName()

```
template<class Settings >
std::string smtrat::VSModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.581.4.73 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.581.4.74 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.581.4.75 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.581.4.76 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.581.4.77 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.581.4.78 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.581.4.79 print()

```
void smtrat::Module::print (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.581.4.80 printAll()

```
template<class Settings >
void smtrat::VSModule< Settings >::printAll (
    const std::string & _init = "",
    std::ostream & _out = std::cout ) const
```

Prints the history to the output stream.

Parameters

_init	The beginning of each row.
_out	The output stream where the history should be printed.

15.581.4.81 printAllModels()

```
void smtrat::Module::printAllModels (
    std::ostream & _out = std::cout ) [inherited]
```

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.581.4.82 printAnswer()

```
template<class Settings >
void smtrat::VSModule< Settings >::printAnswer (
    const std::string & _init = "",
    std::ostream & _out = std::cout ) const
```

Prints the answer if existent.

Parameters

_init	The beginning of each row.
_out	The output stream where the answer should be printed.

15.581.4.83 printFormulaConditionMap()

```
template<class Settings >
void smtrat::VSModule< Settings >::printFormulaConditionMap (
    const std::string & _init = "",
    std::ostream & _out = std::cout ) const
```

Prints the history to the output stream.

Parameters

_init	The beginning of each row.
_out	The output stream where the history should be printed.

15.581.4.84 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.581.4.85 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.581.4.86 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.581.4.87 printRanking()

```
template<class Settings >
void smtrat::VSModule< Settings >::printRanking (
    const std::string & _init = "",
    std::ostream & _out = std::cout ) const
```

Prints the history to the output stream.

Parameters

_init	The beginning of each row.
_out	The output stream where the history should be printed.

15.581.4.88 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.581.4.89 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.581.4.90 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

15.581.4.91 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩
InfeasibleSubset (
            ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.581.4.92 receivedVariable()

```
bool smtrat::Module::receivedVariable (
            carl::Variable::Arg _var ) const [inline], [inherited]
```

15.581.4.93 remove()

```
void smtrat::Module::remove (
            ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.581.4.94 removeCore()

```
template<class Settings >
void smtrat::VSModule< Settings >::removeCore (
            ModuleInput::const_iterator formula ) [virtual]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.581.4.95 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.581.4.96 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected], [inherited]
```

15.581.4.97 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.581.4.98 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.581.4.99 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

15.581.4.100 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.581.4.101 setId()

`void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]`

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.581.4.102 setThreadPriority()

`void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]`

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.581.4.103 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.581.4.104 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.581.4.105 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.581.4.106 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.581.4.107 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.581.4.108 updateModel() `template<class Settings > void smtrat::VSModule< Settings >::updateModel ( ) const [virtual]`

Updates the model, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented from smtrat::Module.

15.581.4.109 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.581.5 Field Documentation

15.581.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.581.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.581.5.3 mBackendsFoundAnswer

`std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.581.5.4 mConstraintsToInform

`carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.581.5.5 mFinalCheck

`bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.581.5.6 mFirstPosInLastBranches

`std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.581.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.581.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::m↩FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.581.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.581.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.581.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.581.5.12 mInformedConstraints `carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.581.5.13 mLastBranches `std::vector< Branching > smtrat::Module::mLastBranches = std↩ ::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.581.5.14 mLemmas `std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.581.5.15 mModel `Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.581.5.16 mModelComputed `bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.581.5.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.581.5.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.581.5.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

15.581.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.581.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.581.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.581.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.581.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.581.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

```

Write results to file.

15.585 benchmax::Z3 Class Reference

Tool wrapper for Z3 for SMT-LIB.

```
#include <Z3.h>
```

Public Member Functions

- Z3 (const fs::path &binary, const std::string &arguments)

  New Z3 tool.

- virtual bool canHandle (const fs::path &path) const override

  Only handle .smt2 files.

- virtual void additionalResults (const fs::path &, BenchmarkResult &result) const override

  Parse answer string from stdout.

- std::string name () const

  Common name of this tool.

- fs::path binary () const

  Full path to the binary.

- const std::map< std::string, std::string > & attributes () const

  A set of attributes, for example compilation options.

- std::vector< std::string > resolveDependencies () const

  Get dependencies of binary required to run it (via ldd)

- std::size_t attributeHash () const

  Hash of the attributes.

- virtual std::string getCommandline (const std::string &file) const

  Compose commandline for this tool and the given input file.

- virtual std::string getCommandline (const std::string &file, const std::string &localBinary) const

  Compose commandline for this tool with another binary name and the given input file.

- virtual std::optional< std::string > parseCommandline (const std::string &cmdline) const

  Compose commandline for this tool and the given input file.

Protected Attributes

- std::string mName

  (Non-unique) identifier for the tool.
- fs::path mBinary

  Path to the binary.
- std::string mArguments

  Command line arguments that should be passed to the binary.
- std::map< std::string, std::string > mAttributes

  Attributes of the tool obtained by introspection of the binary.

15.585.1 Detailed Description

Tool wrapper for Z3 for SMT-LIB.

15.585.2 Constructor & Destructor Documentation

15.585.2.1 Z3()

```
benchmax::Z3::Z3 (
    const fs::path & binary,
    const std::string & arguments ) [inline]
```

New Z3 tool.

15.585.3 Member Function Documentation

15.585.3.1 additionalResults()

```
virtual void benchmax::Z3::additionalResults (
    const fs::path & ,
    BenchmarkResult & result ) const [inline], [override], [virtual]
```

Parse answer string from stdout.

Reimplemented from benchmax::Tool.

15.585.3.2 attributeHash()

```
std::size_t benchmax::Tool::attributeHash ( ) const [inline], [inherited]
```

Hash of the attributes.

15.585.3.3 attributes()

```
const std::map<std::string,std::string>& benchmax::Tool::attributes ( )
const [inline], [inherited]
```

A set of attributes, for example compilation options.

15.585.3.4 binary()

```
fs::path benchmax::Tool::binary ( ) const [inline], [inherited]
```

Full path to the binary.

15.585.3.5 canHandle()

```
virtual bool benchmax::Z3::canHandle (
    const fs::path & path ) const [inline], [override], [virtual]
```

Only handle .smt2 files.

Reimplemented from benchmax::Tool.

15.585.3.6 getCommandline() [1/2]

```
virtual std::string benchmax::Tool::getCommandline (
    const std::string & file ) const [inline], [virtual], [inherited]
```

Compose commandline for this tool and the given input file.

15.585.3.7 getCommandline() [2/2]

```
virtual std::string benchmax::Tool::getCommandline (
    const std::string & file,
    const std::string & localBinary ) const [inline], [virtual], [inherited]
```

Compose commandline for this tool with another binary name and the given input file.

15.585.3.8 name()

```
std::string benchmax::Tool::name ( ) const [inline], [inherited]
```

Common name of this tool.

15.585.3.9 parseCommandline()

```
virtual std::optional<std::string> benchmax::Tool::parse↩
Commandline (
    const std::string & cmdline ) const [inline], [virtual], [inherited]
```

Compose commandline for this tool and the given input file.

15.585.3.10 resolveDependencies()

```
std::vector<std::string> benchmax::Tool::resolveDependencies
( ) const [inline], [inherited]
```

Get dependencies of binary required to run it (via ldd)

15.585.4 Field Documentation

15.585.4.1 mArguments

```
std::string benchmax::Tool::mArguments [protected], [inherited]
```

Command line arguments that should be passed to the binary.

15.585.4.2 mAttributes

```
std::map<std::string,std::string> benchmax::Tool::mAttributes [protected],
[inherited]
```

Attributes of the tool obtained by introspection of the binary.

15.585.4.3 mBinary

```
fs::path benchmax::Tool::mBinary [protected], [inherited]
```

Path to the binary.

15.585.4.4 mName

```
std::string benchmax::Tool::mName [protected], [inherited]
```

(Non-unique) identifier for the tool.
