SMT-RAT

1 SMT-RAT 1

2 Installation 1

2.1 Requirements . . . 1
2.2 Download . . . 2
2.3 Configuration . . . 2
2.4 Build . . . 2
2.5 Check build . . . 2

3 System architecture 2

3.1 Different libraries . . . 2
3.2 Software design . . . 3
3.3 Modules . . . 4
3.4 Strategy . . . 4
3.5 Manager . . . 4
3.6 Procedures implemented as modules . . . 4
3.7 Infeasible subsets and lemmas . . . 4

4 Modules 5

4.1 Main members of a module . . . 5
4.2 Interfaces to implement . . . 5
4.2.1 Informing about a constraint . . . 5
4.2.2 Adding a received formula . . . 6
4.2.3 Removing a received formula . . . 6
4.2.4 Checking for satisfiability . . . 6
4.2.5 Updating the model/satisfying assignment . . . 6
4.3 Running backend modules . . . 7
4.4 Auxiliary functions . . . 8
4.5 Existing module implementation . . . 8
4.6 Available modules . . . 8
4.6.1 BEModule . . . 9
4.6.2 BVModule . . . 9
4.6.3 CNFerModule . . . 9
4.6.4 CSplitModule . . . 9
4.6.5 CoCoAGBModule . . . 9
4.6.6 CubeLIAModule . . . 9
4.6.7 CurryModule . . . 9
4.6.8 EMModule . . . 9
4.6.9 ESModule . . . 9
4.6.10 FPPModule . . . 9
4.6.11 FouMoModule . . . 9
4.6.12 GBModule . . . 9
4.6.13 GBPPModule . . . 10

4.6.14 ICEModule . . . 10
4.6.15 ICPModule . . . 10
4.6.16 IncWidthModule . . . 10
4.6.17 IntBlastModule . . . 10
4.6.18 IntEqModule . . . 10
4.6.19 LRAModule . . . 10
4.6.20 LVEModule . . . 11
4.6.21 MCBModule . . . 11
4.6.22 NRAILModule . . . 11
4.6.23 NewCADModule . . . 11
4.6.24 PBGaussModule . . . 11
4.6.25 PBPPModule . . . 11
4.6.26 PFEModule . . . 11
4.6.27 SATModule . . . 12
4.6.28 STropModule . . . 12
4.6.29 SplitSOSModule . . . 12
4.6.30 SymmetryModule . . . 12
4.6.31 UFCegarModule . . . 12
4.6.32 UnionFindModule . . . 12
4.6.33 VSModule . . . 12

5 Strategies **13**

6 Using SMT-RAT **14**
6.1 Standalone solver . . . 14
6.1.1 Formula analysis . . . 15
6.1.2 Preprocessing . . . 15
6.1.3 Quantifier elimination . . . 15
6.1.4 DIMACS solving . . . 15
6.1.5 Pseudo-Boolean solving . . . 15
6.1.6 Optimization . . . 16
6.2 Embedding in other software . . . 16
6.2.1 Interface . . . 16
6.2.2 Syntax of formulas . . . 17
6.2.3 Boolean combinations of constraints and Boolean variables . . . 17
6.2.4 Normalized constraints . . . 19
6.2.5 Linking . . . 19

7 Other tools **19**
7.1 Benchmarking . . . 19
7.2 Delta debugging . . . 19
7.2.1 SMT-RAT's own delta tool . . . 19
7.2.2 Using ddSMT . . . 20

7.3 Analyzer . . . 20
7.4 Preprocessing . . . 20
7.5 Benchmax . . . 20
7.5.1 General usage . . . 20
7.5.2 Tools . . . 21
7.5.3 Backends . . . 21
7.5.4 Troubleshooting . . . 22
7.5.5 Benchmax python utility . . . 22
7.6 Delta . . . 23
7.6.1 Delta debugging . . . 23

8 Developers information **23**
8.1 Code style . . . 24
8.2 Documentation . . . 24
8.2.1 Code comments . . . 24
8.2.2 Writing out-of-source documentation . . . 25
8.3 Settings . . . 25
8.4 Logging . . . 26
8.5 Statistics and timing . . . 26
8.6 Testing . . . 27
8.7 Validation . . . 27
8.8 Checkpoints . . . 28
8.9 Finding and Reporting Bugs . . . 29

9 README **29**

10 NewCoveringModule #and **29**
10.1 Introduction . . . 29
10.2 Usage . . . 30
10.3 Efficiency . . . 30

11 Todo List **30**

12 Hierarchical Index **30**
12.1 Class Hierarchy . . . 30

13 Data Structure Index **56**
13.1 Data Structures . . . 56

14 Namespace Documentation **81**
14.1 benchmax Namespace Reference . . . 81
14.1.1 Typedef Documentation . . . 84
14.1.2 Function Documentation . . . 84
14.2 benchmax::settings Namespace Reference . . . 88
14.2.1 Function Documentation . . . 88

14.3 benchmax::slurm Namespace Reference . . . 89
14.3.1 Function Documentation . . . 90
14.4 benchmax::ssh Namespace Reference . . . 92
14.5 carl Namespace Reference . . . 92
14.6 delta Namespace Reference . . . 92
14.6.1 Typedef Documentation . . . 94
14.6.2 Function Documentation . . . 94
14.7 Minisat Namespace Reference . . . 96
14.7.1 Typedef Documentation . . . 98
14.7.2 Function Documentation . . . 98
14.7.3 Variable Documentation . . . 102
14.8 smtrat Namespace Reference . . . 102
14.8.1 Detailed Description . . . 111
14.8.2 Typedef Documentation . . . 113
14.8.3 Enumeration Type Documentation . . . 116
14.8.4 Function Documentation . . . 118
14.8.5 Variable Documentation . . . 132
14.9 smtrat::analyzer Namespace Reference . . . 133
14.9.1 Function Documentation . . . 134
14.10 smtrat::cad Namespace Reference . . . 135
14.10.1 Typedef Documentation . . . 137
14.10.2 Enumeration Type Documentation . . . 137
14.10.3 Function Documentation . . . 139
14.11 smtrat::cad::debug Namespace Reference . . . 142
14.12 smtrat::cad::full Namespace Reference . . . 142
14.12.1 Typedef Documentation . . . 142
14.13 smtrat::cad::full_ec Namespace Reference . . . 142
14.13.1 Typedef Documentation . . . 142
14.14 smtrat::cad::preprocessor Namespace Reference . . . 142
14.14.1 Function Documentation . . . 142
14.15 smtrat::cad::projection Namespace Reference . . . 142
14.15.1 Function Documentation . . . 143
14.16 smtrat::cad::projection::brown Namespace Reference . . . 145
14.16.1 Detailed Description . . . 145
14.16.2 Function Documentation . . . 145
14.17 smtrat::cad::projection::collins Namespace Reference . . . 145
14.17.1 Detailed Description . . . 146
14.17.2 Function Documentation . . . 146
14.18 smtrat::cad::projection::hong Namespace Reference . . . 146
14.18.1 Detailed Description . . . 146
14.18.2 Function Documentation . . . 146
14.19 smtrat::cad::projection::lazard Namespace Reference . . . 147

14.19.1 Detailed Description . . . 147
14.19.2 Function Documentation . . . 147
14.20 smtrat::cad::projection::mccallum Namespace Reference . . . 147
14.20.1 Detailed Description . . . 148
14.20.2 Function Documentation . . . 148
14.21 smtrat::cad::projection::mccallum_partial Namespace Reference . . . 148
14.21.1 Detailed Description . . . 148
14.21.2 Function Documentation . . . 148
14.22 smtrat::cad::projection_compare Namespace Reference . . . 149
14.22.1 Typedef Documentation . . . 149
14.22.2 Function Documentation . . . 149
14.23 smtrat::cad::sample_compare Namespace Reference . . . 150
14.23.1 Detailed Description . . . 151
14.23.2 Typedef Documentation . . . 151
14.23.3 Function Documentation . . . 151
14.24 smtrat::cad::variable_ordering Namespace Reference . . . 152
14.24.1 Function Documentation . . . 152
14.25 smtrat::cadcells Namespace Reference . . . 152
14.25.1 Detailed Description . . . 153
14.25.2 Typedef Documentation . . . 153
14.25.3 Variable Documentation . . . 153
14.26 smtrat::cadcells::algorithms Namespace Reference . . . 154
14.26.1 Detailed Description . . . 154
14.26.2 Typedef Documentation . . . 154
14.26.3 Function Documentation . . . 154
14.26.4 Variable Documentation . . . 156
14.27 smtrat::cadcells::algorithms::helper Namespace Reference . . . 157
14.27.1 Function Documentation . . . 157
14.28 smtrat::cadcells::datastructures Namespace Reference . . . 157
14.28.1 Detailed Description . . . 159
14.28.2 Typedef Documentation . . . 161
14.28.3 Enumeration Type Documentation . . . 161
14.28.4 Function Documentation . . . 161
14.29 smtrat::cadcells::datastructures::detail Namespace Reference . . . 165
14.30 smtrat::cadcells::helper Namespace Reference . . . 165
14.30.1 Function Documentation . . . 165
14.31 smtrat::cadcells::operators Namespace Reference . . . 165
14.31.1 Enumeration Type Documentation . . . 166
14.31.2 Function Documentation . . . 166
14.32 smtrat::cadcells::operators::delineation Namespace Reference . . . 168
14.32.1 Function Documentation . . . 168
14.33 smtrat::cadcells::operators::properties Namespace Reference . . . 169

14.33.1 Function Documentation . . . 169
14.34 smtrat::cadcells::operators::rules Namespace Reference . . . 171
14.34.1 Function Documentation . . . 172
14.35 smtrat::cadcells::representation Namespace Reference . . . 174
14.35.1 Enumeration Type Documentation . . . 175
14.35.2 Function Documentation . . . 175
14.36 smtrat::cadcells::representation::util Namespace Reference . . . 177
14.36.1 Function Documentation . . . 177
14.37 smtrat::compile_information Namespace Reference . . . 177
14.37.1 Detailed Description . . . 178
14.37.2 Variable Documentation . . . 178
14.38 smtrat::datastructures Namespace Reference . . . 179
14.39 smtrat::execution Namespace Reference . . . 179
14.39.1 Enumeration Type Documentation . . . 179
14.40 smtrat::expression Namespace Reference . . . 179
14.40.1 Typedef Documentation . . . 180
14.40.2 Enumeration Type Documentation . . . 180
14.40.3 Function Documentation . . . 181
14.41 smtrat::expression::simplifier Namespace Reference . . . 182
14.41.1 Typedef Documentation . . . 182
14.42 smtrat::groebner Namespace Reference . . . 182
14.42.1 Typedef Documentation . . . 183
14.42.2 Function Documentation . . . 183
14.43 smtrat::icp Namespace Reference . . . 183
14.43.1 Typedef Documentation . . . 183
14.43.2 Enumeration Type Documentation . . . 183
14.43.3 Function Documentation . . . 184
14.44 smtrat::impl Namespace Reference . . . 185
14.44.1 Function Documentation . . . 185
14.44.2 Variable Documentation . . . 185
14.45 smtrat::lra Namespace Reference . . . 185
14.45.1 Typedef Documentation . . . 186
14.45.2 Function Documentation . . . 186
14.45.3 Variable Documentation . . . 191
14.46 smtrat::lve Namespace Reference . . . 191
14.46.1 Function Documentation . . . 192
14.47 smtrat::maxsmt Namespace Reference . . . 192
14.47.1 Detailed Description . . . 192
14.48 smtrat::mcsat Namespace Reference . . . 192
14.48.1 Typedef Documentation . . . 193
14.48.2 Enumeration Type Documentation . . . 194
14.48.3 Function Documentation . . . 194

14.49 smtrat::mcsat::arithmetic Namespace Reference . . . 196
14.49.1 Function Documentation . . . 196
14.50 smtrat::mcsat::constraint_type Namespace Reference . . . 196
14.50.1 Function Documentation . . . 196
14.51 smtrat::mcsat::fm Namespace Reference . . . 197
14.51.1 Detailed Description . . . 198
14.51.2 Function Documentation . . . 198
14.52 smtrat::mcsat::icp Namespace Reference . . . 198
14.53 smtrat::mcsat::nlsat Namespace Reference . . . 198
14.54 smtrat::mcsat::nlsat::helper Namespace Reference . . . 199
14.54.1 Function Documentation . . . 199
14.55 smtrat::mcsat::onecell Namespace Reference . . . 200
14.56 smtrat::mcsat::onecellcad Namespace Reference . . . 200
14.56.1 Typedef Documentation . . . 201
14.56.2 Enumeration Type Documentation . . . 201
14.56.3 Function Documentation . . . 202
14.57 smtrat::mcsat::onecellcad::firstlevel Namespace Reference . . . 206
14.57.1 Typedef Documentation . . . 207
14.57.2 Function Documentation . . . 207
14.58 smtrat::mcsat::onecellcad::levelwise Namespace Reference . . . 210
14.59 smtrat::mcsat::onecellcad::recursive Namespace Reference . . . 210
14.59.1 Detailed Description . . . 210
14.59.2 Enumeration Type Documentation . . . 211
14.59.3 Function Documentation . . . 211
14.59.4 Variable Documentation . . . 211
14.60 smtrat::mcsat::smtaf Namespace Reference . . . 211
14.60.1 Typedef Documentation . . . 212
14.60.2 Function Documentation . . . 212
14.61 smtrat::mcsat::variableordering Namespace Reference . . . 212
14.61.1 Function Documentation . . . 212
14.62 smtrat::mcsat::variableordering::detail Namespace Reference . . . 213
14.62.1 Function Documentation . . . 213
14.63 smtrat::mcsat::vs Namespace Reference . . . 215
14.64 smtrat::mcsat::vs::helper Namespace Reference . . . 215
14.64.1 Function Documentation . . . 215
14.65 smtrat::onecellcad Namespace Reference . . . 216
14.66 smtrat::onecellcad::recursive Namespace Reference . . . 216
14.66.1 Typedef Documentation . . . 217
14.66.2 Function Documentation . . . 217
14.67 smtrat::options_detail Namespace Reference . . . 219
14.67.1 Function Documentation . . . 219
14.68 smtrat::parseformula Namespace Reference . . . 219

14.69 smtrat::parser Namespace Reference . . . 220
14.69.1 Typedef Documentation . . . 221
14.69.2 Enumeration Type Documentation . . . 221
14.69.3 Function Documentation . . . 222
14.70 smtrat::parser::arithmetic Namespace Reference . . . 223
14.70.1 Typedef Documentation . . . 223
14.70.2 Function Documentation . . . 223
14.71 smtrat::parser::conversion Namespace Reference . . . 223
14.72 smtrat::parser::core Namespace Reference . . . 223
14.72.1 Function Documentation . . . 223
14.73 smtrat::parser::types Namespace Reference . . . 224

1 SMT-RAT

This is the documentation of SMT-RAT, an Open Source C++ Toolbox for Strategic and Parallel SMT Solving. On this page, you can find introductory information on how to obtain and compile SMT-RAT and a traditional doxygen API documentation. The documentation comes in three flavours:

- API documentation as HTML: the regular web-based doxygen documentation is generated by `make doc-apidoc-html` into `build/doc/apidoc-html/` and online at `https://smtrat.↩ github.io/`.
- API documentation as PDF: (almost) the full doxygen documentation as a pdf file is generated by `make doc-apidoc-pdf` into `build/doc/doc_smtrat-*.pdf` and online `here`.
- Manual as PDF: only the manual, suitable for reading as an introduction into SMT-RAT, is generated by `make doc-manual` into `build/doc/manual_smtrat-*.pdf` and online `here`.

Note that all the information of the manual is contained in the API documentation (both HTML and PDF) as well. It is much more compact, though, and may thus be more approachable as an introduction. However, references to classes do not work in the manual (as the class documentation is not contained).

If you are new to SMT-RAT and want to have a look around, we recommend reading the `manual`. The full API documentation can be found either `online`, or in the `pdf documentation`.

If you want to use SMT-RAT and want to know how to get and install it, have a look at Installation. It covers the most important steps including obtaining the actual source code, obtaining dependencies, building the library and running our test suite.

If you already use SMT-RAT and want to dig deeper or submit new code, you can additionally browse in Developers information. It contains information about supplementary features like our logging framework and some basic guidelines for our code like how we use doxygen.

Note that this documentation is, and will probably still be for quite some time, work in progress. If you feel that some topic that is important to you is missing or some explanation is unclear, please let us know!

2 Installation

2.1 Requirements

SMT-RAT is build and tested on Linux. While MacOS is a secondary target (and should work on the most recent version), we do not target Windows yet. Please contact us if you are interested in changing that.

To build and use SMT-RAT, you need the following other software:

- `git` to checkout the git repository.
- `g++` or `clang` to compile.
- `cmake` to generate the make files.
- `boost` for several additional libraries (automatically built locally if necessary).
- `gmp` for calculations with large numbers (automatically built locally if necessary).
- `carl` from http://smtrat.github.io/carl/ (automatically built locally if necessary).

Optional dependencies

- `ccmake` to set cmake flags.
- `doxygen` to build the documentation.
- `ginac` to enable the usage of polynomial factorization.

When installing the dependencies, make sure that you meet the following version requirements:

- `g++` >= 7
- `clang` >= 5

2.2 Download

Here are archived versions of SMT-RAT for download:

- latest

We mirror our master branch to github.com. If you want to use the newest bleeding edge version, you can checkout from https://github.com/smtrat/smtrat. Although we try to keep the master branch stable, there is a chance that the current revision is broken. You can check here if the current revision compiles.

2.3 Configuration

SMT-RAT is configured with cmake. To prepare the build and perform the configuration run the following, starting from the root folder of SMT-RAT:

```
$ mkdir build && cd build && cmake ..
$ ccmake ..
```

`ccmake` will show the cmake variables. [TODO: document important cmake variables]

2.4 Build

To build SMT-RAT use `make` in the build folder:

```
$ make smtrat-shared
```

Relevant targets you may want to build individually include:

- `smtrat-shared`: Builds the (dynamically linked) executable SMT solver
- `smtrat-static`: Builds the (statically linked) executable SMT solver
- `smtrat`: Builds both `smtrat-shared` and `smtrat-static`.
- `doc-html`: Builds the doxygen documentation as HTML.
- `doc-pdf`: Builds the doxygen documentation as PDF.
- `doc`: Builds both `doc-html` and `doc-pdf`.
- `benchmax`: Builds the benchmarking tool.
- `delta`: Builds the delta debugger.

2.5 Check build

You can now find an executable `smtrat-shared` in the build directory. It shows some usage information if you run `./smtrat-shared --help`. To run it on an SMT-LIB file, simply run

```
$ ./smtrat-shared example.smt2
```

3 System architecture

3.1 Different libraries

THe different parts of SMT-RAT are split into multiple libraries (in the sense of a shared object library) that are responsible for the following tasks:

- `smtrat-analyzer`: static analysis of input formulae;
- `smtrat-cad`: back all CAD-based techniques;
- `smtrat-common`: common definitions and includes;
- `smtrat-max-smt`: takes care of max SMT queries;
- `smtrat-mcsat`: utilities for the MCSAT-based solver;
- `smtrat-modules`: all regular SMT-RAT modules;
- `smtrat-optimization`: takes care of optimization queries;
- `smtrat-qe`: methods for quantifier elimination;
- `smtrat-solver`: core solving infrastructure;
- `smtrat-strategies`: strategies for SMT solving;
- `smtrat-unsat-cores`: takes care of unsat core computations.

All of these yield a library, while a full-fledged SMT solver is build from the `cli/` path, in particular the `cli/smtratSolver.cpp`.

3.2 Software design

The architecture of SMT-RAT puts its focus on modularity and composability of different solving techniques. Every solving technique, for example SAT solving or the simplex method, is encapsulated in a (derivation of the) module class. These modules are composed to a strategy that governs which modules are used in what order. The execution of a strategy is incumbent upon the manager, that also offers an interface for basic SMT solving to the outside.

More advanced solving techniques like quantifier elimination, computing unsatisfiable cores, or tackling max SMT and optimization queries are implemented as individual components in the frontend. The frontend implements (most of) an SMT-LIB compatible interface and can either be used by a generic SMT-LIB parser, or an external tool. This structure is shown in the following picture.

Figure 1 System architecture

The parser itself is implemented in `cli/parser/` and run from `cli/tools/execute_smtlib.h`. The template argument `Executor` is usually instantiated with the executor from `cli/tools/Executor.h` which corresponds to the frontend. The components in the frontend are taken from the respective SMT-RAT libraries.

The manager is a generic class from `smtrat-solver/Manager.h` that every strategy (from `smtrat-strategies/`) inherits from and only constructs the strategy graph in its constructor. The strategy graph is at the core of the composition of SMT-RAT modules and the following picture shows how a single module is embedded in a strategy.

Figure 2 Module in a strategy

Every module has (a pointer to) a set of received formulae that represent its input and a set of passed formulae that represent the formula that is passed on to some backend. The module may "solve" the query from its input on its own, or it may pass (one or more) queries to its backends (in this case B-1, B-2 and B-3). Arrows to backends may be labeled with conditions that restrict whether this particular backend can be used, for example checking whether the passed formulae are linear, contain integer variables or bit-vector formulae.

When a module issues a backend call the manager identifies all suitable backend modules (where the condition evaluates to `true`) and calls all backend modules on the passed formulae. This happens either sequentially (until one backend module solves the query) or in parallel.

3.3 Modules

A module m holds a set of formulas, called its set of received formulas and denoted by $C_{rcv}(m)$. The main function of a module is `check(bool full)`, which either decides whether $C_{rcv}(m)$ is satisfiable or not, returning `SAT` or `UNSAT`, respectively, or returns `UNKNOWN`. A set of formulas is semantically defined by their conjunction. If the function's argument `full` is set to `false`, the underlying procedure of m is allowed to omit hard obstacles during solving at the cost of returning `UNKNOWN` in more cases. We can manipulate $C_{rcv}(m)$ by adding (removing) formulas φ to (from) it with `add(\f$\varphi\f$)` (`remove(\f$\varphi\f$)`). Usually, $C_{rcv}(m)$ is only slightly changed between two consecutive `check` calls, hence, the solver's performance can be significantly improved if a module works incrementally and supports backtracking. In case m determines the unsatisfiability of $C_{rcv}(m)$, it has to compute at least one preferably small infeasible subset $C_{inf}(m) \subseteq C_{rcv}(m)$. Moreover, a module can specify *lemmas*, which are valid formulas. They encapsulate information which can be extracted from a module's internal state and propagated among other modules. Furthermore, a module itself can ask other modules for the satisfiability of its *set of passed formulas* denoted by $C_{pas}(m)$, if it invokes the procedure `runBackends(bool full)` (controlled by the manager). It thereby delegates work to modules that may be more suitable for the problem at hand.

3.4 Strategy

SMT-RAT allows a user to decide how to compose the modules. For this purpose we provide a graphical user interface, where the user can create a *strategy* specifying this composition. A strategy is a directed tree $T := (V, E)$ with a set V of modules as nodes and $E \subseteq V \times \Omega \times \Sigma \times V$, with Ω being the set of *conditions* and Σ being the set of *priority values*. A condition is an arbitrary Boolean combination of formula properties, such as propositions about the Boolean structure of the formula, e.g., whether it is in conjunctive normal form (CNF), about the constraints, \eg whether it contains equations, or about the polynomials, e.g., whether they are linear. Furthermore, each edge carries a unique priority value from $\Sigma = \{1, \ldots, |E|\}$.

3.5 Manager

The manager holds the strategy and the SMT solver's input formula C_{input}. Initially, the manager calls the method `check` of the module m_r given by the root of the strategy with $C_{rcv}(m_r) = C_{input}$. Whenever a module $m \in V$ calls `runBackends`, the manager adds a solving task (σ, m, m') to its priority queue Q of solving tasks (ordered by the priority value), if there exists an edge $(m, \omega, \sigma, m') \in E$ in the strategy such that ω holds for $C_{pas}(m)$. If a processor p on the machine where SMT-RAT is executed on is available, the first solving task of Q is assigned to p and popped from Q. The manager thereby starts the method `check` of m' with $C_{rcv}(m') = C_{pas}(m)$ and passes the result (including infeasible subsets and lemmas) back to m. The module m can now benefit in its solving and reasoning process from this shared information. Note that a strategy-based composition of modules works incrementally and supports backtracking not just within one module but as a whole. This is realized by a mapping in each module m of its passed formulas $\varphi \in C_{pas}(m)$ to sets $R_1, \ldots, R_n \subseteq C_{rcv}(m)$ such that each R_i forms a reason why m included φ in $C_{pas}(m)$ to ask for its satisfiability. In order to exploit the incrementality of the modules, all parallel executed backends terminate in a consistent state (instead of just being killed), if one of them finds an answer.

3.6 Procedures implemented as modules

The heart of an SMT solver usually forms a SAT solver. In SMT-RAT, the module SATModule abstracts the received formulae to propositional logic and uses the efficient SAT solver MiniSat **[minisat]** to find a Boolean assignment of the abstraction. It invokes `runBackends` where the passed formulae of the SATModule contain the constraints abstracted by the assigned Boolean variables in a less-lazy fashion **[sebastiani2007lazy]**. [Todo: Make a concise description here, refer to extensive discussion of modules]

3.7 Infeasible subsets and lemmas

Infeasible subsets and lemmas, which contain only formulas from $C_{pas}(SATModule)$ of a preceding SATModule, prune its Boolean search space and hence the number of theory calls. Smaller infeasible subsets are usually more advantageous, because they make larger cuts in the search space. We call lemmas containing new constraints inventive lemmas (non-inventive otherwise). They might enlarge the Boolean search space, but they can reduce the complexity of later theory calls. When using inventive lemmas, it is important to ensure that the set possible constraints introduced in such lemmas is finite for a given module and a given input formula. Otherwise, the termination of this procedure cannot be guaranteed. In general, any module might contribute lemmas and all preceding modules in the solving hierarchy can directly involve them in their search for satisfiability.

4 Modules

In this chapter we explain how to implement further modules. A module is a derivation of the class `Module` and we give an introduction to its members, interfaces and auxiliary methods in the following of this chapter. A new module and, hence, the corresponding C++ source and header files can be easily created when using the script `writeModules.py`. Its single argument is the module's name and the script creates a new folder in `src/lib/modules/` containing the source and header file with the interfaces yet to implement. Furthermore, it is optional to create the module having a template parameter forming a settings object as explained in sec↩ :auxfunctions. A new module should be created only this way, as the script takes care of a correct integration of the corresponding code into SMT-RAT. A module can be deleted belatedly by just removing the complete folder it is implemented in.

4.1 Main members of a module

Here is an overview of the most important members of the class `Module`.

- `vector<FormulasT> mInfeasibleSubsets`: stores the infeasible subsets of the so far received formulas, if the module determined that their conjunction is not satisfiable.
- `Manager* const mpManager`: a pointer to the manager which maintains the allocation of modules (including this one) to other modules, when they call a backend for a certain formula.

- `const ModuleInput* mpReceivedFormula`: the received formula stores the conjunction of the so far received formulas, which this module considers for a satisfiability check. These formulas are of the type FormulaT and the ModuleInput is basically a list of such formulas, which never contains a formula more than once.
- `ModuleInput* mpPassedFormula`: the passed formula stores the conjunction of the formulas which this module passes to a backend to be solved for satisfiability. There are dedicated methods to change this member, which are explained in the following.

The received formula of a module is the passed formula of the preceding module. The owner is the preceding module, hence, a module has only read access to its received formula. The `ModuleInput` also stores a mapping of a sub-formula in the passed formula of a module to its origins in the received formula of the same module. Why this mapping is essential and how we can construct it is explained in Section sec:runbackend.

4.2 Interfaces to implement

In the following we explain which methods must be implemented in order to fill the module's interfaces with life. All these methods are the core implementation and wrapped by the actual interfaces. This way the developer of a new module needs only to take care about the implementation of the actual procedure for the satisfiability check. All infrastructure-related actions are performed by the actual interface.

4.2.1 Informing about a constraint

```
bool MyModule::informCore( const Formula& _constraint )
{
    // Write the implementation here.
}
```

Informs the module about the existence of the given constraint (actually it is a formula wrapping a constraint) usually before it is actually added to this module for consideration of a later satisfiability check. At least it can be expected, that this method is called, before a formula containing the given constraint is added to this module for consideration of a later satisfiability check. This information might be useful for the module, e.g., for the initialization of the data structures it uses. If the module can already decide whether the given constraint is not satisfiable itself, it returns `false` otherwise `true`.

4.2.2 Adding a received formula

```
bool MyModule::addCore( const ModuleInput::const_iterator )
{
    // Write the implementation here.
}
```

Adds the formula at the given position in the conjunction of received formulas, meaning that this module has to include this formula in the next satisfiability check. If the module can already decide (with very low effort) whether the given formula is not satisfiable in combination with the already received formulas, it returns `false` otherwise `true`. This is usually determined using the solving results this module has stored after the last consistency checks. In the most cases the implementation of a new module needs some initialization in this method.

4.2.3 Removing a received formula

```
void MyModule::removeCore( const ModuleInput::iterator )
{
    // Write the implementation here.
}
```

Removes the formula at the given position from the received formula. Everything, which has been stored in this module and depends on this formula must be removed.

4.2.4 Checking for satisfiability

```
Answer MyModule::checkCore( bool )
{
    // Write the implementation here.
}
```

Implements the actual satisfiability check of the conjunction of formulas, which are in the received formula. There are three options how this module can answer: it either determines that the received formula is satisfiable and returns `true`, it determines unsatisfiability and returns `false`, or it cannot give a conclusive answer and returns `UNKNOWN`. A module has also the opportunity to reason about the conflicts occurred, if it determines unsatisfiability. For this purpose it has to store at least one infeasible subset of the set of so far received formulas. If the method `check` is called with its argument being `false`, this module is allowed to omit hard obstacles during solving at the cost of returning `UNKNOWN` in more cases, we refer to as a *lightweight check*.

4.2.5 Updating the model/satisfying assignment

```
void MyModule::updateModel()
{
    // Write the implementation here.
}
```

If this method is called, the last result of a satisfiability check was `true` and no further formulas have been added to the received formula, this module needs to fill its member `mModel` with a model. This model must be complete, that is all variables and uninterpreted functions occurring in the received formula must be assigned to a value of their corresponding domain. It might be necessary to involve the backends using the method `getBackendsModel()` (if they have been asked for the satisfiability of a sub-problem). It stores the model of one backend into the model of this module.

4.3 Running backend modules

Modules can always call a backend in order to check the satisfiability of any conjunction of formulas. Fortunately, there is no need to manage the assertion of formulas to or removing of formulas from the backend. This would be even more involved as we do allow changing the backend if it is appropriate (more details to this are explained in Chapter chapter:composingats. Running the backend is done in two steps:

1. Change the passed formula to the formula which should be solved by the backend. Keep in mind, that the passed formula could still contain formulas of the previous backend call.
2. Call `runBackends(full)`, where `full` being `false` means that the backends have to perform a lightweight check.

The first step is a bit more tricky, as we need to know which received formulas led to a passed formula. For this purpose the `ModuleInput` maintains a mapping from a passed sub-formula to one or more conjunctions of received sub-formulas. We give a small example. Let us assume that a module has so far received the following constraints (wrapped in formulas)

$$c_0 : x \leq 0,\ c_1 : x \geq 0,\ c_2 : x = 0$$

and combines the first two constraints c_0 and c_1 to c_2. Afterwards it calls its backend on the only remaining constraint, that means the passed formula contains only $c_2 : x = 0$. The mapping of c_2 in the passed formula to the received sub-formulas it stems from then is

$$c_2 \ \mapsto\ (c_0 \wedge c_1,\ c_2).$$

The mapping is maintained automatically and offers two methods to add formulas to the passed formulas:

```
pair<ModuleInput::iterator,bool> addReceivedSubformulaToPassedFormula(ModuleInput::const_iterator)
```

Adds the formula at the given positition in the received formula to the passed formulas. The mapping to its *original formulas* contains only the set consisting of the formula at the given position in the received formula.

```
pair<ModuleInput::iterator,bool> addSubformulaToPassedFormula(const Formula&)
pair<ModuleInput::iterator,bool> addSubformulaToPassedFormula(const Formula&, const Formula&)
pair<ModuleInput::iterator,bool> addSubformulaToPassedFormula(const Formula&, shared_ptr<vector<FormulaT>>&)
```

Adds the given formula to the passed formulas. It is mapped to the given conjunctions of origins in the received formula. The second argument (if it exists) must only consist of formulas in the received formula.

It returns a pair of a position in the passed formula and a `bool`. The `bool` is `true`, if the formula at the given position in the received formula has been added to the passed formula, which is only the case, if this formula was not yet part of the passed formula. Otherwise, the `bool` is `false`. The returned position in the passed formula points to the just added formula.

The vector of conjunctions of origins can be passed as a shared pointer, which is due to a more efficient manipulation of these origins. Some of the current module implementations directly change this vector and thereby achieve directly a change in the origins of a passed formula. \end{itemize} If, by reason of a later removing of received formulas, there is no conjunction of original formulas of a passed formula left (empty conjunction are removed), this passed formula will be automatically removed from the backends and the passed formula. That does also mean, that if we add a formula to the passed formula without giving any origin (which is done by the first version of `addSubformulaToPassedFormula`), the next call of `removeSubformula` of this module removes this formula from the passed formula. Specifying received formulas being the origins of a passed formula highly improves the incremental solving performance, so we recommend to do so.

The second step is really just calling `runBackends` and processing its return value, which can be `True`, `False`, or `Unknown`.

4.4 Auxiliary functions

The Module class provides a rich set of methods for the analysis of the implemented procedures in a module and debugging purposes. Besides all the printing methods, which print the contents of a member of this module to the given output stream, SMT-RAT helps to maintain the correctness of new modules during their development. It therefore provides methods to store formulas with their assumed satisfiability status in order to check them belatedly by any SMT solver which is capable to parse `.smt2` files and solve the stored formula. To be able to use the following methods, the compiler flag `SMTRAT_DEVOPTION_Validation` must be activated, which can be easily achieved when using, e.g., `ccmake`.

- `void checkInfSubsetForMinimality(vector<FormulasT>::const_iterator, const string&, unsigned) const` This method checks the infeasible subset at the given position for minimality, that is it checks whether there is a subset of it having maximally n elements less while still being infeasible. As for some approaches it is computationally too hard to provide always a minimal infeasible subset, they rather provide infeasible subsets not necessarily being minimal. This method helps to analyze how close the size of the encountered infeasible subsets is to a minimal one.
- Another important feature during the development of a new module is the collection of statistics. The script `writeModules.py` for the creation of a new module automatically adds a class to maintain statistics in the same folder in which the module itself is located. The members of this class store the statistics usually represented by primitive data types as integers and floats. They can be extended as one pleases and be manipulated by methods, which have also to be implemented in this class. SMT-RAT collects and prints these statistics automatically, if its command line interface is called with the option `--statistics` or `-s`.
- If the script `writeModules.py` for the creation of a new module is called with the option `-s`, the module has also a template parameter being a settings object. The different settings objects are stored in the settings file again in the same folder as the module is located. Each of these setting objects assigns all settings, which are usually of type `bool`, to values. The name of these objects must be of the form XYSettingsN, if the module is called XYModule and with N being preferably a positive integer. Fulfilling these requirements, the settings to compile this module with, can be chosen, e.g. with `ccmake`, by setting the compiler flag `SMTRAT_XY_Settings` to N. Within the implementation of the module, its settings can then be accessed using its template parameter `Settings`. If, for instance, we want to change the control flow of the implemented procedure in the new module depending on a setting `mySetting` being `true`, we write the following:

```
..
if(Settings::mySettings)
{
    ..
}
..
```

This methodology assures that the right control flow is chosen during compilation and, hence, before runtime.

SMT-RAT contributes a toolbox for composing an SMT compliant solver for its supported logics, that means it is incremental, supports backtracking and provides reasons for inconsistency. The resulting solver is either a fully operative SMT solver, which can be applied directly on `.smt2` files, or a theory solver, which can be embedded into an SMT solver in order to extend its supported logics by those provided by SMT-RAT.

We are talking about composition and toolbox, as SMT-RAT contains implementations of many different procedures to tackle, \eg \supportedLogics, each of them embedded in a module with uniform interfaces. These modules form the tools in the toolbox and it is dedicated to a user how to use them for solving an SMT formula.

In Section sec::strategy we have already introduced a strategy and in the following of this chapter we give a brief introduction to the existing modules equipped with an estimation of their input-based performances.

4.5 Existing module implementation

Available modules

4.6 Available modules

SMT-RAT comes with the following modules that are documented in some more detail below:

BEModule BVModule CNFerModule CSplitModule CoCoAGBModule CubeLIAModule CurryModule EMModule ESModule FPPModule FouMoModule GBModule GBPPModule ICEModule ICPModule IncWidthModule IntBlastModule IntEqModule LRAModule LVEModule MCBModule NRAILModule NewCADModule NewCovering↩ Module PBGaussModule PBPPModule PFEModule SATModule STropModule SplitSOSModule SymmetryModule UFCegarModule UnionFindModule VSModule

4.6.1 BEModule

4.6.2 BVModule This module implements an encoder for bitvector formulae to propositional logic. It is described in more detail in [**?**].

4.6.3 CNFerModule Transforms its received formula into conjunctive normal form CNF.

4.6.3.0.1 Efficiency The worst case complexity of this module is polynomial in the number of operators in the formula to transform.

4.6.4 CSplitModule Implements solving for nonlinear integer arithmetic using incremental linearization. This module was implemented in [**?**] based on [**?**].

4.6.5 CoCoAGBModule Uses Gröbner bases for theory solving, very much like smtrat::GBModule. However, for the underlying implementation of Gröbner bases, this module does not use carl::groebner but CoCoALib.

4.6.6 CubeLIAModule Implements cube-based tests for linear integer arithmetic based on [**?**].

4.6.7 CurryModule Implements curryfiyng preprcessing as described in [**?**].

4.6.8 EMModule This module addempts to eliminate multiple factors from equations and inequations.

4.6.9 ESModule Uses equations (or Boolean assertions) to eliminate variables from the remaining formula. Let the formula have the form $e \wedge \varphi$', then we use knowledge gained from e to simplify φ'. If e is an arithmetic equation such that we can rewrite it to the form $x = t$ (with x a variable) then we substitute t for x into φ'. Otherwise we simply replace e with $true$ in φ'. This is done recursively in the formula.

4.6.10 FPPModule This module implements a generic preprocessing facility. It runs a given strategy on the input and retrieves the simplified formula using the facilities of the Manager class. This process is iterated until a fix point is reached – no further simplification was done by the strategy – or a predefined number of iterations was performed. The resulting simplified formula is then forwarded to the backend.

The strategy should be a linear sequence of preprocessing modules, as passing simplified formulas back to the caller is not possible in a meaningful way for general Module classes.

4.6.11 FouMoModule Implements the SMT compliant Fourier-Motzkin algorithm. Hence, this module can decide the consistency of any conjunction consisting only of linear real arithmetic constraints. Furthermore, it might also find the consistency of a conjunction of constraints even if they are not all linear e.g. in the case of a monomial x^i (where i is a positive integer) only occuring in the shape of this monomial. Such a monomial is subsequently eliminated as common linear variables are eliminated. One can tune a threshold parameter in order to determine when, regarding the size of the considered constraints, this module shall call the backends. In the latter case, the backends are called with the constraint set that is obtained after eliminating a certain number of variables.

4.6.11.1 Integer arithmetic One can also use this approach for (linear) integer arithmetic as unsatisfiability over the real domain implies unsatisfiability over the integer domain. In addition to that, one can heuristically try to construct integer solutions by considering the lowest upper and the highest lower bound of a variable that can be derived from the respective elimination step. Note that this approach is incomplete.

4.6.12 GBModule Implements the Gröbner bases based procedure as presented in [**?**]. In general, this procedure can detect only the unsatisfiability of a conjunction of equations. This module also supports the usage of these equations to further simplify all constraints in the conjunction of constraints forming its input and passes these simplified constraints to its backends. However, it cannot be guaranteed that backends perform better on the simplified constraints than on the constraints before simplification.

4.6.12.0.1 Efficiency The worst case complexity of the underlying procedure is exponential in the number of variables of the input constraints. In the case that the conjunction of constraints to check for satisfiability contains equations, this module can be more efficient than other modules for NRA on finding out inconsistency.

4.6.13 GBPPModule Uses Gröbner basis computations to simplify the input formula. The underlying implementation of Gröbner bases is used from carl::groebner.

The fundamental idea is as follows: Separate the input formula into equalities and inequalities and compute the Gröbner basis of the equalities. Now we can replace the equalities with the Gröbner basis (if this "seems easier") and also simplify the inequalities using the Gröbner basis.

4.6.14 ICEModule This module tries to find simple chains of inequalities that can be combined to form a cycle. It converts constraints of the form $x \geq y + z$ to a hypergraph (with an edge going from x to y, z) and uses the coefficients as edge weights. If this hypergraph contains cycles, these can be used to infer additional constraints on the individual variables. In particular, zero cycles induce equality of variables while negative cycles reveal conflicts.

4.6.15 ICPModule Implements a combination of interval constraint propagation equipped with a Newton-based contraction [**?**] and LRA solving, for which we use our LRAModule. The implementation is inspired by [**?**], but additionally interacts with backends in order to exploit their efficiency on examples, where ICP fails. It thereby incorporates the possibility to invoke lightweight checks and highly benefits from the backends being optimized for small domains as, e.g. described in [**?**]. This module tries to lift splitting decisions as well as lemmas encoding a nonzero contraction to a preceding SATModule. It ensures an efficient processing of these decisions, which are this way shared with other modules.

4.6.15.0.1 Efficiency It is very difficult to give a conclusive statement about the efficiency of ICP. Usually, it performs better, if the domains of all variables are bounded intervals, preferably with a small diameter. It might also benefit from a higher number of constraints, as this introduces more chances for the propagation. However, more constraints mean also more overhead.

4.6.16 IncWidthModule This module is meant to be used for solving nonlinear integer arithmetic problems by encoding them into bitvector arithmetic formulas (as done in smtrat::IntBlastModule), as described in [**?**] and [**?**], both (heavily) inspired by [**?**]. This approach heavily benefits from knowing bounds on individual variables, both in terms of its ability to find infeasibility and its performance in general.

In this module, we use smtrat::ICPModule to infer new bounds and call the backend incrementally with growing bounds until the computed upper bounds are met.

4.6.17 IntBlastModule This module implements encoding nonlinear integer arithmetic problems into bitvector arithmetic formulas as described in [**?**] and [**?**], both (heavily) inspired by [**?**].

4.6.18 IntEqModule Implements the SMT compliant equation elimination method presented in [**?**]. Hence, this module either determines that the equations of an instance are unsatisfiable or calculates a certain number of substitutions for variables. The latter can be used to eliminate the equations by substituting every variable for which a substitution exists by its substitution. The set of constraints that we obtain with this procedure, not containing equations anymore, is passed to the backends.

4.6.19 LRAModule Implements the SMT compliant simplex method presented in [**?**]. Hence, this module can decide the consistency of any conjunction consisting only of linear real arithmetic constraints. Furthermore, it might also find the consistency of a conjunction of constraints even if they are not all linear and calls a backend after removing some redundant linear constraints, if the linear constraints are satisfiable and the found solution does not satisfy the non-linear constraints. Note that the smtrat::LRAModule might need to communicate a lemma/tautology to a preceding smtrat::SATModule, if it receives a constraint with the relation symbol $\neq$ and the strategy needs for this reason to define a smtrat::SATModule at any position before an smtrat::LRAModule.

4.6.19.0.1 Integer arithmetic In order to find integer solutions, this module applies, depending on which settings are used, branch-and-bound, the construction of Gomory cuts and the generation of cuts from proofs [**?**]. It is also supported to combine these approaches. Note that for all of them the smtrat::LRAModule needs to communicate a lemma/tautology to a preceding SATModule and the strategy needs for this reason to define a SATModule at any position before an smtrat::LRAModule.

4.6.19.0.2 Efficiency The worst case complexity of the implemented approach is exponential in the number of variables occurring in the problem to solve. However, in practice, it performs much faster, and the worst case applies only on very artificial examples. This module outperforms any module implementing a method that is designed for solving formulas with non-linear constraints. If the received formula contains integer valued variables, the aforementioned methods might not terminate.

4.6.20 LVEModule This module aims to eliminate lone variables that only occur once. We call a variable a lone variable if it only occurs in a single constraint. Furthermore we only try to eliminate the variable if this constraint is a top-level constraint.

4.6.21 MCBModule This module attempts to detect logic structures that essentially encode a multiple-choice on an arithmetic variable. It extracts this information and translates it to a Boolean structure, thereby eliminating the arithmetic variable.

4.6.22 NRAILModule This module implements incremental linearization as described in [**?**], roughly following [**?**] and [**?**]. In addition, it implements an ICP-based axiom instantiation.

4.6.23 NewCADModule This module is based on the implementation in smtrat::cad. It is described in [**?**] in some detail.

4.6.24 PBGaussModule This module tries to simplify pseudo-Boolean problems using Gauss as described in [**?**].

4.6.25 PBPPModule This module implements a variety of preprocessing techniques for pseudo-Boolean problems. Many of them are based on [**?**].

4.6.26 PFEModule Implements factor elimination in polynomials based on factorization and variable bounds.

Given a constraint $p \sim 0$ with $\sim \in \{=, \neq, \geq, >, \leq, <\}$ and bounds b on the variables in p, the module does the following: It computes a factor q such that $p = q \cdot r$ and evaluates q on the intervals represented by the bounds. If the resulting interval $q(b)$ if sign-invariant, the constraint can be simplified or additional constraints can be added. We consider an interval to be sign-invariant, if it is positive, semi-positive, zero, semi-negative or negative.

4.6.26.0.1 Simplifications The following simplifications are done for for $q \cdot r \sim 0$:

$\sim$	$q(b) > 0$	$q(b) \geq 0$	$q(b) = 0$	$q(b) < 0$	$q(b) \leq 0$
$=$	$p := r$	$f := q = 0 \vee r = 0$	$p := 0$	$p := r$	$f := q = 0 \vee r = 0$
$\neq$	$p := r$	$f := q > 0 \wedge r \neq 0$	$p := 0$	$p := r$	$f := q < 0 \wedge r \neq 0$
$\geq$	$p := r$	$f := q = 0 \vee r \geq 0$	$p := 0$	$c := r \leq 0$	$f := q = 0 \vee r \leq 0$
$>$	$p := r$	$f := q > 0 \wedge r > 0$	$p := 0$	$c := r < 0$	$f := q < 0 \wedge r < 0$
$\leq$	$p := r$	$f := q = 0 \vee r \leq 0$	$p := 0$	$c := r \geq 0$	$f := q = 0 \vee r \geq 0$
$<$	$p := r$	$f := q > 0 \wedge r < 0$	$p := 0$	$c := r > 0$	$f := q < 0 \wedge r > 0$

Notation: $p := p$' replaces the polynomial, $c := p' \sim 0$ replaces the whole constraint by a new one and $f := f$' replaces the constraint by a new formula.

To maximize the cases where $q(b)$ actually is sign-invariant, we proceed as follows. We compute a factorization of p, that is a number of polynomials p_i such that $p = \prod_{i=1}^{k} p_i$. We now separate all p_i into two sets: P_q for all sign-invariant p_i and P_r for all other p_i. Thereby, we set $q = \prod_{t \in P_q} t$ and $r = \prod_{t \in P_r}$ and know that $q(b)$ is sign-invariant.

Instead of computing $q(b)$ once again afterwards, we can determine the type of sign-invariance of $q(b)$ from the types of sign-invariances of the factors from P_q. Assume that we start with a canonical factor 1 and a sign-invariance of $>$, we can iteratively combine them like this:

4.6.26.0.2 Combining types of sign-invariance Combining two types of sign-invariance is done as follows:

$\cdot$	$>$	$\geq$	$=$	$\leq$	$<$
$>$	$>$	$\geq$	$=$	$\leq$	$<$
$\geq$	$\geq$	$\geq$	$=$	$\leq$	$\leq$
$=$	$=$	$=$	$=$	$=$	$=$
$\leq$	$\leq$	$\leq$	$=$	$\geq$	$\geq$
$<$	$<$	$\leq$	$=$	$\geq$	$>$

4.6.27 SATModule This module abstracts it's received formula, being any SMT formula of the supported logics of \smtrat, to it's Boolean skeleton. It thereby replaces all constraints in the formula by fresh Boolean variables. The resulting propositional formula is then solved with \minisat~**[where]** after each completed decision level the constraints belonging to the assigned Boolean variables are checked for consistency by the backends of this module. In the case of inconsistency, the infeasible subsets of the backends are abstracted and then involved in the search for a satisfying solution.

4.6.27.0.1 Efficiency Even though the worst case complexity of this procedure, not considering the complexity of the backend calls, is exponential in the number of variables in the abstracted formula, the procedure is in practice more efficient than any of the theory modules. Hence, it does clearly not form a bottleneck of the SMT solving. However, one should aim at reducing the number and complexity of the theory (backend) calls of this module, which might be influenced by infeasible subsets, which are small and/or involve constraints of earlier decision levels in the SAT solving, and lemmas, which either prune the search space of the SAT solving or ease subsequent theory calls.

4.6.28 STropModule Implements the subtropical satisfiability method as described in [**?**] based on [**?**].

4.6.29 SplitSOSModule Splits the left hand side of constraints according to their sum-of-squares decomposition.

4.6.30 SymmetryModule This module tries to recognize syntactic symmetries in the input formula and adds symmetry breaking constraints. The core functionality is provided by CArL through carl::formula::breakSymmetries() which internally encodes the formula as a graph and uses bliss to find automorphisms on this graph.

4.6.30.0.1 Efficiency Finding automorphisms is as difficult as determining whether two graphs are isomorphic, and it is not known whether this problem can be solved in polynomial or exponential time. In practice, current solvers like bliss perform very good on large graphs and we therefore assume this module to be sufficiently fast.

4.6.31 UFCegarModule This module implements a CEGAR-approach for solving uninterpreted functions (or rather reducing uninterpreted functions to equality logic).

4.6.32 UnionFindModule This module implements a theory solver for equality logic based on a persistent union find structure (based on the immer library).

4.6.33 VSModule Implements the virtual substitution method for a conjunction of constraints as described in [**?**]. This module supports incremental calls, efficient backtracking and infeasible subset generation. Note, that the infeasible subsets are often very small but not necessarily minimal. The implemented approach is not complete, as it maybe cannot decide the satisfiability of a conjunction containing a constraint, which involves a variable with degree 3 or more. Note, that even if no constraint of such form occurs in the received formula, this module might not be able to determine the consistency of its received formula, as it could create constraints of this form in its solving process. Nevertheless, the implemented approach is efficient compared to other approaches for non-linear real arithmetic conjunctions, and therefore well-suited to be used for solving conjunctions of non-linear real arithmetic constraints before complete approaches have their try. In combination with a backend, this module tries to solve the given problem and calls the backend on problems with less variables.

4.6.33.0.1 Efficiency The worst case complexity of this approach is exponential in the number of real arithmetic variables occurring in the conjunction to solve. It performs especially good on almost linear instances and slightly prefers problems only containing constraints with the relation symbols $\leq$, $\geq$ and $=$. It is often the case, that even if the conjunction to solve contains many not suited constraints, this module can determine the consistency on the basis of a well suited subset of the constraints in this conjunction.

5 Strategies

To compose modules to a solver, strategies are used. Strategies are represented as trees of modules where the input file is passed to the root module. Every module can issue calls to its **backend modules** (via `runBackends`) which then calls its child modules in the strategy on the formula this module has put in the passed formulas. If no backend module exists, the call returns `unknown`.

A Strategy is specified by deriving from the Manager class and settings its strategy in the constructor using the `setStrategy` member function. A simple example, supporting only propositional logic, would look like this:

```
class PureSAT: public Manager {
    public:
    PureSAT(): Manager() {
        setStrategy(
            addBackend<SATModule<SATSettings1>>()
        );
    }
};
```

Each module is added to the strategy tree using `addBackend<Module class>` where the module class is usually a template that is instantiated with some settings. A slightly more complex, where the SATModule has the NewCADModule available for theory calls, might look as follows:

```
class CADOnly: public Manager {
    public:
    CADOnly(): Manager() {
        setStrategy(
            addBackend<SATModule<SATSettings1>>(
                addBackend<NewCADModule<NewCADSettingsFOS>>()
            )
        );
    }
};
```

Note that the arguments to `setStrategy` and `addBackend` can not only be a single element, but an `initializer_list` of multiple backends as well. In this case the backends are called in order until one returns a conclusive result (that is: not `unknown`). If SMT-RAT was configured to allow for parallel execution, the backends are executed in parallel and the result of the first backend to terminate is used.

```
class CADVSICP: public Manager {
    public:
    CADVSICP(): Manager() {
        setStrategy(
            addBackend<SATModule<SATSettings1>>({
                addBackend<NewCADModule<NewCADSettingsFOS>>(
                    addBackend<VSModule<VSSettings234>>()
                ),
                addBackend<ICPModule<ICPSettings1>>()
            })
        );
    }
};
```

Finally, we can also attach conditions to individual backends to restrict their applicability. For example, we can construct a strategy that uses separate sub-strategies for linear and nonlinear problems:

```
class RealSolver: public Manager {
    static bool is_nonlinear(carl::Condition condition) {
        return (carl::PROP_CONTAINS_NONLINEAR_POLYNOMIAL <= condition);
    }
    static bool is_linear(carl::Condition condition) {
        return !(carl::PROP_CONTAINS_NONLINEAR_POLYNOMIAL <= condition);
    }
    public:
    RealSolver(): Manager() {
        setStrategy({
            addBackend<FPPModule<FPPSettings1>>(
                addBackend<SATModule<SATSettings1>>(
                    addBackend<ICPModule<ICPSettings1>>(
                        addBackend<VSModule<VSSettings234>>(
                            addBackend<NewCADModule<NewCADSettingsFOS>>()
                        )
                    )
                )
            ).condition( &is_nonlinear ),
            addBackend<FPPModule<FPPSettings1>>(
                addBackend<SATModule<SATSettings1>>(
                    addBackend<LRAModule<LRASettings1>>()
                )
            ).condition( &is_linear )
        });
    }
};
```

6 Using SMT-RAT

SMT-RAT can be used in two ways, either as a standalone solver or as a C++ library within some other software.

6.1 Standalone solver

Before actually compiling SMT-RAT into a binary, an appropriate strategy should be selected. While a number of strategies are available, it sometimes makes sense to craft a strategy for the specific problem at hand. Please refer to Strategies on how to create strategies. To select a strategy use `ccmake` to set the `SMTRAT_Strategy` variable accordingly and then build the solver binary using `make smtrat-shared`. Use `./smtrat-shared --strategy` to check whether the desired strategy is used.

The solver binary can now be used to solve input in the `smt2` format, either given as a filename or on standard input:

```
./smtrat-shared <input file>
cat <input file> | ./smtrat-shared -
```

Note that the solver binary can perform many other tasks as well that we discuss below. Some of these are enabled (or disabled) by a set of `cmake` options of the form `CLI_ENABLE_*` and the currently available ones can be obtained as follows:

```
$ ./smtrat-shared --help
Usage: ./smtrat-shared [options] input-file

Core settings:
  --help                                show help
  --info                                show some basic information about this
                                        binary
  --version                             show the version of this binary
  --settings                            show the settings that are used
  --cmake-options                       show the cmake options during
                                        compilation
  --strategy                            show the configured strategy
  --license                             show the license
  -c [ --config ] arg                   load config from the given config file

Solver settings:
  --preprocess                          only preprocess the input
  --pp-output-file arg                  store the preprocessed input to this
                                        file
  --to-cnf-dimacs                       transform formula to cnf as dimacs
  --to-cnf-smtlib                       transform formula to cnf as smtlib
  --print-model                         print a model if the input is
                                        satisfiable
  --print-all-models                    print all models of the input

Validation settings:
  --validation.export-smtlib            store validation formulas to smtlib
                                        file
  --validation.smtlib-filename arg (=validation.smt2)
                                        filename of smtlib output
  --validation.channel arg              add a channel to be considered

Module settings:
  --module.parameter arg                add a parameter for modules (key=value)

Parser settings:
  --dimacs                              parse input file as dimacs file
  --opb                                 parse input file as OPB file
  --input-file arg                      path of the input file
  --disable-uf-flattening               disable flattening of nested
                                        uninterpreted functions
  --disable-theory                      disable theory construction
```

```
Analysis settings:
  --analyze.enabled                     enable formula analyzer
  --analyze.projections arg (=none)     which CAD projections to analyze (all,
                                        collins, hong, mccallum,
                                        mccallum_partial, lazard, brown, none)

CAD Preprocessor settings:
  --cad.pp.no-elimination               disable variable elimination
  --cad.pp.no-resultants                disable resultant rule
```

6.1.1 Formula analysis One sometimes wants to only obtain certain information about the given formula, usually for statistical purposes. SMT-RAT exposes a formula analyzer that gives a number of properties of the formula.

```
$ ./smtrat-shared --analyze.enabled <input file>
```

6.1.2 Preprocessing While many SMT-RAT strategies employ certain preprocessing techniques, it is sometimes convenient to apply this preprocessing ahead of time, for example to normalize the inputs. The result is either printed or written to an output file if `--pp-output-file` is given.

```
$ ./smtrat-shared --preprocess --pp-output-file <output file> <input file>
```

6.1.3 Quantifier elimination Instead of regular SMT solving, SMT-RAT can also perform quantifier elimination tasks as described in **[Neuhaeuser2018]**. This technique is used when the SMTLIB file contains a `eliminate-quantifiers` command like `(eliminate-quantifiers (exists x y) (forall z))`.

6.1.4 DIMACS solving For purely propositional formulae (i.e. SAT solving) one usually uses the (much more compact) DIMACS format instead of SMT-LIB. Note that SMT-RAT still uses the configured strategy to solve the given input instead of only a SAT solver, allowing to use custom preprocessing techniques.

```
$ ./smtrat-shared --dimacs <input file>
```

6.1.5 Pseudo-Boolean solving Another interesting solving task is concerned with pseudo-Boolean formulae where Boolean variables are used in arithmetic constraints (and implicitly considered as being integers over just zero and one). A special input format called OPB exists (rather similar to DIMACS) that can be read and solved with a strategy based on [**?**] as follows:

```
$ ./smtrat-shared --opb <input file>
```

6.1.6 Optimization For many applications, one wants not only some feasible solution but rather an optimal solution with respect to some objective function. This is used when the SMTLIB file contains one or more `(minimize)` or `(maximize)` commands with semantics similar to what is described for `z3`.

6.2 Embedding in other software

Instead of using SMT-RAT as a standalone solver, it can also be embedded in other software.

6.2.1 Interface The easiest way is to embed a certain strategy.

If for instance the SMT solver based on the strategy of `RatOne` shall be used (we can also choose any self-composed strategy here), we can create it as follows:

```
smtrat::RatOne yourSolver = smtrat::RatOne();
```

As all strategies are derived from the Manager class, we can thus use the Manager interface. The most important methods are the following:

- `bool inform( const FormulaT& )` Informs the solver about a constraint, wrapped by the given formula. Optimally, the solver should be informed about all constraints, which it will receive eventually, before any of them is added as part of a formula with the interface `add(..)`. The method returns `false` if it is easy to decide (for any module used in this solver), whether the constraint itself is inconsistent.
- `bool add( const FormulaT& )` Adds the given formula to the conjunction of formulas, which will be considered for the next satisfiability check. The method returns `false`, if it is easy to decide whether the just added formula is not satisfiable in the context of the already added formulas. Note, that only a very superficial and cheap satisfiability check is performed and mainly depends on solutions of previous consistency checks. In the most cases this method returns `true`, but in the case it does not the corresponding infeasible subset(s) can be obtained by `infeasibleSubsets()`.
- `Answer check( bool )` This method checks the so far added formulas for satisfiability. If, for instance we extend an SMT solver by a theory solver composed with SMT-RAT, these formulas are only constraints. The answer can either be `SAT`, if satisfiability has been detected, or `UNSAT`, if the formulas are not satisfiable, and `UNKNOWN`, if the composition cannot give a conclusive answer. If the answer has been `SAT`, we get the model, satisfying the conjunction of the given formulas, using `model()` and, if it has been `UNSAT`, we can obtain infeasible subsets by `infeasibleSubsets()`. If the answer is `UNKNOWN`, the composed solver is either incomplete (which highly depends on the strategy but for QF_NRA it is actually always possible to define a strategy for a complete SMT-RAT solver) or it communicates lemmas/tautologies, which can be obtained applying `lemmas()`. If we embed, e.g., a theory solver composed with SMT-RAT into an SMT solver, these lemmas can be used in its sat solving process in the same way as infeasible subsets are used. The strategy of an SMT solver composed with SMT-RAT has to involve a `SATModule` before any theory module is used (It is possible to define a strategy using conditions in a way, that we achieve an SMT solver, even if for some cases no `SATModule` is involved before a theory module is applied.) and, therefore, the SMT solver never communicates these lemmas as they are already processed by the `SATModule`. A better explanation on the modules and the strategy can be found in `system architecture`. If the Boolean argument of the function `check` is `false`, the composed solver is allowed to omit hard obstacles during solving at the cost of returning `UNKNOWN` in more cases.
- `void push()` Pushes a backtrack point to the stack of backtrack points.
- `bool pop()` Pops a backtrack point from the stack of backtrack points and undoes everything which has been done after adding that backtrack point. It returns `false` if no backtrack point is on the stack. Note, that SMT-RAT supports incrementality, that means, that by removing everything which has been done after adding a backtrack point, we mean, that all intermediate solving results which only depend on the formulas to remove are deleted. It is highly recommended not to remove anything, which is going to be added directly afterwards.
- `const std::vector<FormulasT>& infeasibleSubsets() const` Returns one or more reasons for the unsatisfiability of the considered conjunction of formulas of this SMT-RAT composition. A reason is an infeasible subset of the sub-formulas of this conjunction.
- `const Model& model() const` Returns an assignment of the variables, which occur in the so far added formulas, to values of their domains, such that it satisfies the conjunction of these formulas. Note, that an assignment is only provided if the conjunction of so far added formulas is satisfiable. Furthermore, when solving non-linear real arithmetic formulas the assignment could contain other variables or freshly introduced variables.
- `std::vector<FormulaT> lemmas() const` Returns valid formulas, which we call lemmas. For instance the `ICPModule` might return lemmas being splitting decisions, which need to be processed in, e.g., a SAT solver. A *splitting decision* has in general the form `(c_1 and ... and c_n) -> (p <= r or p > r)` where c_1, .., c_n are constraints of the set of currently being checked constraints (forming a *premise*), p is a polynomial (in the most cases consisting only of one variable) and r being a rational number. Hence, splitting decisions always form a tautology. We recommend to use the `ICPModule` only in strategies with a preceding `SATModule`. The same holds for the `LRAModule`, `VSModule`, and `CADModule` if used on QF_NIA formulas. Here, again, splitting decisions might be communicated.

Of course, the Manager interface contains more methods that can be found at Manager.

6.2.2 Syntax of formulas The class Formula represents SMT formulas, which are defined according to the following abstract grammar

$$
\begin{array}{lcl|l|l|l|l|l|l}
p & ::= & a & b & x & (p+p) & (p \cdot p) & (p^e) \\
v & ::= & u & x & & & & \\
s & ::= & f(v,\ldots,v) & u & x & & & \\
e & ::= & s = s & & & & & \\
c & ::= & p = 0 & p < 0 & p \leq 0 & p > 0 & p \geq 0 & p \neq 0 \\
\varphi & ::= & c & (\neg\varphi) & (\varphi \wedge \varphi) & (\varphi \vee \varphi) & (\varphi \rightarrow \varphi) & \\
 & & (\varphi \leftrightarrow \varphi) & (\varphi \oplus \varphi) & & & &
\end{array}
$$

where a is a rational number, e is a natural number greater one, b is a *Boolean variable* and the *arithmetic variable* x is an inherently existential quantified and either real- or integer-valued. We call p a *polynomial* and use a multivariate polynomial with rationals as coefficients to represent it. The $*$uninterpreted function f is of a certain *order* $o(f)$ and each of its $o(f)$ arguments are either an arithmetic variable or an *uninterpreted variable* u, which is also inherently existential quantified, but has no domain specified. Than an *uninterpreted equation* e has either an uninterpreted function, an uninterpreted variable or an arithmetic variable as left-hand respectively right-hand side. A *constraint* c compares a polynomial to zero, using a *relation symbol*. Furthermore, we keep constraints in a normalized representation to be able to differ them better.

6.2.3 Boolean combinations of constraints and Boolean variables For more information, check out the docs of `CArL`.

A formula is stored as a directed acyclic graph, where the intermediate nodes represent the Boolean operations on the sub-formulas represented by the successors of this node. The leaves (nodes without successor) contain either a Boolean variable, a constraint or an uninterpreted equality. Equal formulas, that is formulas being leaves and containing the same element or formulas representing the same operation on the same sub-formulas, are stored only once.

The construction of formulas, which are represented by the FormulaT class, is mainly based on the presented abstract grammar. A formula being a leaf wraps the corresponding objects representing a Boolean variable, a constraint or an uninterpreted equality. A Boolean combination of Boolean variables, constraints and uninterpreted equalities consists of a Boolean operator and the sub-formulas it interconnects. For this purpose we either firstly create a set of formulas containing all sub-formulas and then construct the Formula or (if the formula shall not have more than three sub-formulas) construct the formula directly passing the operator and sub-formulas. Formulas, constraints and uninterpreted equalities are non-mutable, once they are constructed.

We give a small example constructing the formula

$$(\neg b \ \wedge \ x^2 - y < 0 \ \wedge \ 4x + y - 8y^7 = 0) \ \rightarrow \ (\neg(x^2 - y < 0) \ \vee \ b),$$

with the Boolean variable b and the real-valued variables x and y, for demonstration. Furthermore, we construct the UF formula

$$v = f(u,u) \ \oplus \ w \neq u$$

with u, v and w being uninterpreted variables of not specified domains S and T, respectively, and f is an uninterpreted function with not specified domain $T^{S \times S}$.

Firstly, we show how to create real valued (integer valued analogously with `VT_INT`), Boolean and uninterpreted variables:

```
carl::Variable x = smtrat::newVariable( "x", carl::VariableType::VT_REAL );
carl::Variable y = smtrat::newVariable( "y", carl::VariableType::VT_REAL );
carl::Variable b = smtrat::newVariable( "b", carl::VariableType::VT_BOOL );
carl::Variable u = smtrat::newVariable( "u", carl::VariableType::VT_UNINTERPRETED );
carl::Variable v = smtrat::newVariable( "v", carl::VariableType::VT_UNINTERPRETED );
carl::Variable w = smtrat::newVariable( "w", carl::VariableType::VT_UNINTERPRETED );
```

Uninterpreted variables, functions and function instances combined in equations or inequalities comparing them are constructed the following way.

```
carl::Sort sortS = smtrat::newSort( "S" );
carl::Sort sortT = smtrat::newSort( "T" );
carl::UVariable uu( u, sortS );
carl::UVariable uv( v, sortT );
carl::UVariable uw( w, sortS );
carl::UninterpretedFunction f = smtrat::newUF( "f", sortS, sortS, sortT );
carl::UFInstance f1 = smtrat::newUFInstance( f, uu, uw );
carl::UEquality ueqA( uv, f1, false );
carl::UEquality ueqB( uw, uu, true );
```

Next we see an example how to create polynomials, which form the left-hand sides of the constraints:

```
smtrat::Poly px( x );
smtrat::Poly py( y );
smtrat::Poly lhsA = px.pow(2) - py;
smtrat::Poly lhsB = smtrat::Rational(4) * px + py - smtrat::Rational(8) * py.pow(7);
```

Constraints can then be constructed as follows:

```
smtrat::ConstraintT constraintA( lhsA, carl::Relation::LESS );
smtrat::ConstraintT constraintB( lhsB, carl::Relation::EQ );
```

Now, we can construct the atoms of the Boolean formula

```
smtrat::FormulaT atomA( constraintA );
smtrat::FormulaT atomB( constraintB );
smtrat::FormulaT atomC( b );
smtrat::FormulaT atomD( ueqA );
smtrat::FormulaT atomE( ueqB );
```

and the formulas itself (either with a set of arguments or directly):

```
smtrat::FormulasT subformulasA;
subformulasA.insert( smtrat::FormulaT( carl::FormulaType::NOT, atomC ) );
subformulasA.insert( atomA );
subformulasA.insert( atomB );
smtrat::FormulaT phiA( carl::FormulaType::AND, std::move(subformulasA) );
smtrat::FormulaT phiB( carl::FormulaType::NOT, atomA )
smtrat::FormulaT phiC( carl::FormulaType::OR, phiB, atomC );
smtrat::FormulaT phiD( carl::FormulaType::IMPLIES, phiA, phiC );
smtrat::FormulaT phiE( carl::FormulaType::XOR, atomD, atomE );
```

Note, that $\wedge$ and $\vee$ are n-ary constructors, $\neg$ is a unary constructor and all the other Boolean operators are binary.

6.2.4 Normalized constraints A normalized constraint has the form

$$a_1 \overbrace{x_{1,1}^{e_{1,1}} \cdot \ldots \cdot x_{1,k_1}^{e_{1,k_1}}}^{m_1} + \ldots + a_n \overbrace{x_{n,1}^{e_{n,1}} \cdot \ldots \cdot x_{n,k_n}^{e_{n,k_n}}}^{m_n} + d \sim 0$$

with $n \geq 0$, the $*$ ith coefficient$*$ a_i being an integral number ($\neq 0$), d being a integral number, x_{i,j_i} being a real- or integer-valued variable and e_{i,j_i} being a natural number greater zero (for all $1 \leq i \leq n$ and $1 \leq j_i \leq k_i$). Furthermore, it holds that $x_{i,j_i} \neq x_{i,l_i}$ if $j_i \neq l_i$ (for all $1 \leq i \leq n$ and $1 \leq j_i, l_i \leq k_i$) and $m_{i_1} \neq m_{i_2}$ if $i_1 \neq i_2$ (for all $1 \leq i_1, i_2 \leq n$). If n is 0 then d is 0 and $\sim$ is either $=$ or $<$. In the former case we have the normalized representation of any variable-free consistent constraint, which semantically equals `true`, and in the latter case we have the normalized representation of any variable-free inconsistent constraint, which semantically equals `false`. Note that the monomials and the variables in them are ordered according the \polynomialOrder of \carl. Moreover, the first coefficient of a normalized constraint (with respect to this order) is always positive and the greatest common divisor of $a_1, \ldots, a_n, d$ is 1. If all variable are integer valued the constraint is further simplified to

$$\frac{a_1}{g} \cdot m_1 + \ldots + \frac{a_n}{g} \cdot m_n + d' \sim' 0,$$

where g is the greatest common divisor of $a_1, \ldots, a_n$,

$$\sim' = \begin{cases} \leq, & \text{if } \sim \text{ is } < \\ \geq, & \text{if } \sim \text{ is } > \\ \sim, & \text{otherwise} \end{cases}$$

and

$$d' = \begin{cases} \lceil \frac{d}{g} \rceil & \text{if } \sim' \text{ is } \leq \\ \lfloor \frac{d}{g} \rfloor & \text{if } \sim' \text{ is } \geq \\ \frac{d}{g} & \text{otherwise} \end{cases}$$

If additionally $\frac{d}{g}$ is not integral and $\sim$ ' is $=$, the constraint is simplified $0 < 0$, or if $\sim$ ' is $\neq$, the constraint is simplified $0 = 0$.

We do some further simplifications, such as the elimination of multiple roots of the left-hand sides in equations and inequalities with the relation symbol $\neq$, e.g., $x^3 = 0$ is simplified to $x = 0$. We also simplify constraints whose left-hand sides are obviously positive (semi)/negative (semi) definite, e.g., $x^2 \leq 0$ is simplified to $x^2 = 0$, which again can be simplified to $x = 0$ according to the first simplification rule.

6.2.5 Linking

[Todo: example how linking works]

7 Other tools

7.1 Benchmarking

Alongside SMT-RAT, `benchmax` allows to easily run solvers on benchmarks and export the results. See Benchmax for more information.

7.2 Delta debugging

Delta debugging describes a generic debugging approach based on automated testing. Given a program and an input that provokes a certain behavior (for example an error) delta debugging is the process of iteratively changing the input, retaining the specific behavior. Usually, as the ultimate goal is a minimal example that triggers some bug by the application of a set of transformation rules.

7.2.1 SMT-RAT's own delta tool

SMT-RAT has its own tool for delta debugging, see Delta for more information.

7.2.2 Using ddSMT

Currently, we recommend using `ddSMT` as the state-of-the-art tool for delta debugging.

For a complete guide, we refer to the `documentation of ddSMT`.

Here, we give instructions for the most common use cases when developing with SMT-RAT. There are mainly two common scenarios where we use delta debugging: If there is a failing assertion or if SMT-RAT returns a wrong result. For these scenarios, we provide wrapper scripts preparing the input to ddsmt properly.

First, install `ddSMT` and `z3`:

```
pip3 install ddsmt
sudo apt install z3
```

In case of a *failing assertion* on `in_file.smt2`, run

```
/src/smtrat/utilities/ddsmt/ddsmt-assertion in_file.smt2 out_file.smt2 path_to_solver
```

In case SMT-RAT returns a *wrong result* on `in_file.smt2`, run

```
/src/smtrat/utilities/ddsmt/ddsmt-wrong in_file.smt2 out_file.smt2 path_to_solver
```

7.3 Analyzer

The `smtrat-analyzer` library can analyze static properties input formulas (such as number of variables, degrees, CAD projections, ...).

To use it from the CLI, build smtrat using `CLI_ENABLE_ANALYZER=ON` and `SMTRAT_DEVOPTION_Statistics=ON`. A single input file can be analyzed by running `./smtrat --analyze.enabled --stats.print input.smt2`; properties will be printed as statistics object, note that the solver will not be called. For further options, see `./smtrat --help`.

To collect properties of all formulas of a benchmark sets, the analyzer can be used with `benchmax`. To do so, specify add the binary as an `smtrat-analyzer` solver; for more information, see the `benchmax` subpage.

7.4 Preprocessing

WIP

7.5 Benchmax

Benchmax is a tool for automated benchmarking. Though it was developed and is primary used for testing SMT solvers, it aims to be agnostic of the tools and formats as good as possible.

Its fundamental model is to load a list of tools and a list of benchmarks, run every tool with every benchmark, obtain the results and output all the results. While the benchmarks are fixed to a single file, we allow to choose between different tool interfaces, execution backends and output formats.

7.5.1 General usage Benchmax could be called as follows:

```
./benchmax -T 1m -M 4Gi -S /path/to/smtrat-static -X out.xml -b ssh --ssh.node user@127.0.0.1@5\#9 -D
 /path/to/benchmark/set
```

This will run benchmax with the SMT-RAT tool at `/path/to/smtrat-static` on the `/path/to/benchmark/set` with a time limit of 1 minute and a memory limit of 4 gigabyte. The resulst will be written to `out.xml`. The execution is done on an SSH backend on localhost with 9 connections and executing 5 parallel jobs per connection.

It is recommended to use static builds to avoid issues with missing libraries.

For more information, run `./benchmax --help`.

7.5.1.1 Collecting statistics Some tools like SMT-RAT or Z3 can provide statistics about the solving process for each individual benchmark. By using the `-s` respectively `--statistics`, statistics are collected and stored in the output file.

7.5.1.1.1 Large output It is recommended to aggregate statistics as much as possible inside SMT-RAT. However, if the output might get large, you might want to use `--use-tmp` to prevent benchmax running out of memory.

7.5.1.2 Working with the results In the SMT-RAT repository, two utilites for converting the result XML file are included:

- `utilities/benchmax/xml2ods.py` for converting it to a *Flat XML LibreOffice Calc Sheet*.
- An XML filter `utilities/benchmax/OOCImporter.xsl` for converting it to a *Flat XML LibreOffice Calc Sheet*.
- `utilities/benchmax/evaluation` is a small python library for importing the results into Python (or a Jupyter notebook), inspecting the results and preparing plots. For more information, see Benchmax python utility.

7.5.2 Tools A tool represents a binary that can be executed on some input files. It is responsible for deciding whether it can be applied to some given file, building a command line to execute it and retrieve additional results from `stdout` or `stderr`.

The generic tool class `benchmax::Tool` can be used as a default. It will run the given binary on any input file and benchmax records the exit code as well as the runtime.

If more information is needed a new tool class can be derived that overrides or extends the default behaviour. Some premade tools are available (and new ones should be easy to create):

- benchmax::MathSAT
- benchmax::Minisatp
- benchmax::SMTRAT
- benchmax::SMTRAT_OPB
- benchmax::Z3

7.5.3 Backends A backend offers the means to run the tasks in a specific manner. A number of different backends are implemented that allow for using benchmax in various scenarios.

7.5.3.1 LocalBackend The LocalBackend can be used to execute benchmarks on a local machine easily. It does not allow for any parallelization but simply executes all tasks sequentially.

7.5.3.2 SlurmBackend The SlurmBackend employs the Slurm workload manager to run benchmarks on a cluster. It essentially collects all tasks that shall be run in a file and creates an appropriate slurm submit file. It then submits this job, waits for it to finish and collects the results from the output files.

The Slurm backend supports starting (`--mode execute`) and collecting results (`--mode collect`) separately, thus avoiding the need for running benchmax in a screen.

7.5.3.3 SSHBackend The SSHBackend can be used if you have multiple workers that can be reached via ssh (essentially a cluster without a batch job system). It allows to configure one or more computing nodes and manually schedules all the jobs on the different computing nodes.

Using `--ssh.node`, a node is specified in the format `<user>[:<password>]@<hostname>[:<port = 22>][@<cores = 1>][#<connections = 1>]`; benchmax will then connect to the specified server with given credentials `connections` times and will run `cores` threads per connection. Thus, the number of overall parallel threads equals `connections * cores` (note that enough memory should be available on the node).

By setting the flag `--ssh.resolvedeps`, dependencies (i.e. dynamic libraries) are resolved and uploaded with the solver.

7.5.3.4 CondorBackend (unstable) The CondorBackend is aimed at the HTCondor batch system and works similar to the SlurmBackend. Note however that this backend is not well tested and we therefore consider it unstable.

7.5.4 Troubleshooting

- If benchmax terminates due to a segmentation fault without any message, then it probably exceeded available memory. A common error is that SMT-RAT has produced too much logging output. To fix this, simply build SMT-RAT with `LOGGING=OFF`.

7.5.5 Benchmax python utility This tool allows loading XML files from Benchmax into a pandas dataframe, inspecting the results and visualizing them.

This is useful for working with the results in a Jupyter notebook.

Dependencies:

- `pandas`
- matplotlib
- pillow
- numpy
- `tikzplotlib`

```
pip3 install pandas matplotlib tikzplotlib numpy pillow
```

7.5.5.1 Loading XMLs into a pandas dataframe First, install this directory as python library; e.g. on Ubuntu

```
cd  /.local/lib/python3.8/site-packages/ # path to your python site-packages directory
ln -s  /src/smtrat/utilities/benchmax/ # path to the benchmax utility
```

In your Jupyter notebook:

```
import benchmax.evaluation as ev
df = ev.xml_to_pandas("path_to/stats_file.xml", {"smtrat-static": "solver_name"},
 ["statistics_name_1","statistics_name_2"]) # second and third parameter is optional
```

or, to load multiplle XMLs into one:

```
import benchmax.evaluation as ev
df = ev.xmls_to_pandas({"path_to/stats_file_1.xml": {"smtrat-static": "solver_name_1"},
 "path_to/stats_file_2.xml": {"smtrat-static": "solver_name_2"}}, ["statistics_name_1","statistics_name_2"]) #
 second parameter is optional
```

This will create a dataframe with columns `(solver_name_1, "answer")`, `(solver_name_1, "runtime")`, `(solver_name_1, "statistics_name_1")` etc (as multi-index).

7.5.5.2 Computing a virtual best solver A virtual best is a solver that behaves optimal on each input w.r.t. a set of solvers. It is computed by selecting for each benchmark instance the solver with shortest running time.

To compute the virtual best solver named `VB` w.r.t. `solver1`,`solver2` and `solver3` and considering statistics `statistics_name_1`.

```
df = df.join(ev.virtual_best(df, ["solver1","solver2","solver3"], "VB", ['statistics_name_1']))
```

7.5.5.3 Plotting We provide the `performance_profile` and `scatter_plot` functions to easily generate a performance profiles and scatter plots.

7.5.5.4 Show a summary of an XML file There are several methods for quickly inspecting the results of a run provided. For instance, the following script can be used to view a summary of a singel XML file and to show instances with wrong results or segmentation faults:

```
#!/usr/bin/env python3
import benchmax.evaluation as ev
import sys
df = ev.xml_to_pandas(sys.argv[1])
ev.inspect(df)
```

SMT-RAT provides a small utility script for showing a summary of one or more XML files:

```
 /Code/smtrat/utilities/benchmax/view.py result_1.xml result_2.xml
```

7.5.5.5 Exporting data to Latex

7.5.5.5.1 Pandas dataframe to latex table `df.to_latex(buf='file.tex')`

7.5.5.5.2 matplotlib to tikz plot see `tikzplotlib`

7.6 Delta

7.6.1 Delta debugging **Delta debugging** describes a generic debugging approach based on automated testing. Given a program and an input that provokes a certain behavior (for example an error) delta debugging is the process of iteratively changing the input, retaining the specific behavior. Each small change to the input represents a **delta** and is the result of some transformation rule. Whenever a change was successful, it is stored and the process continues from this intermediate result. Eventually, there is no transformation left, such that the faulty behavior is retained and the debugging process terminates.

This approach only works, if the transformation rules can neither be chained to form a loop, nor continue infinitely. Usually, as the ultimate goal is a minimal example that triggers some bug, all transformation rules are designed to make the input smaller, in one way or another.

This approach has proven to be very valuable in the context of SAT and SMT solving. However, existing delta debugging tools [**?**] needed a preprocessed input and manual restarts to achieve a fix-point, hence, we decided to include our own delta debugging tool, `delta`, in SMT-RAT. It can be used completely independent of SMT-RAT and is built to be as generic as possible, but focuses on programs operating on SMT-LIB files. It has some knowledge

of the semantics of the corresponding logics, but only operates on nodes. Any SMT-LIB construct, that is either a constant or a braced expression, is a node.

The actual transformation rules are implemented in `operations.h` and are enabled in the constructor of the `Producer` class. The implemented rules are rather simple: removing a node, replacing a node by a child node, simplifying a number, replacing a symbol by a constant or eliminating a let expression. These transformations are designed such that they can be extended easily. For a given input `delta` applies each transformation to each node. Each application may produce arbitrarily many *candidate inputs* which are then tested. The first candidate that provokes the error is then adopted, the other candidates are rejected.

When analyzing the behavior, `delta` relies on the exit code of the program. It will run the program on the original input and obtain the original exit code. Whenever the program returns the same exit code, `delta` assumes that the program behaved the same.

7.6.1.1 Using delta `delta` is currently contained in the SMT-RAT reopsitory and can be built using `make delta`.

Using `delta` is rather easy. It accepts the input file and the solver as its two main arguments: `./delta -i input.smt2 -s ./solver`. There are a couple of other arguments that are documented in the help: `./delta --help`.

7.6.1.1.1 Exit code As delta relies on the exit code of the program, make sure that this event results in a unique exit code:

- **Specific assertions**: Return a unique exit code by replacing the assertion with `if (!assertion_condition) { std:exit(70); }`.
- **Faulty output**: Remove the `(set-info :status unsat)/(set-info :status sat)` line from the benchmark and use the script `utilities/result-incorrect.py` as solver. Note that you need to install z3 first.

8 Developers information

- Code style
- Documentation
- Settings
- Logging
- Statistics and timing
- Testing
- Validation
- Checkpoints
- Finding and Reporting Bugs
- Tools

8.1 Code style

8.1.0.1 Code formatting `ClangFormat` allows to define code style rules and format source files automatically. A `.clang-format` file is provided with the repository. Please use this file to format all sources.

8.1.0.2 Naming conventions For all new code, the following rules apply.

- type names and template parameter: `CamelCase`
- variable and function names: `snake_case`
- compiler macros and defines: `ALL_UPPERCASE`
- enum values: `UPPERCASE`
- (private) class members: start with `m_` respectively `mp_` for pointers and `mr_` for references

8.1.0.3 Headers and namespaces

The following conventions apply for new modules added to SMT-RAT and CArL. When adding code to existing structures, be consistent with existing code.

- Every file should represent a *module*.
- Every (sub-)folder has its own namespace.
- Namespaces and modules have names in `camel_case`.

8.1.0.4 C++ features

- As of now, please stick to C++17 features.
- Use `enum class` instead of `enum`.

8.2 Documentation

For SMT-RAT, there are two sources of documentation: the in-source API documentation and the more manual-like documentation (you are reading right now). While the in-source API documentation is generated based on the doxygen comments from the actual source files, the manual is generated from the markdown files in `doc/markdown/`.

8.2.0.1 Writing documentation

Note that some of the documentation may be incomplete or rendered incorrectly, especially if you use an old version of doxygen. Here is a list of known problems:

- Comments in code blocks (see below) may not work correctly (e.g. with doxygen 1.8.1.2). See `here` for a workaround. This will however look ugly for newer doxygen versions, hence we do not use it.
- Files with `static_assert` statements will be incomplete. A `patch` is pending and will hopefully make it into doxygen 1.8.9.
- Member groups (usually used to group operators) may or may not work. There still seem to be a few cases where doxygen `messes up`.
- Documenting unnamed parameters is not possible. A corresponding `ticket` exists for several years.

8.2.0.2 Literature references

Literature references should be provided when appropriate by citing references from the bibtex database located at `doc/literature.bib` using the `@cite` command. The labels are the last name of the first author and the four-digit year. In case of duplicates, we append lowercase letters.

These references can be used with `@cite label`, for example like this:

```
/**
 * Checks whether the polynomial is unit normal
 * @see @cite GCL92, page 39
 * @return If polynomial is normal.
 */
bool isNormal() const;
```

8.2.1 Code comments

8.2.1.1 File headers

```
/**
 * @file <filename>
 * @ingroup <groupid1>
 * @ingroup <groupid2>
 * @author <author1>
 * @author <author2>
 *
 * [ Short description ]
 */
```

Descriptions may be omitted when the file contains a single class, either implementation or declaration.

8.2.1.2 Namespaces

Namespaces are documented in a separate file, found at '/doc/markdown/codedocs/namespaces.dox'

8.2.1.3 Class headers

```
/**
 * @ingroup <groupid>
 * [ Description ]
 * @see <reference>
 * @see <OtherClass>
 */
```

8.2.1.4 Method headers

```
/**
 * [ Usage Description ]
 * @param <p1> [ Short description for first parameter ]
 * @param <p2> [ Short description for second parameter ]
 * @return [ Short description of return value ]
 * @see <reference>
 * @see <otherMethod>
 */
```

These method headers are written directly above the method declaration. Comments about the implementation are written above the or inside the implementation.

The `see` command is used likewise as for classes.

8.2.1.5 Method groups There are some cases when documenting each method is tedious and meaningless, for example operators. In this case, we use doxygen method groups.

For member operators (for example `operator+=`), this works as follows:

```
/** @name In-place addition operators
 *  @{ */
/**
 * Add something to this polynomial and return the changed polynomial.
 * @param rhs Right hand side.
 * @return Changed polynomial.
 */
MultivariatePolynomial& operator+=(const MultivariatePolynomial& rhs);
MultivariatePolynomial& operator+=(const Term<Coeff>& rhs);
MultivariatePolynomial& operator+=(const Monomial& rhs);
MultivariatePolynomial& operator+=(Variable::Arg rhs);
MultivariatePolynomial& operator+=(const Coeff& rhs);
/// @}
```

8.2.2 Writing out-of-source documentation Documentation not directly related to the source code is written in Markdown format, and is located in `/doc/markdown/`.

8.3 Settings

As described in sec::modules, each module has a settings template parameter.

8.3.0.1 Dynamic settings These settings are considered at compile time. For certain purposes, it is unhandy to recompile SMT-RAT for every parameter. For this, module parameters can be set

- via the command line using `--module.parameter key1=value1 --module.parameter key2=value2 ...` or
- via the `set-option` command of SMT-LIB: `(set-option :key "value")` (note that you need to pass every value as a string, even if it represents a number!).

These parameters can be accessed (most appropriately in a settings object of a module) via `int my_setting = settings_module().get("my_module.my_setting", 2)` or `std::string my_setting = settings_module().get("my_module.my_setting", "default_value")`. Note that the second parameter is the default value also specifying the type of the setting to which it is parsed.

8.4 Logging

8.4.0.1 Logging frontend The frontend for logging is defined in logging.h.

It provides the following macros for logging:

- SMTRAT_LOG_TRACE(channel, msg)
- SMTRAT_LOG_DEBUG(channel, msg)
- SMTRAT_LOG_INFO(channel, msg)
- SMTRAT_LOG_WARN(channel, msg)
- SMTRAT_LOG_ERROR(channel, msg)
- SMTRAT_LOG_FATAL(channel, msg)
- SMTRAT_LOG_FUNC(channel, args)
- SMTRAT_LOG_FUNC(channel, args, msg)
- SMTRAT_LOG_ASSERT(channel, condition, msg)
- SMTRAT_LOG_NOTIMPLEMENTED()
- SMTRAT_LOG_INEFFICIENT()

Where the arguments mean the following:

- `channel`: A string describing the context. For example `"smtrat.parser"`.
- `msg`: The actual message as an expression that can be sent to a std::stringstream. For example `"foo: " << foo`.
- `args`: A description of the function arguments as an expression like `msg`.
- `condition`: A boolean expression that can be passed to `assert()`.

Typically, logging looks like this:

```
bool checkStuff(Object o, bool flag) {
    SMTRAT_LOG_FUNC("smtrat", o << ", " << flag);
    bool result = o.property(flag);
    SMTRAT_LOG_TRACE("smtrat", "Result: " << result);
    return result;
}
```

Logging is enabled (or disabled) by the `LOGGING` macro in CMake.

8.5 Statistics and timing

8.5.0.1 Statistics SMT-RAT has the ability to collect statistics after the solving process is finished.

For enabling this feature, the `SMTRAT_DEVOPTION_Statistics` needs to be turned on in the CMake settings.

8.5.0.1.1 Collecting statistics A statistics object can be created by inheriting from `Statistics.h`:

```
#pragma once
#include <smtrat-common/statistics/Statistics.h>
#ifdef SMTRAT_DEVOPTION_Statistics
namespace smtrat {
namespace myModule {
class MyStatistics : public Statistics {
private:
    std::size_t mCounter = 0;
public:
    void collect() { // called after the solving process to collect statistics
        Statistics::addKeyValuePair("counter", mCounter);
    }
    void count() { // user defined
        ++mCounter;
    }
};
}
}
#endif
```

This is then instantiated by calling

```
#ifdef SMTRAT_DEVOPTION_Statistics
auto& myStatistics = statistics_get<myModule::MyStatistics>("MyModuleName");
#endif
```

or, as shortcut

```
SMTRAT_STATISTICS_INIT(myModule::MyStatistics, myStatistics, "MyModuleName")
```

and statistics can be collected by calling the user defined operations (e.g. `myStatistics.count()`).

All statistics-related code should be encapsulated by the `SMTRAT_DEVOPTION_Statistics` flag. Alternatively, code can be encapsulated in `SMTRAT_STATISTICS_CALL()`.

8.5.0.2 Timing The statistics framework has the ability to easily collect timings.

The following code will measure the total running time of the code block as well as the number of times the code block was executed:

```
class MyStatistics : public Statistics {
private:
    carl::statistics::timer mTimer;

public:
    void collect() {
        Statistics::addKeyValuePair("timer", mTimer);
    }
    auto& timer() {
        return mTimer;
    }
};

SMTRAT_STATISTICS_INIT(myModule::MyStatistics, myStatistics, "MyModuleName")

auto start = SMTRAT_TIME_START();
// expensive code
SMTRAT_TIME_FINISH(myStatistics.timer(), start);
```

The measured timings will then appear alongside the statistics.

Note that the resolution of these measurements is in 1 millisecond. Thus, be careful when interpreting results; especially, it measured code blocks should be big enough.

8.6 Testing

SMT-RAT and CArL use `GoogleTest` for unit testing. To do so, go to the `src/tests/` folder and create a test analogously to the other tests (i.e. creating a new folder, adapting the `CMakeList.txt` in the new folder and in the `tests` folder). *Note that in the SMT-RAT repository are some obsolete tests.*

8.6.0.1 Utilities For creating CArL data structure in unit tests, we refer to `carl/src/util/parser/Parser.h`.

8.7 Validation

For debugging purposes, it can be useful to verify intermediate results (explanations, lemmas, etc) using an external SMT solver. SMT-RAT allows to store formulas during the solving process which are written to a `smt2` file once the solving process is finished.

8.7.0.1 Enabling this feature For enabling this feature, the `SMTRAT_DEVOPTION_Validation` needs to be turned on in the CMake settings.

8.7.0.2 Logging formulas The API allows to create a *validation point* with a given channel and a name. The channel and name should identify the validation point uniquely. The channel (e.g. `smtrat.modules.vs`) can be used to turn on and off validation points (similarly to logging channels) while the name (e.g. `substitution_result`) further distinguishes validation points within a channel.

To initialize a validation point with channel and name and sotre its reference to a member, use

```
SMTRAT_VALIDATION_INIT(channel, name, member);
```

Hint: to put it in a static member, use

```
SMTRAT_VALIDATION_INIT_STATIC(channel, name, member);
```

To an initialized validation point stored in a member, we can add a formula to be assumed to be satisfiable (consistent = true) or unsatisfiable (consistent = false). Each formula added to a validation point gets a unique index (given incrementally), which is also logged in the given channel with debug level.

```
SMTRAT_VALIDATION_ADD_TO(member, formula, consistent);
```

To combine the two steps above, use:

```
SMTRAT_VALIDATION_ADD(channel, name, formula, consistent);
```

8.7.0.3 Command line usage By appending the command line parameter `--validation.export-smtlib`, the formulas are stored to an smtlib file (by default `validation.smt2`, can be customized using `--validation.smtlib-filename`).

Note that all channels of interest need to be activated explicitly with `--validation.channel channel1 --validation.channel channel2 ...`. Furthermore, `--validation.channel path.to` will activate all channels starting with `path.to`, i.e. `path.to.channel1`, `path.to.channel2` etc.

8.8 Checkpoints

Checkpoints are useful for debugging a run of SMT-RAT, i.e. if an implementation of SMT-RAT behaves the same as some other implementation or some pseudocode.

To do so, we can insert checkpoints with a channel, a name, and a list of arguments of arbitrary type into the code. During a run, a sequence of checkpoints is produced which represent a run of the algorithm. We then can specify test cases which set up a reference run and then start the solver on an according input. SMT-RAT will then check during this run whether all checkpoints are hit in the correct order and will give output on that.

8.8.0.1 Enabling this feature You need to turn on the CMake option `SMTRAT_DEVOPTION_Checkpoints`.

8.8.0.2 Specyfing checkpoints Insert

```
SMTRAT_CHECKPOINT("channel_name", "checkpoint_name", parameter1, parameter2, ...);
```

into the code.

8.8.0.3 Setting up a reference run Create a test case in `src/test`. Include `#include <smtrat-common/smtrat-com` and add checkpoints using

```
SMTRAT_ADD_CHECKPOINT("channel_name", "checkpoint_name", false, parameter1, parameter2, ...)
```

or

```
SMTRAT_ADD_CHECKPOINT("channel_name", "checkpoint_name", true, parameter1, parameter2, ...)
```

to assert that a checkpoint is reached.

Afterwards, run the respective SMT-RAT code.

You can clear all checkpoints of a channel using

```
SMTRAT_CLEAR_CHECKPOINT("channel_name");
```

to reset a channel, that is, removing all checkpoints and resetting the pointer.

8.9 Finding and Reporting Bugs

This page is meant as a guide for the case that you find a bug or any unexpected behaviour. We consider any of the following events a (potential) bug:

- SMT-RAT crashes.
- A library used through SMT-RAT crashes.
- SMT-RAT gives incorrect results.
- SMT-RAT does not terminate (for reasonably sized inputs).
- SMT-RAT does not provide a method or functionality that should be available according to this documentation.
- SMT-RAT does not provide a method or functionality that you consider crucial or trivial for some of the datastructures.
- Compiling SMT-RAT fails.
- Compiling your code using SMT-RAT fails and you are pretty sure that you use SMT-RAT according to this documentation.

In any of the above cases, make sure that:

- You have installed all necessary dependencies in the required versions.
- You work on something that is similar to a system listed as supported platform at getting_started.
- You can (somewhat reliably) reproduce the error with a (somewhat) clean build of SMT-RAT. (i.e., you did not screw up the CMake flags, see build_cmake for more information)
- You compile either with `CMAKE_BUILD_TYPE=DEBUG` or `DEVELOPER=ON`. This will give additional warnings during compilation and enable assertions during runtime. This will slow down SMT-RAT significantly, but detect errors before an actual crash happens and give a meaningful error message in many cases.

If you are unable to solve issue yourself or you find the issue to be an actual bug in SMT-RAT, please do not hesitate to contact us. You can either contact us via email (if you suspect a configuration or usage issue on your side) or create a ticket in our bug tracker (if you suspect an error that is to be fixed by us). The bug tracker is available at https://github.com/smtrat/smtrat/issues.

When sending us a mail or creating a ticket, please provide us with:

- Your system specifications, including versions of compilers and libraries listed in the dependencies.
- The SMT-RAT version (release version of git commit id).
- A minimal working example.
- A description of what you would expect to happen.
- A description of what actually happens.

9 README

This is dead code.

The expressions were meant as an alternative to carl::Formula. Instead of having own theory constraints for each theory, here, everything is stored in a single tree structure. This would make theory combinations easier (think of a variable being interpreted both as uninterpreted and as arithmetic variable); furthermore, handling ite expression is easer: currently, we need to resolve ite expressions within the theory in the parser, leading to bad performance on some examples.

10 NewCoveringModule #and

Author: Philip Kroll (Philip.Kroll@rwth-aachen.de)

10.1 Introduction

New implementation of the CDCAC algorithm, also called the covering algorithm. The basic implementation is based on the paper Deciding the Consistency of Non-Linear Real Arithmetic Constraints with a Conflict Driven Search Using Cylindrical Algebraic Coverings. In short↩ : The algorithm is a variant of Cylindrical Algebraic Decomposition (CAD) adapted for satisfiability, where solution candidates (sample points) are constructed incrementally, either until a satisfying sample is found or sufficient samples have been sampled to conclude unsatisfiability. The choice of samples is guided by the input constraints and previous conflicts.

10.2 Usage

In this implementation as much code as possible from src/smtrat-cadcells. This also includes the projection operators implemented in src/smtrat-cadcells/operators and the representation heuristics implemented in src/smtrat-cadcells/representation. We also reuse the code from src/smtrat-mcsat/variableordering/VariableOrdering.h to calculate the used variable ordering. Change of the strategy to calculate the variable ordering, the used heuristics or the used projection operator, can be done by changing the respective settings in src/smtrat-modules/New↩ CoveringModule/NewCoveringSettings.h

10.3 Efficiency

The implementation also supports backtracking and incrementality, both of which are not covered in detail by the paper. The following cases are possible depending on what the previous result of the Covering Algorithm was :

- Previous result was SAT, i.e. a satisfying assignment was found and the cached coverings for all dimensions are partial
  - addConstraintSAT() is called with the new constraint and these are checked for satisfiability. The lowest level with an unsatisfied new constraints is returned. This also means that when all constraints SAT is concluded and no calculations are done.
  - removeConstraintSAT() is called with constraints that have to be removed from the cached partial coverings for all dimensions. This only makes the covering smaller, and the assignment is still satisfying.
- Previous result was UNSAT, i.e. the stored covering for level 0 is complete and thus no satisfying assignment could be found.
  - addConstraintUNSAT() is called with the new constraint. As the covering is unsatisfiable anyways these constraints are just added without further calculations.
  - removeConstraintUNSAT() is called with constraints that have to be removed from the cached complete coverings all dimensions.

13 Data Structure Index

13.1 Data Structures

Here are the data structures with brief descriptions:

smtrat::AbstractModuleFactory 245

smtrat::parser::AbstractTheory
Base class for all theories 246

smtrat::cad::sample_compare::absvalue 249

smtrat::analyzer::AnalysisSettings 249

smtrat::analyzer::AnalyzerStatistics 249

smtrat::AnnotatedBVTerm 250

benchmax::slurm::ArchiveProperties
All properties needed to archive log files 251

smtrat::parser::ArithmeticTheory
Implements the theory of arithmetic, including LRA, LIA, NRA and NIA 251

smtrat::parser::types::ArithmeticTheory
Types of the arithmetic theory 254

smtrat::execution::Assertion 254

smtrat::cad::preprocessor::AssignmentCollector 255

smtrat::mcsat::arithmetic::AssignmentFinder 256

smtrat::mcsat::smtaf::AssignmentFinder< Settings > 256

smtrat::mcsat::arithmetic::AssignmentFinder_detail 256

smtrat::mcsat::smtaf::AssignmentFinder_SMT 257

smtrat::cadcells::datastructures::detail::AssignmentProperties 258

smtrat::parser::Attribute
Represents an Attribute 258

smtrat::parser::AttributeParser 259

smtrat::parser::AttributeValueParser 260

smtrat::AxiomFactory 260

benchmax::Backend
Base class for all backends 261

smtrat::Backend< Settings > 263

smtrat::BackendLink 266

smtrat::BackendSynchronisation 267

smtrat::Backtrackable< UnionFind > 267

smtrat::cadcells::datastructures::BaseDerivation< Properties >
A BaseDerivation has a level and a set of properties of this level, and an underlying derivation representing the lower levels 269

smtrat::cad::BaseProjection< Settings > 271

smtrat::cad::BaseSettings 277

smtrat::expression::simplifier::BaseSimplifier 278

smtrat::cad::Origin::BaseType 280

smtrat::BEModule< Settings > 282

benchmax::BenchmarkResult
Results for a single benchmark run 311

benchmax::BenchmarkSet
A set of benchmarks from some common base directory 313

benchmax::settings::BenchmarkSettings
Settings for benchmarks 314

smtrat::Bimap< Class, FirstKeyType, FirstKeyName, SecondKeyType, SecondKeyName >
Container that stores expensive to construct objects and allows the fast lookup with respect to two independent keys within the objects 315

smtrat::expression::BinaryExpression 317

smtrat::datastructures::BinaryHeap< T > 318

smtrat::parser::BinaryParser
Parses binaries: `#b[01]+` 319

smtrat::parser::BitvectorTheory
Implements the theory of bitvectors 320

smtrat::parser::types::BitvectorTheory
Types of the theory of bitvectors 323

smtrat::BlastedConstr 323

smtrat::BlastedPoly 324

smtrat::mcsat::Bookkeeping
Represent the trail, i.e 325

smtrat::parser::BooleanEncodingTheory
Implements the theory of bitvectors 327

Minisat::BoolOption 329

smtrat::BoolUEQRewriter 331

smtrat::lra::Bound< T1, T2 >
Stores a bound, which could be an upper "<= b" or a lower bound ">= b" for a bound value b 331

smtrat::vb::Bound< T >
Class for the bound of a variable 342

smtrat::mcsat::fm::Bound 346

smtrat::Branching
Stores all necessary information of an branch, which can be used to detect probable infinite loop of branchings 347

smtrat::BVAnnotation 348

smtrat::BVDirectEncoder 350

smtrat::BVModule< Settings > 350

smtrat::by_address_hasher< IterType >
Hash an iterator by the pointed-to address 379

smtrat::cad::CAD< Settings > 380

smtrat::qe::cad::CAD< Settings > 383

smtrat::cad::CADConstraints< BT > 384

smtrat::cad::CADCore< CH > 388

smtrat::cad::CADCore< CoreHeuristic::BySample > 388

smtrat::cad::CADCore< CoreHeuristic::EnumerateAll > 389

smtrat::cad::CADCore< CoreHeuristic::Interleave > 389

smtrat::cad::CADCore< CoreHeuristic::PreferProjection > 390

smtrat::cad::CADCore< CoreHeuristic::PreferSampling > 390

smtrat::qe::cad::CADElimination 390

smtrat::cad::CADPreprocessor 391

smtrat::cad::CADPreprocessorSettings 392

smtrat::qe::cad::CADSettings 393

smtrat::CardinalityEncoder 394

smtrat::cadcells::representation::cell< H >
Note: If connected(i) holds, then the indexed root ordering must contain an ordering between the interval bounds 395

smtrat::cadcells::representation::cell< CellHeuristic::BIGGEST_CELL > 395

smtrat::cadcells::representation::cell< CellHeuristic::CHAIN_EQ > 396

smtrat::cadcells::representation::cell< CellHeuristic::LOWEST_DEGREE_BARRIERS > 396

smtrat::cadcells::representation::cell< CellHeuristic::LOWEST_DEGREE_BARRIERS_EQ > 396

smtrat::cadcells::operators::properties::cell_connected 397

smtrat::cadcells::datastructures::CellDescription
Holds the description of a cell 397

smtrat::cadcells::datastructures::CellRepresentation< P >
Represents a cell 399

delta::Checker
This class takes care of calling the actual solver 400

benchmax::slurm::ChunkedSubmitfileProperties
All properties needed to create a submit file 401

Minisat::Clause 403

Minisat::ClauseAllocator 406

smtrat::mcsat::ClauseChain
An explanation is either a single clause or a chain of clauses, satisfying the following properties: 408

smtrat::sat::detail::ClauseChecker 411

smtrat::CMakeOptionPrinter 411

Minisat::CMap< T > 411

smtrat::CNFerModule 413

smtrat::CoCoAGBModule< Settings > 444

smtrat::CollectBoolsInUEQs 474

smtrat::CollectionWithOrigins< Element, Origin > 475

smtrat::ICPModule< Settings >::comp
Typedefs: 477

smtrat::vs::Condition 477

benchmax::CondorBackend
Backend for the HTCondor batch system 480

smtrat::mcsat::fm::ConflictGenerator< Comparator > 482

smtrat::cad::ConflictGraph
Representation of a bipartite graph (C+S, E) of vertices C and S, representing the constraints and samples, respectively 483

smtrat::parser::Theories::ConstantAdder
Helper functor for addConstants() method 485

smtrat::cad::CADConstraints< BT >::ConstraintComparator 485

smtrat::cad::preprocessor::ConstraintUpdate 485

smtrat::ConstrTree 486

delta::Consumer
This class takes care of asynchronous execution of calls to the solver 486

smtrat::LRAModule< Settings >::Context
Stores a formula, being part of the received formula of this module, and the position of this formula in the passed formula 488

smtrat::icp::ContractionCandidate 489

smtrat::icp::contractionCandidateComp 494

smtrat::icp::ContractionCandidateManager 494

smtrat::parser::conversion::Converter< To > 496

smtrat::parser::conversion::Converter< FormulaT > 497

smtrat::parser::conversion::Converter< Poly > 497

smtrat::parser::conversion::Converter< types::BVTerm > 498

benchmax::settings::CoreSettings
Core settings 499

smtrat::settings::CoreSettings 500

smtrat::parser::CoreTheory
Implements the core theory of the booleans 501

smtrat::parser::types::CoreTheory
Types of the core theory 503

smtrat::cadcells::representation::covering< H > 504

smtrat::mcsat::arithmetic::Covering
Semantics: The space is divided into a number of intervals: (-oo,a)[a,a](a,b)[b,b](b,oo) A bit is set if the constraints refutes the corresponding interval 504

smtrat::cadcells::representation::covering< CoveringHeuristic::CHAIN_COVERING > 505

smtrat::cadcells::representation::covering< CoveringHeuristic::DEFAULT_COVERING > 505

smtrat::mcsat::onecellcad::firstlevel::covering_at_level 506

smtrat::cadcells::datastructures::CoveringDescription
Describes a covering of the real line by CellDescriptions (given an appropriate sample) 506

smtrat::cadcells::datastructures::CoveringRepresentation< P >
Represents a covering over a cell 507

smtrat::mcsat::onecellcad::recursive::CoverNullification 508

smtrat::CSplitModule< Settings > 508

smtrat::CubeLIAModule< Settings > 538

smtrat::CurryModule< Settings > 568

smtrat::CycleEnumerator< FHG, Collector >
This class encapsulates an algorithm for enumerating all cycles 598

benchmax::Database
Dummy database that effectively disables storing to database. Set BENCHMAX_DATABASE to actually use a database 598

benchmax::DBAL 600

smtrat::parser::DecimalParser
Parses decimals: `numeral.0*numeral` 604

Minisat::DeepEqual< K > 604

Minisat::DeepHash< K > 604

smtrat::mcsat::fm::DefaultComparator
Does not order anything 605

smtrat::mcsat::vs::DefaultSettings 605

smtrat::mcsat::smtaf::DefaultSettings 605

smtrat::mcsat::fm::DefaultSettings 606

smtrat::cad::projection_compare::degree 606

smtrat::mcsat::onecellcad::recursive::DegreeAscending 606

smtrat::analyzer::DegreeCollector 606

smtrat::mcsat::onecellcad::recursive::DegreeDescending 607

smtrat::cadcells::datastructures::DelineatedDerivation< Properties >
A DelineatedDerivation is a BaseDerivation with a Delineation and an underlying SampledDerivation 607

smtrat::cadcells::datastructures::Delineation
Represents the delineation of a set of polynomials (at a sample), that is 609

smtrat::cadcells::representation::delineation< H > 611

smtrat::cadcells::representation::delineation< DelineationHeuristic::CHAIN > 611

smtrat::cadcells::datastructures::DelineationInterval
An interval of a delineation 611

smtrat::cadcells::datastructures::DelineationRepresentation< P >
Represents a delineation 612

smtrat::mcsat::icp::Dependencies 613

smtrat::cadcells::datastructures::DerivationRef< Properties >
A reference to a derivation, which is either 614

smtrat::mcsat::onecellcad::recursive::DontCoverNullification 616

smtrat::cad::debug::DotSubgraph 617

Minisat::DoubleOption 617

Minisat::DoubleRange 619

smtrat::expression::simplifier::DuplicateSimplifier 619

smtrat::DynamicPriorityQueue< T, Compare > 621

smtrat::dynarray< T >
Dynarray is similar to std::vector, but has only a reduced interface 623

smtrat::dynarray_allocator< T > 627

smtrat::datastructures::DynHeap< KeyType, Compare, WeightType > 627

smtrat::cad::ProjectionGlobalInformation::ECData 628

smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::Edge
Internal type of an edge 629

smtrat::EQModule< Settings >::graph_info::edge_list_type< EdgeType >
Implements a list of edges 631

smtrat::ElementWithOrigins< Element, Origin > 633

smtrat::EMModule< Settings > 634

smtrat::EQGraph< VertexName > 665

smtrat::EQModule< Settings > 667

smtrat::EQPreprocessingModule< Settings > 697

Minisat::Equal< K > 726

delta::ErrorHandler 726

smtrat::parser::ErrorHandler 727

smtrat::ESModule< Settings > 727

smtrat::uf_impl::estimator< IteratorType, IsRandomAccess >
Distance estimation for a range delimited by iterators; if the given iterators are random access, returns the result of std::distance in the estimate_distance function 758

smtrat::uf_impl::estimator< IteratorType, false > 758

smtrat::ExactlyOneCommanderEncoder 758

smtrat::execution::ExecutionState 760

smtrat::Executor< Strategy > 763

smtrat::mcsat::onecellcad::recursive::Explanation< Setting1, Setting2 > 770

smtrat::mcsat::vs::Explanation 771

smtrat::mcsat::fm::Explanation< Settings > 771

smtrat::mcsat::icp::Explanation 771

smtrat::mcsat::nlsat::Explanation 772

smtrat::mcsat::onecell::Explanation 772

smtrat::mcsat::onecellcad::levelwise::Explanation< Setting1, Setting2 > 773

smtrat::mcsat::vs::ExplanationGenerator< Settings > 773

smtrat::mcsat::nlsat::ExplanationGenerator 773

smtrat::expression::Expression 774

smtrat::expression::ExpressionContent 777

smtrat::expression::ExpressionConverter 778

smtrat::expression::ExpressionModifier 779

smtrat::expression::ExpressionPool 780

smtrat::parser::ParserState::ExpressionScope 782

smtrat::expression::ExpressionTypeChecker< T > 782

smtrat::expression::ExpressionVisitor 782

smtrat::mcsat::FastParallelExplanation< Backends >
This explanation executes all given explanation in parallel processes and waits for the fastest explanation, returning the fastest delivered explanation, terminating all other parallel processes 784

smtrat::mcsat::variableordering::detail::FeatureCollector< Objects >
This class manages features that are used to valuate variables on objects 784

smtrat::fixedsize_allocator< T >
An allocator meant to be used for containers that typically allocate single objects or nodes, such as sets, maps and linked lists 785

smtrat::fixedsize_allocator< void >
I do not know where an allocator for void would be of any use; but in order to mimic std↩ ::allocator (where this is explicitly mentioned) as good as possible, we do this for the void case 786

smtrat::impl::fixedsize_allocator_freelists 787

smtrat::impl::fixedsize_allocator_impl< T, SizeShift, LargeEnough, SmallEnough > 787

smtrat::impl::fixedsize_allocator_impl< T, SizeShift, true, true > 787

smtrat::impl::fixedsize_allocator_size_helper< T, Size > 789

smtrat::fixedsize_freelist< ChunkSizeShift >
Implements a fixed-(at-compile-time)-size allocator based on a free list embedded in the space of currently unused objects 789

smtrat::impl::fixedsize_freelists< SizeCurrent, SizeMax, LowEnough >
Publicly derive from all fixedsize_freelist types with chunk sizes between SizeCurrent and SizeMax 790

smtrat::impl::fixedsize_freelists< SizeCurrent, SizeMax, true > 791

smtrat::parser::FixedWidthConstant< T >
Represents a constant of a fixed width 791

smtrat::parseformula::FormulaCollector 792

smtrat::ICPModule< Settings >::formulaPtrComp 798

smtrat::FormulaWithOrigins
Stores a formula along with its origins 798

smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >
This class implements a forward hypergraph 801

smtrat::FouMoModule< Settings >
A module which applies the Fourier-Motzkin algorithm 804

smtrat::qe::fm::FourierMotzkinQE
Provides a simple implementation for Fourier Motzkin variable elimination for linear, existentially quantified constraints 834

smtrat::FPPModule< Settings > 835

smtrat::freelist< T >
Implements a fixed-(at-runtime)-size allocator based on a free list embedded in the space of currently unused objects 865

smtrat::mcsat::FullParallelExplanation< Backends >
This explanation executes all given explanation parallel in multiple threads and waits until every single one has finished, returning the result of the first listed explanation 867

smtrat::cad::FullSampleComparator< Iterator, Strategy > 867

smtrat::cad::FullSampleComparator< Iterator, FullSampleCompareStrategy::T > 867

smtrat::cad::FullSampleComparator< Iterator, FullSampleCompareStrategy::Type > 867

smtrat::cad::FullSampleComparator< Iterator, FullSampleCompareStrategy::Value > 867

smtrat::parser::FunctionInstantiator 867

smtrat::GBModule< Settings >
A solver module based on Groebner basis 868

smtrat::GBModuleState< Settings >
A class to save the current state of a GBModule 906

smtrat::GBPPModule< Settings > 907

smtrat::EQModule< Settings >::not_asserted_equality::hash 938

Minisat::Hash< K > 938

std::hash< const smtrat::expression::ExpressionContent * > 938

std::hash< smtrat::expression::BinaryExpression > 938

std::hash< smtrat::expression::Expression > 939

std::hash< smtrat::expression::ITEExpression > 939

std::hash< smtrat::expression::NaryExpression > 939

std::hash< smtrat::expression::QuantifierExpression > 939

std::hash< smtrat::expression::UnaryExpression > 939

std::hash< smtrat::lra::Variable< T1, T2 > >
Implements std::hash for sort value 940

std::hash< smtrat::vs::Substitution > 940

std::hash< std::vector< T > > 940

std::hash_combiner 941

Minisat::Heap< Comp > 941

smtrat::parser::HexadecimalParser
Parses hexadecimals: `#x[0-9a-fA-F]+` 943

smtrat::icp::HistoryNode 944

smtrat::ICEModule< Settings > 948

smtrat::ICPModule< Settings > 978

smtrat::icp::IcpVariable 1009

smtrat::icp::icpVariableComp 1012

smtrat::parser::Identifier 1012

smtrat::parser::IdentifierParser 1014

smtrat::cad::debug::IDSanitizer 1014

smtrat::mcsat::fm::IgnoreCoreSettings 1014

smtrat::IncWidthModule< Settings > 1015

smtrat::mcsat::onecellcad::firstlevel::indexed_root 1044

smtrat::parser::IndexedFunctionInstantiator 1044

smtrat::cadcells::datastructures::IndexedRoot
Represents the i-th root of a multivariate polynomial at its main variable (given an appropriate sample) 1045

smtrat::cadcells::datastructures::IndexedRootOrdering
Describes an ordering of IndexedRoots 1046

smtrat::InequalitiesTable< Settings >
Datastructure for the GBModule 1047

smtrat::lra::Bound< T1, T2 >::Info
Stores some additional information for a bound 1050

smtrat::mcsat::InformationGetter 1052

smtrat::parser::Instantiator< V, T > 1053

smtrat::parser::InstructionHandler 1055

Minisat::Int64Range 1061

smtrat::IntBlastModule< Settings > 1062

smtrat::IntEqModule< Settings >
A module which checks whether the equations contained in the received (linear integer) formula have a solution 1091

smtrat::mcsat::icp::IntervalPropagation 1120

Minisat::IntOption 1121

Minisat::IntRange 1122

smtrat::is_sample_outside< S > 1123

smtrat::is_sample_outside< IsSampleOutsideAlgorithm::DEFAULT > 1123

smtrat::is_variant< T >
States whether a given type is a `boost::variant` 1123

smtrat::expression::ITEExpression 1123

benchmax::RandomizationAdaptor< T >::iterator 1124

smtrat::ModuleInput::IteratorCompare 1125

benchmax::Jobs
Represents a set of jobs, constructed as the cartesian product of a set of tools and a set of benchmarks 1125

smtrat::JunctorMerger 1126

smtrat::parser::KeywordParser
Parses keywords: `:simple_symbol` 1127

Minisat::lbool 1127

smtrat::lra::Tableau< Settings, T1, T2 >::LearnedBound 1128

smtrat::Module::Lemma 1130

Minisat::LessThan_default< T > 1131

smtrat::cad::sample_compare::level 1131

smtrat::cad::projection_compare::level 1131

smtrat::cad::ProjectionLevelInformation::LevelInfo 1131

smtrat::mcsat::onecellcad::levelwise::LevelwiseCAD 1133

smtrat::LevelWiseInformation< Settings > 1135

smtrat::cad::LiftingTree< Settings > 1138

smtrat::resource::Limiter 1141

smtrat::ICPModule< Settings >::linearVariable 1142

smtrat::mcsat::ClauseChain::Link 1142

Minisat::Lit 1143

benchmax::LocalBackend
This backend simply runs files sequentially on the local machine 1143

smtrat::LOG 1146

smtrat::parser::LogicParser 1146

smtrat::LongFormulaEncoder 1146

smtrat::LRAModule< Settings >
A module which performs the Simplex method on the linear part of it's received formula 1148

smtrat::LVEModule< Settings > 1183

smtrat::Manager
Base class for solvers 1213

Minisat::Map< K, D, H, E > 1223

benchmax::MathSAT
Tool wrapper for MathSAT for SMT-LIB 1225

smtrat::mcsat::fm::MaxSizeComparator
This heuristic chooses the explanation excluding the largest interval 1228

smtrat::MaxSMT< Solver, Strategy > 1228

smtrat::maxsmt::MaxSMTBackend< Solver, Strategy > 1229

smtrat::maxsmt::MaxSMTBackend< Solver, MaxSMTStrategy::FU_MALIK_INCREMENTAL > 1229

smtrat::maxsmt::MaxSMTBackend< Solver, MaxSMTStrategy::LINEAR_SEARCH > 1230

smtrat::maxsmt::MaxSMTBackend< Solver, MaxSMTStrategy::MSU3 > 1230

smtrat::MCBModule< Settings > 1230

smtrat::mcsat::MCSATBackend< Settings > 1262

smtrat::mcsat::MCSATMixin< Settings > 1263

smtrat::expression::simplifier::MergeSimplifier 1270

benchmax::Minisat
Tool wrapper for a Minisat solver 1271

benchmax::Minisatp
Tool wrapper for the Minisatp solver for pseudo-Boolean problems 1274

smtrat::mcsat::fm::MinSizeComparator
This heuristic chooses the explanation excluding the smallest interval 1277

smtrat::mcsat::fm::MinVarCountComparator
This heuristic tries to minimize the number of variables occuring in the explanation 1277

smtrat::cad::MISGeneration< heuristic > 1277

smtrat::MixedSignEncoder 1279

smtrat::cad::ModelBasedProjection< incrementality, backtracking, Settings > 1280

smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >
This class implements a projection that supports no incrementality and expects backtracking to be in order 1286

smtrat::Module
A base class for all kind of theory solving methods 1293

smtrat::ModuleFactory< Module > 1323

smtrat::ModuleInput
The input formula a module has to consider for it's satisfiability check 1324

smtrat::settings::ModuleSettings 1330

smtrat::Module::ModuleStatistics 1331

smtrat::ModuleWrapper< M > 1332

smtrat::MonomialMappingByVariablePool 1333

smtrat::expression::NaryExpression 1333

smtrat::expression::simplifier::NegationSimplifier 1334

smtrat::NewCADModule< Settings > 1336

smtrat::NewCoveringModule< Settings > 1366

smtrat::NNFPreparation 1395

smtrat::NNFRewriter 1396

benchmax::ssh::Node
Specification of a compuation node for the SSH backend 1397

delta::Node
This class represents a node in a SMTLIB file 1398

delta::NodePrinter< pretty > 1402

smtrat::mcsat::onecellcad::recursive::NoHeuristic 1403

smtrat::NRAILModule< Settings > 1403

smtrat::parser::NumeralParser
Parses numerals: `(0 | [1-9][0-9]*)` 1433

smtrat::lra::Numeric 1433

smtrat::execution::Objective 1440

Minisat::OccLists< Idx, Vec, Deleted > 1440

smtrat::mcsat::onecellcad::OneCellCAD 1441

benchmax::settings::OperationSettings
Operation settings 1443

smtrat::Optimization< Solver > 1444

Minisat::Option 1445

Minisat::Option::OptionLt 1446

smtrat::datastructures::OrderPair< T1, T2, reversed > 1447

smtrat::datastructures::OrderPair< T1, T2, true > 1447

smtrat::cad::Origin
This class represents one or more origins of some object 1447

smtrat::cad::preprocessor::Origins 1450

smtrat::OrPathShortener
A rewriter that checks every (X)OR that only contains ANDs and UEQs as children for equalities that hold for every alternative, and adds such equalities explicitly 1451

Minisat::OutOfMemoryException 1452

smtrat::parser::OutputWrapper 1452

Minisat::Map< K, D, H, E >::Pair 1452

smtrat::pairhash< F, S, FirstHasher, SecondHasher >
Note that this may NOT be a specialization of std::hash for std::pair, this is not allowed by the standard as it does not involve a user-defined type 1453

smtrat::mcsat::ParallelExplanation< Backends > 1453

delta::Parser
This class parses a whole smtlib file into a hierarchy of Node objects 1453

smtrat::parser::ParserSettings 1454

smtrat::parser::ParserState 1455

smtrat::PBGaussModule< Settings > 1458

smtrat::PBPPModule< Settings > 1490

smtrat::PersistentUnionFind 1519

smtrat::PFEModule< Settings > 1520

smtrat::PModule 1550

smtrat::cadcells::operators::properties::poly_irreducible_sgn_inv 1581

smtrat::cadcells::operators::properties::poly_ord_inv 1581

smtrat::cadcells::operators::properties::poly_pdel 1582

smtrat::cadcells::operators::properties::poly_sgn_inv 1582

smtrat::cad::ProjectionPolynomialInformation::PolyInfo 1583

smtrat::cad::PolynomialComparator< PolynomialGetter > 1583

smtrat::cad::PolynomialLiftingQueue< PolynomialGetter > 1584

smtrat::cadcells::datastructures::PolyPool
A pool for polynomials 1585

smtrat::cadcells::datastructures::detail::PolyProperties 1586

smtrat::cadcells::datastructures::PolyRef
Refers to a polynomial 1587

smtrat::PolyTree 1587

smtrat::PolyTreeContent 1588

smtrat::PolyTreePool 1589

smtrat::cad::Preprocessor 1589

smtrat::cad::PreprocessorSettings 1591

benchmax::settings::PresetSettings 1591

smtrat::PriorityQueue< T, Compare > 1592

delta::Producer
This class iteratively applies the operators to a smtlib file until no further simplifications can be performed 1594

delta::ProgressBar
This class provides a simple way to show progress bars on the command line 1594

smtrat::cad::Projection< incrementality, backtracking, Settings > 1596

smtrat::qe::cad::Projection< Settings > 1601

smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings > 1608

smtrat::cad::Projection< Incrementality::FULL, BT, Settings > 1614

smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >
This class implements a projection that supports no incrementality and expects backtracking to be in order 1620

smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >
This class implements a projection that supports no incrementality and allows backtracking to be out of order 1627

smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings > 1633

smtrat::cad::projection_compare::ProjectionComparator< Strategy > 1639

smtrat::cad::projection_compare::ProjectionComparator< ProjectionCompareStrategy::D > 1639

smtrat::cad::projection_compare::ProjectionComparator< ProjectionCompareStrategy::ID > 1639

smtrat::cad::projection_compare::ProjectionComparator< ProjectionCompareStrategy::LD > 1640

smtrat::cad::projection_compare::ProjectionComparator< ProjectionCompareStrategy::PD > 1640

smtrat::cad::projection_compare::ProjectionComparator< ProjectionCompareStrategy::SD > 1640

smtrat::cad::projection_compare::ProjectionComparator_impl< Args > 1641

smtrat::cad::ProjectionGlobalInformation 1641

smtrat::cad::ProjectionInformation 1642

smtrat::cad::ProjectionLevelInformation 1644

smtrat::cad::ProjectionOperator 1645

smtrat::cad::ProjectionPolynomialInformation 1645

smtrat::cadcells::datastructures::Projections
Encapsulates all computations on polynomials 1646

smtrat::cadcells::operators::PropertiesSet< Op > 1649

smtrat::cadcells::operators::PropertiesSet< op::mccallum > 1650

smtrat::cadcells::datastructures::PropertiesT< Ts >
Set of properties 1650

smtrat::cadcells::datastructures::PropertiesT< T, Ts... > 1650

smtrat::cadcells::datastructures::PropertiesTContent< T, is_flag > 1651

smtrat::cadcells::datastructures::PropertiesTContent< T, false > 1651

smtrat::cadcells::datastructures::PropertiesTContent< T, true > 1651

smtrat::cadcells::datastructures::property_hash< T > 1651

smtrat::PseudoBoolEncoder
Base class for a PseudoBoolean Encoder 1651

smtrat::PseudoBoolNormalizer 1653

smtrat::parser::QEParser 1653

smtrat::parser::QualifiedIdentifierParser 1654

smtrat::expression::QuantifierExpression 1655

smtrat::parser::QuantifierParser 1655

Minisat::Queue< T > 1656

smtrat::mcsat::icp::QueueEntry 1657

benchmax::RandomizationAdaptor< T >
Provides iteration over a given std::vector in a pseudo-randomized order 1657

smtrat::RationalCapsule 1658

smtrat::parser::RationalPolicies
Specialization of qi::real_policies for a Rational 1659

smtrat::fixedsize_allocator< T >::rebind< U > 1659

smtrat::mcsat::onecellcad::recursive::RecursiveCAD 1659

smtrat::cad::projection::Reducta< Poly >
Construct the set of reducta of the given polynomial 1664

Minisat::RegionAllocator< T > 1665

smtrat::NNFRewriter::remove_xor_first_arg 1667

smtrat::ReplaceVariablesRewriter 1667

delta::ErrorHandler::result< typename > 1668

smtrat::parser::ErrorHandler::result< typename > 1668

smtrat::cad::preprocessor::ResultantRule 1669

benchmax::Results
Stores results for for whole benchmax run 1669

smtrat::RNSEncoder 1670

smtrat::mcsat::onecellcad::firstlevel::root_indexer 1671

smtrat::cadcells::operators::properties::root_well_def 1672

smtrat::mcsat::arithmetic::RootIndexer 1673

smtrat::cad::Sample 1674

smtrat::cad::sample_compare::SampleComparator< Iterator, Strategy > 1676

smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::LS > 1676

smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::LT > 1676

smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::LTA > 1677

smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::LTS > 1677

smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::LTSA > 1677

smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::S > 1677

smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::T > 1678

smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::TLSA > 1678

smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::TS > 1678

smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::TSA > 1679

smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::Type > 1679

smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::Value > 1679

smtrat::cad::sample_compare::SampleComparator_impl< It, Args > 1680

smtrat::cadcells::datastructures::SampledDerivation< Properties >
A SampledDerivation is a DelineatedDerivation with a sample and an DelineationInterval w.r.t 1680

smtrat::SampledDerivationRefCompare 1683

smtrat::cad::SampleIteratorQueue< Iterator, Comparator > 1683

smtrat::sampling< S > 1684

smtrat::sampling< SamplingAlgorithm::LOWER_UPPER_BETWEEN_SAMPLING > 1685

smtrat::SATModule< Settings >
Implements a module performing DPLL style SAT checking 1685

smtrat::parser::ScriptParser< Callee > 1721

smtrat::parser::ParserState::ScriptScope 1724

smtrat::mcsat::onecellcad::firstlevel::section 1724

smtrat::onecellcad::recursive::Section
Represent a cell's closed-interval-boundary object along one single axis by an irreducible, multivariate polynomial of level k 1725

smtrat::mcsat::onecellcad::Section
Represent a cell's (closed-interval-boundary) component along th k-th axis 1725

smtrat::mcsat::onecellcad::levelwise::SectionHeuristic1 1726

smtrat::mcsat::onecellcad::levelwise::SectionHeuristic2 1726

smtrat::mcsat::onecellcad::levelwise::SectionHeuristic3 1726

smtrat::mcsat::onecellcad::firstlevel::sector 1726

smtrat::mcsat::onecellcad::Sector
Represent a cell's open-interval boundary object along one single axis by two irreducible, multivariate polynomials of level k 1727

smtrat::onecellcad::recursive::Sector
Represent a cell's open-interval boundary object along one single axis by two irreducible, multivariate polynomials of level k 1728

smtrat::mcsat::onecellcad::levelwise::SectorHeuristic1 1728

smtrat::mcsat::onecellcad::levelwise::SectorHeuristic2 1729

smtrat::mcsat::onecellcad::levelwise::SectorHeuristic3 1729

smtrat::mcsat::SequentialAssignment< Backends > 1729

smtrat::mcsat::SequentialExplanation< Backends > 1729

delta::Settings
This class loads and checks the command line options with help of boost::program_options 1729

benchmax::settings::Settings
Generic class to manage runtime settings 1731

smtrat::settings::Settings 1732

smtrat::SettingsComponents 1732

benchmax::SettingsParser
Generic class to manage settings parsing using boost::program_options 1732

smtrat::SettingsParser 1732

smtrat::CNFerModule::SettingsType 1732

smtrat::parser::SExpressionParser 1732

smtrat::parser::SExpressionSequence< T > 1733

smtrat::ShortFormulaEncoder 1734

benchmax::simple_parser 1735

smtrat::parser::Theories::SimpleSortAdder
Helper functor for addSimpleSorts() method 1736

smtrat::parser::SimpleSymbolParser
Parses symbols: simple_symbol | quoted_symbol where 1736

smtrat::expression::simplifier::Simplifier 1737

smtrat::expression::simplifier::SimplifierChainCaller< chainID > 1737

smtrat::expression::simplifier::SimplifierChainCaller< 0 > 1737

smtrat::expression::simplifier::SingletonSimplifier 1738

smtrat::cad::sample_compare::size 1739

smtrat::parser::Skipper 1739

delta::Skipper
This class is a boost::spirit::qi grammar that matches whitespaces and smtlib comments 1740

benchmax::SlurmBackend
Backend for the Slurm workload manager 1740

benchmax::settings::SlurmBackendSettings
Settings for the Slurm backend 1743

smtrat::parser::SMTLIBParser 1744

benchmax::SMTRAT
Tool wrapper for SMT-RAT for SMT-LIB 1747

benchmax::SMTRAT_Analyzer
Tool wrapper for SMT-RAT for SMT-LIB 1750

benchmax::SMTRAT_OPB
Adapts the SMTRAT solver for OPB files 1753

smtrat::execution::SoftAssertion 1756

smtrat::settings::SolverSettings 1756

smtrat::parser::SortedVariableParser 1757

smtrat::parser::SortParser 1757

smtrat::parser::SpecConstantParser 1758

smtrat::SplitSOSModule< Settings > 1759

benchmax::SSHBackend 1789

benchmax::settings::SSHBackendSettings
Settings for SSH backend 1791

benchmax::ssh::SSHConnection
A wrapper class that manages a single SSH connection as specified in a Node object (with all its channels) 1792

smtrat::vs::State 1794

smtrat::StaticUnionFind 1820

smtrat::statistics::StatisticsSettings 1821

smtrat::StrategyGraph 1821

delta::String
This class can be used to create `std::string` objects using streaming operators 1822

Minisat::StringOption 1823

smtrat::parser::StringParser
Parses strings: `".+"` with escape sequences \\" and \\\\ 1824

smtrat::STropModule< Settings > 1824

benchmax::slurm::SubmitfileProperties
All properties needed to create a submit file 1854

smtrat::vs::Substitution 1856

smtrat::vs::substitutionPointerEqual 1860

smtrat::vs::substitutionPointerHash 1860

delta::SymbolParser
This class is a `boost::spirit::qi` grammar that matches all kinds of smtlib symbols, numbers etc 1860

smtrat::parser::SymbolParser 1861

smtrat::SymmetryModule< Settings > 1861

smtrat::lra::Tableau< Settings, T1, T2 > 1892

smtrat::lra::TableauEntry< T1, T2 > 1910

smtrat::mcsat::onecellcad::TagPoly
Tagged Polynomials 1914

smtrat::Task 1914

delta::TempFilenameGenerator
This class generates and reuses temporary filenames with a common prefix 1915

smtrat::parser::TermParser 1916

smtrat::mcsat::vs::helper::TestCandidate 1917

smtrat::parser::Theories
Combines all implemented theories and provides a single interface to interact with all theories at once 1918

smtrat::parser::TheoryError 1921

smtrat::mcsat::TheoryLevel 1921

smtrat::Module::TheoryPropagation 1922

smtrat::TheoryVarSchedulerStatic< vot >
Schedules theory variables statically 1923

smtrat::ThreadPool 1927

smtrat::cad::debug::TikzBasePrinter 1928

smtrat::cad::debug::TikzDAGPrinter 1929

smtrat::cad::debug::TikzHistoryPrinter 1930

smtrat::cad::debug::TikzTreePrinter 1931

benchmax::Tool
Base class for any tool 1933

benchmax::settings::ToolSettings
Tool-related settings 1937

smtrat::TotalizerEncoder
TotalizerEncoder implements the Totalizer encoding as described in "Incremental Cardinality Constraints for MaxSAT" by Martins et al https://doi.org/10.1007/978-3-319-10428-7↩_39 1938

smtrat::TotalizerTree 1940

smtrat::cad::projection_compare::type 1940

smtrat::cad::sample_compare::type 1940

smtrat::uf_impl::uf_data_wrapper< T, compression >
Wrapper around data entry and uf_rank_and_class; this class contains a value of type T and both rank and class of an entry in the UF datastructure 1941

smtrat::uf_impl::uf_data_wrapper< void, compression >
Special case of the uf_data_wrapper in case the data type is void 1942

smtrat::uf_impl::uf_rank_and_class< compression >
Wrapper class that contains the rank and parent class of some entry of the UF datastructure 1943

smtrat::uf_impl::uf_rank_and_class< true >
Compressed implementation of uf_rank_and_class 1944

smtrat::UFCegarModule< Settings > 1945

smtrat::UFRewriter 1974

smtrat::expression::UnaryExpression 1975

smtrat::cad::debug::UnifiedData 1975

smtrat::parser::types::UninterpretedTheory
Types of the theory of equalities and uninterpreted functions 1976

smtrat::parser::UninterpretedTheory
Implements the theory of equalities and uninterpreted functions 1977

smtrat::union_find< T, no_compression, MaxTracebackLength >
Implements a union-find datastructure, a datastructure containing an array of entries 1980

smtrat::UnionFindInterface< T, Implementation > 1984

smtrat::UnionFindModule< Settings > 1986

smtrat::SATModule< Settings >::UnorderedClauseLookup::UnorderedClauseHasher 2016

smtrat::UnsatCore< Solver, Strategy > 2016

smtrat::unsatcore::UnsatCoreBackend< Solver, Strategy > 2017

smtrat::unsatcore::UnsatCoreBackend< Solver, UnsatCoreStrategy::ModelExclusion >
Implements an easy strategy to obtain an unsatisfiable core 2018

smtrat::vs::unsignedTripleCmp 2018

smtrat::parser::UserFunctionInstantiator 2019

smtrat::validation::ValidationCollector 2020

smtrat::validation::ValidationPoint 2020

smtrat::validation::ValidationPrinter< SOF > 2021

smtrat::validation::ValidationSettings 2021

smtrat::lra::Value< T > 2022

smtrat::lra::Variable< T1, T2 > 2030

smtrat::vb::Variable< T >
Class for a variable 2040

smtrat::vb::VariableBounds< T >
Class to manage the bounds of a variable 2043

smtrat::VariableCapsule 2050

smtrat::mcsat::variableordering::VariableIDs 2050

smtrat::VariableRewriteRule 2051

smtrat::mcsat::VariableSelector 2052

smtrat::variant_hash_visitor 2053

smtrat::parser::conversion::VariantConverter< Res >
Converts variants to some type using the Converter class 2053

smtrat::VariantMap< Key, Value >
This class is a specialization of `std::map` where the keys are of arbitrary type and the values are of type `boost::variant` 2054

smtrat::parser::conversion::VariantVariantConverter< Res >
Converts variants to another variant type not using the Converter class 2057

smtrat::VarSchedulerBase
Base class for variable schedulers 2057

smtrat::VarSchedulerFixedRandom 2061

smtrat::VarSchedulerMcsatActivityPreferTheory< vot >
Activity-based scheduler preferring initially theory variables 2064

smtrat::VarSchedulerMcsatBase
Base class for all MCSAT variable scheduler 2068

smtrat::VarSchedulerMcsatBooleanFirst< vot >
Variable scheduling that all decides Boolean variables first before deciding any theory variable 2072

smtrat::VarSchedulerMcsatTheoryFirst< TheoryScheduler >
Variable scheduling that all decides theory variables first before deciding any Boolean variable 2075

smtrat::VarSchedulerMcsatUnivariateClausesOnly< TheoryScheduler, respectActivities >
Decides only Constraints occuring in clauses that are univariate in the current theory variable while the theory ordering is static 2079

smtrat::VarSchedulerMcsatUnivariateConstraintsOnly< lookahead, vot >
Decides only Constraints univariate in the current theory variable while the theory ordering is static 2083

smtrat::VarSchedulerMinisat
Minisat's activity-based variable scheduling 2087

smtrat::VarSchedulerRandom
Random scheduler 2090

smtrat::VarSchedulerSMTTheoryGuided< theory_conflict_guided_decision_heuristic >
Scheduler for SMT, implementing theory guided heuristics 2093

Minisat::vec< T > 2097

smtrat::parser::conversion::VectorVariantConverter< Res >
Converts a vector of variants to a vector of some type using the Converter class 2100

smtrat::VSModule< Settings > 2101

Minisat::Watcher
[Minisat related code] 2132

smtrat::ICPModule< Settings >::weights 2133

benchmax::XMLWriter
Writes results to a xml file 2134

benchmax::Z3
Tool wrapper for Z3 for SMT-LIB 2134

14 Namespace Documentation

14.1 benchmax Namespace Reference

Namespaces

- settings
- slurm
- ssh

Data Structures

- class Backend

  Base class for all backends.

- struct BenchmarkResult

  Results for a single benchmark run.

- class BenchmarkSet

  A set of benchmarks from some common base directory.

- class CondorBackend

  Backend for the HTCondor batch system.

- class Database

  Dummy database that effectively disables storing to database. Set BENCHMAX_DATABASE to actually use a database.

- class DBAL
- class Jobs

  Represents a set of jobs, constructed as the cartesian product of a set of tools and a set of benchmarks.

- class LocalBackend

  This backend simply runs files sequentially on the local machine.

- class MathSAT

  Tool wrapper for MathSAT for SMT-LIB.

- class Minisat

  Tool wrapper for a Minisat solver.

- class Minisatp

  Tool wrapper for the Minisatp solver for pseudo-Boolean problems.

- class RandomizationAdaptor

  Provides iteration over a given std::vector in a pseudo-randomized order.

- class Results

  Stores results for for whole benchmax run.

- class SettingsParser

  Generic class to manage settings parsing using boost::program_options.

- class simple_parser
- class SlurmBackend

  Backend for the Slurm workload manager.

- class SMTRAT

  Tool wrapper for SMT-RAT for SMT-LIB.

- class SMTRAT_Analyzer

  Tool wrapper for SMT-RAT for SMT-LIB.

- class SMTRAT_OPB

  Adapts the SMTRAT solver for OPB files.

- class SSHBackend
- class Tool

  Base class for any tool.

- class XMLWriter

  Writes results to a xml file.

- class Z3

  Tool wrapper for Z3 for SMT-LIB.

Typedefs

- using Job = std::pair< const Tool *, std::filesystem::path >

  Typedef for a job, consisting of a tool and an input file.

- using ToolPtr = std::unique_ptr< Tool >

  A std::unique_ptr to a Tool.

- using Tools = std::vector< ToolPtr >

  A vector of ToolPtr.

Functions

- template<typename Backend >
  void execute_backend (const std::string &name, const Jobs &jobs)
- void run_backend (const std::string &backend, const Jobs &jobs)

  Runs a given backend on a list of tools and benchmarks.

- const auto & settings_slurm ()

  Return the Slurm settings.

- const auto & settings_ssh ()

  Return the SSH settings.

- BenchmarkSet loadBenchmarks ()

  Loads benchmark files from directory specified in settings.

- const auto & settings_benchmarks ()

  Return the benchmark settings.

- void logging_configure ()

  Configure default logging for benchmax.

- void logging_quiet ()

  Configure quiet logging for benchmax.

- void logging_verbose ()

  Configure verbose logging for benchmax.

- std::ostream & operator<< (std::ostream &os, const BenchmarkResult &results)

  Streaming operator for BenchmarkResult.

- const auto & settings_preset ()

  Return the Slurm settings.

- template<typename T >
  const auto & settings_get (const std::string &name)

  Helper function to obtain settings by name and type.

- const auto & settings_core ()

  Retrieved core settings.

- const auto & settings_operation ()

  Retrieved operation settings.

- bool is_system_lib (std::string path)
- std::ostream & operator<< (std::ostream &os, const Tool &tool)

  Streaming operator for a generic tool.

- template<typename T >
  void createTools (const std::vector< std::filesystem::path > &arguments, Tools &tools)

  Create tools of a given type T from a list of binaries and store them in tools.

- Tools loadTools ()

  Load all tools from the tool settings.

- const auto & settings_tools ()

  Returns the tool settings.

- int call_program (const std::string &commandline, std::string &stdout, bool print_to_stdout=false)

Runs an external program from some command line and records the output to stdout.

- std::filesystem::path common_prefix (const std::filesystem::path &p1, const std::filesystem::path &p2)

  Computes the common prefix of two paths.
- std::filesystem::path common_prefix (const std::vector< std::filesystem::path > &s, bool skip_last=true)

  Computes the common prefix of a list of paths.
- std::filesystem::path common_prefix (const std::initializer_list< std::vector< std::filesystem::path >> &s, bool skip_last=true)

  Computes the common prefix of multiple lists of paths.
- std::filesystem::path remove_prefix (const std::filesystem::path &s, const std::filesystem::path &prefix)

  Remove a prefix from a path.
- bool is_extension (const std::filesystem::path &path, const std::string &extension)

  Checks whether the extension of the filename is as specified.
- std::size_t parse_peak_memory (const std::string &output)

14.1.1 Typedef Documentation

14.1.1.1 Job `using benchmax::Job = typedef std::pair<const Tool*, std::filesystem::path>`

Typedef for a job, consisting of a tool and an input file.

14.1.1.2 ToolPtr `using benchmax::ToolPtr = typedef std::unique_ptr<Tool>`

A std::unique_ptr to a Tool.

14.1.1.3 Tools `using benchmax::Tools = typedef std::vector<ToolPtr>`

A vector of ToolPtr.

14.1.2 Function Documentation

14.1.2.1 call_program()

```
int benchmax::call_program (
    const std::string & commandline,
    std::string & stdout,
    bool print_to_stdout = false ) [inline]
```

Runs an external program from some command line and records the output to stdout.

Prints the program output and records it at the same time if print_to_stdout is set to true.

Parameters

commandline	Program to execute.
stdout	Standard output.
print_to_stdout	Also print if true.

Returns Exit code of the program.

14.1.2.2 common_prefix() [1/3]

```
std::filesystem::path benchmax::common_prefix (
    const std::filesystem::path & p1,
    const std::filesystem::path & p2 ) [inline]
```

Computes the common prefix of two paths.

14.1.2.3 common_prefix() [2/3]

```
std::filesystem::path benchmax::common_prefix (
    const std::initializer_list< std::vector< std::filesystem::path >> & s,
    bool skip_last = true ) [inline]
```

Computes the common prefix of multiple lists of paths.

skip_last specifies whether the last part if the path (usually the filename) may be part of the prefix.

14.1.2.4 common_prefix() [3/3]

```
std::filesystem::path benchmax::common_prefix (
    const std::vector< std::filesystem::path > & s,
    bool skip_last = true ) [inline]
```

Computes the common prefix of a list of paths.

skip_last specifies whether the last part if the path (usually the filename) may be part of the prefix.

14.1.2.5 createTools()

```
template<typename T >
void benchmax::createTools (
    const std::vector< std::filesystem::path > & arguments,
    Tools & tools )
```

Create tools of a given type T from a list of binaries and store them in tools.

14.1.2.6 execute_backend()

```
template<typename Backend >
void benchmax::execute_backend (
    const std::string & name,
    const Jobs & jobs )
```

14.1.2.7 is_extension()

```
bool benchmax::is_extension (
    const std::filesystem::path & path,
    const std::string & extension ) [inline]
```

Checks whether the extension of the filename is as specified.

14.1.2.8 is_system_lib()

```
bool benchmax::is_system_lib (
    std::string path ) [inline]
```

14.1.2.9 loadBenchmarks()

```
BenchmarkSet benchmax::loadBenchmarks ( )
```

Loads benchmark files from directory specified in settings.

14.1.2.10 loadTools() `Tools benchmax::loadTools ( )`

Load all tools from the tool settings.

14.1.2.11 logging_configure() `void benchmax::logging_configure ( ) [inline]`

Configure default logging for benchmax.

14.1.2.12 logging_quiet() `void benchmax::logging_quiet ( ) [inline]`

Configure quiet logging for benchmax.

14.1.2.13 logging_verbose() `void benchmax::logging_verbose ( ) [inline]`

Configure verbose logging for benchmax.

14.1.2.14 operator<<() [1/2]

```
std::ostream& benchmax::operator<< (
    std::ostream & os,
    const BenchmarkResult & results ) [inline]
```

Streaming operator for BenchmarkResult.

14.1.2.15 operator<<() [2/2]

```
std::ostream& benchmax::operator<< (
    std::ostream & os,
    const Tool & tool ) [inline]
```

Streaming operator for a generic tool.

14.1.2.16 parse_peak_memory()

```
std::size_t benchmax::parse_peak_memory (
    const std::string & output ) [inline]
```

14.1.2.17 remove_prefix()

```
std::filesystem::path benchmax::remove_prefix (
    const std::filesystem::path & s,
    const std::filesystem::path & prefix ) [inline]
```

Remove a prefix from a path.

14.1.2.18 run_backend()

```
void benchmax::run_backend (
    const std::string & backend,
    const Jobs & jobs )
```

Runs a given backend on a list of tools and benchmarks.

Parameters

backend	Backend name.
tools	List of tools.
benchmarks	List of benchmarks.

14.1.2.19 settings_benchmarks() `const auto& benchmax::settings_benchmarks ( ) [inline]`

Return the benchmark settings.

14.1.2.20 settings_core() `const auto& benchmax::settings_core ( ) [inline]`

Retrieved core settings.

14.1.2.21 settings_get() `template<typename T >`

```
const auto& benchmax::settings_get (
            const std::string & name ) [inline]
```

Helper function to obtain settings by name and type.

14.1.2.22 settings_operation() `const auto& benchmax::settings_operation ( ) [inline]`

Retrieved operation settings.

14.1.2.23 settings_preset() `const auto& benchmax::settings_preset ( ) [inline]`

Return the Slurm settings.

14.1.2.24 settings_slurm() `const auto& benchmax::settings_slurm ( ) [inline]`

Return the Slurm settings.

14.1.2.25 settings_ssh() `const auto& benchmax::settings_ssh ( ) [inline]`

Return the SSH settings.

14.1.2.26 settings_tools() `const auto& benchmax::settings_tools ( ) [inline]`

Returns the tool settings.

14.2 benchmax::settings Namespace Reference

Data Structures

- struct BenchmarkSettings

  Settings for benchmarks.
- struct CoreSettings

  Core settings.
- struct OperationSettings

  Operation settings.
- struct PresetSettings
- struct Settings

  Generic class to manage runtime settings.
- struct SlurmBackendSettings

  Settings for the Slurm backend.
- struct SSHBackendSettings

  Settings for SSH backend.
- struct ToolSettings

  Tool-related settings.

Functions

- void registerSlurmBackendSettings (SettingsParser *parser)

  Registers Slurm settings with the settings parser.
- void registerSSHBackendSettings (SettingsParser *parser)

  Registers SSH settings with settings parser.
- bool finalize_benchmark_settings (BenchmarkSettings &s, const boost::program_options::variables_map &)

  Postprocess benchmark settings.
- void registerBenchmarkSettings (SettingsParser *parser)

  Registers benchmark settings with the settings parser.
- bool finalize_preset_settings (PresetSettings &s, boost::program_options::variables_map &values)

  Postprocess preset settings.
- void registerPresetSettings (SettingsParser *parser)

  Registers preset settings with the settings parser.
- bool finalize_tool_settings (ToolSettings &s, const boost::program_options::variables_map &)

  Postprocess settings to compute common prefix.
- void registerToolSettings (SettingsParser *parser)

  Registers tool settings with the settings parser.

14.2.1 Function Documentation

14.2.1.1 finalize_benchmark_settings()

```
bool benchmax::settings::finalize_benchmark_settings (
    BenchmarkSettings & s,
    const boost::program_options::variables_map & )
```

Postprocess benchmark settings.

14.2.1.2 finalize_preset_settings()

```
bool benchmax::settings::finalize_preset_settings (
    PresetSettings & s,
    boost::program_options::variables_map & values )
```

Postprocess preset settings.

14.2.1.3 finalize_tool_settings()

```
bool benchmax::settings::finalize_tool_settings (
    ToolSettings & s,
    const boost::program_options::variables_map &  )
```

Postprocess settings to compute common prefix.

14.2.1.4 registerBenchmarkSettings()

```
void benchmax::settings::registerBenchmarkSettings (
    SettingsParser * parser )
```

Registers benchmark settings with the settings parser.

14.2.1.5 registerPresetSettings()

```
void benchmax::settings::registerPresetSettings (
    SettingsParser * parser )
```

Registers preset settings with the settings parser.

14.2.1.6 registerSlurmBackendSettings()

```
void benchmax::settings::registerSlurmBackendSettings (
    SettingsParser * parser )
```

Registers Slurm settings with the settings parser.

14.2.1.7 registerSSHBackendSettings()

```
void benchmax::settings::registerSSHBackendSettings (
    SettingsParser * parser )
```

Registers SSH settings with settings parser.

14.2.1.8 registerToolSettings()

```
void benchmax::settings::registerToolSettings (
    SettingsParser * parser )
```

Registers tool settings with the settings parser.

14.3 benchmax::slurm Namespace Reference

Data Structures

- struct ArchiveProperties

  All properties needed to archive log files.
- struct ChunkedSubmitfileProperties

  All properties needed to create a submit file.
- struct SubmitfileProperties

  All properties needed to create a submit file.

Functions

- void archive_log_files (const ArchiveProperties &p)

  Put all log files into an archive.
- std::vector< fs::path > collect_result_files (const fs::path &basedir)

  Collects all result files in the given base directory for this job id.
- std::string generate_submit_file (const SubmitfileProperties &p)

  Generate a submit file for Slurm with the given properties.
- std::string generate_submit_file_chunked (const ChunkedSubmitfileProperties &p)
- int parse_job_id (const std::string &output)

  Parses the job id from the output of `sbatch`.
- std::string parse_result_info (const std::string &content, const std::string &name)

  Parse a single result information from the output.
- void remove_log_files (const std::vector< fs::path > &files, bool remove)

  Remove the given list of files.
- void clear_log_files (const fs::path &basedir)

  Clear log files from directory.
- bool is_job_finished (int jobid)

  Checks if the given job is finished.
- template<typename Jobs >
  void generate_jobs_file (const std::string &filename, std::pair< std::size_t, std::size_t > range, const Jobs &jobs)

14.3.1 Function Documentation

14.3.1.1 archive_log_files()

```
void benchmax::slurm::archive_log_files (
    const ArchiveProperties & p )
```

Put all log files into an archive.

14.3.1.2 clear_log_files()

```
void benchmax::slurm::clear_log_files (
    const fs::path & basedir )
```

Clear log files from directory.

Parameters

basedir	Base directory to search in.

14.3.1.3 collect_result_files()

```
std::vector< fs::path > benchmax::slurm::collect_result_files (
    const fs::path & basedir )
```

Collects all result files in the given base directory for this job id.

Parameters

basedir	Base directory to search in.
jobid	ID of slurm job.

Returns List of result files.

14.3.1.4 generate_jobs_file()

```
template<typename Jobs >
void benchmax::slurm::generate_jobs_file (
            const std::string & filename,
            std::pair< std::size_t, std::size_t > range,
            const Jobs & jobs )
```

14.3.1.5 generate_submit_file()

```
std::string benchmax::slurm::generate_submit_file (
            const SubmitfileProperties & p )
```

Generate a submit file for Slurm with the given properties.

Parameters

p	Collection of all information needed.

Returns The filename of the submit file.

14.3.1.6 generate_submit_file_chunked()

```
std::string benchmax::slurm::generate_submit_file_chunked
(
            const ChunkedSubmitfileProperties & p )
```

14.3.1.7 is_job_finished()

```
bool benchmax::slurm::is_job_finished (
            int jobid )
```

Checks if the given job is finished.

Parameters

jobid	The job id.

Returns True if the job is completed.

14.3.1.8 parse_job_id()

```
int benchmax::slurm::parse_job_id (
            const std::string & output )
```

Parses the job id from the output of `sbatch`.

Parameters

output	Output of `sbatch`.

Returns Slurm job id.

14.3.1.9 parse_result_info()

```
std::string benchmax::slurm::parse_result_info (
    const std::string & content,
    const std::string & name )
```

Parse a single result information from the output.

Parameters

content	Result information output.
name	Information to be parsed.

Returns Information specified in the output.

14.3.1.10 remove_log_files()

```
void benchmax::slurm::remove_log_files (
    const std::vector< fs::path > & files,
    bool remove )
```

Remove the given list of files.

Parameters

files	List of files.
remove	Boolean flag whether to actually remove files.

14.4 benchmax::ssh Namespace Reference

Data Structures

- struct Node

  Specification of a compuation node for the SSH backend.
- class SSHConnection

  A wrapper class that manages a single SSH connection as specified in a Node object (with all its channels).

14.5 carl Namespace Reference

14.6 delta Namespace Reference

Data Structures

- class Checker

This class takes care of calling the actual solver.

- class Consumer

  This class takes care of asynchronous execution of calls to the solver.

- struct ErrorHandler
- struct Node

  This class represents a node in a SMTLIB file.

- struct NodePrinter
- class Parser

  This class parses a whole smtlib file into a hierarchy of Node objects.

- class Producer

  This class iteratively applies the operators to a smtlib file until no further simplifications can be performed.

- class ProgressBar

  This class provides a simple way to show progress bars on the command line.

- class Settings

  This class loads and checks the command line options with help of `boost::program_options`.

- struct Skipper

  This class is a `boost::spirit::qi` grammar that matches whitespaces and smtlib comments.

- class String

  This class can be used to create `std::string` objects using streaming operators.

- struct SymbolParser

  This class is a `boost::spirit::qi` grammar that matches all kinds of smtlib symbols, numbers etc.

- class TempFilenameGenerator

  This class generates and reuses temporary filenames with a common prefix.

Typedefs

- using NodeChangeSet = std::vector< Node >

  Set of new nodes.

- using NodeOperator = std::function< NodeChangeSet(const Node &)>

  Type of an node operator.

- typedef boost::spirit::istream_iterator BaseIteratorType
- typedef boost::spirit::line_pos_iterator< BaseIteratorType > PositionIteratorType
- typedef PositionIteratorType Iterator

Functions

- std::ostream & operator<< (std::ostream &os, const Node &n)

  Streaming operator.

- template<bool pretty>
  std::ostream & operator<< (std::ostream &os, const NodePrinter< pretty > &np)
- NodeChangeSet children (const Node &n)

  Node operator that returns all children of a node.

- NodeChangeSet reorderChildren (const Node &n)

  Node operator that reorders children of a node.

- NodeChangeSet mergeChild (const Node &n)

  Node operator that merges nodes with one of its own children.

- NodeChangeSet number (const Node &n)

  Node operator that provides meaningful replacements for numbers.

- NodeChangeSet constant (const Node &n)

  Node operator that provides meaningful replacements for variables.

- NodeChangeSet letExpression (const Node &n)

  Node operator that eliminated let expressions.

- NodeChangeSet BV_zeroExtend (const Node &n)
- NodeChangeSet BV_mergeShift (const Node &n)

  (bvlshr (bvlshr x (_ bv1 8)) (_ bv1 8))

14.6.1 Typedef Documentation

14.6.1.1 BaseIteratorType `typedef boost::spirit::istream_iterator delta::BaseIteratorType`

14.6.1.2 Iterator `typedef PositionIteratorType delta::Iterator`

14.6.1.3 NodeChangeSet `using delta::NodeChangeSet = typedef std::vector<Node>`

Set of new nodes.

14.6.1.4 NodeOperator `using delta::NodeOperator = typedef std::function<NodeChangeSet(const Node&)>`

Type of an node operator.

A NodeOperator is called on a node and shall return a set of new nodes. These new nodes are supposed to be a simplifying replacement for the given node.

14.6.1.5 PositionIteratorType `typedef boost::spirit::line_pos_iterator<BaseIteratorType> delta::PositionIterato`

14.6.2 Function Documentation

14.6.2.1 BV_mergeShift() `NodeChangeSet delta::BV_mergeShift ( const Node & n )`

(bvlshr (bvlshr x (_ bv1 8)) (_ bv1 8))

14.6.2.2 BV_zeroExtend() `NodeChangeSet delta::BV_zeroExtend ( const Node & n )`

14.6.2.3 children() `NodeChangeSet delta::children ( const Node & n )`

Node operator that returns all children of a node.

Parameters

n	Node.

Returns A set of replacements.

14.6.2.4 constant() `NodeChangeSet delta::constant ( const Node & n )`

Node operator that provides meaningful replacements for variables.

Parameters

n	Node.

Returns A set of replacements.

14.6.2.5 letExpression() `NodeChangeSet delta::letExpression ( const Node & n )`

Node operator that eliminated let expressions.

Parameters

n	Node.

Returns A set of replacements.

14.6.2.6 mergeChild() `NodeChangeSet delta::mergeChild ( const Node & n )`

Node operator that merges nodes with one of its own children.

Parameters

n	Node.

Returns A set of replacements.

14.6.2.7 number() `NodeChangeSet delta::number ( const Node & n )`

Node operator that provides meaningful replacements for numbers.

Parameters

n	Node.

Returns A set of replacements.

14.6.2.8 operator<<() [1/2]

```
std::ostream& delta::operator<< (
    std::ostream & os,
    const Node & n ) [inline]
```

Streaming operator.

This operator should output a representation that is syntactically identically to the one that was parsed.

Parameters

os	Output stream.
n	Node.

Returns `os`.

14.6.2.9 operator<<() [2/2]

```
template<bool pretty>
std::ostream& delta::operator<< (
    std::ostream & os,
    const NodePrinter< pretty > & np ) [inline]
```

14.6.2.10 reorderChildren()

```
NodeChangeSet delta::reorderChildren (
    const Node & n )
```

Node operator that reorders children of a node.

Parameters

n	Node.

Returns A set of replacements.

```
std::ostream& Minisat::operator<< (
    std::ostream & os,
    Minisat::lbool b ) [inline]
```

14.7.2.16 operator^()

```
Lit Minisat::operator^ (
    Lit p,
    bool b ) [inline]
```

14.7.2.17 operator~()

```
Lit Minisat::operator~ (
    Lit p ) [inline]
```

14.7.2.18 printUsageAndExit()

```
void Minisat::printUsageAndExit (
    int argc,
    char ** argv,
    bool verbose = false )
```

14.7.2.19 remove()

```
template<class V , class T >
static void Minisat::remove (
    V & ts,
    const T & t ) [inline], [static]
```

14.7.2.20 selectionSort() [1/2]

```
template<class T >
static void Minisat::selectionSort (
    T * array,
    int size ) [inline], [static]
```

14.7.2.21 selectionSort() [2/2]

```
template<class T , class LessThan >
void Minisat::selectionSort (
    T * array,
    int size,
    LessThan lt )
```

14.7.2.22 setHelpPrefixStr()

```
void Minisat::setHelpPrefixStr (
    const char * str )
```

14.7.2.23 setUsageHelp()

```
void Minisat::setUsageHelp (
    const char * str )
```

14.7.2.24 sign()

```
bool Minisat::sign (
    Lit p ) [inline]
```

14.7.2.25 sort() [1/4] template<class T >

```
static void Minisat::sort (
            T * array,
            int size )  [inline], [static]
```

14.7.2.26 sort() [2/4] template<class T , class LessThan >

```
void Minisat::sort (
            T * array,
            int size,
            LessThan lt )
```

14.7.2.27 sort() [3/4] template<class T >

```
void Minisat::sort (
            vec< T > & v )
```

14.7.2.28 sort() [4/4] template<class T , class LessThan >

```
void Minisat::sort (
            vec< T > & v,
            LessThan lt )
```

14.7.2.29 toInt() [1/3] int Minisat::toInt (

```
            lbool l )  [inline]
```

14.7.2.30 toInt() [2/3] int Minisat::toInt (

```
            Lit p )  [inline]
```

14.7.2.31 toInt() [3/3] int Minisat::toInt (

```
            Var v )  [inline]
```

14.7.2.32 toLbool() lbool Minisat::toLbool (

```
            int v )  [inline]
```

14.7.2.33 toLit() Lit Minisat::toLit (

```
            int i )  [inline]
```

14.7.2.34 var() int Minisat::var (

```
            Lit p )  [inline]
```

14.7.2.35 xrealloc()

```
static void* Minisat::xrealloc (
    void * ptr,
    size_t size ) [inline], [static]
```

14.7.3 Variable Documentation

14.7.3.1 CONFLICT_CLAUSE

```
const unsigned Minisat::CONFLICT_CLAUSE = 2 [static]
```

14.7.3.2 CRef_Lazy

```
const CRef Minisat::CRef_Lazy = RegionAllocator<uint32_t>::Ref_Undef - 1
```

14.7.3.3 CRef_TPropagation

```
const CRef Minisat::CRef_TPropagation = RegionAllocator<uint32_t>↩
::Ref_Undef - 2
```

14.7.3.4 CRef_Undef

```
const CRef Minisat::CRef_Undef = RegionAllocator<uint32_t>::Ref_Undef
```

14.7.3.5 LEMMA_CLAUSE

```
const unsigned Minisat::LEMMA_CLAUSE = 1 [static]
```

14.7.3.6 lit_Error

```
const Lit Minisat::lit_Error = { -1 }
```

14.7.3.7 lit_Undef

```
const Lit Minisat::lit_Undef = { -2 }
```

14.7.3.8 NORMAL_CLAUSE

```
const unsigned Minisat::NORMAL_CLAUSE = 0 [static]
```

14.7.3.9 nprimes

```
const int Minisat::nprimes = 25 [static]
```

14.7.3.10 PERMANENT_CLAUSE

```
const unsigned Minisat::PERMANENT_CLAUSE = 3 [static]
```

14.7.3.11 primes

```
const int Minisat::primes[nprimes] = { 31, 73, 151, 313, 643, 1291, 2593,
5233, 10501, 21013, 42073, 84181, 168451, 337219, 674701, 1349473, 2699299, 5398891, 10798093,
21596719, 43193641, 86387383, 172775299, 345550609, 691101253 } [static]
```

14.8 smtrat Namespace Reference

Functions for adding the delineation of a property.

Namespaces

- analyzer
- cad
- cadcells

  A framework for sample-based CAD algorithms.

- compile_information

  Compile time generated information about compiler and system version.

- datastructures
- execution
- expression
- groebner
- icp
- impl
- lra
- lve
- maxsmt

  Contains strategy implementations for max SMT computations.

- mcsat
- onecellcad
- options_detail
- parseformula
- parser
- preprocessor
- qe
- resource
- sat
- settings
- statistics
- uf_impl
- unsatcore

  Contains strategy implementations for unsat core computations.

- validation
- vb
- vs

Data Structures

- struct AbstractModuleFactory
- class AnnotatedBVTerm
- class AxiomFactory
- class Backend
- class BackendLink
- class BackendSynchronisation
- struct Backtrackable
- class BEModule
- class Bimap

  Container that stores expensive to construct objects and allows the fast lookup with respect to two independent keys within the objects.

- class BlastedConstr
- class BlastedPoly
- struct BoolUEQRewriter
- struct Branching

  Stores all necessary information of an branch, which can be used to detect probable infinite loop of branchings.

- class BVAnnotation
- class BVDirectEncoder
- class BVModule
- struct by_address_hasher

  Hash an iterator by the pointed-to address.

- class CardinalityEncoder

- struct CMakeOptionPrinter
- class CNFerModule
- class CoCoAGBModule
- struct CollectBoolsInUEQs
- class CollectionWithOrigins
- class ConstrTree
- class CSplitModule
- class CubeLIAModule
- class CurryModule
- struct CycleEnumerator

  This class encapsulates an algorithm for enumerating all cycles.

- class DynamicPriorityQueue
- class dynarray

  dynarray is similar to std::vector, but has only a reduced interface.

- class dynarray_allocator
- class ElementWithOrigins
- class EMModule
- struct EQGraph
- class EQModule
- class EQPreprocessingModule
- class ESModule
- class ExactlyOneCommanderEncoder
- class Executor
- class fixedsize_allocator

  An allocator meant to be used for containers that typically allocate single objects or nodes, such as sets, maps and linked lists.

- class fixedsize_allocator< void >

  I do not know where an allocator for void would be of any use; but in order to mimic std::allocator (where this is explicitly mentioned) as good as possible, we do this for the void case.

- class fixedsize_freelist

  Implements a fixed-(at-compile-time)-size allocator based on a free list embedded in the space of currently unused objects.

- class FormulaWithOrigins

  Stores a formula along with its origins.

- class ForwardHyperGraph

  This class implements a forward hypergraph.

- class FouMoModule

  A module which applies the Fourier-Motzkin algorithm.

- class FPPModule
- class freelist

  Implements a fixed-(at-runtime)-size allocator based on a free list embedded in the space of currently unused objects.

- class GBModule

  A solver module based on Groebner basis.

- class GBModuleState

  A class to save the current state of a GBModule.

- class GBPPModule
- class ICEModule
- class ICPModule
- class IncWidthModule
- class InequalitiesTable

  Datastructure for the GBModule.

- class IntBlastModule
- class IntEqModule

  A module which checks whether the equations contained in the received (linear integer) formula have a solution.

- struct is_sample_outside

- struct is_sample_outside< IsSampleOutsideAlgorithm::DEFAULT >
- struct is_variant

  States whether a given type is a `boost::variant`.

- struct **is_variant< boost::variant< BOOST_VARIANT_ENUM_PARAMS(U)> >**

  States that `boost::variant` is indeed a `boost::variant`.

- struct **is_variant< const boost::variant< BOOST_VARIANT_ENUM_PARAMS(U)> >**

  States that `const boost::variant` is indeed a `boost::variant`.

- struct JunctorMerger
- class LevelWiseInformation
- class LOG
- class LongFormulaEncoder
- class LRAModule

  A module which performs the Simplex method on the linear part of it's received formula.

- class LVEModule
- class Manager

  Base class for solvers.

- class MaxSMT
- class MCBModule
- class MixedSignEncoder
- class Module

  A base class for all kind of theory solving methods.

- struct ModuleFactory
- class ModuleInput

  The input formula a module has to consider for it's satisfiability check.

- class ModuleWrapper
- class MonomialMappingByVariablePool
- class NewCADModule
- class NewCoveringModule
- struct NNFPreparation
- class NNFRewriter
- class NRAILModule
- class Optimization
- struct OrPathShortener

  A rewriter that checks every (X)OR that only contains ANDs and UEQs as children for equalities that hold for every alternative, and adds such equalities explicitly.

- struct pairhash

  Note that this may NOT be a specialization of std::hash for std::pair, this is not allowed by the standard as it does not involve a user-defined type.

- class PBGaussModule
- class PBPPModule
- struct PersistentUnionFind
- class PFEModule
- class PModule
- class PolyTree
- class PolyTreeContent
- class PolyTreePool
- class PriorityQueue
- class PseudoBoolEncoder

  Base class for a PseudoBoolean Encoder.

- class PseudoBoolNormalizer
- class RationalCapsule
- struct ReplaceVariablesRewriter
- class RNSEncoder
- struct SampledDerivationRefCompare
- struct sampling
- struct sampling< SamplingAlgorithm::LOWER_UPPER_BETWEEN_SAMPLING >
- class SATModule

Implements a module performing DPLL style SAT checking.

- class SettingsComponents
- class SettingsParser
- class ShortFormulaEncoder
- class SplitSOSModule
- struct StaticUnionFind
- class StrategyGraph
- class STropModule
- class SymmetryModule
- class Task
- class TheoryVarSchedulerStatic

  Schedules theory variables statically.

- class ThreadPool
- class TotalizerEncoder

  TotalizerEncoder implements the Totalizer encoding as described in "Incremental Cardinality Constraints for MaxSAT" by Martins et al `https://doi.org/10.1007/978-3-319-10428-7_39`.

- class TotalizerTree
- class UFCegarModule
- struct UFRewriter
- class union_find

  Implements a union-find datastructure, a datastructure containing an array of entries.

- struct UnionFindInterface
- class UnionFindModule
- class UnsatCore
- class VariableCapsule
- class VariableRewriteRule
- struct variant_hash_visitor
- class VariantMap

  This class is a specialization of `std::map` *where the keys are of arbitrary type and the values are of type* `boost↩::variant`.

- class VarSchedulerBase

  Base class for variable schedulers.

- class VarSchedulerFixedRandom
- class VarSchedulerMcsatActivityPreferTheory

  Activity-based scheduler preferring initially theory variables.

- class VarSchedulerMcsatBase

  Base class for all MCSAT variable scheduler.

- class VarSchedulerMcsatBooleanFirst

  Variable scheduling that all decides Boolean variables first before deciding any theory variable.

- class VarSchedulerMcsatTheoryFirst

  Variable scheduling that all decides theory variables first before deciding any Boolean variable.

- class VarSchedulerMcsatUnivariateClausesOnly

  Decides only Constraints occuring in clauses that are univariate in the current theory variable while the theory ordering is static.

- class VarSchedulerMcsatUnivariateConstraintsOnly

  Decides only Constraints univariate in the current theory variable while the theory ordering is static.

- class VarSchedulerMinisat

  Minisat's activity-based variable scheduling.

- class VarSchedulerRandom

  Random scheduler.

- class VarSchedulerSMTTheoryGuided

  Scheduler for SMT, implementing theory guided heuristics.

- class VSModule

Typedefs

Enumerations

- enum LemmaLevel { NONE = 0, NORMAL = 1, ADVANCED = 2 }
- enum Answer {
  SAT = 0, UNSAT = 1, UNKNOWN = 2, ABORTED = 3,
  OPTIMAL = 4 }

  An enum with the possible answers a Module can give.

- enum MaxSMTStrategy { MaxSMTStrategy::FU_MALIK_INCREMENTAL, MaxSMTStrategy::MSU3, MaxSMTStrategy::LINEAR_SEARCH }

- enum CoveringStatus { partial = 0, full = 1, unknown = 2, failed = 3 }
- enum SamplingAlgorithm { LOWER_UPPER_BETWEEN_SAMPLING }
- enum IsSampleOutsideAlgorithm { DEFAULT }
- enum TheoryGuidedDecisionHeuristicLevel : unsigned { TheoryGuidedDecisionHeuristicLevel::CONFLICT_FIRST, TheoryGuidedDecisionHeuristicLevel::SATISFIED_FIRST, TheoryGuidedDecisionHeuristicLevel::DISABLED }
- enum UnsatCoreStrategy { UnsatCoreStrategy::ModelExclusion }

Functions

- int handle_basic_options (const SettingsParser &parser)
- const auto & settings_parser ()
- bool parseSMT2File (parser::InstructionHandler &handler, bool queueInstructions, std::istream &input)
- int convert_to_cnf_dimacs (const std::string &, const std::string &)
- int convert_to_cnf_smtlib (const std::string &, const std::string &)
- std::ostream & operator<< (std::ostream &os, CMakeOptionPrinter cmop)
- constexpr CMakeOptionPrinter CMakeOptions (bool advanced=false) noexcept
- template<typename Executor >
  bool parseInput (const std::string &pathToInputFile, Executor &e, bool &queueInstructions)
- template<typename Executor >
  int executeFile (const std::string &pathToInputFile, Executor &e)

  Parse the file and save it in formula.
- int analyze_file (const std::string &)
- template<typename Strategy >
  int run_dimacs_file (Strategy &, const std::string &)
- template<typename Strategy >
  int run_opb_file (Strategy &, const std::string &)
- FormulaT parse_smtlib (const std::string &)
- FormulaT parse_formula (const std::string &filename)

  Loads the smt2 file specified in filename and returns the formula.
- int preprocess_file (const std::string &filename, const std::string &outfile)

  Loads the smt2 file specified in filename and runs the preprocessing strategy.
- const auto & settings_analyzer ()
- analyzer::AnalyzerStatistics & analyze_formula (const FormulaT &f)
- template<typename TT , typename C >
  std::ostream & operator<< (std::ostream &os, const PriorityQueue< TT, C > &pq)
- const settings::Settings & Settings ()
- const auto & settings_core ()
- const auto & settings_solver ()
- const auto & settings_module ()
- template<typename T >
  auto & statistics_get (const std::string &name)
- const auto & settings_statistics ()
- bool is_sat (Answer a)
- std::ostream & operator<< (std::ostream &os, Answer a)
- auto & validation_get (const std::string &channel, const std::string &name)
- const auto & settings_validation ()
- void visiting (const Expression &expr)
- void testExpression ()
- std::ostream & operator<< (std::ostream &os, MaxSMTStrategy ucs)
- template<std::size_t N, class RandomAccessIterator , class Comparator >
  static void select_best (typename std::iterator_traits< RandomAccessIterator >::value_type *result, RandomAccessIterator begin, RandomAccessIterator end, Comparator &&compare)
- static void hash_combine (std::size_t &seed, std::size_t hash_value) noexcept
- carl::Sign sign_of (carl::Relation rel, bool invert)
- std::ostream & operator<< (std::ostream &os, const CoveringStatus &status)
- template<typename Settings >
  std::ostream & operator<< (std::ostream &os, const LevelWiseInformation< Settings > &levelWise↩Information)
- std::string get_name (SamplingAlgorithm samplingAlgorithm)
- std::string get_name (IsSampleOutsideAlgorithm samplingAlgorithm)

- FormulaT createZeroOne (carl::Variable xVariable, carl::Variable yVariable, carl::Variable zVariable)
- FormulaT createZeroTwo (carl::Variable xVariable, carl::Variable yVariable, carl::Variable zVariable)
- FormulaT createZeroThree (carl::Variable xVariable, carl::Variable yVariable, carl::Variable zVariable)
- FormulasT createZero (smtrat::VariableCapsule variableCapsule)
- FormulaT createTangentPlaneNEQOne (carl::Variable xVariable, carl::Variable yVariable, carl::Variable z↩ Variable, Rational aRational)
- FormulaT createTangentPlaneNEQTwo (carl::Variable xVariable, carl::Variable yVariable, carl::Variable z↩ Variable, Rational bRational)
- FormulaT createTangentPlaneNEQThree (carl::Variable xVariable, carl::Variable yVariable, carl::Variable z↩ Variable, Rational aRational, Rational bRational)
- FormulaT createTangentPlaneNEQFour (carl::Variable xVariable, carl::Variable yVariable, carl::Variable z↩ Variable, Rational aRational, Rational bRational)
- FormulasT createTangentPlaneNEQ (VariableCapsule variableCapsule, RationalCapsule rationalCapsule)
- FormulaT createTangentPlaneEQOne (carl::Variable xVariable, carl::Variable yVariable, carl::Variable z↩ Variable, Rational aRational)
- FormulaT createTangentPlaneEQTwo (carl::Variable xVariable, carl::Variable yVariable, carl::Variable z↩ Variable, Rational aRational)
- FormulasT createTangentPlaneEQ (VariableCapsule variableCapsule, RationalCapsule rationalCapsule)
- const smtrat::VariableCapsule extractVariables (MonomialMapIterator monomialIterator)
- Model createAbsoluteValuedModel (Model linearizedModel)
- carl::Variable createAuxiliaryVariable (carl::Variable variable)

  create an auxiliary variable e.g.

- FormulaT generateAbsFormula (carl::Variable variable, carl::Variable aux_variable)

  | x1 | = (and (=> (x1 >= 0) (y1 = x1)) (=> (x1 < 0) (y1 = -x1)))

- FormulaT generateAbsFormula (carl::Variable variableLeft, carl::Variable variableRight, carl::Relation relation)

  | x1 | <= | x1 | = (and (=> (x1 >= 0) (y1 = x1)) (=> (x1 < 0) (y1 = -x1)) (=> (x2 >= 0) (y2 = x2)) (=> (x2 < 0) (y2 = -x2)) (y1 <= y2))

- FormulaT createEquivalentToOriginalMonotonicityOne (smtrat::VariableCapsule variableCapsule, smtrat::VariableCapsule variableCapsuleInner)
- FormulaT createEquivalentToOriginalMonotonicityTwo (smtrat::VariableCapsule variableCapsule, smtrat::VariableCapsule variableCapsuleInner)
- FormulaT createEquivalentToOriginalMonotonicityThree (smtrat::VariableCapsule variableCapsule, smtrat::VariableCapsule variableCapsuleInner)
- RationalCapsule extractRationalCapsule (VariableCapsule variableCapsule, Model linearizedModel)
- FormulaT createOriginalMonotonicityOne (smtrat::VariableCapsule variableCapsule, smtrat::VariableCapsule variableCapsuleInner)
- FormulaT createOriginalMonotonicityTwo (smtrat::VariableCapsule variableCapsule, smtrat::VariableCapsule variableCapsuleInner)
- FormulaT createOriginalMonotonicityThree (smtrat::VariableCapsule variableCapsule, smtrat::VariableCapsule variableCapsuleInner)
- FormulasT createMonotonicity (VariableCapsule variableCapsuleOuter, VariableCapsule variableCapsule↩ Inner, Model absoluteValuedModel)
- FormulaT createCongruence (smtrat::VariableCapsule variableCapsuleOuter, smtrat::VariableCapsule variableCapsuleInner)
- FormulaT createICPGreaterOne (VariableCapsule variableCapsule, RationalCapsule rationalCapsule)
- FormulaT createICPGreaterTwo (VariableCapsule variableCapsule, RationalCapsule rationalCapsule)
- FormulasT createICPGreater (VariableCapsule variableCapsule, RationalCapsule rationalCapsule)
- FormulaT createICPLess (VariableCapsule variableCapsule, RationalCapsule rationalCapsule)
- bool abEqualcCheck (VariableCapsule variableCapsuleOuter, Model linearizedModel)
- bool abGreatercCheck (RationalCapsule rationalCapsule)
- bool abLesscCheck (RationalCapsule rationalCapsule)
- RationalCapsule generateAbcPrimeForICP (RationalCapsule rationalCapsule, bool isGreater)
- bool isAnyRationalIsZero (RationalCapsule rationalCapsule)
- ModuleInput * originalFormula (new ModuleInput())
- carl::Variable createZVariable ()

  create variables and each time increment the suffix e.g., z_0, z_1, etc.

- carl::Monomial::Arg createSquareOfVariable (carl::Variable Variable)

  create a square of the variable

- void insertIntoMap (carl::Variable GeneratedVariable, carl::Monomial::Arg monomial)

  Insert the variable as key with monomial as value into the map The map is singeltone.
- int divisionOfExponentByTwo (int exponent)
- carl::Variable insertIntoMapOrRetrieveExistingVariable (carl::Monomial::Arg monomial)

  Check if the monomial is alreday inserted imto the map, If yes, returned the key which is a variable otherwise create new variable and insert the monomial into the map against this new variable.
- carl::Monomial::Arg abstractUnivariateMonomialForEvenExponent (carl::Variable Variable, int exponent)

  Replace square of variable (x_0^2) of a monomial (x_0^6) by a variable (z_0), create a new monomial (z_0^3) and insert this variable as key with monomial (x_0^2) as value in the map.
- carl::Variable abstractProductRecursively (std::list< carl::Variable > variables)

  It creates monomial by taking and popping first two items from the list, Insert this new monomial as value into the map against a newly generated variable, Each time the newly generated variable is insterted at the front of the list.
- carl::Monomial::Arg abstractUnivariateMonomialForOddExponent (carl::Variable Variable, int exponent)

  Replace square of variable (x_0^2) of a monomial (x_0^7) by a variable (z_0), create a linear monomial (z_1) and insert the variable as key with monomial as value in the map.
- carl::Monomial::Arg abstractUnivariateMonomial (carl::Variable Variable, int exponent)

  create monomial which is linear
- carl::Variable abstractMonomial (carl::Monomial::Arg monomial)

  It linearizes a non-linear monomial.
- FormulaT linearization (FormulaT formula)
- Answer toAnswer (int value)
- Answer isNRASatisfied (Model estimatedModel)

  Chekcs if the estimated Assignment satisfies the input NRA formula.
- Model createEstimatedAssignment (Model linearizedModel)

  Creates the estimated model.
- Model extendLinearizedModel (Model mModel, Model estimatedModel)

  create a model combining mModel, estimatedModel and rest of the variables are guessed.
- int rand (int min, int max)
- FormulasT unsatisfiedFormulas (AxiomFactory::AxiomType axiomType, FormulasT formulas, Model model, UNSATFormulaSelectionStrategy formulaSelectionStrategy)
- FormulasT refinement (AxiomFactory::AxiomType axiomType, Model linearizedModel, UNSATFormula↩ SelectionStrategy formulaSelectionStrategy)
- Rational factorial (Rational n)
- Rational factorial (std::size_t)
- std::string flatten_name (const carl::UTerm &term)
- std::string flatten_name_impl (const carl::UVariable &var)
- std::string flatten_name_impl (const carl::UFInstance &ufi)
- template<typename Instances >
  bool flattened_function_calls (const Instances &instances) noexcept
- std::ostream & operator<< (std::ostream &os, Module::LemmaType lt)
- template<typename AnnotationType >
  void annotateFormula (const FormulaT &, const std::vector< AnnotationType > &)
- std::ostream & operator<< (std::ostream &os, const ModuleInput &mi)
- bool isCondition (carl::Condition _condition)
- template<typename Module >
  std::ostream & operator<< (std::ostream &os, const ModuleFactory< Module > &mf)
- std::ostream & operator<< (std::ostream &os, UnsatCoreStrategy ucs)

Variables

14.8.1 Detailed Description Functions for adding the delineation of a property.

File: VSModule.cpp.

Class to create a substitution object.

Class to create a state object.

Class to create a condition object.

Class to create the formulas for axioms.

Implements a specialization of std::hash for any boost::variant.

Heuristics for computing representations.

Implementation of derivation rules.

Contains all properties that are stored in a derivation.

Projection operators.

The delineation of a property is a set of indexed root expressions representing the critical points of the property.

E.g. for sign invariance of a polynomial, it is the set of roots of the polynomial.

Currently, only the McCallum based operator is implemented.

14.8.1.1 Relevant projection functions We refer to algorithms for usage examples.

14.8.1.1.1 Cells

- project_cell_properties
- project_basic_properties
- delineate_properties
- project_delineated_cell_properties

14.8.1.1.2 Coverings

- project_cell_properties (on each cell individually)
- project_basic_properties (on each cell individually)
- delineate_properties (on each cell individually)
- project_covering_properties

14.8.1.1.3 Delineaton

- project_basic_properties
- delineate_properties
- project_delineation_properties

Note that not all properties have a representation here as not all of them are stored but resolved directly in the derivation rules.

Each rule is realized by a function which works on a derivation object. The parameters of the respective properties are passed as function parameter. The function realizing a derivation rule might either call other derivation rules or add properties to the given derivation.

This only works if the types of the variant are std::hash-enabled (have a std::hash specialization of their own).

14.8.2 Typedef Documentation

14.8.2.1 BacktrackableClasses

```
using smtrat::BacktrackableClasses = typedef EQClasses< Backtrackable<
PersistentUnionFind > >
```

14.8.2.2 Classes

```
using smtrat::Classes = typedef BacktrackableClasses
```

14.8.2.3 Conditionals

```
typedef std::vector< std::atomic_bool * > smtrat::Conditionals
```

A vector of atomic bool pointers.

14.8.2.4 ConditionEvaluation

```
typedef bool(* smtrat::ConditionEvaluation) (carl::Condition)
```

14.8.2.5 ConditionFunction

```
typedef std::function<bool(carl::Condition)> smtrat::ConditionFunction
```

14.8.2.6 ConstraintsT

```
using smtrat::ConstraintsT = typedef carl::Constraints<Poly>
```

14.8.2.7 ConstraintT

```
using smtrat::ConstraintT = typedef carl::Constraint<Poly>
```

14.8.2.8 ContractionCandidates

```
typedef std::set<icp::ContractionCandidate*, icp::contractionCandidateComp>
smtrat::ContractionCandidates
```

14.8.2.9 DoubleInterval

```

14.8.4 Function Documentation

14.8.4.1 abEqualcCheck()

```
bool smtrat::abEqualcCheck (
    VariableCapsule variableCapsuleOuter,
    Model linearizedModel )
```

14.8.4.2 abGreatercCheck()

```
bool smtrat::abGreatercCheck (
    RationalCapsule rationalCapsule )
```

14.8.4.3 abLesscCheck()

```
bool smtrat::abLesscCheck (
    RationalCapsule rationalCapsule )
```

14.8.4.4 abstractMonomial()

```
carl::Variable smtrat::abstractMonomial (
    carl::Monomial::Arg monomial )
```

It linearizes a non-linear monomial.

Parameters

monomial	a monomoal object

Returns a linear variable

14.8.4.5 abstractProductRecursively()

```
carl::Variable smtrat::abstractProductRecursively (
    std::list< carl::Variable > variables )
```

It creates monomial by taking and popping first two items from the list, Insert this new monomial as value into the map against a newly generated variable, Each time the newly generated variable is insterted at the front of the list.

Parameters

variables	List of carl variables

Returns created new linear variable

14.8.4.6 abstractUnivariateMonomial()

```
carl::Monomial::Arg smtrat::abstractUnivariateMonomial (
    carl::Variable Variable,
    int exponent )
```

create monomial which is linear

Parameters

Variable	a carl Variable object
exponent	even or odd exponent of the variable

Returns a linear monomial

14.8.4.7 abstractUnivariateMonomialForEvenExponent()

```
carl::Monomial::Arg smtrat::abstract↩
UnivariateMonomialForEvenExponent (
    carl::Variable Variable,
    int exponent )
```

Replace square of variable (x_0^2) of a monomial (x_0^6) by a variable (z_0), create a new monomial (z_0^3) and insert this variable as key with monomial (x_0^2) as value in the map.

Parameters

Variable	a carl::Variable object
exponent	an even exponent

Returns new monomial

14.8.4.8 abstractUnivariateMonomialForOddExponent()

```
carl::Monomial::Arg smtrat::abstract↩
UnivariateMonomialForOddExponent (
    carl::Variable Variable,
    int exponent )
```

Replace square of variable (x_0^2) of a monomial (x_0^7) by a variable (z_0), create a linear monomial (z_1) and insert the variable as key with monomial as value in the map.

Parameters

Variable	a carl::Variable object
exponent	an odd exponent

Returns new linear monomial

14.8.4.9 analyze_file()

```
int smtrat::analyze_file (
    const std::string & )
```

14.8.4.10 analyze_formula()

```
analyzer::AnalyzerStatistics & smtrat::analyze_formula (
    const FormulaT & f )
```

14.8.4.11 annotateFormula()

```
template<typename AnnotationType >
void smtrat::annotateFormula (
    const FormulaT & ,
    const std::vector< AnnotationType > & )
```

14.8.4.12 CMakeOptions()

```
constexpr CMakeOptionPrinter smtrat::CMakeOptions (
    bool advanced = false ) [constexpr], [noexcept]
```

14.8.4.13 convert_to_cnf_dimacs()

```
int smtrat::convert_to_cnf_dimacs (
    const std::string & ,
    const std::string & )
```

14.8.4.14 convert_to_cnf_smtlib()

```
int smtrat::convert_to_cnf_smtlib (
    const std::string & ,
    const std::string & )
```

14.8.4.15 createAbsoluteValuedModel()

```
Model smtrat::createAbsoluteValuedModel (
    Model linearizedModel )
```

14.8.4.16 createAuxiliaryVariable()

```
carl::Variable smtrat::createAuxiliaryVariable (
    carl::Variable variable )
```

create an auxiliary variable e.g.

aux_<Variable Name>

Parameters

variable	the variable for which auxiliary variable to be created

Returns created auxiliary variable

14.8.4.17 createCongruence()

```
FormulaT smtrat::createCongruence (
    smtrat::VariableCapsule variableCapsuleOuter,
    smtrat::VariableCapsule variableCapsuleInner )
```

14.8.4.18 createEquivalentToOriginalMonotonicityOne()

```
FormulaT smtrat::createEquivalentTo↩
OriginalMonotonicityOne (
    smtrat::VariableCapsule variableCapsule,
    smtrat::VariableCapsule variableCapsuleInner )
```

14.8.4.19 createEquivalentToOriginalMonotonicityThree()

```
FormulaT smtrat::createEquivalentTo↩
OriginalMonotonicityThree (
    smtrat::VariableCapsule variableCapsule,
    smtrat::VariableCapsule variableCapsuleInner )
```

14.8.4.20 createEquivalentToOriginalMonotonicityTwo()

```
FormulaT smtrat::createEquivalentTo↩
OriginalMonotonicityTwo (
    smtrat::VariableCapsule variableCapsule,
    smtrat::VariableCapsule variableCapsuleInner )
```

14.8.4.21 createEstimatedAssignment()

```
Model smtrat::createEstimatedAssignment (
    Model linearizedModel )
```

Creates the estimated model.

estimated model takes the solution from mModel or randomly chosen.

Parameters

linearizedModel	Model of linearized formula.

14.8.4.22 createICPGreater()

```
FormulasT smtrat::createICPGreater (
    VariableCapsule variableCapsule,
    RationalCapsule rationalCapsule )
```

14.8.4.23 createICPGreaterOne()

```
FormulaT smtrat::createICPGreaterOne (
    VariableCapsule variableCapsule,
    RationalCapsule rationalCapsule )
```

14.8.4.24 createICPGreaterTwo()

```
FormulaT smtrat::createICPGreaterTwo (
    VariableCapsule variableCapsule,
    RationalCapsule rationalCapsule )
```

14.8.4.25 createICPLess()

```
FormulaT smtrat::createICPLess (
    VariableCapsule variableCapsule,
    RationalCapsule rationalCapsule )
```

14.8.4.26 createMonotonicity()

```
FormulasT smtrat::createMonotonicity (
    VariableCapsule variableCapsuleOuter,
    VariableCapsule variableCapsuleInner,
    Model absoluteValuedModel )
```

14.8.4.27 createOriginalMonotonicityOne()

```
FormulaT smtrat::createOriginalMonotonicityOne (
    smtrat::VariableCapsule variableCapsule,
    smtrat::VariableCapsule variableCapsuleInner )
```

14.8.4.28 createOriginalMonotonicityThree()

```
FormulaT smtrat::createOriginalMonotonicityThree (
    smtrat::VariableCapsule variableCapsule,
    smtrat::VariableCapsule variableCapsuleInner )
```

14.8.4.29 createOriginalMonotonicityTwo()

```
FormulaT smtrat::createOriginalMonotonicityTwo (
    smtrat::VariableCapsule variableCapsule,
    smtrat::VariableCapsule variableCapsuleInner )
```

14.8.4.30 createSquareOfVariable()

```
carl::Monomial::Arg smtrat::createSquareOfVariable (
    carl::Variable Variable )
```

create a square of the variable

Parameters

Variable	a carl Variable object e.g., x_0

Returns a monomial object e.g., x_0^2

14.8.4.31 createTangentPlaneEQ()

```
FormulasT smtrat::createTangentPlaneEQ (
    VariableCapsule variableCapsule,
    RationalCapsule rationalCapsule )
```

14.8.4.32 createTangentPlaneEQOne()

```
FormulaT smtrat::createTangentPlaneEQOne (
    carl::Variable xVariable,
    carl::Variable yVariable,
    carl::Variable zVariable,
    Rational aRational )
```

14.8.4.33 createTangentPlaneEQTwo()

```
FormulaT smtrat::createTangentPlaneEQTwo (
    carl::Variable xVariable,
    carl::Variable yVariable,
    carl::Variable zVariable,
    Rational aRational )
```

14.8.4.34 createTangentPlaneNEQ()

```
FormulasT smtrat::createTangentPlaneNEQ (
    VariableCapsule variableCapsule,
    RationalCapsule rationalCapsule )
```

14.8.4.35 createTangentPlaneNEQFour()

```
FormulaT smtrat::createTangentPlaneNEQFour (
    carl::Variable xVariable,
    carl::Variable yVariable,
    carl::Variable zVariable,
    Rational aRational,
    Rational bRational )
```

14.8.4.36 createTangentPlaneNEQOne()

```
FormulaT smtrat::createTangentPlaneNEQOne (
    carl::Variable xVariable,
    carl::Variable yVariable,
    carl::Variable zVariable,
    Rational aRational )
```

14.8.4.37 createTangentPlaneNEQThree()

```
FormulaT smtrat::createTangentPlaneNEQThree (
    carl::Variable xVariable,
    carl::Variable yVariable,
    carl::Variable zVariable,
    Rational aRational,
    Rational bRational )
```

14.8.4.38 createTangentPlaneNEQTwo()

```
FormulaT smtrat::createTangentPlaneNEQTwo (
    carl::Variable xVariable,
    carl::Variable yVariable,
    carl::Variable zVariable,
    Rational bRational )
```

14.8.4.39 createZero()

```
FormulasT smtrat::createZero (
    smtrat::VariableCapsule variableCapsule )
```

14.8.4.40 createZeroOne()

```
FormulaT smtrat::createZeroOne (
    carl::Variable xVariable,
    carl::Variable yVariable,
    carl::Variable zVariable )
```

14.8.4.41 createZeroThree()

```
FormulaT smtrat::createZeroThree (
    carl::Variable xVariable,
    carl::Variable yVariable,
    carl::Variable zVariable )
```

14.8.4.42 createZeroTwo()

```
FormulaT smtrat::createZeroTwo (
    carl::Variable xVariable,
    carl::Variable yVariable,
    carl::Variable zVariable )
```

14.8.4.43 createZVariable()

```
carl::Variable smtrat::createZVariable ( )
```

create variables and each time increment the suffix e.g., z_0, z_1, etc.

Returns a carl Variable object

14.8.4.44 divisionOfExponentByTwo()

```
int smtrat::divisionOfExponentByTwo (
    int exponent )
```

14.8.4.45 executeFile()

```
template<typename Executor >
int smtrat::executeFile (
    const std::string & pathToInputFile,
    Executor & e )
```

Parse the file and save it in formula.

Parameters

pathToInputFile	The path to the input smt2 file.
formula	A pointer to the formula object which holds the parsed input afterwards.
options	Save options from the smt2 file here.

14.8.4.46 extendLinearizedModel()

```
Model smtrat::extendLinearizedModel (
    Model mModel,
    Model estimatedModel )
```

create a model combining mModel, estimatedModel and rest of the variables are guessed.

This model checks the satifiability of the axioms.

Parameters

mModel	Model of linearized formula.
estimatedModel	the estimated model for original formula.

Returns the Abstract Model

14.8.4.47 extractRationalCapsule()

```
RationalCapsule smtrat::extractRationalCapsule (
    VariableCapsule variableCapsule,
    Model linearizedModel )
```

14.8.4.48 extractVariables()

```
const smtrat::VariableCapsule smtrat::extractVariables (
    MonomialMapIterator monomialIterator )
```

14.8.4.49 factorial() [1/2]

```
Rational smtrat::factorial (
    Rational n )
```

14.8.4.50 factorial() [2/2]

```
Rational smtrat::factorial (
    std::size_t n )
```

14.8.4.51 flatten_name()

```
std::string smtrat::flatten_name (
    const carl::UTerm & term )
```

14.8.4.52 flatten_name_impl() [1/2]

```
std::string smtrat::flatten_name_impl (
    const carl::UFInstance & ufi )
```

14.8.4.53 flatten_name_impl() [2/2]

```
std::string smtrat::flatten_name_impl (
    const carl::UVariable & var )
```

14.8.4.54 flattened_function_calls()

```
template<typename Instances >
bool smtrat::flattened_function_calls (
            const Instances & instances )  [noexcept]
```

14.8.4.55 generateAbcPrimeForICP()

```
RationalCapsule smtrat::generateAbcPrimeForICP (
            RationalCapsule rationalCapsule,
            bool isGreater )
```

14.8.4.56 generateAbsFormula() [1/2]

```
FormulaT smtrat::generateAbsFormula (
            carl::Variable variable,
            carl::Variable aux_variable )
```

| x1 | = (and (=> (x1 >= 0) (y1 = x1)) (=> (x1 < 0) (y1 = -x1)))

Parameters

variable	

Returns

14.8.4.57 generateAbsFormula() [2/2]

```
FormulaT smtrat::generateAbsFormula (
    carl::Variable variableLeft,
    carl::Variable variableRight,
    carl::Relation relation )
```

| x1 | <= | x1 | = (and (=> (x1 >= 0) (y1 = x1)) (=> (x1 < 0) (y1 = -x1)) (=> (x2 >= 0) (y2 = x2)) (=> (x2 < 0) (y2 = -x2)) (y1 <= y2))

Parameters

variableLeft	
variableRight	
relation	

Returns

14.8.4.58 get_name() [1/2]

```
std::string smtrat::get_name (
    IsSampleOutsideAlgorithm samplingAlgorithm ) [inline]
```

14.8.4.59 get_name() [2/2]

```
std::string smtrat::get_name (
    SamplingAlgorithm samplingAlgorithm ) [inline]
```

14.8.4.60 handle_basic_options()

```
int smtrat::handle_basic_options (
    const SettingsParser & parser )
```

14.8.4.61 hash_combine()

```
static void smtrat::hash_combine (
    std::size_t & seed,
    std::size_t hash_value ) [inline], [static], [noexcept]
```

14.8.4.62 insertIntoMap()

```
void smtrat::insertIntoMap (
    carl::Variable GeneratedVariable,
    carl::Monomial::Arg monomial )
```

Insert the variable as key with monomial as value into the map The map is singeltone.

Parameters

GeneratedVariable	
monomial	

14.8.4.63 insertIntoMapOrRetrieveExistingVariable()

```
carl::Variable smtrat::insertIntoMapOr↩
RetrieveExistingVariable (
            carl::Monomial::Arg monomial )
```

Check if the monomial is alreday inserted imto the map, If yes, returned the key which is a variable otherwise create new variable and insert the monomial into the map against this new variable.

Parameters

monomial	a monomoal object

Returns a carl::Variable object

14.8.4.64 is_sat()

```
bool smtrat::is_sat (
            Answer a )  [inline]
```

14.8.4.65 isAnyRationalIsZero()

```
bool smtrat::isAnyRationalIsZero (
            RationalCapsule rationalCapsule )
```

14.8.4.66 isCondition()

```
bool smtrat::isCondition (
            carl::Condition _condition )
```

14.8.4.67 isNRASatisfied()

```
Answer smtrat::isNRASatisfied (
            Model estimatedModel )
```

Chekcs if the estimated Assignment satisfies the input NRA formula.

Parameters

estimatedModel	The estimated model.

14.8.4.68 linearization()

```
FormulaT smtrat::linearization (
            FormulaT formula )
```

14.8.4.69 operator<<() [1/10]

```
std::ostream& smtrat::operator<< (
    std::ostream & os,
    Answer a ) [inline]
```

14.8.4.70 operator<<() [2/10]

```
std::ostream & smtrat::operator<< (
    std::ostream & os,
    CMakeOptionPrinter cmop )
```

14.8.4.71 operator<<() [3/10]

```
std::ostream& smtrat::operator<< (
    std::ostream & os,
    const CoveringStatus & status ) [inline]
```

14.8.4.72 operator<<() [4/10]

```
template<typename Settings >
std::ostream& smtrat::operator<< (
    std::ostream & os,
    const LevelWiseInformation< Settings > & levelWiseInformation ) [inline]
```

14.8.4.73 operator<<() [5/10]

```
template<typename Module >
std::ostream& smtrat::operator<< (
    std::ostream & os,
    const ModuleFactory< Module > & mf ) [inline]
```

14.8.4.74 operator<<() [6/10]

```
std::ostream& smtrat::operator<< (
    std::ostream & os,
    const ModuleInput & mi ) [inline]
```

14.8.4.75 operator<<() [7/10]

```
template<typename TT , typename C >
std::ostream& smtrat::operator<< (
    std::ostream & os,
    const PriorityQueue< TT, C > & pq )
```

14.8.4.76 operator<<() [8/10]

```
std::ostream& smtrat::operator<< (
    std::ostream & os,
    MaxSMTStrategy ucs ) [inline]
```

14.8.4.77 operator<<() [9/10]

```
std::ostream& smtrat::operator<< (
    std::ostream & os,
    Module::LemmaType lt ) [inline]
```

14.8.4.78 operator<<() [10/10]

```
std::ostream& smtrat::operator<< (
    std::ostream & os,
    UnsatCoreStrategy ucs ) [inline]
```

14.8.4.79 originalFormula()

```
ModuleInput* smtrat::originalFormula (
    new ModuleInput() )
```

14.8.4.80 parse_formula()

```
FormulaT smtrat::parse_formula (
    const std::string & filename )
```

Loads the smt2 file specified in filename and returns the formula.

This function ignores most SMT-LIB commands but simply accumulated all asserted formulas.

14.8.4.81 parse_smtlib()

```
FormulaT smtrat::parse_smtlib (
    const std::string & )
```

14.8.4.82 parseInput()

```
template<typename Executor >
bool smtrat::parseInput (
    const std::string & pathToInputFile,
    Executor & e,
    bool & queueInstructions )
```

14.8.4.83 parseSMT2File()

```
bool smtrat::parseSMT2File (
    parser::InstructionHandler & handler,
    bool queueInstructions,
    std::istream & input )
```

14.8.4.84 preprocess_file()

```
int smtrat::preprocess_file (
    const std::string & filename,
    const std::string & outfile )
```

Loads the smt2 file specified in filename and runs the preprocessing strategy.

The resulting (simplified) problem is written to outfile (or stdout if outfile is empty).

14.8.4.85 rand()

```
int smtrat::rand (
    int min,
    int max )
```

14.8.4.86 refinement()

```
FormulasT smtrat::refinement (
    AxiomFactory::AxiomType axiomType,
    Model linearizedModel,
    UNSATFormulaSelectionStrategy formulaSelectionStrategy )
```

14.8.4.87 run_dimacs_file()

```
template<typename Strategy >
int smtrat::run_dimacs_file (
            Strategy & ,
            const std::string &  )
```

14.8.4.88 run_opb_file()

```
template<typename Strategy >
int smtrat::run_opb_file (
            Strategy & ,
            const std::string &  )
```

14.8.4.89 select_best()

```
template<std::size_t N, class RandomAccessIterator , class Comparator >
static void smtrat::select_best (
            typename std::iterator_traits< RandomAccessIterator >::value_type * result,
            RandomAccessIterator begin,
            RandomAccessIterator end,
            Comparator && compare )  [static]
```

14.8.4.90 Settings()

- mccallum_partial

  Contains the implementation of an optimized version McCallums projection operator.

Data Structures

- struct Reducta

  Construct the set of reducta of the given polynomial.

Functions

- bool canBeRemoved (const UPoly &p)

  Checks whether a polynomial can safely be ignored.
- bool canBeForwarded (std::size_t, const UPoly &p)

  Checks whether a polynomial can safely be forwarded to the next level.
- template<typename Poly >
  bool doesNotVanish (const Poly &p)

  Tries to determine whether the given Poly vanishes for some assignment.
- template<typename Poly >
  Poly normalize (const Poly &p)

  Normalizes the given Poly by removing constant and duplicate factors.
- template<typename Poly >
  Poly resultant (carl::Variable variable, const Poly &p, const Poly &q)

  Computes the resultant of two polynomials.
- template<typename Poly >
  Poly discriminant (carl::Variable variable, const Poly &p)

  Computes the discriminant of a polynomial.
- template<typename Poly >
  std::vector< Poly > PSC (const Poly &p, const Poly &q)

  Computes the Principal Subresultant Coefficients of two polynomials.
- template<typename Poly , typename Callback >
  void returnPoly (const Poly &p, Callback &&cb)

14.15.1 Function Documentation

14.15.1.1 canBeForwarded()

```
bool smtrat::cad::projection::canBeForwarded (
    std::size_t ,
    const UPoly & p )  [inline]
```

Checks whether a polynomial can safely be forwarded to the next level.

14.15.1.2 canBeRemoved()

```
bool smtrat::cad::projection::canBeRemoved (
    const UPoly & p )  [inline]
```

Checks whether a polynomial can safely be ignored.

14.15.1.3 discriminant()

```
template<typename Poly >
Poly smtrat::cad::projection::discriminant (
    carl::Variable variable,
    const Poly & p )
```

Computes the discriminant of a polynomial.

The polynomial is assumed to be univariate and thus knows is main variable. The given variable instead indicates the main variable of the resulting polynomial.

Parameters

variable	Main variable of the resulting polynomial.
p	Input polynomial.

Returns Discriminant of p in main variable variable.

14.15.1.4 doesNotVanish()

```
template<typename Poly >
bool smtrat::cad::projection::doesNotVanish (
            const Poly & p )
```

Tries to determine whether the given Poly vanishes for some assignment.

Returns true if the Poly is guaranteed not to vanish. Returns false otherwise.

14.15.1.5 normalize()

```
template<typename Poly >
Poly smtrat::cad::projection::normalize (
            const Poly & p )
```

Normalizes the given Poly by removing constant and duplicate factors.

14.15.1.6 PSC()

```
template<typename Poly >
std::vector<Poly> smtrat::cad::projection::PSC (
            const Poly & p,
            const Poly & q )
```

Computes the Principal Subresultant Coefficients of two polynomials.

14.15.1.7 resultant()

```
template<typename Poly >
Poly smtrat::cad::projection::resultant (
            carl::Variable variable,
            const Poly & p,
            const Poly & q )
```

Computes the resultant of two polynomials.

The polynomials are assumed to be univariate polynomials and thus know their respective main variables. The given variable instead indicates the main variable of the resulting polynomial.

Parameters

variable	Main variable of the resulting polynomial.
p	First input polynomial.
q	Second input polynomial.

Returns Resultant of p and q in main variable variable.

14.15.1.8 returnPoly()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::returnPoly (
            const Poly & p,
            Callback && cb )
```

14.16 smtrat::cad::projection::brown Namespace Reference

Contains the implementation of Browns projection operator as specified in [**?**] after Theorem 3.1.

Functions

- template<typename Poly , typename Callback >
  void single (const Poly &p, carl::Variable variable, Callback &&cb)

  *Implements the part of Browns projection operator from [**?**] that deals with a single polynomial* $p \hookleftarrow$ *:* $\{leading_c oeff(p), discriminant(p)\}$.

- template<typename Poly , typename Callback >
  void paired (const Poly &p, const UPoly &q, carl::Variable variable, Callback &&cb)

  *Implements the part of Browns projection operator from [**?**] that deals with two polynomials* p *and* q *which is just the respective part of McCallums projection operator mccallum::paired.*

14.16.1 Detailed Description

Contains the implementation of Browns projection operator as specified in [**?**] after Theorem 3.1.

14.16.2 Function Documentation

14.16.2.1 paired()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::brown::paired (
            const Poly & p,
            const UPoly & q,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of Browns projection operator from [**?**] that deals with two polynomials p and q which is just the respective part of McCallums projection operator mccallum::paired.

14.16.2.2 single()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::brown::single (
            const Poly & p,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of Browns projection operator from [**?**] that deals with a single polynomial $p \hookleftarrow$: $\{leading_c oeff(p), discriminant(p)\}$.

14.17 smtrat::cad::projection::collins Namespace Reference

Contains the implementation of Collins projection operator as specified in [**?**] below Theorem 4.

Functions

- template<typename Poly , typename Callback >
  void single (const Poly &p, carl::Variable variable, Callback &&cb)

  *Implements the part of Collins projection operator from [**?**] that deals with a single polynomial* $p \hookleftarrow$ *:* $\bigcup_{B \in RED(p)} \{ldcf(B)\} \cup PSC(B, B')$.

- template<typename Poly , typename Callback >
  void paired (const Poly &p, const UPoly &q, carl::Variable variable, Callback &&cb)

  *Implements the part of Collins projection operator from [**?**] that deals with two polynomials* p *and* $q \hookleftarrow$ *:* $\bigcup_{B_1 \in RED(p), B_2 \in RED(q)} PSC(B_1, B_2)$.

14.17.1 Detailed Description Contains the implementation of Collins projection operator as specified in [**?**] below Theorem 4.

14.17.2 Function Documentation

14.17.2.1 paired() `template<typename Poly , typename Callback >`

```
void smtrat::cad::projection::collins::paired (
            const Poly & p,
            const UPoly & q,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of Collins projection operator from [**?**] that deals with two polynomials p and q↩ : $\bigcup_{B_1 \in RED(p), B_2 \in RED(q)} PSC(B_1, B_2)$.

14.17.2.2 single() `template<typename Poly , typename Callback >`

```
void smtrat::cad::projection::collins::single (
            const Poly & p,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of Collins projection operator from [**?**] that deals with a single polynomial p↩ : $\bigcup_{B \in RED(p)} \{ldcf(B)\} \cup PSC(B, B')$.

14.18 smtrat::cad::projection::hong Namespace Reference

Contains the implementation of Hongs projection operator as specified in [**?**] in Section 2.2.

Functions

- template<typename Poly , typename Callback >
  void single (const Poly &p, carl::Variable variable, Callback &&cb)

  *Implements the part of Hongs projection operator from [**?**] that deals with a single polynomial p which is just the respective part of Collins' projection operator collins::single.*

- template<typename Poly , typename Callback >
  void paired (const Poly &p, const UPoly &q, carl::Variable variable, Callback &&cb)

  *Implements the part of Hongs projection operator from [**?**] that deals with two polynomials p and q↩ : $\bigcup_{F \in RED(p)} PSC(F, q)$.*

14.18.1 Detailed Description Contains the implementation of Hongs projection operator as specified in [**?**] in Section 2.2.

14.18.2 Function Documentation

14.18.2.1 paired() `template<typename Poly , typename Callback >`

```
void smtrat::cad::projection::hong::paired (
            const Poly & p,
            const UPoly & q,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of Hongs projection operator from [**?**] that deals with two polynomials p and q↩ : $\bigcup_{F \in RED(p)} PSC(F, q)$.

14.18.2.2 single()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::hong::single (
            const Poly & p,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of Hongs projection operator from [**?**] that deals with a single polynomial p which is just the respective part of Collins' projection operator collins::single.

14.19 smtrat::cad::projection::lazard Namespace Reference

Contains the implementation of Lazards projection operator as specified in **[Lauard1994]**.

Functions

- template<typename Poly , typename Callback >
  void single (const Poly &p, carl::Variable variable, Callback &&cb)

  *Implements the part of Lazards projection operator from [**?**] that deals with a single polynomial* $p \leftarrow : \{leading_c oeff(p), trailing_c oeff(p), discriminant(p)\}$.
- template<typename Poly , typename Callback >
  void paired (const Poly &p, const UPoly &q, carl::Variable variable, Callback &&cb)

  *Implements the part of Lazard projection operator from [**?**] that deals with two polynomials* p *and* q *which is just the respective part of McCallums projection operator mccallum::paired.*

14.19.1 Detailed Description

Contains the implementation of Lazards projection operator as specified in **[Lauard1994]**.

14.19.2 Function Documentation

14.19.2.1 paired()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::lazard::paired (
            const Poly & p,
            const UPoly & q,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of Lazard projection operator from [**?**] that deals with two polynomials p and q which is just the respective part of McCallums projection operator mccallum::paired.

14.19.2.2 single()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::lazard::single (
            const Poly & p,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of Lazards projection operator from [**?**] that deals with a single polynomial $\mathrm{p} \leftarrow : \{leading_c oeff(p), trailing_c oeff(p), discriminant(p)\}$.

14.20 smtrat::cad::projection::mccallum Namespace Reference

Contains the implementation of McCallums projection operator as specified in [**?**].

Functions

- template<typename Poly , typename Callback >
  void single (const Poly &p, carl::Variable variable, Callback &&cb)

  Implements the part of McCallums projection operator from [?] that deals with a single polynomial $p \hookleftarrow : coefficients(p) \cup \{discriminant(p)\}$.

- template<typename Poly , typename Callback >
  void paired (const Poly &p, const UPoly &q, carl::Variable variable, Callback &&cb)

  Implements the part of McCallums projection operator from [?] that deals with two polynomials p *and* $q \hookleftarrow : \{resultant(p, q)\}$.

14.20.1 Detailed Description Contains the implementation of McCallums projection operator as specified in [?].

14.20.2 Function Documentation

14.20.2.1 paired()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::mccallum::paired (
            const Poly & p,
            const UPoly & q,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of McCallums projection operator from [?] that deals with two polynomials p and $q \hookleftarrow : \{resultant(p, q)\}$.

14.20.2.2 single()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::mccallum::single (
            const Poly & p,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of McCallums projection operator from [?] that deals with a single polynomial $p \hookleftarrow : coefficients(p) \cup \{discriminant(p)\}$.

14.21 smtrat::cad::projection::mccallum_partial Namespace Reference

Contains the implementation of an optimized version McCallums projection operator.

Functions

- template<typename Poly , typename Callback >
  void single (const Poly &p, carl::Variable variable, Callback &&cb)
- template<typename Poly , typename Callback >
  void paired (const Poly &p, const UPoly &q, carl::Variable variable, Callback &&cb)

14.21.1 Detailed Description Contains the implementation of an optimized version McCallums projection operator.

It is based on the observation by Brown that if some coefficient does not vanish only the leading coefficient is required.

14.21.2 Function Documentation

14.21.2.1 paired()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::mccallum_partial::paired (
            const Poly & p,
            const UPoly & q,
            carl::Variable variable,
            Callback && cb )
```

14.21.2.2 single()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::mccallum_partial::single (
            const Poly & p,
            carl::Variable variable,
            Callback && cb )
```

  bool compare (const Candidate< Poly > &lhs, const Candidate< Poly > &rhs)
- template<typename Poly , typename tag , typename F , typename... Tail>
  bool compare (const Candidate< Poly > &lhs, const Candidate< Poly > &rhs)

14.22.1 Typedef Documentation

14.22.1.1 Candidate

```
template<typename Poly >
using smtrat::cad::projection_compare::Candidate = typedef std::tuple<const Poly&, const Poly&,
std::size_t>
```

14.22.1.2 gt

```
using smtrat::cad::projection_compare::gt = typedef std::greater<>
```

14.22.1.3 lt

```
using smtrat::cad::projection_compare::lt = typedef std::less<>
```

14.22.2 Function Documentation

14.22.2.1 compare() [1/2]

```
template<typename Poly >
bool smtrat::cad::projection_compare::compare (
            const Candidate< Poly > & lhs,
            const Candidate< Poly > & rhs )
```

14.22.2.2 compare() [2/2]

```
template<typename Poly , typename tag , typename F , typename...
Tail>
bool smtrat::cad::projection_compare::compare (
            const Candidate< Poly > & lhs,
            const Candidate< Poly > & rhs )
```

14.22.2.3 compareCriterion()

```
template<typename Poly , typename tag , typename F >
int smtrat::cad::projection_compare::compareCriterion (
            const Candidate< Poly > & lhs,
            const Candidate< Poly > & rhs,
            tag t,
            F && f )
```

Compares the criterion given by `t` of two samples `lhs` and `rhs` using a comparator `f`.

Returns `0` if the values are the same, `-1` if `lhs` should be used first and `1` if `rhs` should be used first.

14.22.2.4 get() [1/3]

```
template<typename Poly >

14.25.1 Detailed Description

A framework for sample-based CAD algorithms.

This is a highly modular framework for sample-based CAD algorithms, i.e. single cell construction and coverings.

The basic idea is to have properties (of some polynomials or real root functions); each property has a level w.r.t. to a variable ordering (i.e. the index of the main variable of a polynomial) and rules operating on them, each replacing a property by a "simpler" set of properties (eventually reducing the level). At some stage, we delineate properties (that is, ordering the root under a partial sample), determine an ordering and cell boundaries (called representation) to continue proving properties. For more details on the general framework, we refer to the paper.

The structure of this implementation is as follows:

- cadcells::datastructures contains the main datastructures. Read here for more details on the general structure of the framework.
- cadcells::operators defines the properties, the rules and methods to delineate properties. These are used by operators which provide an interface for performing projections on certain steps.
- cadcells::representation provides heuristics for computing the representations for cells, coverings and delineations.
- cadcells::algorithms contains helper methods, building blocks for algorithms as well as algorithms themselves. Go here for usage of the framework and high-level interfaces.

14.25.1.1 Quick start

For an introduction, we refer to the code of algorithms::onecell.

14.25.2 Typedef Documentation

14.25.2.1 Assignment

```
using smtrat::cadcells::Assignment = typedef carl::ran_assignment<Rational>
```

14.25.2.2 RAN

```
using smtrat::cadcells::RAN = typedef carl::real_algebraic_number<Rational>
```

14.25.2.3 VariableOrdering

`using smtrat::cadcells::VariableOrdering = typedef std::vector<carl↩::Variable>`

14.25.3 Variable Documentation

14.25.3.1 empty_assignment

`const Assignment smtrat::cadcells::empty_assignment [static]`

14.26 smtrat::cadcells::algorithms Namespace Reference

Various algorithms as well as helper functions for developing new algorithms.

Namespaces

- helper

Typedefs

- using PropSet = operators::PropertiesSet< op >::type

Functions

- template<cadcells::operators::op op, representation::DelineationHeuristic delineation_heuristic>
  std::optional< datastructures::SampledDerivationRef< typename operators::PropertiesSet< op >::type > > get_delineation (datastructures::Projections &proj, const FormulasT &cs, const Assignment &sample)

  Computes a delineation w.r.t.
- template<cadcells::operators::op op, representation::CoveringHeuristic covering_heuristic>
  std::optional< datastructures::SampledDerivationRef< typename operators::PropertiesSet< op >::type > > get_level_covering (datastructures::Projections &proj, const FormulasT &constraints, const Assignment &sample)

  Computes an unsat covering w.r.t.
- std::optional< std::pair< FormulasT, FormulaT > > onecell (const FormulasT &constraints, const VariableOrdering &vars, const Assignment &sample)

  An MCAST-style single cell explanation function.
- template<cadcells::operators::op op>
  std::vector< datastructures::SampledDerivationRef< typename operators::PropertiesSet< op >::type > > get_unsat_intervals (const ConstraintT &c, datastructures::Projections &proj, const Assignment &sample)
- template<cadcells::operators::op op>
  std::vector< datastructures::SampledDerivationRef< typename operators::PropertiesSet< op >::type > > get_unsat_intervals (const VariableComparisonT &c, datastructures::Projections &proj, const Assignment &sample)
- template<cadcells::operators::op op>
  std::vector< datastructures::SampledDerivationRef< typename operators::PropertiesSet< op >::type > > get_unsat_intervals (const FormulaT &c, datastructures::Projections &proj, const Assignment &sample)

  Returns the unsat intervals of the given atom w.r.t.

Variables

- constexpr auto covering_heuristic = representation::CHAIN_COVERING
- constexpr auto op = operators::op::mccallum
- constexpr bool use_delineation = false

14.26.1 Detailed Description

Various algorithms as well as helper functions for developing new algorithms.

14.26.2 Typedef Documentation

14.26.2.1 PropSet

`using smtrat::cadcells::algorithms::PropSet = typedef operators::PropertiesSet<op>↩::type`

14.26.3 Function Documentation

14.26.3.1 get_delineation()

```
template<cadcells::operators::op op, representation::Delineation↩
Heuristic delineation_heuristic>
std::optional<datastructures::SampledDerivationRef<typename operators::PropertiesSet<op>↩
::type> > smtrat::cadcells::algorithms::get_delineation (
            datastructures::Projections & proj,
            const FormulasT & cs,
            const Assignment & sample )
```

Computes a delineation w.r.t.

a set of constraints.

A set of polynomials that are univariate under a sample induces a delineation (i.e. the order of their roots, polynomials without roots and nullified polynomials). This delineation is generalized such that the ordering on the roots etc is invariant.

Parameters

constraints	Atoms of the same level.
sample	A sample such that all but the highest variable in constraints are assigned.

Returns A sampled derivation which contains the information to keep the delineation invariant.

14.26.3.2 get_level_covering()

```
template<cadcells::operators::op op, representation::Covering↩
Heuristic covering_heuristic>
std::optional<datastructures::SampledDerivationRef<typename operators::PropertiesSet<op>↩
::type> > smtrat::cadcells::algorithms::get_level_covering (
            datastructures::Projections & proj,
            const FormulasT & constraints,
            const Assignment & sample )
```

Computes an unsat covering w.r.t.

a set of constraints.

If a constraint is univariate under a sample, for the unassinged variables, the constraint induces intervals in which the constraint will be conflicting. If multiple such intervals from a set of constraints cover the real line, then the partial sample cannot be extended without making a conflict. This conflict is generalized.

Parameters

constraints	Atoms of the same level such that sample cannot be extended for the highest variable without making one atom false. Note that this property is not checked.
sample	A sample such that all but the highest variable in constraints are assigned.

Returns A sampled derivation which contains the information to reproduce the conflict.

14.26.3.3 get_unsat_intervals() [1/3]

```
template<cadcells::operators::op op>
std::vector<datastructures::SampledDerivationRef<typename operators::PropertiesSet<op>↩
::type> > smtrat::cadcells::algorithms::get_unsat_intervals (
            const ConstraintT & c,
            datastructures::Projections & proj,
            const Assignment & sample )
```

14.26.3.4 get_unsat_intervals() [2/3]

```
template<cadcells::operators::op op>
std::vector<datastructures::SampledDerivationRef<typename operators::PropertiesSet<op>↩
::type> > smtrat::cadcells::algorithms::get_unsat_intervals (
            const FormulaT & c,
            datastructures::Projections & proj,
            const Assignment & sample )
```

Returns the unsat intervals of the given atom w.r.t.

an underlying sample.

Parameters

c	A constraint or a variable comparison.
sample	A sample point such that the highest variable in c w.r.t. the variable odering in proj is the only unassigned variable.

Returns A list of sampled derivations with the same delineated derivations. The samples for the unassigned variables are sampled from the respective interval.

14.26.3.5 get_unsat_intervals() [3/3]

```
template<cadcells::operators::op op>
std::vector<datastructures::SampledDerivationRef<typename operators::PropertiesSet<op>↩
::type> > smtrat::cadcells::algorithms::get_unsat_intervals (
            const VariableComparisonT & c,
            datastructures::Projections & proj,
            const Assignment & sample )
```

14.26.3.6 onecell()

```
std::optional<std::pair<FormulasT, FormulaT> > smtrat::cadcells::algorithms↩
::onecell (
            const FormulasT & constraints,
            const VariableOrdering & vars,
            const Assignment & sample )
```

An MCAST-style single cell explanation function.

A set of constraints is called infeasible w.r.t. an assignment if the defining polynomials are univariate under the sample and there does not exists a value for the unassigned variable that satisfies all constraints.

This method eliminates the unassigned variable using get_level_covering or get_delineation and then constructs a single cell in the assigned variables level by level.

Parameters

constraints	Atoms of the same level such that sample cannot be extended for the highest variable without making one atom false. Note that this property is not checked.
sample	A sample such that all but the highest variable in constraints are assigned.

Returns A pair of a set of constraints causign the conflict and a formula describing the cell.

14.26.4 Variable Documentation

14.26.4.1 cell_heuristic

```
constexpr auto smtrat::cadcells::algorithms::cell_heuristic = representation::LOWEST_DEG
[constexpr]
```

14.26.4.2 covering_heuristic

```
constexpr auto smtrat::cadcells::algorithms::covering_heuristic =
representation::CHAIN_COVERING [constexpr]
```

14.26.4.3 op

```
constexpr auto smtrat::cadcells::algorithms::op = operators::op::mccallum [constexpr]
```

14.26.4.4 use_delineation

```
constexpr bool smtrat::cadcells::algorithms::use_delineation = false
[constexpr]
```

14.27 smtrat::cadcells::algorithms::helper Namespace Reference

Functions

- MultivariateRootT as_multivariate_root (const datastructures::PolyPool &pool, carl::Variable main_var, datastructures::IndexedRoot r)

  Converts an datastructures::IndexedRoot to a MultivariateRootT.
- FormulaT to_formula (const datastructures::PolyPool &pool, carl::Variable main_var, datastructures::CellDescription &c)

  Converts a datastructures::CellDescription to a FormulaT.

14.27.1 Function Documentation

14.27.1.1 as_multivariate_root()

```
MultivariateRootT smtrat::cadcells::algorithms::helper::as_↩
multivariate_root (
            const datastructures::PolyPool & pool,
            carl::Variable main_var,
            datastructures::IndexedRoot r ) [inline]
```

Converts an datastructures::IndexedRoot to a MultivariateRootT.

14.27.1.2 to_formula()

```
FormulaT smtrat::cadcells::algorithms::helper::to_formula (
            const datastructures::PolyPool & pool,
            carl::Variable main_var,
            datastructures::CellDescription & c )
```

Converts a datastructures::CellDescription to a FormulaT.

14.28 smtrat::cadcells::datastructures Namespace Reference

Main datastructures.

Namespaces

- detail

Data Structures

- class BaseDerivation

  A BaseDerivation has a level and a set of properties of this level, and an underlying derivation representing the lower levels.

- class CellDescription

  Holds the description of a cell.

- struct CellRepresentation

  Represents a cell.

- class CoveringDescription

  Describes a covering of the real line by CellDescriptions (given an appropriate sample).

- struct CoveringRepresentation

  Represents a covering over a cell.

- class DelineatedDerivation

  A DelineatedDerivation is a BaseDerivation with a Delineation and an underlying SampledDerivation.

- class Delineation

  Represents the delineation of a set of polynomials (at a sample), that is.

- class DelineationInterval

  An interval of a delineation.

- struct DelineationRepresentation

  Represents a delineation.

- class DerivationRef

  A reference to a derivation, which is either.

- struct IndexedRoot

  Represents the i-th root of a multivariate polynomial at its main variable (given an appropriate sample).

- class IndexedRootOrdering

  Describes an ordering of IndexedRoots.

- class PolyPool

  A pool for polynomials.

- struct PolyRef

  Refers to a polynomial.

- class Projections

  Encapsulates all computations on polynomials.

- struct PropertiesT

  Set of properties.

- struct PropertiesT< T, Ts... >
- struct PropertiesTContent
- struct PropertiesTContent< T, false >
- struct PropertiesTContent< T, true >
- struct property_hash
- class SampledDerivation

  A SampledDerivation is a DelineatedDerivation with a sample and an DelineationInterval w.r.t.

14.28.1 Detailed Description Main datastructures.

14.28.1.1 Polynomials and projection results We assume a fixed variable ordering VariableOrdering. All polynomials are pooled in PolyPool w.r.t. this ordering, that is, they are identified by a PolyRef (a pair of the polynomial's level and an ID on this level). Projection results are cached in Projections. The latter holds a reference to a PolyPool. An instance Projections will be required for all kinds of operations and passed during various function calls. Thus, we initialize these data structures as follows:

```
VariableOrdering vars; // a variable ordering of all variables that will occur.
datastructures::PolyPool pool(vars);
datastructures::Projections proj(pool);
```

Note that PolyPool and Projections do not do reference counting; the cache needs to be cleared explicitly, see Projections::clear_cache and Projections::clear_assignment_cache.

14.28.1.2 Basic datastructures The basic datastructures for representing mathematical objects are datastructures::IndexedRoot, datastructures::CellDescription, datastructures::CoveringDescription, and datastructures::IndexedRootO

14.28.1.3 Properties datastructures::PropertiesT is the datastructure for storing properties on a single level.

If you work on an algorithm using this framework, you don't need to know this datastructure. If you need to implement a new property, then you find the interfaces a property needs to implement there.

14.28.1.4 Delineations datastructures::Delineation is the datastructure for storing the delineation of the indexed roots that stem from properties.

If you work on an algorithm using this framework, you don't need to know this datastructure. If you need to implement a new property or a heuristic for describing a cell (i.e. compute a representation), then you might be interested in this.

14.28.1.5 Derivations In the derivation datastructures, all data regarding the derivation is stored - that is the current sample points, the set of properties, the delineation of roots and the possible cell boundaries.

This datastructure is recursive, that is, each derivation object handles only a single level and holds a pointer to a derivation object of the next lower level (the underyling derivation). All operations are forwarded to lower levels whenever neccessary.

Furthermore, there are three types of derivations:

- datastructures::BaseDerivation assumes no sample point or whatever. It simply stores properties.
- datastructures::DelineatedDerivation extends the datastructures::BaseDerivation; it requires that the underlying derivation is a datastructures::SampledDerivation, thus a sample for all lower levels is present under which the properties of the current level can be delineated (i.e. their zeros can be isolated and sorted).
- datastructures::SampledDerivation extends the datastructures::DelineatedDerivation, thus a full sample point is available for which a cell can be isolated. The derivation datastructures are thus two-dimensional recursive. Note that multiple derivation objects can have common underlying cells or even share the same base or delineated derivation.

datastructures::DerivationRef allows to reference a derivation independent of its type.

For initializing derivations properly, use datastructures::make_derivation. To create a sampled derivation from a delineated derivation and a sample, use datastructures::make_sampled_derivation. For merging underlying derivations, use datastructures::merge_underlying.

For more information on memory management read datastructures::DerivationRef.

14.28.1.6 Representations The derivation objects do not store heuristic decisions, they just describe the current state. At some point, a representation of this state needs to be determined that is passed to the operator. This heuristic decision is stored in datastructures::CellRepresentation, datastructures::CoveringRepresentation or datastructures::DelineationRepresentation.

The heuristics for computing representations are in representation.

14.28.1.7 Operators The operators work on derivations and representations.

14.28.2 Typedef Documentation

14.28.2.1 BaseDerivationRef

```
template<typename Properties >
using smtrat::cadcells::datastructures::BaseDerivationRef = typedef std::shared_ptr<BaseDerivation<Properties
>
```

14.28.2.2 DelineatedDerivationRef

```
template<typename Properties >
using smtrat::cadcells::datastructures::DelineatedDerivationRef = typedef std::shared_ptr<DelineatedDerivation
>
```

14.28.2.3 PropertiesTSet

```
template<typename T >
using smtrat::cadcells::datastructures::PropertiesTSet = typedef boost::container::flat_set<T>
```

14.28.2.4 RootMap

```
using smtrat::cadcells::datastructures::RootMap = typedef std::map<RAN,
std::vector<IndexedRoot> >
```

14.28.2.5 SampledDerivationRef

```
template<typename Properties >
using smtrat::cadcells::datastructures::SampledDerivationRef = typedef std::shared_ptr<SampledDerivation<Prope
>
```

14.28.3 Enumeration Type Documentation

14.28.3.1 Bound

```
enum smtrat::cadcells::datastructures::Bound [strong]
```

Bound type.

Enumerator

infty	

14.28.4 Function Documentation

14.28.4.1 lower_equal()

```
bool smtrat::cadcells::datastructures::lower_equal (
    const DelineationInterval & del1,
    const DelineationInterval & del2 ) [inline]
```

14.28.4.2 lower_less()

```
bool smtrat::cadcells::datastructures::lower_less (
    const DelineationInterval & del1,
    const DelineationInterval & del2 ) [inline]
```

14.28.4.3 make_derivation()

```
template<typename Properties >
DerivationRef<Properties> smtrat::cadcells::datastructures::make_derivation (
    Projections & proj,
    const Assignment & assignment,
    size_t level )
```

Initializes a derivation according the the given assignment and level.

14.28.4.4 make_sampled_derivation()

```
template<typename Properties >
SampledDerivationRef<Properties> smtrat::cadcells::datastructures::make_sampled_derivation (
    DelineatedDerivationRef< Properties > delineated,
    const RAN & main_sample )
```

Initializes a sampled derivation w.r.t.

the delineated derivation and sample.

14.28.4.5 merge()

```
template<class T , class... Ts>
void smtrat::cadcells::datastructures::merge (
    PropertiesT< T, Ts... > & sets_a,
    const PropertiesT< T, Ts... > & sets_b )
```

14.28.4.6 merge_underlying()

```
template<typename Properties >
void smtrat::cadcells::datastructures::merge_underlying (
    std::vector< SampledDerivationRef< Properties >> & derivations )
```

Merges the underlying derivations of a set of sampled derivations.

After the operation, all sampled derivations point to the same underlying derivation.

14.28.4.7 operator"!=() [1/2]

```
bool smtrat::cadcells::datastructures::operator!= (
    const IndexedRoot & lhs,
    const IndexedRoot & rhs ) [inline]
```

14.28.4.8 operator"!=() [2/2]

```
bool smtrat::cadcells::datastructures::operator!= (
    const PolyRef & lhs,
    const PolyRef & rhs ) [inline]
```

14.28.4.9 operator<() [1/2]

```
bool smtrat::cadcells::datastructures::operator< (
    const IndexedRoot & lhs,
    const IndexedRoot & rhs ) [inline]
```

14.28.4.10 operator<() [2/2]

```
bool smtrat::cadcells::datastructures::operator< (
    const PolyRef & lhs,
    const PolyRef & rhs ) [inline]
```

14.28.4.11 operator<<() [1/10]

```

    const S & element )
```

14.28.4.28 prop_insert() [2/2]

```
template<class T , class... Ts>
void smtrat::cadcells::datastructures::prop_insert (
            PropertiesT< T, Ts... > & sets,
            const T & element )
```

14.28.4.29 upper_less()

```
bool smtrat::cadcells::datastructures::upper_less (
            const DelineationInterval & del1,
            const DelineationInterval & del2 ) [inline]
```

14.29 smtrat::cadcells::datastructures::detail Namespace Reference

Data Structures

- struct AssignmentProperties
- struct PolyProperties

14.30 smtrat::cadcells::helper Namespace Reference

Functions

- static size_t level_of (const VariableOrdering &order, const Poly &poly)

  Find the index of the highest variable (wrt.
- static carl::Variable main_var (const VariableOrdering &order, const Poly &poly)

14.30.1 Function Documentation

14.30.1.1 level_of()

```
static size_t smtrat::cadcells::helper::level_of (
            const VariableOrdering & order,
            const Poly & poly ) [static]
```

Find the index of the highest variable (wrt.

the ordering in 'order') that occurs with positive degree in 'poly'. We start counting at 1 and represent "no level/variable" as 0. Examples:

- level(2) == 0 wrt. any variable order
- level(0∗x+2) == 0 wrt. any variable order
- level(x+2) == 1 wrt. [x < y < z]
- level(x+2) == 2 wrt. [y < x < z]
- level(x+2) == 3 wrt. [y < z < x]
- level(x∗y+2) == 2 wrt. [x < y < z] because of y
- level(x∗y+2) == 2 wrt. [y < x < z] because of x
- level(x∗y+2) == 3 wrt. [x < z < y] because of y Preconditions:
- 'poly.gatherVariables()' must be a subset of 'order'.

14.30.1.2 main_var()

```
static carl::Variable smtrat::cadcells::helper::main_var (
            const VariableOrdering & order,
            const Poly & poly ) [static]
```

14.31.1 Enumeration Type Documentation

14.31.1.1 op `enum smtrat::cadcells::operators::op`

Enumerator

mccallum	

14.31.2 Function Documentation

14.31.2.1 delineate_properties() template<op Op>

```
void smtrat::cadcells::operators::delineate_properties (
            datastructures::DelineatedDerivation< typename PropertiesSet< Op >::type > &
deriv )  [inline]
```

Delineate properties.

14.31.2.2 delineate_properties< op::mccallum >() template<>

```
void smtrat::cadcells::operators::delineate_properties< op::mccallum > (
            datastructures::DelineatedDerivation< PropertiesSet< op::mccallum >::type > &
deriv )  [inline]
```

14.31.2.3 get_name() std::string smtrat::cadcells::operators::get_name (

```
            op op )  [inline]
```

14.31.2.4 operator<<() std::ostream& smtrat::cadcells::operators::operator<< (

```
            std::ostream & os,
            op op )  [inline]
```

14.31.2.5 project_basic_properties() template<op Op>

```
void smtrat::cadcells::operators::project_basic_properties (
            datastructures::DelineatedDerivation< typename PropertiesSet< Op >::type > &
deriv )  [inline]
```

Project basic properties, i.e.

independent from any sample or delineation.

14.31.2.6 project_basic_properties< op::mccallum >() template<>

```
void smtrat::cadcells::operators::project_basic_properties< op::mccallum > (
            datastructures::DelineatedDerivation< PropertiesSet< op::mccallum >::type > &
deriv )  [inline]
```

14.31.2.7 project_cell_properties() template<op Op>

```
bool smtrat::cadcells::operators::project_cell_properties (
            datastructures::SampledDerivation< typename PropertiesSet< Op >::type > & deriv
)  [inline]
```

Project cell properties.

Returns false iff the given operator is incomplete and cannot cover the given case (i.e. on nullification with Mc↩ Callum).

14.31.2.8 project_cell_properties< op::mccallum >() template<>

```
bool smtrat::cadcells::operators::project_cell_properties< op::mccallum > (
            datastructures::SampledDerivation< PropertiesSet< op::mccallum >::type > & deriv
) [inline]
```

14.31.2.9 project_covering_properties() template<op Op>

```
void smtrat::cadcells::operators::project_covering_properties (
            datastructures::CoveringRepresentation< typename PropertiesSet< Op >::type > &
repr ) [inline]
```

Project covering properties.

14.31.2.10 project_covering_properties< op::mccallum >() template<>

```
void smtrat::cadcells::operators::project_covering_properties< op::mccallum > (
            datastructures::CoveringRepresentation< PropertiesSet< op::mccallum >::type > &
repr ) [inline]
```

14.31.2.11 project_delineated_cell_properties() template<op Op>

```
void smtrat::cadcells::operators::project_delineated_cell_properties (
            datastructures::CellRepresentation< typename PropertiesSet< Op >::type > & deriv,
            bool cell_represents = true ) [inline]
```

Project cell properties that depend on a delineation.

14.31.2.12 project_delineated_cell_properties< op::mccallum >() template<>

```
void smtrat::cadcells::operators::project_delineated_cell_properties< op::mccallum > (
            datastructures::CellRepresentation< PropertiesSet< op::mccallum >::type > &
repr,
            bool cell_represents ) [inline]
```

14.43.2.1 Updated `enum smtrat::icp::Updated [strong]`

Enumerator

LEFT	
RIGHT	
BOTH	
NONE	

14.43.3 Function Documentation

14.43.3.1 getNonlinearMonomials()

```
std::vector< Poly > smtrat::icp::getNonlinearMonomials (
    const Poly & _expr )
```

Obtains the non-linear monomials of the given polynomial.

Parameters

_expr	The polynomial to obtain the non-linear monomials for.

Returns The non-linear monomials.

14.43.3.2 getOriginalLraVar()

```
const LRAModule< LRASettings1 >::LRAVariable * smtrat::icp::get↩
OriginalLraVar (
    carl::Variable::Arg _var,
    const LRAModule< LRASettings1 > & _lra )
```

14.43.3.3 intervalBoxContainsEmptyInterval()

```
bool smtrat::icp::intervalBoxContainsEmptyInterval
(
    const EvalDoubleIntervalMap & _intervals )
```

Checks mIntervals if it contains an empty interval.

Returns

14.43.3.4 intervalToConstraint()

```
std::pair< ConstraintT, ConstraintT > smtrat::icp::intervalTo↩
Constraint (
    const Poly & _lhs,
    const smtrat::DoubleInterval _interval )
```

Creates a new constraint from an existing interval.

Parameters

_interval	

Returns pair <lowerBoundConstraint*, upperBoundConstraint*>

14.44 smtrat::impl Namespace Reference

Data Structures

- class fixedsize_allocator_freelists
- class fixedsize_allocator_impl
- class fixedsize_allocator_impl< T, SizeShift, true, true >
- class fixedsize_allocator_size_helper
- class fixedsize_freelists

  Publicly derive from all fixedsize_freelist types with chunk sizes between SizeCurrent and SizeMax.
- class fixedsize_freelists< SizeCurrent, SizeMax, true >

Functions

- template<typename T >
  static CONSTEXPR std::size_t roundup_log2 (T)

  Used to find ceil(log2(n)) (the shift distance in the freelist allocator).

Variables

- static CONSTEXPR std::size_t LOWER_SIZE_BOUND = sizeof(void*)
- static CONSTEXPR std::size_t UPPER_SIZE_BOUND = 256

14.44.1 Function Documentation

14.44.1.1 roundup_log2()

```
template<typename T >
static CONSTEXPR std::size_t smtrat::impl::roundup_log2 (
            T ) [inline], [static]
```

Used to find ceil(log2(n)) (the shift distance in the freelist allocator).

14.44.2 Variable Documentation

14.44.2.1 LOWER_SIZE_BOUND

```
CONSTEXPR std::size_t smtrat::impl::LOWER_SIZE_BOUND = sizeof(void*)
[static]
```

14.44.2.2 UPPER_SIZE_BOUND

```
CONSTEXPR std::size_t smtrat::impl::UPPER_SIZE_BOUND = 256 [static]
```

14.45 smtrat::lra Namespace Reference

Data Structures

- class Bound

  Stores a bound, which could be an upper "<= b" or a lower bound ">= b" for a bound value b.
- class Numeric
- class Tableau
- class TableauEntry
- class Value
- class Variable

Typedefs

- typedef size_t EntryID

Functions

- Numeric abs (const Numeric &_value)

  Calculates the absolute value of the given Numeric.
- Numeric mod (const Numeric &_valueA, const Numeric &_valueB)

  Calculates the result of the first argument modulo the second argument.
- Numeric lcm (const Numeric &_valueA, const Numeric &_valueB)

  Calculates the least common multiple of the two arguments.
- Numeric gcd (const Numeric &_valueA, const Numeric &_valueB)

  Calculates the greatest common divisor of the two arguments.
- Numeric operator+ (const Numeric &_valueA, const Numeric &_valueB)

  Calculates the sum of the two given Numerics.
- Numeric operator- (const Numeric &_valueA, const Numeric &_valueB)

  Calculates the difference between the two given Numerics.
- Numeric operator∗ (const Numeric &_valueA, const Numeric &_valueB)

  Calculates the product of the two given Numerics.
- Numeric operator/ (const Numeric &_valueA, const Numeric &_valueB)

  Calculates the division of the two given Numerics.
- Numeric & operator+= (Numeric &_valueA, const Numeric &_valueB)

  Adds the value of the second given Numeric to the second given Numeric.
- Numeric & operator-= (Numeric &_valueA, const Numeric &_valueB)

  Subtracts the second given Numeric to the first given Numeric.
- Numeric & operator∗= (Numeric &_valueA, const Numeric &_valueB)

  Multiplies the second given Numeric to the first given Numeric.
- Numeric & operator/= (Numeric &_valueA, const Numeric &_valueB)

  Divides the first given Numeric by the second given Numeric.
- Numeric operator- (const Numeric &_value)

  Calculates the additive inverse of the given Numeric.
- Numeric & operator++ (Numeric &_value)

  Increments the given Numeric by one.
- Numeric & operator-- (Numeric &_value)

  Decrements the given Numeric by one.
- std::ostream & operator<< (std::ostream &_out, const Numeric &_value)

  Prints the given Numerics representation on the given output stream.
- template<typename T1 >
  std::ostream & operator<< (std::ostream &_out, const Value< T1 > &_value)

Variables

- static EntryID LAST_ENTRY_ID = 0

14.45.1 Typedef Documentation

14.45.1.1 EntryID `typedef size_t smtrat::lra::EntryID`

14.45.2 Function Documentation

14.45.2.1 abs()

```
Numeric smtrat::lra::abs (
    const Numeric & _value )
```

Calculates the absolute value of the given Numeric.

Parameters

_value	The Numeric to calculate the Numeric for.

Returns The absolute value of the given Numeric.

14.45.2.2 gcd()

```
Numeric smtrat::lra::gcd (
    const Numeric & _valueA,
    const Numeric & _valueB )
```

Calculates the greatest common divisor of the two arguments.

Note, that this method can only be applied to integers.

Parameters

_valueA	An integer.
_valueB	An integer.

Returns The least common divisor of the two arguments.

14.45.2.3 lcm()

```
Numeric smtrat::lra::lcm (
    const Numeric & _valueA,
    const Numeric & _valueB )
```

Calculates the least common multiple of the two arguments.

Note, that this method can only be applied to integers.

Parameters

_valueA	An integer.
_valueB	An integer.

Returns The least common multiple of the two arguments.

14.45.2.4 mod()

```
Numeric smtrat::lra::mod (
    const Numeric & _valueA,
    const Numeric & _valueB )
```

Calculates the result of the first argument modulo the second argument.

Note, that this method can only be applied to integers.

Parameters

_valueA	An integer.
_valueB	An integer != 0.

Returns The first argument modulo the second argument.

14.45.2.5 operator*()

```
Numeric smtrat::lra::operator* (
    const Numeric & _valueA,
    const Numeric & _valueB )
```

Calculates the product of the two given Numerics.

Parameters

_valueA	The first factor.
_valueB	The second factor.

Returns The product of the two given Numerics.

14.45.2.6 operator*=()

```
Numeric & smtrat::lra::operator*= (
    Numeric & _valueA,
    const Numeric & _valueB )
```

Multiplies the second given Numeric to the first given Numeric.

Parameters

_valueA	The Numeric to multiply.
_valueB	The Numeric to multiply by.

Returns The first given Numeric multiplied by the second given Numeric.

14.45.2.7 operator+()

```
Numeric smtrat::lra::operator+ (
    const Numeric & _valueA,
    const Numeric & _valueB )
```

Calculates the sum of the two given Numerics.

Parameters

_valueA	The first summand.
_valueB	The second summand.

Returns The sum of the two given Numerics.

14.45.2.8 operator++()

```
Numeric & smtrat::lra::operator++ (
    Numeric & _value )
```

Increments the given Numeric by one.

Parameters

_value	The Numeric to increment.

Returns The given Numeric incremented by one.

14.45.2.9 operator+=()

```
Numeric & smtrat::lra::operator+= (
    Numeric & _valueA,
    const Numeric & _valueB )
```

Adds the value of the second given Numeric to the second given Numeric.

Parameters

_valueA	The Numeric to add to.
_valueB	The Numeric to add.

Returns The first given Numeric increased by the second given Numeric.

14.45.2.10 operator-() [1/2]

```
Numeric smtrat::lra::operator- (
    const Numeric & _value )
```

Calculates the additive inverse of the given Numeric.

Parameters

_value	The Numeric to calculate the additive inverse for.

Returns The additive inverse of the given Numeric.

14.45.2.11 operator-() [2/2]

```
Numeric smtrat::lra::operator- (
    const Numeric & _valueA,
    const Numeric & _valueB )
```

Calculates the difference between the two given Numerics.

Parameters

_valueA	The minuend.
_valueB	The subtrahend.

Returns The difference between the two given Numerics.

14.45.2.12 operator--()

```
Numeric & smtrat::lra::operator-- (
    Numeric & _value )
```

Decrements the given Numeric by one.

Parameters

_value	The Numeric to decrement.

Returns The given Numeric decremented by one.

14.45.2.13 operator-=()

```
Numeric & smtrat::lra::operator-= (
    Numeric & _valueA,
    const Numeric & _valueB )
```

Subtracts the second given Numeric to the first given Numeric.

Parameters

_valueA	The Numeric to subtract from.
_valueB	The Numeric to subtract.

Returns The first given Numeric subtracted by the second given Numeric.

14.45.2.14 operator/()

```
Numeric smtrat::lra::operator/ (
    const Numeric & _valueA,
    const Numeric & _valueB )
```

Calculates the division of the two given Numerics.

Parameters

_valueA	The dividend.
_valueB	The divisor.

Returns The difference of the two given Numerics.

14.45.2.15 operator/=()

```
Numeric & smtrat::lra::operator/= (
    Numeric & _valueA,
    const Numeric & _valueB )
```

Divides the first given Numeric by the second given Numeric.

Parameters

_valueA	The Numeric to divide.
_valueB	The Numeric to divide by.

Returns The first given Numeric divided by the second given Numeric.

14.45.2.16 operator<<() [1/2]

```
std::ostream & smtrat::lra::operator<< (
    std::ostream & _out,
    const Numeric & _value )
```

Prints the given Numerics representation on the given output stream.

Parameters

_out	The output stream to print on.
_value	The Numeric to print.

Returns The output stream after printing the given Numerics representation on it.

14.45.2.17 operator<<() [2/2]

```
template<typename T1 >
std::ostream& smtrat::lra::operator<< (
    std::ostream & _out,
    const Value< T1 > & _value )
```

14.45.3 Variable Documentation

14.45.3.1 LAST_ENTRY_ID

```

Data Structures

- class Bookkeeping

  Represent the trail, i.e.

- class ClauseChain

  An explanation is either a single clause or a chain of clauses, satisfying the following properties:

- struct FastParallelExplanation

  This explanation executes all given explanation in parallel processes and waits for the fastest explanation, returning the fastest delivered explanation, terminating all other parallel processes.

- struct FullParallelExplanation

  This explanation executes all given explanation parallel in multiple threads and waits until every single one has finished, returning the result of the first listed explanation.

14.48.2 Enumeration Type Documentation

14.48.2.1 ConstraintType

`enum smtrat::mcsat::ConstraintType [strong]`

This type categorizes constraints with respect to a given (partial) model and the next variable to be assigned.

Note that `Constant` implies `Assigned`.

Enumerator

Constant	
Assigned	The constraint contains no variables.
Univariate	The constraint is fully assigned.
Unassigned	The constraint has a single unassigned variable being the next one. The constraint has an unassigned variable that is not the next one.

14.48.2.2 VariableOrdering

`enum smtrat::mcsat::VariableOrdering [strong]`

Enumerator

GreedyMaxUnivariate	
FeatureBased	
FeatureBasedZ3	
FeatureBasedBrown

14.50 smtrat::mcsat::constraint_type Namespace Reference

Functions

- template<typename T >
  ConstraintType categorize (const T &t, const Model &model, carl::Variable next)
- template<typename T >
  bool isConstant (const T &t)

  Checks whether the constraint is constant, i.e.
- template<typename T >
  bool isAssigned (const T &t, const Model &model)

  Checks whether all variables contained in the constraint are assigned in the model.
- template<typename T >
  bool isUnivariate (const T &t, const Model &model, carl::Variable next)

  Checks whether the constraint contains only a single unassigned variable, and this is the next one.
- template<typename T >
  bool isUnassigned (const T &t, const Model &model, carl::Variable next)

  Checks whether the constraint contains an unassigned variable that is not the next one.

14.50.1 Function Documentation

14.50.1.1 categorize()

```
template<typename T >
ConstraintType smtrat::mcsat::constraint_type::categorize (
    const T & t,
    const Model & model,
    carl::Variable next )
```

14.50.1.2 isAssigned() template<typename T >

```
bool smtrat::mcsat::constraint_type::isAssigned (
            const T & t,
            const Model & model )
```

Checks whether all variables contained in the constraint are assigned in the model.

In particular, a `Constant` constraint is also `Assigned`.

14.50.1.3 isConstant() template<typename T >

```
bool smtrat::mcsat::constraint_type::isConstant (
            const T & t )
```

Checks whether the constraint is constant, i.e.

whether it contains no variables.

14.50.1.4 isUnassigned() template<typename T >

```
bool smtrat::mcsat::constraint_type::isUnassigned (
            const T & t,
            const Model & model,
            carl::Variable next )
```

Checks whether the constraint contains an unassigned variable that is not the next one.

14.50.1.5 isUnivariate() template<typename T >

```
bool smtrat::mcsat::constraint_type::isUnivariate (
            const T & t,
            const Model & model,
            carl::Variable next )
```

Checks whether the constraint contains only a single unassigned variable, and this is the next one.

14.51 smtrat::mcsat::fm Namespace Reference

A Fourier-Motzkin based backend.

Data Structures

- struct Bound
- struct ConflictGenerator
- struct DefaultComparator

  Does not order anything.
- struct DefaultSettings
- struct Explanation
- struct IgnoreCoreSettings
- struct MaxSizeComparator

  This heuristic chooses the explanation excluding the largest interval.
- struct MinSizeComparator

  This heuristic chooses the explanation excluding the smallest interval.
- struct MinVarCountComparator

  This heuristic tries to minimize the number of variables occuring in the explanation.

Functions

- bool isSubset (const carl::Variables &subset, const carl::Variables &superset)
- std::ostream & operator<< (std::ostream &os, const Bound &b)

14.51.1 Detailed Description

A Fourier-Motzkin based backend.

Preprocessing of constraints:

The input is a constraint c: p∗x∼q which can be used as a bound on x with p,q multivariate polynomials. If x only occurs linearly in c, this decomposition is possible. If p is zero, then c is conflicting iff !(0∼q). If this is the case, we can return (c && p=0) -> 0∼q as explanation. Otherwise, we evaluate c over the partial model and obtain x∼r, where r is a rational. To properly perform the elimination step detailed below, we additionally store whether p is negative over the current assignment as a Boolean.

We store (c,p,q,r,n) for each bound.

FM elimination:

Given a lower bound l and an upper bound u, the elimination is as follows: Conflict if l.r >= u.r (or strict, if both relations from c are weak) l.q ∗ u.p < u.q ∗ l.p

If exactly one of u.p and l.p was found to be negative, the relation has to be inverted. If u.p or l.p are not constants, we additionally have to add a literal stating that their sign does not change.

For all bounds involved, we add b.p < 0 resp. b.p > 0 as side condition to the explanation.

Handling of "not equal":

For linear arithmetic, a bound i belonging to a constraint with relation != can be in conflict with

- a bound e for a constraint with = iff i.r == e.r, then we return i.c && e.c -> i.q ∗ e.p != e.q ∗ i.p
- two bounds l, u with >= resp. <= as relation and i.r == l.r == u.r, then we return i.c && l.c && u.c && (l.q ∗ u.p = u.q ∗ l.p) -> l.q ∗ i.p != i.q ∗ l.p

For all bounds b involved, we add b.p != 0 as side condition to the explanation.

14.51.2 Function Documentation

14.51.2.1 isSubset()

```
bool smtrat::mcsat::fm::isSubset (
    const carl::Variables & subset,
    const carl::Variables & superset ) [inline]
```

14.51.2.2 operator<<()

```
std::ostream& smtrat::mcsat::fm::operator<< (
    std::ostream & os,
    const Bound & b ) [inline]
```

Functions

- FormulaT buildFormulaFromVC (VariableComparisonT &&vc)

  Construct a formula representing a variable comparison.

- template<typename MVRootParams >
  FormulaT buildEquality (carl::Variable var, const MVRootParams &mvp)

  Construct an atomic formula representing a variable being equal to the given multivariate root.

- template<typename MVRootParams >
  FormulaT buildBelow (carl::Variable var, const MVRootParams &mvp)

  Construct an atomic formula representing a variable being less than the given multivariate root.

- template<typename MVRootParams >
  FormulaT buildAbove (carl::Variable var, const MVRootParams &mvp)

  Construct an atomic formula representing a variable being greater than the given multivariate root.

- std::set< ConstraintT > convertToConstraints (std::vector< FormulaT > constraintAtoms)

  Transform constraints represented as atomic formualas into the easier to use objects of the Constraint class.

14.54.1 Function Documentation

14.54.1.1 buildAbove()

```
template<typename MVRootParams >
FormulaT smtrat::mcsat::nlsat::helper::buildAbove (
            carl::Variable var,
            const MVRootParams & mvp )
```

Construct an atomic formula representing a variable being greater than the given multivariate root.

”v > root(..)”

14.54.1.2 buildBelow()

```
template<typename MVRootParams >
FormulaT smtrat::mcsat::nlsat::helper::buildBelow (
            carl::Variable var,
            const MVRootParams & mvp )
```

Construct an atomic formula representing a variable being less than the given multivariate root.

”v < root(..)”

14.54.1.3 buildEquality()

```
template<typename MVRootParams >
FormulaT smtrat::mcsat::nlsat::helper::buildEquality (
            carl::Variable var,
            const MVRootParams & mvp )
```

Construct an atomic formula representing a variable being equal to the given multivariate root.

”v = root(..)”

14.54.1.4 buildFormulaFromVC()

```
FormulaT smtrat::mcsat::nlsat::helper::buildFormulaFromVC (
            VariableComparisonT && vc ) [inline]
```

Construct a formula representing a variable comparison.

Simplify to a regular constraint if possible.

14.54.1.5 convertToConstraints()

```
std::set<ConstraintT> smtrat::mcsat::nlsat::helper::convert↩
ToConstraints (
            std::vector< FormulaT > constraintAtoms ) [inline]
```

Transform constraints represented as atomic formualas into the easier to use objects of the Constraint class.

SIGN_INV	

14.56.3 Function Documentation

14.56.3.1 addResultants()

```
void smtrat::mcsat::onecellcad::addResultants (
    std::vector< std::pair< Poly, Poly >> & resultants,
    std::vector< std::vector< TagPoly >> & polys,
    carl::Variable mainVar,
    const std::vector< carl::Variable > & variableOrder ) [inline]
```

14.56.3.2 appendOnCorrectLevel()

```
void smtrat::mcsat::onecellcad::appendOnCorrectLevel (
    const Poly & poly,
    InvarianceType tag,
    std::vector< std::vector< TagPoly >> & polys,
    std::vector< carl::Variable > variableOrder ) [inline]
```

14.56.3.3 asMultiPolys()

```
std::vector<Poly> smtrat::mcsat::onecellcad::asMultiPolys (
    const std::vector< TagPoly > polys ) [inline]
```

14.56.3.4 asRANPoint()

```
carl::RealAlgebraicPoint<smtrat::Rational> smtrat::mcsat::onecellcad↩
::asRANPoint (
    const mcsat::Bookkeeping & data ) [inline]
```

14.56.3.5 asRootExpr()

```
MultivariateRootT smtrat::mcsat::onecellcad::asRootExpr (
    carl::Variable rootVariable,
    Poly poly,
    std::size_t rootIdx ) [inline]
```

Parameters

rootVariable	The variable with respect to which the roots are computed in the end. It will be replaced by the special unique root-variable "_z" common in root-expressions.

14.56.3.6 asVector()

```
template<typename T >
std::vector<T> smtrat::mcsat::onecellcad::asVector (
    const std::set< T > s )
```

14.56.3.7 cellDimension()

```
std::size_t smtrat::mcsat::onecellcad::cellDimension (
    const CADCell & cell,
    const std::size_t uptoLevel ) [inline]
```

Returns Dimension of a hybercube to which the given cell is homeomorphic, i.e., count the number of sectors of the given Cell restricted to its first components (with index 0 to 'uptoLevel').

14.56.3.8 contains() [1/2]

```
template<typename T >
bool smtrat::mcsat::onecellcad::contains (
            const std::vector< T > & list,
            const T & elem )
```

14.56.3.9 contains() [2/2]

```
bool smtrat::mcsat::onecellcad::contains (
            const std::vector< TagPoly > & polys,
            const Poly & poly ) [inline]
```

14.56.3.10 discriminant()

```
Poly smtrat::mcsat::onecellcad::discriminant (
            const carl::Variable & mainVariable,
            const Poly & p ) [inline]
```

Projection related utilities for onecellcad.

14.56.3.11 duplicateElimination() [1/2]

```
void smtrat::mcsat::onecellcad::duplicateElimination (
            std::vector< Poly > & vec ) [inline]
```

14.56.3.12 duplicateElimination() [2/2]

```
std::vector<std::pair<Poly, Poly> > smtrat::mcsat↩
::onecellcad::duplicateElimination (
            std::vector< std::pair< Poly, Poly >> vec ) [inline]
```

14.56.3.13 fullSpaceCell()

```
CADCell smtrat::mcsat::onecellcad::fullSpaceCell (
            std::size_t cellComponentCount ) [inline]
```

14.56.3.14 getDegree()

```
std::size_t smtrat::mcsat::onecellcad::getDegree (
            TagPoly p,
            carl::Variable v ) [inline]
```

Parameters

p	Polynomial to get degree from
v	Rootvariable for degree calc

Returns

14.56.3.15 hasOnlyNonConstIrreducibles()

```
template<typename PolyType >
bool smtrat::mcsat::onecellcad::hasOnlyNonConstIrreducibles (
            const std::vector< PolyType > & polys )
```

14.56.3.16 hasUniqElems()

```
template<typename T >
bool smtrat::mcsat::onecellcad::hasUniqElems (
            const std::vector< T > & container )
```

14.56.3.17 isNonConstIrreducible()

```
template<typename PolyType >
bool smtrat::mcsat::onecellcad::isNonConstIrreducible (
            const PolyType & poly )
```

14.56.3.18 isSubset()

```
template<typename T >
bool smtrat::mcsat::onecellcad::isSubset (
            const std::vector< T > & c1,
            const std::vector< T > & c2 )
```

14.56.3.19 leadcoefficient()

```
Poly smtrat::mcsat::onecellcad::leadcoefficient (
            const carl::Variable & mainVariable,
            const Poly & p ) [inline]
```

14.56.3.20 levelOf()

```
std::optional<std::size_t> smtrat::mcsat::onecellcad::levelOf (
            const std::vector< carl::Variable > & variableOrder,
            const Poly & poly ) [inline]
```

Find the index of the highest variable (wrt.

the ordering in 'variableOrder') that occurs with positive degree in 'poly'. Although 'level' is a math concept that starts counting at 1 we start counting at 0 and represent "no level/variable" as std::nullopt because it simplifies using the level directly as an index into arrays or vectors. Examples:

- polyLevel(2) == nullopt wrt. any variable order
- polyLevel(0∗x+2) == nullopt wrt. any variable order
- polyLevel(x+2) == 0 wrt. [x < y < z]
- polyLevel(x+2) == 1 wrt. [y < x < z]
- polyLevel(x+2) == 2 wrt. [y < z < x]
- polyLevel(x∗y+2) == 1 wrt. [x < y < z] because of y
- polyLevel(x∗y+2) == 1 wrt. [y < x < z] because of x
- polyLevel(x∗y+2) == 2 wrt. [x < z < y] because of y Preconditions:
- 'poly.gatherVariables()' must be a subset of 'variableOrder'.

14.56.3.21 nonConstIrreducibleFactors()

```
std::vector<TagPoly> smtrat::mcsat::onecellcad::non↩
ConstIrreducibleFactors (
            std::vector< carl::Variable > variableOrder,
            Poly poly,
            InvarianceType tag ) [inline]
```

14.56.3.22 operator<()

```
bool smtrat::mcsat::onecellcad::operator< (
            const InvarianceType & l,
            const InvarianceType & r ) [inline]
```

14.56.3.23 operator<<() [1/7]

14.59.1 Detailed Description

OneCell Explanation.

14.59.1.1 Rationale To better understand the CAD implementation this document concisely explains important CAD terminology from the literature and high-level implementation design decisions. Low-level design decisions for structs and classes are found in the implementation files themselves.

14.59.1.2 Universe The n-dimensional space in which a CADCell exists. The universe has n axes (=std basis vectors), numbered 0 to n-1, and each axis is associated with one variable.

14.59.1.3 Variables order A variable order like x,y,z tell us that the universe is 3-dimensional, gives a name to the each coordinate axis (thus also defines an axis ordering), tells us how to interpret a point like (5,2,1), and allows us to define properties like ”level” for points and polynomials and ”cylindrical” for CADCells.

14.59.1.4 Level of a point Number of components that a point has but interpreted with respect to the first variables in a variable ordering. E.g., if the universe has 3 axes/variables like x,y,z in that (increasing) order, then a point of level 2 has exactly 2 components representing the coordinates for the first two variables, x and y.

14.59.1.5 Level of a polynomial The number/index of the highest variable, with respect to a variable ordering, that appears with a positive degree in a polynomial. E.g., if the universe has 3 axes/variables like x,y,z in that (increasing) order, then a polynomial of level 2 at most mentions the first 2 variables, x and y, and definitely mentions second variable y but no "higher" variable like z .

14.59.1.6 CADCell A "cylindric algebraic cell" exists in an n-dimensional vector space called a "universe". A cell is a subspace of that universe with a possibly lower dimension and is "cylindric" only with respect to a specific variable ordering, numbered 0 to n-1. A cell is "algebraic", because its boundaries are represented by polynomials. Along each axis a cell is bound by either an non-empty open interval, called a "sector" and represented by two polynomials, or by a closed point-interval, called a "section" and represented by one polynomial. E.g. a section along axis k, said to be of "level k", requires a polynomial instead of a fixed number, because the fixed number can vary depending on the position along the (lower dimensional) axes 0 to k-1. This is why a section of level k is represented by a multivariate polynomial of "level k" (uses only the first k variables in the variable ordering). If we replace the first k-1 variables in that polynomial by specific numbers, we are left with a univariate polynomial whose root is then the fixed boundary number along axis k (if that polynomial has multiple roots, we also need to specify precisely which one of those represents the fixed boundary number). A different position, i.e., a different variable replacement, yields a possibly different univariate polynomial with a different root.

14.59.1.7 Level of a sector/section The number of the axis (with respect to some variable ordering that defines the same axis ordering) for which a sector/section defines the bounds. This number is also the level of the polynomial(s) inside the sector/section.

14.59.1.8 Open CADCell A cell is "open" if it only consists of sectors, i.e., it is open along all axes and is therefore a subspace with the same dimension as its universe.

- struct TestCandidate

Functions

- void getFormulaAtoms (const FormulaT &f, FormulaSetT &result)
- FormulaT to_formula (const carl::vs::CaseDistinction< Poly > &docc)

  Converts a DisjunctionOfConstraintConjunctions to a regular Formula.
- static bool generateZeros (const FormulaT &formula, const carl::Variable &eliminationVar, std::function< void(SqrtEx &&sqrtExpression, ConstraintsT &&sideConditions)> yield_result)

  Get zeros with side conditions of the given constraint.
- static bool addOrMergeTestCandidate (std::vector< TestCandidate > &results, const TestCandidate &new↩Substitution)

  Adds a new substitution to the given list of substitutions or merges it to an existing one.
- static bool generateTestCandidates (std::vector< TestCandidate > &results, const carl::Variable &eliminationVar, const FormulaSetT &constraints)

  Generate all test candidates according to "vanilla" virtual substitution.
- bool substitute (const FormulaT &constr, const carl::Variable var, const carl::vs::Term< Poly > &term, FormulaT &result)

14.64.1 Function Documentation

14.64.1.1 addOrMergeTestCandidate()

```
static bool smtrat::mcsat::vs::helper::addOrMergeTest↩
Candidate (
    std::vector< TestCandidate > & results,
    const TestCandidate & newSubstitution ) [static]
```

Adds a new substitution to the given list of substitutions or merges it to an existing one.

Returns true if a new substitution was created.

14.64.1.2 generateTestCandidates()

```
static bool smtrat::mcsat::vs::helper::generateTestCandidates
(
    std::vector< TestCandidate > & results,
    const carl::Variable & eliminationVar,
    const FormulaSetT & constraints ) [static]
```

Generate all test candidates according to "vanilla" virtual substitution.

Returns false iff VS is not applicable.

14.64.1.3 generateZeros()

```
static bool smtrat::mcsat::vs::helper::generateZeros (
    const FormulaT & formula,
    const carl::Variable & eliminationVar,
    std::function< void(SqrtEx &&sqrtExpression, ConstraintsT &&sideConditions)>
yield_result ) [static]
```

Get zeros with side conditions of the given constraint.

Kind of a generator function. Passes generated zeros to a callback function to avoid copying.

14.64.1.4 getFormulaAtoms()

```
void smtrat::mcsat::vs::helper::getFormulaAtoms (
    const FormulaT & f,
    FormulaSetT & result ) [inline]
```

14.64.1.5 substitute()

```
bool smtrat::mcsat::vs::helper::substitute (
    const FormulaT & constr,
    const carl::Variable var,
    const carl::vs::Term< Poly > & term,
    FormulaT & result ) [inline]
```

14.64.1.6 to_formula()

```
FormulaT smtrat::mcsat::vs::helper::to_formula (
    const carl::vs::CaseDistinction< Poly > & docc ) [inline]
```

Converts a DisjunctionOfConstraintConjunctions to a regular Formula.

14.66 smtrat::onecellcad::recursive Namespace Reference

Data Structures

- struct Section

  Represent a cell's closed-interval-boundary object along one single axis by an irreducible, multivariate polynomial of level k.

- struct Sector

  Represent a cell's open-interval boundary object along one single axis by two irreducible, multivariate polynomials of level k.

Typedefs

- using UniPoly = carl::UnivariatePolynomial< smtrat::Rational >
- using MultiPoly = carl::MultivariatePolynomial< smtrat::Rational >
- using MultiCoeffUniPoly = carl::UnivariatePolynomial< MultiPoly >
- using RAN = carl::RealAlgebraicNumber< smtrat::Rational >
- using RANPoint = carl::RealAlgebraicPoint< smtrat::Rational >
- using RANMap = std::map< carl::Variable, RAN >
- using OpenCADCell = std::vector< Sector >

  Represent a single open cell [1].

Functions

- std::ostream & operator<< (std::ostream &o, const Section &s)
- std::ostream & operator<< (std::ostream &o, const Sector &s)
- std::ostream & operator<< (std::ostream &o, const OpenCADCell &c)
- OpenCADCell createFullspaceCoveringCell (size_t level)
- size_t levelOf (const MultiPoly &poly, const std::vector< carl::Variable > &variableOrder)

  Find the index of the highest variable (wrt.
- std::map< carl::Variable, RAN > toStdMap (const RANPoint &point, size_t count, const std::vector< carl::↩ Variable > &variableOrder)

  Create a mapping from the first 'count'-many variables in the given 'variableOrder' to the first 'count'-many components of the given 'point'.
- std::optional< OpenCADCell > mergeCellWithPoly (OpenCADCell &cell, const RANPoint &point, const std↩ ::vector< carl::Variable > &variableOrder, const MultiPoly poly)

  Merge the given open OpenCADCell 'cell' that contains the given 'point' (called "alpha" in [1]) with a polynomial 'poly'.
- std::optional< OpenCADCell > createOpenCADCell (const std::vector< MultiPoly > polySet, const RANPoint &point, const std::vector< carl::Variable > &variableOrder)

  Construct a OpenCADCell for the given set of polynomials 'polySet' that contains the given 'point'.

14.66.1 Typedef Documentation

14.66.1.1 MultiCoeffUniPoly

`using smtrat::onecellcad::recursive::MultiCoeffUniPoly = typedef carl::UnivariatePolynomial<MultiPoly>`

14.66.1.2 MultiPoly

`using smtrat::onecellcad::recursive::MultiPoly = typedef carl::Multivariate↩ Polynomial<smtrat::Rational>`

14.66.1.3 OpenCADCell

`using smtrat::onecellcad::recursive::OpenCADCell = typedef std::vector<Sector>`

Represent a single open cell [1].

A cell is a collection of boundary objects along each axis. In case of an open cell, the boundary objects are all sectors.

14.66.1.4 RAN

`using smtrat::onecellcad::recursive::RAN = typedef carl::RealAlgebraicNumber<smtrat::Rational>`

14.66.1.5 RANMap

`using smtrat::onecellcad::recursive::RANMap = typedef std::map<carl::↩ Variable, RAN>`

14.66.1.6 RANPoint

`using smtrat::onecellcad::recursive::RANPoint = typedef carl::RealAlgebraic↩ Point<smtrat::Rational>`

14.66.1.7 UniPoly

`using smtrat::onecellcad::recursive::UniPoly = typedef carl::Univariate↩ Polynomial<smtrat::Rational>`

14.66.2 Function Documentation

14.66.2.1 createFullspaceCoveringCell()

```
OpenCADCell smtrat::onecellcad::recursive::create↩
FullspaceCoveringCell (
            size_t level )
```

14.66.2.2 createOpenCADCell()

```
std::optional<OpenCADCell> smtrat::onecellcad::recursive↩
::createOpenCADCell (
            const std::vector< MultiPoly > polySet,
            const RANPoint & point,
            const std::vector< carl::Variable > & variableOrder )
```

Construct a OpenCADCell for the given set of polynomials 'polySet' that contains the given 'point'.

The returned cell represents the largest region that is sign-invariant on all polynomials in the 'polySet' and is cylindrical with respect to the variables ordering given in 'variableOrder'. Note that this construction is only correct if plugging in the 'point' into any polynomial of the 'polySet' yields a non-zero value, i.e. 'point' is not a root of any polynomial in 'polySet', otherwise no OpenCADCell is returned. Note that the dimension (number of components) of the 'point' == the number of variables in 'variableOrder' and that any polynomial of the 'polySet' must be irreducible and mention only variables from 'variableOrder'.

14.66.2.3 levelOf()

```
size_t smtrat::onecellcad::recursive::levelOf (
            const MultiPoly & poly,
            const std::vector< carl::Variable > & variableOrder )
```

Find the index of the highest variable (wrt.

the ordering in 'variableOrder') that occurs with positive degree in 'poly'. Since levelOf is a math concept it starts counting at 1! Examples:

- levelOf(2) == 0 wrt. any variable order
- levelOf(0∗x+2) == 0 wrt. any variable order
- levelOf(x+2) == 1 wrt. [x < y < z]
- levelOf(x+2) == 2 wrt. [y < x < z]
- levelOf(x+2) == 3 wrt. [y < z < x]
- levelOf(x∗y+2) == 2 wrt. [x < y < z] because of y
- levelOf(x∗y+2) == 2 wrt. [y < x < z] because of x
- levelOf(x∗y+2) == 3 wrt. [x < z < y] because of y Preconditions:
- 'poly.gatherVariables()' must be a subset of 'variableOrder'.

14.66.2.4 mergeCellWithPoly()

```
std::optional<OpenCADCell> smtrat::onecellcad::recursive::merge↩
CellWithPoly (
            OpenCADCell & cell,
            const RANPoint & point,
            const std::vector< carl::Variable > & variableOrder,
            const MultiPoly poly )
```

Merge the given open OpenCADCell 'cell' that contains the given 'point' (called ”alpha” in [1]) with a polynomial 'poly'.

Before the merge 'cell' represents a region that is sign-invariant on other (previously merged) polynomials (all signs are non-zero). The returned cell represents a region that is additionally sign-invariant on 'poly' (also with non-zero sign).

Returns either an OpenCADCell or nothing (representing a failed construction)

14.66.2.5 operator<<() [1/3]

```
std::ostream& smtrat::onecellcad::recursive::operator<< (
    std::ostream & o,
    const OpenCADCell & c )
```

14.66.2.6 operator<<() [2/3]

```
std::ostream& smtrat::onecellcad::recursive::operator<< (
    std::ostream & o,
    const Section & s )
```

14.66.2.7 operator<<() [3/3]

```
std::ostream& smtrat::onecellcad::recursive::operator<< (
    std::ostream & o,
    const Sector & s )
```

14.66.2.8 toStdMap()

```
std::map<carl::Variable, RAN> smtrat::onecellcad::recursive::toStdMap (
    const RANPoint & point,
    size_t count,
    const std::vector< carl::Variable > & variableOrder )
```

Create a mapping from the first 'count'-many variables in the given 'variableOrder' to the first 'count'-many components of the given 'point'.

14.67 smtrat::options_detail Namespace Reference

Functions

- void print_cmake_options ()
- void print_info ()
- void print_license ()

Data Structures

- struct AbstractTheory

  Base class for all theories.

- struct ArithmeticTheory

  Implements the theory of arithmetic, including LRA, LIA, NRA and NIA.

- class Attribute

  Represents an Attribute.

- struct AttributeParser
- struct AttributeValueParser
- struct BinaryParser

  Parses binaries: `#b[01]+`

- struct BitvectorTheory

  Implements the theory of bitvectors.

- struct BooleanEncodingTheory

  Implements the theory of bitvectors.

- struct CoreTheory

  Implements the core theory of the booleans.

- struct DecimalParser

  Parses decimals: `numeral.0*numeral`

- struct ErrorHandler
- struct FixedWidthConstant

  Represents a constant of a fixed width.

- struct FunctionInstantiator
- struct HexadecimalParser

  Parses hexadecimals: `#x[0-9a-fA-F]+`

- struct Identifier
- struct IdentifierParser
- struct IndexedFunctionInstantiator
- struct Instantiator
- class InstructionHandler
- struct KeywordParser

  Parses keywords: `:simple_symbol`

- struct LogicParser
- struct NumeralParser

  Parses numerals: `(0 | [1-9][0-9]*)`

- class OutputWrapper
- struct ParserSettings
- struct ParserState
- struct QEParser
- struct QualifiedIdentifierParser
- struct QuantifierParser
- struct RationalPolicies

  Specialization of qi::real_policies for a Rational.

- struct ScriptParser
- struct SExpressionParser

- struct SExpressionSequence
- struct SimpleSymbolParser

  Parses symbols: `simple_symbol | quoted_symbol` *where.*
- struct Skipper
- class SMTLIBParser
- struct SortedVariableParser
- struct SortParser
- struct SpecConstantParser
- struct StringParser

  *Parses strings: " . + " with escape sequences \\ " and *
- struct SymbolParser
- struct TermParser
- struct Theories

  The Theories class combines all implemented theories and provides a single interface to interact with all theories at once.
- struct TheoryError
- struct UninterpretedTheory

  Implements the theory of equalities and uninterpreted functions.
- struct UserFunctionInstantiator

14.84 smtrat::uf_impl Namespace Reference

Data Structures

- struct estimator

  Distance estimation for a range delimited by iterators; if the given iterators are random access, returns the result of std::distance in the estimate_distance function.
- struct estimator< IteratorType, false >
- class uf_data_wrapper

  Wrapper around data entry and uf_rank_and_class; this class contains a value of type T and both rank and class of an entry in the UF datastructure.
- class uf_data_wrapper< void, compression >

  Special case of the uf_data_wrapper in case the data type is void.
- class uf_rank_and_class

  Wrapper class that contains the rank and parent class of some entry of the UF datastructure.
- class uf_rank_and_class< true >

  Compressed implementation of uf_rank_and_class.

14.85 smtrat::unsatcore Namespace Reference

Contains strategy implementations for unsat core computations.

Data Structures

- class UnsatCoreBackend
- class UnsatCoreBackend< Solver, UnsatCoreStrategy::ModelExclusion >

  Implements an easy strategy to obtain an unsatisfiable core.

14.85.1 Detailed Description

Contains strategy implementations for unsat core computations.

14.87 smtrat::vb Namespace Reference

Data Structures

- class Bound

  Class for the bound of a variable.

- class Variable

  Class for a variable.

- class VariableBounds

  Class to manage the bounds of a variable.

Functions

- template<typename Type >
  std::ostream & operator<< (std::ostream &_os, const VariableBounds< Type > &_vs)

  Prints the contents of the given variable bounds manager to the given stream.

14.87.1 Function Documentation

14.87.1.1 operator<<()

```
template<typename Type >
std::ostream& smtrat::vb::operator<< (
    std::ostream & _os,
    const VariableBounds< Type > & _vs ) [inline]
```

Prints the contents of the given variable bounds manager to the given stream.

Parameters

_os	The stream to print on.
_vs	The variable bounds manager to print.

Returns The stream after printing on it.

14.88 smtrat::vs Namespace Reference

Data Structures

- class Condition
- class State
- class Substitution
- struct substitutionPointerEqual
- struct substitutionPointerHash
- struct unsignedTripleCmp

Typedefs

- typedef std::set< carl::PointerSet< Condition > > ConditionSetSet
- typedef std::set< ConditionSetSet > ConditionSetSetSet
- typedef std::list< const Condition * > ConditionList
- typedef std::vector< ConditionList > DisjunctionOfConditionConjunctions
- typedef std::pair< size_t, std::pair< size_t, size_t > > UnsignedTriple
- typedef std::pair< UnsignedTriple, vs::State * > ValStatePair
- typedef std::map< UnsignedTriple, vs::State *, unsignedTripleCmp > ValuationMap
- typedef std::vector< smtrat::ConstraintT > ConstraintVector

  a vector of constraints

- typedef std::vector< ConstraintVector > DisjunctionOfConstraintConjunctions

  a vector of vectors of constraints

- template<typename T >
  using SubstitutionFastPointerMap = std::unordered_map< const smtrat::Poly *, T, substitutionPointerHash, substitutionPointerEqual >

Functions

- std::ostream & operator<< (std::ostream &_out, const Condition &_condition)
- void simplify (DisjunctionOfConstraintConjunctions &)

  Simplifies a disjunction of conjunctions of constraints by deleting consistent constraint and inconsistent conjunctions of constraints.

- void simplify (DisjunctionOfConstraintConjunctions &_toSimplify, Variables &_conflictingVars, const smtrat::EvalDoubleIntervalMap &_solutionSpace)
- bool splitProducts (DisjunctionOfConstraintConjunctions &, bool=false)

  Splits all constraints in the given disjunction of conjunctions of constraints having a non-trivial factorization into a set of constraints which compare the factors instead.

- bool splitProducts (const ConstraintVector &, DisjunctionOfConstraintConjunctions &, bool=false)

  Splits all constraints in the given conjunction of constraints having a non-trivial factorization into a set of constraints which compare the factors instead.

- DisjunctionOfConstraintConjunctions splitProducts (const smtrat::ConstraintT &, bool=false)

  Splits the given constraint into a set of constraints which compare the factors of the factorization of the constraints considered polynomial.

- void splitSosDecompositions (DisjunctionOfConstraintConjunctions &_toSimplify)
- DisjunctionOfConstraintConjunctions getSignCombinations (const smtrat::ConstraintT &)

  For a given constraint f_1...*f_n ~ 0 this method computes all combinations of constraints f_1 ~_1 0 ...*

- void getOddBitStrings (std::size_t _length, std::vector< std::bitset< MAX_PRODUCT_SPLIT_NUMBER > > &_strings)
- void getEvenBitStrings (std::size_t _length, std::vector< std::bitset< MAX_PRODUCT_SPLIT_NUMBER > > &_strings)
- void print (DisjunctionOfConstraintConjunctions &_substitutionResults)

  Prints the given disjunction of conjunction of constraints.

- bool substitute (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper, Variables &_conflictingVariables, const smtrat::EvalDoubleIntervalMap &_solutionSpace)
- bool substituteNormal (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper, Variables &_conflictingVariables, const smtrat::EvalDoubleIntervalMap &_solutionSpace)
- bool substituteNormalSqrtEq (const smtrat::Poly &_radicand, const smtrat::Poly &_q, const smtrat::Poly &_r, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper)

  Sub-method of substituteNormalSqrt, where applying the substitution led to a term containing a square root.

- bool substituteNormalSqrtNeq (const smtrat::Poly &_radicand, const smtrat::Poly &_q, const smtrat::Poly &_r, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper)

  Sub-method of substituteNormalSqrt, where applying the substitution led to a term containing a square root.

- bool substituteNormalSqrtLess (const smtrat::Poly &_radicand, const smtrat::Poly &_q, const smtrat::Poly &_r, const smtrat::Poly &_s, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper)

  Sub-method of substituteNormalSqrt, where applying the substitution led to a term containing a square root.

- bool substituteNormalSqrtLeq (const smtrat::Poly &_radicand, const smtrat::Poly &_q, const smtrat::Poly &_r, const smtrat::Poly &_s, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper)

  Sub-method of substituteNormalSqrt, where applying the substitution led to a term containing a square root.

- bool substitutePlusEps (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper, Variables &_conflictingVariables, const smtrat::EvalDoubleIntervalMap &_solutionSpace)
- bool substituteEpsGradients (const smtrat::ConstraintT &_cons, const Substitution &_subs, const Relation _relation, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper, Variables &_conflictingVariables, const smtrat::EvalDoubleIntervalMap &_solutionSpace)
- void substituteInf (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunctions &_result, Variables &_conflictingVariables, const smtrat::EvalDoubleIntervalMap &_solutionSpace)
- void substituteInfLessGreater (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunction &_result)

  Applies the given substitution to the given constraint, where the substitution is of the form [x -> +/-infinity] with x as the variable and c and b polynomials in the real theory excluding x.

- void substituteTrivialCase (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunctions &_result)

  Deals with the case, that the left hand side of the constraint to substitute is a trivial polynomial in the variable to substitute.

- void substituteNotTrivialCase (const smtrat::ConstraintT &, const Substitution &, DisjunctionOfConstraintConjunctions &)

  Deals with the case, that the left hand side of the constraint to substitute is not a trivial polynomial in the variable to substitute.

- template<class combineType >
  bool combine (const std::vector< std::vector< std::vector< combineType > > > &_toCombine, std::vector< std::vector< combineType > > &_combination)

  Combines vectors.

- void simplify (DisjunctionOfConstraintConjunctions &, carl::Variables &, const smtrat::EvalDoubleIntervalMap &)

  Simplifies a disjunction of conjunctions of constraints by deleting consistent constraint and inconsistent conjunctions of constraints.

- void getOddBitStrings (size_t _length, std::vector< std::bitset< MAX_PRODUCT_SPLIT_NUMBER > > &_strings)

- void getEvenBitStrings (size_t _length, std::vector< std::bitset< MAX_PRODUCT_SPLIT_NUMBER > > &↩ _strings)
- bool substitute (const smtrat::ConstraintT &, const Substitution &, DisjunctionOfConstraintConjunctions &, bool _accordingPaper, carl::Variables &, const smtrat::EvalDoubleIntervalMap &)

  Applies a substitution to a constraint and stores the results in the given vector.
- bool substituteNormal (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper, carl::Variables &_conflictingVariables, const smtrat::EvalDoubleIntervalMap &_solutionSpace)

  Applies a substitution of a variable to a term, which is not minus infinity nor a to an square root expression plus an infinitesimal.
- bool substitutePlusEps (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper, carl::Variables &_conflictingVariables, const smtrat::EvalDoubleIntervalMap &_solutionSpace)

  Applies the given substitution to the given constraint, where the substitution is of the form [x -> t+epsilon] with x as the variable and c and b polynomials in the real theory excluding x.
- bool substituteEpsGradients (const smtrat::ConstraintT &_cons, const Substitution &_subs, const carl↩ ::Relation _relation, DisjunctionOfConstraintConjunctions &, bool _accordingPaper, carl::Variables &_↩ conflictingVariables, const smtrat::EvalDoubleIntervalMap &_solutionSpace)

  Sub-method of substituteEps, where one of the gradients in the point represented by the substitution must be negative if the given relation is less or positive if the given relation is greater.
- void substituteInf (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunctions &_result, carl::Variables &_conflictingVariables, const smtrat::EvalDoubleIntervalMap &_solutionSpace)

  Applies the given substitution to the given constraint, where the substitution is of the form [x -> -infinity] with x as the variable and c and b polynomials in the real theory excluding x.
- std::ostream & operator<< (std::ostream &os, const Substitution &s)

  Prints the given substitution on the given output stream.

14.88.1 Typedef Documentation

14.88.1.1 ConditionList `typedef std::list< const Condition* > smtrat::vs::ConditionList`

14.88.1.2 ConditionSetSet `typedef std::set< carl::PointerSet<Condition> > smtrat::vs::ConditionSetSet`

14.88.1.3 ConditionSetSetSet `typedef std::set< ConditionSetSet > smtrat::vs::ConditionSetSetSet`

14.88.1.4 ConstraintVector `typedef std::vector<smtrat::ConstraintT> smtrat::vs::ConstraintVector`

a vector of constraints

14.88.1.5 DisjunctionOfConditionConjunctions `typedef std::vector< ConditionList > smtrat::vs::DisjunctionOfCon`

14.88.1.6 DisjunctionOfConstraintConjunctions `typedef std::vector<ConstraintVector> smtrat::vs::DisjunctionOfC`

a vector of vectors of constraints

14.88.1.7 SubstitutionFastPointerMap

```
template<typename T >
using smtrat::vs::SubstitutionFastPointerMap = typedef std::unordered_map<const smtrat::Poly*,
T, substitutionPointerHash, substitutionPointerEqual>
```

14.88.1.8 UnsignedTriple

```
typedef std::pair<size_t, std::pair<size_t, size_t> > smtrat::vs::UnsignedTriple
```

14.88.1.9 ValStatePair

```
typedef std::pair<UnsignedTriple, vs::State*> smtrat::vs::ValStatePair
```

14.88.1.10 ValuationMap

```
typedef std::map<UnsignedTriple, vs::State*, unsignedTripleCmp> smtrat::vs::Valuation
```

14.88.2 Function Documentation

14.88.2.1 combine()

```
template<class combineType >
bool smtrat::vs::combine (
            const std::vector< std::vector< std::vector< combineType > > > & _toCombine,
            std::vector< std::vector< combineType > > & _combination )
```

Combines vectors.

Parameters

_toCombine	The vectors to combine.
_combination	The resulting combination.

Returns false, if the upper limit in the number of combinations resulting by this method is exceeded. Note, that this hinders a combinatorial blow up. true, otherwise.

14.88.2.2 getEvenBitStrings() [1/2]

```
void smtrat::vs::getEvenBitStrings (
            size_t _length,
            std::vector< std::bitset< MAX_PRODUCT_SPLIT_NUMBER > > & _strings )
```

Parameters

_length	The maximal length of the bit strings with even parity to compute.
_strings	All bit strings of length less or equal the given length with even parity.

14.88.2.3 getEvenBitStrings() [2/2]

```
void smtrat::vs::getEvenBitStrings (
            std::size_t _length,
            std::vector< std::bitset< MAX_PRODUCT_SPLIT_NUMBER > > & _strings )
```

14.88.2.4 getOddBitStrings() [1/2]

```
void smtrat::vs::getOddBitStrings (
            size_t _length,
            std::vector< std::bitset< MAX_PRODUCT_SPLIT_NUMBER > > & _strings )
```

Parameters

_length	The maximal length of the bit strings with odd parity to compute.
_strings	All bit strings of length less or equal the given length with odd parity.

14.88.2.5 getOddBitStrings() [2/2]

```
void smtrat::vs::getOddBitStrings (
    std::size_t _length,
    std::vector< std::bitset< MAX_PRODUCT_SPLIT_NUMBER > > & _strings )
```

14.88.2.6 getSignCombinations()

```
DisjunctionOfConstraintConjunctions smtrat::vs::getSign↩
Combinations (
    const smtrat::ConstraintT &  )
```

For a given constraint f_1∗...∗f_n ∼ 0 this method computes all combinations of constraints f_1 ∼_1 0 ...

f_n ∼_n 0 such that

```
f_1 ~_1 0 and ... and f_n ~_n 0   iff   f_1*...*f_n ~ 0
```

holds.

Parameters

_constraint	A pointer to the constraint to split this way.

Returns The resulting combinations.

14.88.2.7 operator<<() [1/2]

```
std::ostream& smtrat::vs::operator<< (
    std::ostream & _out,
    const Condition & _condition )
```

14.88.2.8 operator<<() [2/2]

```
std::ostream & smtrat::vs::operator<< (
    std::ostream & os,
    const Substitution & s )
```

Prints the given substitution on the given output stream.

Parameters

_out	The output stream, on which to write.
_substitution	The substitution to print.

Returns The output stream after printing the substitution on it.

14.88.2.9 print()

```
void smtrat::vs::print (
    DisjunctionOfConstraintConjunctions & _substitutionResults )
```

Prints the given disjunction of conjunction of constraints.

Parameters

_substitutionResults	The disjunction of conjunction of constraints to print.

14.88.2.10 simplify() [1/3]

```
void smtrat::vs::simplify (
    DisjunctionOfConstraintConjunctions &  )
```

Simplifies a disjunction of conjunctions of constraints by deleting consistent constraint and inconsistent conjunctions of constraints.

If a conjunction of only consistent constraints exists, the simplified disjunction contains one empty conjunction.

Parameters

_toSimplify	The disjunction of conjunctions to simplify.

14.88.2.11 simplify() [2/3]

```
void smtrat::vs::simplify (
    DisjunctionOfConstraintConjunctions & ,
    carl::Variables & ,
    const smtrat::EvalDoubleIntervalMap &  )
```

Simplifies a disjunction of conjunctions of constraints by deleting consistent constraint and inconsistent conjunctions of constraints.

If a conjunction of only consistent constraints exists, the simplified disjunction contains one empty conjunction.

Parameters

_toSimplify	The disjunction of conjunctions to simplify.
_conflictingVars	
_solutionSpace	

14.88.2.12 simplify() [3/3]

```
void smtrat::vs::simplify (
    DisjunctionOfConstraintConjunctions & _toSimplify,
    Variables & _conflictingVars,
    const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

14.88.2.13 splitProducts() [1/3]

```
bool smtrat::vs::splitProducts (
    const ConstraintVector & ,
    DisjunctionOfConstraintConjunctions & ,
    bool  = false )
```

Splits all constraints in the given conjunction of constraints having a non-trivial factorization into a set of constraints which compare the factors instead.

Parameters

_toSimplify	The conjunction of the constraints to split.
_result	The result, being a disjunction of conjunctions of constraints.
_onlyNeq	A flag indicating that only constraints with the relation symbol != are split.

Returns false, if the upper limit in the number of combinations resulting by this method is exceeded. Note, that this hinders a combinatorial blow up. true, otherwise.

14.88.2.14 splitProducts() [2/3]

```
DisjunctionOfConstraintConjunctions smtrat::vs::splitProducts (
    const smtrat::ConstraintT & ,
    bool  = false )
```

Splits the given constraint into a set of constraints which compare the factors of the factorization of the constraints considered polynomial.

Parameters

_constraint	A pointer to the constraint to split.
_onlyNeq	A flag indicating that only constraints with the relation symbol != are split.

Returns The resulting disjunction of conjunctions of constraints, which is semantically equivalent to the given constraint.

14.88.2.15 splitProducts() [3/3]

```
bool smtrat::vs::splitProducts (
    DisjunctionOfConstraintConjunctions & ,
    bool  = false )
```

Splits all constraints in the given disjunction of conjunctions of constraints having a non-trivial factorization into a set of constraints which compare the factors instead.

Parameters

_toSimplify	The disjunction of conjunctions of the constraints to split.
_onlyNeq	A flag indicating that only constraints with the relation symbol != are split.

Returns false, if the upper limit in the number of combinations resulting by this method is exceeded. Note, that this hinders a combinatorial blow up. true, otherwise.

14.88.2.16 splitSosDecompositions()

```
void smtrat::vs::splitSosDecompositions (
    DisjunctionOfConstraintConjunctions & _toSimplify )
```

14.88.2.17 substitute() [1/2]

```
bool smtrat::vs::substitute (
    const smtrat::ConstraintT & ,
    const Substitution & ,
    DisjunctionOfConstraintConjunctions & ,
    bool _accordingPaper,
    carl::Variables & ,
    const smtrat::EvalDoubleIntervalMap &  )
```

Applies a substitution to a constraint and stores the results in the given vector.

Parameters

_cons	The constraint to substitute in.
_subs	The substitution to apply.
_result	The vector, in which to store the results of this substitution.

Returns false, if the upper limit in the number of combinations in the result of the substitution is exceeded. Note, that this hinders a combinatorial blow up. true, otherwise.

14.88.2.18 substitute() [2/2]

```
bool smtrat::vs::substitute (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    DisjunctionOfConstraintConjunctions & _result,
    bool _accordingPaper,
    Variables & _conflictingVariables,
    const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

14.88.2.19 substituteEpsGradients() [1/2]

```
bool smtrat::vs::substituteEpsGradients (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    const carl::Relation _relation,
    DisjunctionOfConstraintConjunctions & ,
    bool _accordingPaper,
    carl::Variables & _conflictingVariables,
    const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

Sub-method of substituteEps, where one of the gradients in the point represented by the substitution must be negative if the given relation is less or positive if the given relation is greater.

Parameters

_cons	The constraint to substitute in.
_subs	The substitution to apply.

Parameters

_relation	The relation symbol, deciding whether the substitution result must be negative or positive.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.
_accordingPaper	A flag that indicates whether to apply the virtual substitution rules according to the paper "Quantifier elimination for real algebra - the quadratic case and beyond." by Volker Weispfenning (true) or in an adapted way which omits a higher degree in the result by splitting the result in more cases (false).
_conflictingVariables	If a conflict with the given solution space occurs, the variables being part of this conflict are stored in this container.
_solutionSpace	The solution space in form of double intervals of the variables occurring in the given constraint.

14.88.2.20 substituteEpsGradients() [2/2]

```
bool smtrat::vs::substituteEpsGradients (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    const Relation _relation,
    DisjunctionOfConstraintConjunctions & _result,
    bool _accordingPaper,
    Variables & _conflictingVariables,
    const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

14.88.2.21 substituteInf() [1/2]

```
void smtrat::vs::substituteInf (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    DisjunctionOfConstraintConjunctions & _result,
    carl::Variables & _conflictingVariables,
    const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

Applies the given substitution to the given constraint, where the substitution is of the form [x -> -infinity] with x as the variable and c and b polynomials in the real theory excluding x.

The constraint is of the form "f(x) \rho 0" with \rho element of {=,!=,<,>,<=,>=} and k as the maximum degree of x in f.

Parameters

_cons	The constraint to substitute in.
_subs	The substitution to apply.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.
_conflictingVariables	If a conflict with the given solution space occurs, the variables being part of this conflict are stored in this container.
_solutionSpace	The solution space in form of double intervals of the variables occurring in the given constraint.

14.88.2.22 substituteInf() [2/2]

```
void smtrat::vs::substituteInf (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    DisjunctionOfConstraintConjunctions & _result,
    Variables & _conflictingVariables,
    const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

14.88.2.23 substituteInfLessGreater()

```
void smtrat::vs::substituteInfLessGreater (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    DisjunctionOfConstraintConjunctions & _result )
```

Applies the given substitution to the given constraint, where the substitution is of the form [x -> +/-infinity] with x as the variable and c and b polynomials in the real theory excluding x.

The constraint is of the form "a∗x^2+bx+c \rho 0", where \rho is less or greater.

Parameters

_cons	The constraint to substitute in.
_subs	The substitution to apply.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.

14.88.2.24 substituteNormal() [1/2]

```
bool smtrat::vs::substituteNormal (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    DisjunctionOfConstraintConjunctions & _result,
    bool _accordingPaper,
    carl::Variables & _conflictingVariables,
    const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

Applies a substitution of a variable to a term, which is not minus infinity nor a to an square root expression plus an infinitesimal.

Parameters

_cons	The constraint to substitute in.
_subs	The substitution to apply.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.
_accordingPaper	A flag that indicates whether to apply the virtual substitution rules according to the paper "Quantifier elimination for real algebra - the quadratic case and beyond." by Volker Weispfenning (true) or in an adapted way which omits a higher degree in the result by splitting the result in more cases (false).
_conflictingVariables	If a conflict with the given solution space occurs, the variables being part of this conflict are stored in this container.
_solutionSpace	The solution space in form of double intervals of the variables occurring in the given constraint.

14.88.2.25 substituteNormal() [2/2]

```
bool smtrat::vs::substituteNormal (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    DisjunctionOfConstraintConjunctions & _result,
    bool _accordingPaper,
    Variables & _conflictingVariables,
    const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

14.88.2.26 substituteNormalSqrtEq()

```
bool smtrat::vs::substituteNormalSqrtEq (
    const smtrat::Poly & _radicand,
    const smtrat::Poly & _q,
    const smtrat::Poly & _r,
    DisjunctionOfConstraintConjunctions & _result,
    bool _accordingPaper )
```

Sub-method of substituteNormalSqrt, where applying the substitution led to a term containing a square root.

The relation symbol of the constraint to substitute is "=".

```
(_q+_r*sqrt(_radicand))
```

The term then looks like: ----------— _s

Parameters

_radicand	The radicand of the square root.
_q	The summand not containing the square root.
_r	The coefficient of the radicand.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.
_accordingPaper	A flag that indicates whether to apply the virtual substitution rules according to the paper "Quantifier elimination for real algebra - the quadratic case and beyond." by Volker Weispfenning (true) or in an adapted way which omits a higher degree in the result by splitting the result in more cases (false).

14.88.2.27 substituteNormalSqrtLeq()

```
bool smtrat::vs::substituteNormalSqrtLeq (
    const smtrat::Poly & _radicand,
    const smtrat::Poly & _q,
    const smtrat::Poly & _r,
    const smtrat::Poly & _s,
    DisjunctionOfConstraintConjunctions & _result,
    bool _accordingPaper )
```

Sub-method of substituteNormalSqrt, where applying the substitution led to a term containing a square root.

The relation symbol of the constraint to substitute is less or equal.

```
(_q+_r*sqrt(_radicand))
```

The term then looks like: ----------— _s

Parameters

_radicand	The radicand of the square root.
_q	The summand not containing the square root.
_r	The coefficient of the radicand.
_s	The denominator of the expression containing the square root.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.
_accordingPaper	A flag that indicates whether to apply the virtual substitution rules according to the paper "Quantifier elimination for real algebra - the quadratic case and beyond." by Volker Weispfenning (true) or in an adapted way which omits a higher degree in the result by splitting the result in more cases (false).

14.88.2.28 substituteNormalSqrtLess()

```
bool smtrat::vs::substituteNormalSqrtLess (
    const smtrat::Poly & _radicand,
    const smtrat::Poly & _q,
    const smtrat::Poly & _r,
    const smtrat::Poly & _s,
    DisjunctionOfConstraintConjunctions & _result,
    bool _accordingPaper )
```

Sub-method of substituteNormalSqrt, where applying the substitution led to a term containing a square root.

The relation symbol of the constraint to substitute is less.

```
(_q+_r*sqrt(_radicand))
```

The term then looks like: ----------— _s

Parameters

_radicand	The radicand of the square root.
_q	The summand not containing the square root.
_r	The coefficient of the radicand.
_s	The denominator of the expression containing the square root.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.
_accordingPaper	A flag that indicates whether to apply the virtual substitution rules according to the paper "Quantifier elimination for real algebra - the quadratic case and beyond." by Volker Weispfenning (true) or in an adapted way which omits a higher degree in the result by splitting the result in more cases (false).

14.88.2.29 substituteNormalSqrtNeq()

```
bool smtrat::vs::substituteNormalSqrtNeq (
    const smtrat::Poly & _radicand,
    const smtrat::Poly & _q,
    const smtrat::Poly & _r,
    DisjunctionOfConstraintConjunctions & _result,
    bool _accordingPaper )
```

Sub-method of substituteNormalSqrt, where applying the substitution led to a term containing a square root.

The relation symbol of the constraint to substitute is "!=".

```
(_q+_r*sqrt(_radicand))
```

The term then looks like: ----------— _s

Parameters

_radicand	The radicand of the square root.
_q	The summand not containing the square root.
_r	The coefficient of the radicand.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.
_accordingPaper	A flag that indicates whether to apply the virtual substitution rules according to the paper "Quantifier elimination for real algebra - the quadratic case and beyond." by Volker Weispfenning (true) or in an adapted way which omits a higher degree in the result by splitting the result in more cases (false).

14.88.2.30 substituteNotTrivialCase()

```
void smtrat::vs::substituteNotTrivialCase (
    const smtrat::ConstraintT & ,
    const Substitution & ,
    DisjunctionOfConstraintConjunctions & )
```

Deals with the case, that the left hand side of the constraint to substitute is not a trivial polynomial in the variable to substitute.

The constraints left hand side then should looks like: ax^2+bx+c

Parameters

_cons	The constraint to substitute in.
_subs	The substitution to apply.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.

14.88.2.31 substitutePlusEps() [1/2]

```
bool smtrat::vs::substitutePlusEps (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    DisjunctionOfConstraintConjunctions & _result,
    bool _accordingPaper,
    carl::Variables & _conflictingVariables,
    const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

Applies the given substitution to the given constraint, where the substitution is of the form [x -> t+epsilon] with x as the variable and c and b polynomials in the real theory excluding x.

The constraint is of the form "f(x) \rho 0" with \rho element of {=,!=,<,>,<=,>=} and k as the maximum degree of x in f.

Parameters

_cons	The constraint to substitute in.
_subs	The substitution to apply.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.
_accordingPaper	A flag that indicates whether to apply the virtual substitution rules according to the paper "Quantifier elimination for real algebra - the quadratic case and beyond." by Volker Weispfenning (true) or in an adapted way which omits a higher degree in the result by splitting the result in more cases (false).
_conflictingVariables	If a conflict with the given solution space occurs, the variables being part of this conflict are stored in this container.
_solutionSpace	The solution space in form of double intervals of the variables occurring in the given constraint.

14.88.2.32 substitutePlusEps() [2/2]

```
bool smtrat::vs::substitutePlusEps (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    DisjunctionOfConstraintConjunctions & _result,
    bool _accordingPaper,
    Variables & _conflictingVariables,
    const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

14.88.2.33 substituteTrivialCase()

```
void smtrat::vs::substituteTrivialCase (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    DisjunctionOfConstraintConjunctions & _result )
```

Deals with the case, that the left hand side of the constraint to substitute is a trivial polynomial in the variable to substitute.

The constraints left hand side then should look like: ax^2+bx+c

Parameters

_cons	The constraint to substitute in.
_subs	The substitution to apply.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.

15 Data Structure Documentation

15.1 smtrat::AbstractModuleFactory Struct Reference

```
#include <StrategyGraph.h>
```

Public Member Functions

  Resolve another unknown function call.

Static Public Member Functions

- static void addSimpleSorts (qi::symbols< char, carl::Sort > &)

  Initialize the global symbol table for simple sorts.
- static void addConstants (qi::symbols< char, types::ConstType > &)

  Initialize the global symbol table for constants.

Data Fields

- ParserState * state

15.2.1 Detailed Description

Base class for all theories.

A theory represents one or multiple SMT-LIB theories and takes care of converting smtlib constructs into our datastructures.

A theory has two kinds of functions:

- Initializer are static functions that initialize global datastructures. These are for example the set of constants.
- Handlers are member functions that implement a certain SMT-LIB functionality. Handlers always return a boolean that indicates if the theory could complete the request. Oftentimes, a theory will return false because the request should be handled by another theory. Handlers are used, whenever the parser can not easily decide which theory to use and thus tries to call every theory. The result of a handler is always a term that is returned through a reference argument.
  A theory may override any of the following methods.

15.2.2 Constructor & Destructor Documentation

15.2.2.1 AbstractTheory()

```
smtrat::parser::AbstractTheory::AbstractTheory (
    ParserState * state ) [inline]
```

15.2.2.2 ~AbstractTheory()

```
virtual smtrat::parser::AbstractTheory::~AbstractTheory ( ) [inline], [virtual]
```

15.2.3 Member Function Documentation

15.2.3.1 addConstants()

```
static void smtrat::parser::AbstractTheory::addConstants (
    qi::symbols< char, types::ConstType > & ) [inline], [static]
```

Initialize the global symbol table for constants.

15.2.3.2 addSimpleSorts()

```
static void smtrat::parser::AbstractTheory::addSimpleSorts (
    qi::symbols< char, carl::Sort > & ) [inline], [static]
```

Initialize the global symbol table for simple sorts.

15.2.3.3 declareVariable()

```
virtual bool smtrat::parser::AbstractTheory::declareVariable (
    const std::string & ,
    const carl::Sort & ,
    types::VariableType & ,
    TheoryError & errors ) [inline], [virtual]
```

Declare a new variable with the given name and the given sort.

Reimplemented in smtrat::parser::UninterpretedTheory, smtrat::parser::ArithmeticTheory, smtrat::parser::CoreTheory, and smtrat::parser::BitvectorTheory.

15.2.3.4 expandDistinct()

```
template<typename T , typename Builder >
FormulaT smtrat::parser::AbstractTheory::expandDistinct (
            const std::vector< T > & values,
            const Builder & neqBuilder )  [inline]
```

15.2.3.5 functionCall()

```
virtual bool smtrat::parser::AbstractTheory::functionCall (
            const Identifier & ,
            const std::vector< types::TermType > & ,
            types::TermType & ,
            TheoryError & errors )  [inline], [virtual]
```

Resolve another unknown function call.

Reimplemented in smtrat::parser::UninterpretedTheory, smtrat::parser::BitvectorTheory, smtrat::parser::ArithmeticTheory, and smtrat::parser::CoreTheory.

15.2.3.6 handleDistinct()

```
virtual bool smtrat::parser::AbstractTheory::handleDistinct (
            const std::vector< types::TermType > & ,
            types::TermType & ,
            TheoryError & errors )  [inline], [virtual]
```

Resolve a distinct operator.

Reimplemented in smtrat::parser::ArithmeticTheory, smtrat::parser::BitvectorTheory, smtrat::parser::CoreTheory, and smtrat::parser::UninterpretedTheory.

15.2.3.7 handleITE()

```
virtual bool smtrat::parser::AbstractTheory::handleITE (
            const FormulaT & ,
            const types::TermType & ,
            const types::TermType & ,
            types::TermType & ,
            TheoryError & errors )  [inline], [virtual]
```

Resolve an if-then-else operator.

Reimplemented in smtrat::parser::UninterpretedTheory, smtrat::parser::ArithmeticTheory, smtrat::parser::BitvectorTheory, and smtrat::parser::CoreTheory.

15.2.3.8 instantiate()

```
virtual bool smtrat::parser::AbstractTheory::instantiate (
            const types::VariableType & ,
            const types::TermType & ,
            types::TermType & ,
            TheoryError & errors )  [inline], [virtual]
```

Instantiate a variable within a term.

Reimplemented in smtrat::parser::BitvectorTheory, and smtrat::parser::ArithmeticTheory.

15.2.3.9 refreshVariable()

```
virtual bool smtrat::parser::AbstractTheory::refreshVariable (
    const types::VariableType & ,
    types::VariableType & ,
    TheoryError & errors )  [inline], [virtual]
```

Reimplemented in smtrat::parser::BitvectorTheory.

15.2.3.10 resolveSymbol()

```
virtual bool smtrat::parser::AbstractTheory::resolveSymbol (
    const Identifier & ,
    types::TermType & ,
    TheoryError & errors )  [inline], [virtual]
```

Resolve a symbol that was not declared within the ParserState.

This might be a symbol that actually uses indices, for example bitvector constants.

Reimplemented in smtrat::parser::BitvectorTheory.

15.2.4 Field Documentation

15.2.4.1 state

15.7 benchmax::slurm::ArchiveProperties Struct Reference

All properties needed to archive log files.

```
#include <SlurmUtilities.h>
```

Data Fields

- std::string filename_archive

  Filename of the archive.

- std::string tmp_dir

  Temporary directory to look for output files.

15.7.1 Detailed Description

All properties needed to archive log files.

15.7.2 Field Documentation

15.7.2.1 filename_archive `std::string benchmax::slurm::ArchiveProperties::filename_archive`

Filename of the archive.

15.7.2.2 tmp_dir `std::string benchmax::slurm::ArchiveProperties::tmp_dir`

Temporary directory to look for output files.

15.8 smtrat::parser::ArithmeticTheory Struct Reference

Implements the theory of arithmetic, including LRA, LIA, NRA and NIA.

```
#include <Arithmetic.h>
```

Public Member Functions

- ArithmeticTheory (ParserState *state)
- bool declareVariable (const std::string &name, const carl::Sort &sort, types::VariableType &result, TheoryError &errors)

  Declare a new variable with the given name and the given sort.

- bool handleITE (const FormulaT &ifterm, const types::TermType &thenterm, const types::TermType &elseterm, types::TermType &result, TheoryError &errors)

  Resolve an if-then-else operator.

- bool handleDistinct (const std::vector< types::TermType > &arguments, types::TermType &result, TheoryError &errors)

  Resolve a distinct operator.

- bool instantiate (const types::VariableType &var, const types::TermType &replacement, types::TermType &result, TheoryError &errors)

  Instantiate a variable within a term.

- bool functionCall (const Identifier &identifier, const std::vector< types::TermType > &arguments, types::TermType &result, TheoryError &errors)

  Resolve another unknown function call.

- virtual bool resolveSymbol (const Identifier &, types::TermType &, TheoryError &errors)

  Resolve a symbol that was not declared within the ParserState.

- template<typename T , typename Builder >

15.8.1 Detailed Description

Implements the theory of arithmetic, including LRA, LIA, NRA and NIA.

15.8.2 Constructor & Destructor Documentation

15.8.2.1 ArithmeticTheory()

```
smtrat::parser::ArithmeticTheory::ArithmeticTheory (
    ParserState * state )
```

15.8.3 Member Function Documentation

15.8.3.1 addConstants()

```
static void smtrat::parser::AbstractTheory::addConstants (
    qi::symbols< char, types::ConstType > & ) [inline], [static], [inherited]
```

Initialize the global symbol table for constants.

15.8.3.2 addSimpleSorts()

```
void smtrat::parser::ArithmeticTheory::addSimpleSorts (
    qi::symbols< char, carl::Sort > & sorts ) [static]
```

15.8.3.3 declareVariable()

```
bool smtrat::parser::ArithmeticTheory::declareVariable (
    const std::string & ,
    const carl::Sort & ,
    types::VariableType & ,
    TheoryError & errors ) [virtual]
```

Declare a new variable with the given name and the given sort.

Reimplemented from smtrat::parser::AbstractTheory.

15.8.3.4 expandDistinct()

```
template<typename T , typename Builder >
FormulaT smtrat::parser::AbstractTheory::expandDistinct (
    const std::vector< T > & values,
    const Builder & neqBuilder ) [inline], [inherited]
```

15.8.3.5 functionCall()

```
bool smtrat::parser::ArithmeticTheory::functionCall (
    const Identifier & ,
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors ) [virtual]
```

Resolve another unknown function call.

Reimplemented from smtrat::parser::AbstractTheory.

15.8.3.6 handleDistinct()

```
bool smtrat::parser::ArithmeticTheory::handleDistinct (
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors )  [virtual]
```

Resolve a distinct operator.

Reimplemented from smtrat::parser::AbstractTheory.

15.8.3.7 handleITE()

```
bool smtrat::parser::ArithmeticTheory::handleITE (
    const FormulaT & ,
    const types::TermType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors )  [virtual]
```

Resolve an if-then-else operator.

Reimplemented from smtrat::parser::AbstractTheory.

15.8.3.8 instantiate()

```
bool smtrat::parser::ArithmeticTheory::instantiate (
    const types::VariableType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors )  [virtual]
```

Instantiate a variable within a term.

Reimplemented from smtrat::parser::AbstractTheory.

15.8.3.9 refreshVariable()

```
virtual bool smtrat::parser::AbstractTheory::refreshVariable (
    const types::VariableType & ,
    types::VariableType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Reimplemented in smtrat::parser::BitvectorTheory.

15.8.3.10 resolveSymbol()

```
virtual bool smtrat::parser::AbstractTheory::resolveSymbol (
    const Identifier & ,
    types::TermType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Resolve a symbol that was not declared within the ParserState.

This might be a symbol that actually uses indices, for example bitvector constants.

Reimplemented in smtrat::parser::BitvectorTheory.

15.8.4 Field Documentation

15.8.4.1 mITEs `std::map<carl::Variable, std::tuple<FormulaT, Poly, Poly> > smtrat::parser::ArithmeticTheory::mITEs`

15.8.4.2 ops `std::map<std::string, arithmetic::OperatorType> smtrat::parser::ArithmeticTheory::ops`

15.8.4.3 state `ParserState* smtrat::parser::AbstractTheory::state [inherited]`

15.9 smtrat::parser::types::ArithmeticTheory Struct Reference

Types of the arithmetic theory.

`#include <TheoryTypes.h>`

```

15.21 benchmax::Backend Class Reference

Base class for all backends.

```
#include <Backend.h>
```

Public Member Functions

- bool suspendable () const
- void process_results (const Jobs &jobs, bool check_finished)
- void addResult (const Tool *tool, const fs::path &file, BenchmarkResult &&result)

  Add a result.
- void run (const Jobs &jobs, bool wait_for_termination)

  Run the list of tools against the list of benchmarks.

Protected Member Functions

- Backend ()
- virtual void startTool (const Tool *)

  Hook for every tool at the beginning.
- virtual void finalize ()

  Hook to allow for asynchronous backends to wait for jobs to terminate.
- virtual void execute (const Tool *, const fs::path &)

  Execute a single pair of tool and benchmark.
- void madeProgress (std::size_t files=1)

  Can be called to give information about the current progress, if available.
- virtual bool collect_results (const Jobs &, bool)
- void sanitize_results (const Jobs &jobs) const
- void write_results (const Jobs &jobs) const

Protected Attributes

- std::size_t mExpectedJobs

  Number of jobs that should be run.
- std::atomic< std::size_t > mFinishedJobs

  Number of jobs that are finished.
- std::atomic< std::size_t > mLastPercent

  Percentage of finished jobs when madeProgress() was last called.

15.21.1 Detailed Description

Base class for all backends.

Offers appropriate hooks to model the whole workflow for backends where each job is executed individually. The run() method is called from ourside which first calls startTool() for every tool and then runs execute() for every pair of tool and benchmark. It also offers addResult() to store results and madeProgress() to provide a progress indication to the user. If a benchmark requires a completely different workflow, for example for a batch job, it should override the run() method.

15.21.2 Constructor & Destructor Documentation

15.21.2.1 Backend()

```
benchmax::Backend::Backend ( ) [inline], [protected]
```

15.21.3 Member Function Documentation

15.21.3.1 addResult()

```
void benchmax::Backend::addResult (
    const Tool * tool,
    const fs::path & file,
    BenchmarkResult && result ) [inline]
```

Add a result.

15.21.3.2 collect_results()

```
virtual bool benchmax::Backend::collect_results (
    const Jobs & ,
    bool ) [inline], [protected], [virtual]
```

15.21.3.3 execute()

```
virtual void benchmax::Backend::execute (
    const Tool * ,
    const fs::path & ) [inline], [protected], [virtual]
```

Execute a single pair of tool and benchmark.

Reimplemented in benchmax::LocalBackend, and benchmax::CondorBackend.

15.21.3.4 finalize()

```
virtual void benchmax::Backend::finalize ( ) [inline], [protected], [virtual]
```

Hook to allow for asynchronous backends to wait for jobs to terminate.

15.21.3.5 madeProgress()

```
void benchmax::Backend::madeProgress (
    std::size_t files = 1 ) [inline], [protected]
```

Can be called to give information about the current progress, if available.

15.21.3.6 process_results()

```
void benchmax::Backend::process_results (
    const Jobs & jobs,
    bool check_finished ) [inline]
```

15.21.3.7 run()

```
void benchmax::Backend::run (
    const Jobs & jobs,
    bool wait_for_termination ) [inline]
```

Run the list of tools against the list of benchmarks.

15.21.3.8 sanitize_results()

```
void benchmax::Backend::sanitize_results (
    const Jobs & jobs ) const [inline], [protected]
```

15.21.3.9 startTool()

```
virtual void benchmax::Backend::startTool (
    const Tool * ) [inline], [protected], [virtual]
```

Hook for every tool at the beginning.

Can be used to upload the tool to some remote system.

15.21.3.10 suspendable()

```
bool benchmax::Backend::suspendable ( ) const [inline]
```

15.21.3.11 write_results()

```
void benchmax::Backend::write_results (
    const Jobs & jobs ) const [inline], [protected]
```

15.21.4 Field Documentation

15.21.4.1 mExpectedJobs

```
std::size_t benchmax::Backend::mExpectedJobs [protected]
```

Number of jobs that should be run.

15.21.4.2 mFinishedJobs

```
std::atomic<std::size_t> benchmax::Backend::mFinishedJobs [protected]
```

Number of jobs that are finished.

15.21.4.3 mLastPercent

```
std::atomic<std::size_t> benchmax::Backend::mLastPercent [protected]
```

Percentage of finished jobs when madeProgress() was last called.

15.22 smtrat::Backend< Settings > Class Template Reference

```
#include <Backend.h>
```

15.26.1 Detailed Description

template<typename Properties>
class smtrat::cadcells::datastructures::BaseDerivation< Properties >

A BaseDerivation has a level and a set of properties of this level, and an underlying derivation representing the lower levels.

Template Parameters

Properties	Set of properties (from the operator)

15.26.2 Constructor & Destructor Documentation

15.26.2.1 BaseDerivation()

```
template<typename Properties >
smtrat::cadcells::datastructures::BaseDerivation< Properties >::BaseDerivation (
            Projections & Projections,
            DerivationRef< Properties > underlying,
            size_t level ) [inline]
```

15.26.3 Member Function Documentation

15.26.3.1 contains()

```
template<typename Properties >
template<typename P >
bool smtrat::cadcells::datastructures::BaseDerivation< Properties >::contains (
            const P & property ) const [inline]
```

15.26.3.2 insert()

```
template<typename Properties >
template<typename P >
void smtrat::cadcells::datastructures::BaseDerivation< Properties >::insert (
            P property ) [inline]
```

15.26.3.3 level()

```
template<typename Properties >
size_t smtrat::cadcells::datastructures::BaseDerivation< Properties >::level ( ) const [inline]
```

15.26.3.4 main_var()

```
template<typename Properties >
carl::Variable smtrat::cadcells::datastructures::BaseDerivation< Properties >::main_var ( )
const [inline]
```

15.26.3.5 merge_with()

```
template<typename Properties >
void smtrat::cadcells::datastructures::BaseDerivation< Properties >::merge_with (
            const BaseDerivation< Properties > & other ) [inline]
```

15.26.3.6 polys()

```
template<typename Properties >
PolyPool& smtrat::cadcells::datastructures::BaseDerivation< Properties >::polys ( ) [inline]
```

15.26.3.7 proj()

```
template<typename Properties >
Projections& smtrat::cadcells::datastructures::BaseDerivation< Properties >::proj ( ) [inline]
```

15.26.3.8 properties()

```
template<typename Properties >
template<typename P >
const PropertiesTSet<P>& smtrat::cadcells::datastructures::BaseDerivation< Properties >↩
::properties ( ) const  [inline]
```

15.26.3.9 underlying() [1/2]

```
template<typename Properties >
DerivationRef<Properties>& smtrat::cadcells::datastructures::BaseDerivation< Properties >↩
::underlying ( )  [inline]
```

15.26.3.10 underlying() [2/2]

```
template<typename Properties >
DerivationRef<Properties>& smtrat::cadcells::datastructures::BaseDerivation< Properties >↩
::underlying ( ) const  [inline]
```

15.26.4 Friends And Related Function Documentation

15.26.4.1 merge_underlying

```
template<typename Properties >
template<typename P >
void merge_underlying (
            std::vector< SampledDerivationRef< P >> & derivations )  [friend]
```

15.27 smtrat::cad::BaseProjection< Settings > Class Template Reference

```
#include <BaseProjection.h>
```

Public Member Functions

- std::size_t dim () const

  Returns the dimension of the projection.
- const auto & vars () const

  Returns the variables used for projection.
- void reset ()

  Resets all datastructures, use the given variables from now on.
- template<typename F >
  void setRemoveCallback (F &&f)

  Sets a callback that is called whenever polynomials are removed.
- carl::Bitset addPolynomial (const Poly &p, std::size_t cid, bool isBound)

  Adds the given polynomial to the projection. Converts to a UPoly and calls the appropriate overload.
- virtual carl::Bitset addPolynomial (const UPoly &p, std::size_t cid, bool isBound)=0

  Adds the given polynomial to the projection.
- carl::Bitset addEqConstraint (const Poly &p, std::size_t cid, bool isBound)

  Adds the given polynomial of an equational constraint to the projection. Converts to a UPoly and calls the appropriate overload.
- virtual carl::Bitset addEqConstraint (const UPoly &p, std::size_t cid, bool isBound)

  Adds the given polynomial of an equational constraint to the projection.
- void removePolynomial (const Poly &p, std::size_t cid, bool isBound)

  Removes the given polynomial from the projection. Converts to a UPoly and calls the appropriate overload.
- virtual void removePolynomial (const UPoly &p, std::size_t cid, bool isBound)=0

  Removes the given polynomial from the projection.
- virtual std::size_t size (std::size_t level) const =0
- std::size_t size () const
- virtual bool empty (std::size_t level) const =0

- virtual bool empty ()
- OptionalID getPolyForLifting (std::size_t level, SampleLiftedWith &slw)

  Get a polynomial from this level suited for lifting.

- virtual bool hasPolynomialById (std::size_t level, std::size_t id) const =0
- virtual const UPoly & getPolynomialById (std::size_t level, std::size_t id) const =0

  Retrieves a polynomial from its id.

- virtual void exportAsDot (std::ostream &) const
- virtual Origin getOrigin (std::size_t level, std::size_t id) const

Protected Types

- using Constraints = CADConstraints< Settings::backtracking >

Protected Member Functions

- BaseProjection (const Constraints &c)
- void callRemoveCallback (std::size_t level, const SampleLiftedWith &slw) const
- std::size_t getID (std::size_t level)

  Returns a fresh polynomial id for the given level.

- void freeID (std::size_t level, std::size_t id)

  Frees a currently used polynomial id for the given level.

- carl::Variable var (std::size_t level) const

  Returns the variable that corresponds to the given level, that is the variable eliminated in this level.

- bool canBePurgedByBounds (const UPoly &p) const

  Checks whether a polynomial can safely be ignored due to the bounds.

- bool isPurged (std::size_t level, std::size_t id)

Protected Attributes

- const Constraints & mConstraints
- std::vector< PolynomialLiftingQueue< BaseProjection > > mLiftingQueues

  List of lifting queues that can be used for incremental projection.

- ProjectionInformation mInfo

  Additional info on projection, projection levels and projection polynomials.

- ProjectionOperator mOperator

  The projection operator.

- std::function< void(std::size_t, const SampleLiftedWith &)> mRemoveCallback

  Callback to be called when polynomials are removed. The arguments are the projection level and a bitset that indicate which polynomials were removed in this level.

15.27.1 Member Typedef Documentation

15.27.1.1 Constraints

```
template<typename Settings>
using smtrat::cad::BaseProjection< Settings >::Constraints = CADConstraints<Settings::backtracking>
[protected]
```

15.27.2 Constructor & Destructor Documentation

15.27.2.1 BaseProjection()

```
template<typename Settings>
smtrat::cad::BaseProjection< Settings >::BaseProjection (
            const Constraints & c )  [inline], [protected]
```

15.27.3 Member Function Documentation

15.27.3.1 addEqConstraint() [1/2] template<typename Settings>

```
carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline]
```

Adds the given polynomial of an equational constraint to the projection. Converts to a UPoly and calls the appropriate overload.

15.27.3.2 addEqConstraint() [2/2] template<typename Settings>

```
virtual carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [inline], [virtual]
```

Adds the given polynomial of an equational constraint to the projection.

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >.

15.27.3.3 addPolynomial() [1/2] template<typename Settings>

```
carl::Bitset smtrat::cad::BaseProjection< Settings >::addPolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline]
```

Adds the given polynomial to the projection. Converts to a UPoly and calls the appropriate overload.

15.27.3.4 addPolynomial() [2/2] template<typename Settings>

```
virtual carl::Bitset smtrat::cad::BaseProjection< Settings >::addPolynomial (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [pure virtual]
```

Adds the given polynomial to the projection.

Implemented in smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Incrementality::NONE
smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, smtrat::cad::Projection< Incrementality::FULL, BT, S
and smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings >.

15.27.3.5 callRemoveCallback() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::callRemoveCallback (
            std::size_t level,
            const SampleLiftedWith & slw ) const  [inline], [protected]
```

15.27.3.6 canBePurgedByBounds()

```
template<typename Settings>
bool smtrat::cad::BaseProjection< Settings >::canBePurgedByBounds (
            const UPoly & p ) const [inline], [protected]
```

Checks whether a polynomial can safely be ignored due to the bounds.

15.27.3.7 dim()

```
template<typename Settings>
std::size_t smtrat::cad::BaseProjection< Settings >::dim ( ) const [inline]
```

Returns the dimension of the projection.

15.27.3.8 empty() [1/2]

```
template<typename Settings>
virtual bool smtrat::cad::BaseProjection< Settings >::empty ( ) [inline], [virtual]
```

15.27.3.9 empty() [2/2]

```
template<typename Settings>
virtual bool smtrat::cad::BaseProjection< Settings >::empty (
            std::size_t level ) const [pure virtual]
```

Implemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, smtrat::cad::Projection< Incremental smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Increme smtrat::qe::cad::Projection< Settings >, smtrat::qe::cad::Projection< smtrat::qe::cad::CADSettings >, and smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.27.3.10 exportAsDot()

```
template<typename Settings>
virtual void smtrat::cad::BaseProjection< Settings >::exportAsDot (
            std::ostream & ) const [inline], [virtual]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, and smtrat::cad::Projection< Incre

15.27.3.11 freeID()

```
template<typename Settings>
void smtrat::cad::BaseProjection< Settings >::freeID (
            std::size_t level,
            std::size_t id ) [inline], [protected]
```

Frees a currently used polynomial id for the given level.

15.27.3.12 getID()

```
template<typename Settings>
std::size_t smtrat::cad::BaseProjection< Settings >::getID (
            std::size_t level ) [inline], [protected]
```

Returns a fresh polynomial id for the given level.

15.27.3.13 getOrigin() template<typename Settings>

```
virtual Origin smtrat::cad::BaseProjection< Settings >::getOrigin (
            std::size_t level,
            std::size_t id ) const  [inline], [virtual]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, BT, Settings >.

15.27.3.14 getPolyForLifting() template<typename Settings>

```
OptionalID smtrat::cad::BaseProjection< Settings >::getPolyForLifting (
            std::size_t level,
            SampleLiftedWith & slw )  [inline]
```

Get a polynomial from this level suited for lifting.

15.27.3.15 getPolynomialById() template<typename Settings>

```
virtual const UPoly& smtrat::cad::BaseProjection< Settings >::getPolynomialById (
            std::size_t level,
            std::size_t id ) const  [pure virtual]
```

Retrieves a polynomial from its id.

Implemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, smtrat::cad::Projection< Incremental smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Increme smtrat::qe::cad::Projection< Settings >, smtrat::qe::cad::Projection< smtrat::qe::cad::CADSettings >, and smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.27.3.16 hasPolynomialById() template<typename Settings>

```
virtual bool smtrat::cad::BaseProjection< Settings >::hasPolynomialById (
            std::size_t level,
            std::size_t id ) const  [pure virtual]
```

Implemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, smtrat::cad::Projection< Incremental smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Increme smtrat::qe::cad::Projection< Settings >, smtrat::qe::cad::Projection< smtrat::qe::cad::CADSettings >, and smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.27.3.17 isPurged() template<typename Settings>

```
bool smtrat::cad::BaseProjection< Settings >::isPurged (
            std::size_t level,
            std::size_t id )  [inline], [protected]
```

15.27.3.18 removePolynomial() [1/2] template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::removePolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline]
```

Removes the given polynomial from the projection. Converts to a UPoly and calls the appropriate overload.

15.27.3.19 removePolynomial() [2/2] template<typename Settings>

```
virtual void smtrat::cad::BaseProjection< Settings >::removePolynomial (
            const UPoly & p,
            std::size_t cid,
            bool isBound ) [pure virtual]
```

Removes the given polynomial from the projection.

Implemented in smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Incrementality::FULL smtrat::cad::Projection< Incrementality::FULL, BT, Settings >, smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings >, and smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.27.3.20 reset() template<typename Settings>

```
void smtrat::cad::BaseProjection< Settings >::reset ( ) [inline]
```

Resets all datastructures, use the given variables from now on.

15.27.3.21 setRemoveCallback() template<typename Settings>

```
template<typename F >
void smtrat::cad::BaseProjection< Settings >::setRemoveCallback (
            F && f ) [inline]
```

Sets a callback that is called whenever polynomials are removed.

15.27.3.22 size() [1/2] template<typename Settings>

```
std::size_t smtrat::cad::BaseProjection< Settings >::size ( ) const [inline]
```

15.27.3.23 size() [2/2] template<typename Settings>

```
virtual std::size_t smtrat::cad::BaseProjection< Settings >::size (
            std::size_t level ) const [pure virtual]
```

Implemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, smtrat::cad::Projection< Incremental smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Increme smtrat::qe::cad::Projection< Settings >, smtrat::qe::cad::Projection< smtrat::qe::cad::CADSettings >, and smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >.

15.27.3.24 var() template<typename Settings>

```
carl::Variable smtrat::cad::BaseProjection< Settings >::var (
            std::size_t level ) const [inline], [protected]
```

Returns the variable that corresponds to the given level, that is the variable eliminated in this level.

15.27.3.25 vars() template<typename Settings>

```
const auto& smtrat::cad::BaseProjection< Settings >::vars ( ) const [inline]
```

Returns the variables used for projection.

15.27.4 Field Documentation

15.27.4.1 mConstraints

```
template<typename Settings>
const Constraints& smtrat::cad::BaseProjection< Settings >::mConstraints [protected]
```

15.27.4.2 mInfo

```
template<typename Settings>
ProjectionInformation smtrat::cad::BaseProjection< Settings >::mInfo [protected]
```

Additional info on projection, projection levels and projection polynomials.

15.27.4.3 mLiftingQueues

```
template<typename Settings>
std::vector<PolynomialLiftingQueue<BaseProjection> > smtrat::cad::BaseProjection< Settings
>::mLiftingQueues [protected]
```

List of lifting queues that can be used for incremental projection.

15.27.4.4 mOperator

```
template<typename Settings>
ProjectionOperator smtrat::cad::BaseProjection< Settings >::mOperator [protected]
```

The projection operator.

15.27.4.5 mRemoveCallback

```
template<typename Settings>
std::function<void(std::size_t, const SampleLiftedWith&)> smtrat::cad::BaseProjection< Settings
>::mRemoveCallback [protected]
```

Callback to be called when polynomials are removed. The arguments are the projection level and a bitset that indicate which polynomials were removed in this level.

15.28 smtrat::cad::BaseSettings Struct Reference

```
#include <Settings.h>
```

```

Reimplemented in smtrat::expression::simplifier::DuplicateSimplifier, smtrat::expression::simplifier::MergeSimplifier, and smtrat::expression::simplifier::SingletonSimplifier.

15.29.1.12 simplify() [5/6]

```
virtual const ExpressionContent* smtrat::expression::simplifier::↩
BaseSimplifier::simplify (
            const QuantifierExpression &  ) const  [inline], [protected], [virtual]
```

15.29.1.13 simplify() [6/6]

```
virtual const ExpressionContent* smtrat::expression::simplifier::↩
BaseSimplifier::simplify (
            const UnaryExpression &  ) const  [inline], [protected], [virtual]
```

Reimplemented in smtrat::expression::simplifier::NegationSimplifier.

15.30 smtrat::cad::Origin::BaseType Struct Reference

```
#include <Origin.h>
```

`#include <BEModule.h>`

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- BEModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=NULL)
- ~BEModule ()
- Answer checkCore ()

  Checks the received formula for consistency.
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void updateModel () const

  Updates the current assignment into the model.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput ∗ pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput ∗ pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module ∗ > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- void print (const std::string &_initiation="∗∗∗") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="∗∗∗") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="∗∗∗") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="∗∗∗") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore (ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore (ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())

- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

Stores the constraints which the backends must be informed about.

- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.

- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.31.4 Member Function Documentation

15.31.4.1 add() `bool smtrat::PModule::add (`

```
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.31.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.31.4.3 addCore()

```
virtual bool smtrat::Module::addCore (
    ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.31.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.31.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
```

```
const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) )  [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.31.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.31.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula )  [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.31.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.31.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.31.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.31.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const  [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.31.4.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.31.4.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.31.4.14 appliedPreprocessing() `bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]`

Returns true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

15.31.4.15 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.31.4.16 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.31.4.17 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.31.4.18 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.31.4.19 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.31.4.20 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.31.4.21 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.31.4.22 check()

```
Answer smtrat::PModule::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.31.4.23 checkCore()

```
template<class Settings >
Answer smtrat::BEModule< Settings >::checkCore ( )  [virtual]
```

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.31.4.24 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
            std::vector< FormulaSetT >::const_iterator _infsubset,
            const std::string & _filename = "smaller_muses",
            unsigned _maxSizeDifference = 1 ) const  [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.31.4.25 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.31.4.26 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.31.4.27 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.31.4.28 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.31.4.29 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.31.4.30 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.31.4.31 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.31.4.32 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.31.4.33 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.31.4.34 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraintsTo↩ Inform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.31.4.35 currentlySatisfied() `virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.31.4.36 currentlySatisfiedByBackend() `unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.31.4.37 deinform() `void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.31.4.38 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.31.4.39 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.31.4.40 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.31.4.41 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceived↩
VariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.31.4.42 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.31.4.43 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.31.4.44 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.31.4.45 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.31.4.46 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.31.4.47 getBackendsAllModels()

```
void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]
```

Stores all models of a backend in the list of all models of this module.

15.31.4.48 getBackendsModel()

```
void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]
```

15.31.4.49 getInfeasibleSubsets() [1/2]

```
void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]
```

Copies the infeasible subsets of the passed formula.

15.31.4.50 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets (
    const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.31.4.51 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.31.4.52 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.31.4.53 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.31.4.54 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.31.4.55 getOrigins() [3/3]

`const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.31.4.56 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

15.31.4.57 hasLemmas()

`bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.31.4.58 hasValidInfeasibleSubset()

`bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.31.4.59 id()

`std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.31.4.60 infeasibleSubsets()

`const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.31.4.61 inform()

`bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.31.4.62 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.31.4.63 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.31.4.64 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.31.4.65 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.31.4.66 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.31.4.67 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.31.4.68 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.31.4.69 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.31.4.70 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.31.4.71 model()

```
const Model& smtrat::Module::model ( ) const [inline], [inherited]
```

Returns The assignment of the current satisfiable result, if existent.

15.31.4.72 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.31.4.73 moduleName()

```
template<typename Settings >
std::string smtrat::BEModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.31.4.74 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

15.31.4.75 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.31.4.76 passedFormulaBegin() `ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.31.4.77 passedFormulaEnd() `ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.31.4.78 pPassedFormula() `const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.31.4.79 pReceivedFormula() `const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.31.4.80 print() `void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.31.4.81 printAllModels() `void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.31.4.82 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.31.4.83 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.31.4.84 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.31.4.85 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.31.4.86 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.31.4.87 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

15.31.4.88 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAsInfeasible↩Subset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

15.31.4.89 receivedVariable()

`bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

15.31.4.90 remove()

`void smtrat::PModule::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.31.4.91 removeCore()

`virtual void smtrat::Module::removeCore ( ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.31.4.92 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.31.4.93 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins
(
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.31.4.94 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.31.4.95 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.31.4.96 runBackends() [1/2]

```
virtual Answer smtrat::PModule::runBackends ( ) [inline],
[virtual], [inherited]
```

Reimplemented from smtrat::Module.

15.31.4.97 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.31.4.98 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.31.4.99 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.31.4.100 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.31.4.101 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint (
    const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.31.4.102 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.31.4.103 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.31.4.104 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.31.4.105 updateModel() `void smtrat::PModule::updateModel ( ) const [virtual], [inherited]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.31.4.106 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.31.5 Field Documentation

15.31.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.31.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.31.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.31.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.31.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.31.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.31.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaToPass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.31.5.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module::m↩ FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.31.5.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.31.5.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.31.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.31.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.31.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.31.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.31.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.31.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.31.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.31.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.31.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

15.31.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.31.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.31.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.31.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.31.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.31.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.32 benchmax::BenchmarkResult Struct Reference

Results for a single benchmark run.

```
#include <BenchmarkResult.h>
```

Public Member Functions

- template<typename TimeLimit >
  void cleanup (const TimeLimit &limit)

  Properly detect timeouts.
- auto get_path () const
- void store (size_t id) const
- void store () const
- void restore () const
- void forget () const

Data Fields

- int exitCode

  Shell exit code.
- std::chrono::milliseconds time

  Runtime in milliseconds.
- std::string answer

  Answer string.
- std::size_t peak_memory_kbytes

  Peak memory usage.
- std::string stdout

  Standard output (mostly for parsing the answer and additional information).
- std::string stderr

  Error output (mostly for parsing the answer and additional information).
- std::map< std::string, std::string > additional

  Arbitrary additional information that can be provided by the tool class.
- size_t stored_id = 0

  Identifier for temporary file.

15.32.1 Detailed Description

Results for a single benchmark run.

15.32.2 Member Function Documentation

15.32.2.1 cleanup()

```
template<typename TimeLimit >
void benchmax::BenchmarkResult::cleanup (
            const TimeLimit & limit )  [inline]
```

Properly detect timeouts.

Most backends give processes a bit more time to avoid having race-condition-like situations.

15.32.2.2 forget()

```
void benchmax::BenchmarkResult::forget ( ) const  [inline]
```

15.32.2.3 get_path()

```
auto benchmax::BenchmarkResult::get_path ( ) const  [inline]
```

15.32.2.4 restore()

```
void benchmax::BenchmarkResult::restore ( ) const  [inline]
```

15.32.2.5 store() [1/2]

```
void benchmax::BenchmarkResult::store ( ) const  [inline]
```

15.32.2.6 store() [2/2]

```
void benchmax::BenchmarkResult::store (
            size_t id ) const  [inline]
```

15.32.3 Field Documentation

15.32.3.1 additional

```
std::map<std::string, std::string> benchmax::BenchmarkResult::additional
[mutable]
```

Arbitrary additional information that can be provided by the tool class.

15.32.3.2 answer `std::string benchmax::BenchmarkResult::answer`

Answer string.

15.32.3.3 exitCode `int benchmax::BenchmarkResult::exitCode`

Shell exit code.

15.32.3.4 peak_memory_kbytes `std::size_t benchmax::BenchmarkResult::peak_memory_kbytes`

Peak memory usage.

15.32.3.5 stderr `std::string benchmax::BenchmarkResult::stderr`

Error output (mostly for parsing the answer and additional information).

15.32.3.6 stdout `std::string benchmax::BenchmarkResult::stdout`

Standard output (mostly for parsing the answer and additional information).

15.32.3.7 stored_id `size_t benchmax::BenchmarkResult::stored_id = 0 [mutable]`

Identifier for temporary file.

15.32.3.8 time `std::chrono::milliseconds benchmax::BenchmarkResult::time`

Runtime in milliseconds.

15.33 benchmax::BenchmarkSet Class Reference

A set of benchmarks from some common base directory.

```
#include <BenchmarkSet.h>
```

Public Member Functions

- void add_directory (const std::filesystem::path &dir)

  Recursively find all benchmarks from this directory.
- std::size_t size () const

  Number of files.
- auto begin () const

  Begin iterator.
- auto end () const

  End iterator.

15.33.1 Detailed Description

A set of benchmarks from some common base directory.

15.33.2 Member Function Documentation

15.33.2.1 add_directory() `void benchmax::BenchmarkSet::add_directory ( const std::filesystem::path & dir )`

Recursively find all benchmarks from this directory.

15.33.2.2 begin() `auto benchmax::BenchmarkSet::begin ( ) const [inline]`

Begin iterator.

15.33.2.3 end() `auto benchmax::BenchmarkSet::end ( ) const [inline]`

End iterator.

15.33.2.4 size() `std::size_t benchmax::BenchmarkSet::size ( ) const [inline]`

Number of files.

15.34 benchmax::settings::BenchmarkSettings Struct Reference

Settings for benchmarks.

```
#include <benchmarks.h>
```

Data Fields

- carl::settings::binary_quantity limit_memory

  Memory limit in megabytes.
- carl::settings::duration limit_time

  Time limit in seconds.
- carl::settings::duration grace_time

  Grace time in seconds.
- std::vector< std::filesystem::path > input_directories

  Lift of input directories.
- std::filesystem::path input_directories_common_prefix

  Common prefix of input directories (to shorten filenames in output).
- std::filesystem::path output_dir

  Output directory.
- std::filesystem::path output_file_xml

  Filename of xml file.

15.34.1 Detailed Description

Settings for benchmarks.

15.34.2 Field Documentation

15.34.2.1 grace_time `carl::settings::duration benchmax::settings::BenchmarkSettings::grace_time`

Grace time in seconds.

15.34.2.2 input_directories `std::vector<std::filesystem::path> benchmax::settings::BenchmarkSettings::input_directories`

Lift of input directories.

15.34.2.3 input_directories_common_prefix `std::filesystem::path benchmax::settings::BenchmarkSettings::input_directories_common_prefix`

Common prefix of input directories (to shorten filenames in output).

15.34.2.4 limit_memory `carl::settings::binary_quantity benchmax::settings::BenchmarkSettings::limit_memory`

Memory limit in megabytes.

15.34.2.5 limit_time `carl::settings::duration benchmax::settings::BenchmarkSettings::limit_time`

Time limit in seconds.

15.34.2.6 output_dir `std::filesystem::path benchmax::settings::BenchmarkSettings::output_dir`

Output directory.

15.34.2.7 output_file_xml `std::filesystem::path benchmax::settings::BenchmarkSettings::output_file_xml`

Filename of xml file.

15.35 smtrat::Bimap< Class, FirstKeyType, FirstKeyName, SecondKeyType, SecondKeyName > Class Template Reference

Container that stores expensive to construct objects and allows the fast lookup with respect to two independent keys within the objects.

```
#include <Bimap.h>
```

Public Types

- typedef std::forward_list< Class > Data
- typedef Data::iterator Iterator
- typedef Data::const_iterator ConstIterator

Public Member Functions

- Iterator begin () noexcept
- ConstIterator begin () const noexcept
- Iterator end () noexcept
- ConstIterator end () const noexcept
- Class & firstAt (const FirstKeyType &firstKey)
- Class & secondAt (const SecondKeyType &secondKey)
- Iterator firstFind (const FirstKeyType &firstKey)
- Iterator secondFind (const SecondKeyType &secondKey)
- template<typename... Args>
  Iterator emplace (Args &&... args)

15.35.1 Detailed Description

template<class Class, typename FirstKeyType, FirstKeyType Class::* FirstKeyName, typename SecondKeyType, SecondKeyType Class::* SecondKeyName>
class smtrat::Bimap< Class, FirstKeyType, FirstKeyName, SecondKeyType, SecondKeyName >

Container that stores expensive to construct objects and allows the fast lookup with respect to two independent keys within the objects.

15.35.2 Member Typedef Documentation

15.35.2.1 ConstIterator

`template<class Class, typename FirstKeyType, FirstKeyType Class::* FirstKeyName, typename SecondKeyType, SecondKeyType Class::* SecondKeyName>`
`typedef Data::const_iterator smtrat::Bimap< Class, FirstKeyType, FirstKeyName, SecondKeyType, SecondKeyName >::ConstIterator`

15.37.2.3 insert()

```
template<typename T >
void smtrat::datastructures::BinaryHeap< T >::insert (
    const T & item ) [inline]
```

15.37.2.4 isEmpty() `template<typename T >`

`bool smtrat::datastructures::BinaryHeap< T >::isEmpty ( ) const [inline]`

15.37.2.5 size() `template<typename T >`

`std::size_t smtrat::datastructures::BinaryHeap< T >::size ( ) const [inline]`

15.38 smtrat::parser::BinaryParser Struct Reference

Parses binaries: `#b[01]+`

`#include <Lexicon.h>`

Public Types

- typedef boost::iterator_range< Iterator > ITRange

Public Member Functions

- BinaryParser ()
- FixedWidthConstant< Integer > build (const ITRange &itr, const Integer &val)

Data Fields

- qi::uint_parser< Integer, 2, 1,-1 > number
- qi::rule< Iterator, FixedWidthConstant< Integer >), Skipper, qi::locals< Integer > > main
- qi::rule< Iterator, FixedWidthConstant< Integer >), Skipper > main2

15.38.1 Detailed Description

Parses binaries: `#b[01]+`

15.38.2 Member Typedef Documentation

15.38.2.1 ITRange `typedef boost::iterator_range<Iterator> smtrat::parser::BinaryParser::ITRange`

15.38.3 Constructor & Destructor Documentation

15.38.3.1 BinaryParser() `smtrat::parser::BinaryParser::BinaryParser ( ) [inline]`

15.38.4 Member Function Documentation

15.38.4.1 build()

```
FixedWidthConstant<Integer> smtrat::parser::BinaryParser::build (
    const ITRange & itr,
    const Integer & val ) [inline]
```

15.38.5 Field Documentation

15.38.5.1 main `qi::rule<Iterator, FixedWidthConstant<Integer>), Skipper, qi::locals<Integer> > smtrat::parser::BinaryParser::main`

15.38.5.2 main2 `qi::rule<Iterator, FixedWidthConstant<Integer>), Skipper> smtrat::parser::↩ BinaryParser::main2`

15.38.5.3 number `qi::uint_parser<Integer,2,1,-1> smtrat::parser::BinaryParser::number`

15.39 smtrat::parser::BitvectorTheory Struct Reference

Implements the theory of bitvectors.

```
#include <Bitvector.h>
```

Public Types

- using OperatorType = carl::BVTermType

Public Member Functions

- BitvectorTheory (ParserState *state)
- bool declareVariable (const std::string &name, const carl::Sort &sort, types::VariableType &result, TheoryError &errors)

  Declare a new variable with the given name and the given sort.
- bool resolveSymbol (const Identifier &identifier, types::TermType &result, TheoryError &errors)

  Resolve a symbol that was not declared within the ParserState.
- bool handleITE (const FormulaT &ifterm, const types::TermType &thenterm, const types::TermType &elseterm, types::TermType &result, TheoryError &errors)

  Resolve an if-then-else operator.
- bool handleDistinct (const std::vector< types::TermType > &arguments, types::TermType &result, TheoryError &errors)

  Resolve a distinct operator.
- bool instantiate (const types::VariableType &var, const types::TermType &replacement, types::TermType &subject, TheoryError &errors)

  Instantiate a variable within a term.
- bool refreshVariable (const types::VariableType &var, types::VariableType &subject, TheoryError &errors)
- bool functionCall (const Identifier &identifier, const std::vector< types::TermType > &arguments, types::TermType &result, TheoryError &errors)

  Resolve another unknown function call.
- template<typename T , typename Builder >
  FormulaT expandDistinct (const std::vector< T > &values, const Builder &neqBuilder)

Static Public Member Functions

- static void addSimpleSorts (qi::symbols< char, carl::Sort > &sorts)
- static void addConstants (qi::symbols< char, types::ConstType > &)

  Initialize the global symbol table for constants.

Data Fields

- carl::Sort bvSort
- conversion::VectorVariantConverter< types::BVTerm > vectorConverter
- conversion::VariantConverter< types::BVTerm > termConverter
- ParserState * state

15.39.1 Detailed Description

Implements the theory of bitvectors.

15.39.2 Member Typedef Documentation

15.39.2.1 OperatorType

```
using smtrat::parser::BitvectorTheory::OperatorType = carl::BVTermType
```

15.39.3 Constructor & Destructor Documentation

15.39.3.1 BitvectorTheory()

```
smtrat::parser::BitvectorTheory::BitvectorTheory (
    ParserState * state )
```

15.39.4 Member Function Documentation

15.39.4.1 addConstants()

```
static void smtrat::parser::AbstractTheory::addConstants (
    qi::symbols< char, types::ConstType > & ) [inline], [static], [inherited]
```

Initialize the global symbol table for constants.

15.39.4.2 addSimpleSorts()

```
void smtrat::parser::BitvectorTheory::addSimpleSorts (
    qi::symbols< char, carl::Sort > & sorts ) [static]
```

15.39.4.3 declareVariable()

```
bool smtrat::parser::BitvectorTheory::declareVariable (
    const std::string & ,
    const carl::Sort & ,
    types::VariableType & ,
    TheoryError & errors ) [virtual]
```

Declare a new variable with the given name and the given sort.

Reimplemented from smtrat::parser::AbstractTheory.

15.39.4.4 expandDistinct()

```
template<typename T , typename Builder >
FormulaT smtrat::parser::AbstractTheory::expandDistinct (
    const std::vector< T > & values,
    const Builder & neqBuilder ) [inline], [inherited]
```

15.39.4.5 functionCall()

```
bool smtrat::parser::BitvectorTheory::functionCall (
    const Identifier & ,
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors ) [virtual]
```

Resolve another unknown function call.

Reimplemented from smtrat::parser::AbstractTheory.

15.39.4.6 handleDistinct()

```
bool smtrat::parser::BitvectorTheory::handleDistinct (
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors ) [virtual]
```

Resolve a distinct operator.

Reimplemented from smtrat::parser::AbstractTheory.

15.39.4.7 handleITE()

```
bool smtrat::parser::BitvectorTheory::handleITE (
    const FormulaT & ,
    const types::TermType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors )  [virtual]
```

Resolve an if-then-else operator.

Reimplemented from smtrat::parser::AbstractTheory.

15.39.4.8 instantiate()

```
bool smtrat::parser::BitvectorTheory::instantiate (
    const types::VariableType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors )  [virtual]
```

Instantiate a variable within a term.

Reimplemented from smtrat::parser::AbstractTheory.

15.39.4.9 refreshVariable()

```
bool smtrat::parser::BitvectorTheory::refreshVariable (
    const types::VariableType & var,
    types::VariableType & subject,
    TheoryError & errors )  [virtual]
```

Reimplemented from smtrat::parser::AbstractTheory.

15.39.4.10 resolveSymbol()

```
bool smtrat::parser::BitvectorTheory::resolveSymbol (
    const Identifier & ,
    types::TermType & ,
    TheoryError & errors )  [virtual]
```

Resolve a symbol that was not declared within the ParserState.

This might be a symbol that actually uses indices, for example bitvector constants.

Reimplemented from smtrat::parser::AbstractTheory.

15.39.5 Field Documentation

15.39.5.1 bvSort

15.43 smtrat::mcsat::Bookkeeping Class Reference

Represent the trail, i.e.

```
#include <Bookkeeping.h>
```

Public Member Functions

- const auto & model () const
- const auto & assignedVariables () const
- const auto & assignments () const
- const auto & constraints () const
- const auto & mvBounds () const
- const auto & variables () const
- void updateVariables (const carl::Variables &variables)
- void pushConstraint (const FormulaT &f)

  Assert a constraint/literal.
- void popConstraint (const FormulaT &f)
- void pushAssignment (carl::Variable v, const ModelValue &mv, const FormulaT &f)
- void popAssignment (carl::Variable v)

15.43.1 Detailed Description

Represent the trail, i.e.

the assignment/model state, of a MCSAT run in different representations (kept in sync) for a fast access. Most notably, we store literals, i.e. a polynomial (in)equality-atom or its negation, which we assert to be true. Since the negation can be represented by an atom by flipping the (in)equality, it suffices to store only atoms. Here we call atomic formulas over the theory of real arithmetic "constraints".

15.43.2 Member Function Documentation

15.43.2.1 assignedVariables()

`const auto& smtrat::mcsat::Bookkeeping::assignedVariables ( ) const [inline]`

15.43.2.2 assignments()

`const auto& smtrat::mcsat::Bookkeeping::assignments ( ) const [inline]`

15.43.2.3 constraints()

`const auto& smtrat::mcsat::Bookkeeping::constraints ( ) const [inline]`

15.43.2.4 model()

`const auto& smtrat::mcsat::Bookkeeping::model ( ) const [inline]`

15.43.2.5 mvBounds()

`const auto& smtrat::mcsat::Bookkeeping::mvBounds ( ) const [inline]`

15.43.2.6 popAssignment()

```
void smtrat::mcsat::Bookkeeping::popAssignment (
    carl::Variable v ) [inline]
```

15.43.2.7 popConstraint()

```
void smtrat::mcsat::Bookkeeping::popConstraint (
    const FormulaT & f ) [inline]
```

15.43.2.8 pushAssignment()

```
void smtrat::mcsat::Bookkeeping::pushAssignment (
    carl::Variable v,
    const ModelValue & mv,
    const FormulaT & f ) [inline]
```

15.43.2.9 pushConstraint()

```
void smtrat::mcsat::Bookkeeping::pushConstraint (
    const FormulaT & f ) [inline]
```

Assert a constraint/literal.

15.43.2.10 updateVariables()

```
void smtrat::mcsat::Bookkeeping::updateVariables (
    const carl::Variables & variables ) [inline]
```

15.43.2.11 variables()

```
const auto& smtrat::mcsat::Bookkeeping::variables ( ) const [inline]
```

15.44 smtrat::parser::BooleanEncodingTheory Struct Reference

Implements the theory of bitvectors.

```
#include <BooleanEncoding.h>
```

Public Member Functions

- BooleanEncodingTheory (ParserState *state)
- virtual bool declareVariable (const std::string &, const carl::Sort &, types::VariableType &, TheoryError &errors)

  Declare a new variable with the given name and the given sort.
- virtual bool resolveSymbol (const Identifier &, types::TermType &, TheoryError &errors)

  Resolve a symbol that was not declared within the ParserState.
- virtual bool handleITE (const FormulaT &, const types::TermType &, const types::TermType &, types::TermType &, TheoryError &errors)

  Resolve an if-then-else operator.
- virtual bool handleDistinct (const std::vector< types::TermType > &, types::TermType &, TheoryError &errors)

  Resolve a distinct operator.
- template<typename T , typename Builder >
  FormulaT expandDistinct (const std::vector< T > &values, const Builder &neqBuilder)
- virtual bool instantiate (const types::VariableType &, const types::TermType &, types::TermType &, TheoryError &errors)

  Instantiate a variable within a term.
- virtual bool refreshVariable (const types::VariableType &, types::VariableType &, TheoryError &errors)
- virtual bool functionCall (const Identifier &, const std::vector< types::TermType > &, types::TermType &, TheoryError &errors)

  Resolve another unknown function call.

Static Public Member Functions

- static void addSimpleSorts (qi::symbols< char, carl::Sort > &)

  Initialize the global symbol table for simple sorts.
- static void addConstants (qi::symbols< char, types::ConstType > &)

  Initialize the global symbol table for constants.

Data Fields

- ParserState * state

15.44.1 Detailed Description

Implements the theory of bitvectors.

15.44.2 Constructor & Destructor Documentation

15.44.2.1 BooleanEncodingTheory()

```
smtrat::parser::BooleanEncodingTheory::BooleanEncodingTheory (
    ParserState * state )
```

15.44.3 Member Function Documentation

15.44.3.1 addConstants()

```
static void smtrat::parser::AbstractTheory::addConstants (
    qi::symbols< char, types::ConstType > & ) [inline], [static], [inherited]
```

Initialize the global symbol table for constants.

15.44.3.2 addSimpleSorts()

```
static void smtrat::parser::AbstractTheory::addSimpleSorts (
    qi::symbols< char, carl::Sort > & ) [inline], [static], [inherited]
```

Initialize the global symbol table for simple sorts.

15.44.3.3 declareVariable()

```
virtual bool smtrat::parser::AbstractTheory::declareVariable (
    const std::string & ,
    const carl::Sort & ,
    types::VariableType & ,
    TheoryError & errors ) [inline], [virtual], [inherited]
```

Declare a new variable with the given name and the given sort.

Reimplemented in smtrat::parser::UninterpretedTheory, smtrat::parser::ArithmeticTheory, smtrat::parser::CoreTheory, and smtrat::parser::BitvectorTheory.

15.44.3.4 expandDistinct()

```
template<typename T , typename Builder >
FormulaT smtrat::parser::AbstractTheory::expandDistinct (
    const std::vector< T > & values,
    const Builder & neqBuilder ) [inline], [inherited]
```

15.44.3.5 functionCall()

```
virtual bool smtrat::parser::AbstractTheory::functionCall (
    const Identifier & ,
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors ) [inline], [virtual], [inherited]
```

Resolve another unknown function call.

Reimplemented in smtrat::parser::UninterpretedTheory, smtrat::parser::BitvectorTheory, smtrat::parser::ArithmeticTheory, and smtrat::parser::CoreTheory.

15.44.3.6 handleDistinct()

```
virtual bool smtrat::parser::AbstractTheory::handleDistinct (
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors ) [inline], [virtual], [inherited]
```

Resolve a distinct operator.

Reimplemented in smtrat::parser::ArithmeticTheory, smtrat::parser::BitvectorTheory, smtrat::parser::CoreTheory, and smtrat::parser::UninterpretedTheory.

15.44.3.7 handleITE()

```
virtual bool smtrat::parser::AbstractTheory::handleITE (
    const FormulaT & ,
    const types::TermType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Resolve an if-then-else operator.

Reimplemented in smtrat::parser::UninterpretedTheory, smtrat::parser::ArithmeticTheory, smtrat::parser::BitvectorTheory, and smtrat::parser::CoreTheory.

15.44.3.8 instantiate()

```
virtual bool smtrat::parser::AbstractTheory::instantiate (
    const types::VariableType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Instantiate a variable within a term.

Reimplemented in smtrat::parser::BitvectorTheory, and smtrat::parser::ArithmeticTheory.

15.44.3.9 refreshVariable()

```
virtual bool smtrat::parser::AbstractTheory::refreshVariable (
    const types::VariableType & ,
    types::VariableType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Reimplemented in smtrat::parser::BitvectorTheory.

15.44.3.10 resolveSymbol()

```
virtual bool smtrat::parser::AbstractTheory::resolveSymbol (
    const Identifier & ,
    types::TermType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Resolve a symbol that was not declared within the ParserState.

This might be a symbol that actually uses indices, for example bitvector constants.

Reimplemented in smtrat::parser::BitvectorTheory.

15.44.4 Field Documentation

15.44.4.1 state

```
ParserState* smtrat::parser::AbstractTheory::state  [inherited]
```

15.45 Minisat::BoolOption Class Reference

```
#include <Options.h>
```

Public Member Functions

- BoolOption (const char *c, const char *n, const char *d, bool v)
- operator bool (void) const
- BoolOption & operator= (bool b)

15.47.1 Detailed Description

template<typename T1, typename T2>
class smtrat::lra::Bound< T1, T2 >

Stores a bound, which could be an upper "<= b" or a lower bound ">= b" for a bound value b.

In the case that "<= b" and ">= b" hold this bound is a so called equal bound represented by "==b".

15.47.2 Member Typedef Documentation

15.47.2.1 BoundSet

```
template<typename T1, typename T2>
typedef carl::PointerSet<Bound<T1, T2> > smtrat::lra::Bound< T1, T2 >::BoundSet
```

A set of pointer to bounds.

15.47.3 Member Enumeration Documentation

15.47.3.1 Type

```
template<typename T1, typename T2>
enum smtrat::lra::Bound::Type
```

The type of the bound: LOWER = ">=", UPPER = "<=", EQUAL "==".

Enumerator

LOWER	
UPPER	
EQUAL	

15.47.4 Constructor & Destructor Documentation

15.47.4.1 Bound() [1/2]

```
template<typename T1, typename T2>
smtrat::lra::Bound< T1, T2 >::Bound ( ) [delete]
```

15.47.4.2 Bound() [2/2]

```
template<typename T1, typename T2>
smtrat::lra::Bound< T1, T2 >::Bound (
            const Value< T1 > *const _limit,
            Variable< T1, T2 > *const _var,
            Type _type,
            const FormulaT & _constraint,
            Bound< T1, T2 >::Info * _boundInfo = NULL,
            bool _deduced = false )
```

Parameters

_limit	
_var	
_type	
_constraint	
_boundInfo	
_deduced	

15.47.4.3 ~Bound()

```
template<typename T1, typename T2>
smtrat::lra::Bound< T1, T2 >::~Bound ( )
```

15.47.5 Member Function Documentation

15.47.5.1 asConstraint()

```
template<typename T1, typename T2>
const FormulaT& smtrat::lra::Bound< T1, T2 >::asConstraint ( ) const [inline]
```

Returns

15.47.5.2 boundExists()

```
template<typename T1, typename T2>
void smtrat::lra::Bound< T1, T2 >::boundExists ( ) const [inline]
```

15.47.5.3 deduced()

```
template<typename T1, typename T2>

bool smtrat::lra::Bound< T1, T2 >::exists ( ) const [inline]
```

15.47.5.5 hasNeqRepresentation()

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::hasNeqRepresentation ( ) const [inline]
```

Returns

15.47.5.6 isActive()

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::isActive ( ) const [inline]
```

Returns

15.47.5.7 isComplementActive()

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::isComplementActive ( ) const [inline]
```

Returns

15.47.5.8 isInfinite()

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::isInfinite ( ) const  [inline]
```

Returns

15.47.5.9 isLowerBound()

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::isLowerBound ( ) const  [inline]
```

Returns

15.47.5.10 isSatisfied()

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::isSatisfied (
            const T1 & _delta ) const  [inline]
```

15.47.5.11 isUnassigned()

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::isUnassigned ( ) const  [inline]
```

15.47.5.12 isUpperBound()

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::isUpperBound ( ) const  [inline]
```

Returns

15.47.5.13 isWeak()

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::isWeak ( ) const  [inline]
```

Returns

15.47.5.14 limit()

```
template<typename T1, typename T2>
const Value<T1>& smtrat::lra::Bound< T1, T2 >::limit ( ) const  [inline]
```

Returns

15.47.5.15 markAsDeleted()

```
template<typename T1, typename T2>
void smtrat::lra::Bound< T1, T2 >::markAsDeleted ( ) const  [inline]
```

Returns

15.47.5.16 markedAsDeleted()

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::markedAsDeleted ( ) const [inline]
```

Returns

15.47.5.17 neqRepresentation()

```
template<typename T1, typename T2>
const FormulaT& smtrat::lra::Bound< T1, T2 >::neqRepresentation ( ) const [inline]
```

Returns

15.47.5.18 operator<() [1/3]

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::operator< (
            const Bound< T1, T2 > & _bound ) const
```

Parameters

_bound	

Returns

15.47.5.19 operator<() [2/3]

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::operator< (
            const T1 & _a ) const
```

Parameters

↩	
_↩	
a	

Returns

15.47.5.20 operator<() [3/3]

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::operator< (
            const Value< T1 > & _value ) const
```

Parameters

_value	

Returns

15.47.5.21 operator<=() [1/2]

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::operator<= (
            const T1 & _a ) const
```

Parameters

↩	
_↩	
a	

Returns

15.47.5.22 operator<=() [2/2]

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::operator<= (
            const Value< T1 > & v ) const  [inline]
```

Returns

15.47.5.23 operator==() [1/2]

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::operator== (
            const T1 & _a ) const
```

Parameters

↩ _a	

Returns

15.47.5.24 operator==() [2/2]

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::operator== (
            const Value< T1 > & _value ) const
```

Parameters

_value	

Returns

15.47.5.25 operator>() [1/3]

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::operator> (
            const Bound< T1, T2 > & _bound ) const
```

Parameters

_bound	

Returns

15.47.5.26 operator>() [2/3]

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::operator> (
            const T1 & _a ) const
```

Parameters

↩ _↩ *a*	

Returns

15.47.5.27 operator>() [3/3]

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::operator> (
            const Value< T1 > & _value ) const
```

Parameters

_value	

Returns

15.47.5.28 operator>=() [1/2]

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::operator>= (
            const T1 & _a ) const
```

Parameters

↩ _↩ *a*	

Returns

15.47.5.29 operator>=() [2/2]

```
template<typename T1, typename T2>
bool smtrat::lra::Bound< T1, T2 >::operator>= (
            const Value< T1 > & v ) const  [inline]
```

Returns

15.47.5.30 origins()

```
template<typename T1, typename T2>
const std::vector<FormulaT>& smtrat::lra::Bound< T1, T2 >::origins ( ) const  [inline]
```

Returns

15.47.5.31 pInfo()

```
template<typename T1, typename T2>
Info* smtrat::lra::Bound< T1, T2 >::pInfo ( ) const [inline]
```

Returns

15.47.5.32 pLimit()

```
template<typename T1, typename T2>
const Value<T1>* smtrat::lra::Bound< T1, T2 >::pLimit ( ) const [inline]
```

Returns

15.47.5.33 pOrigins()

```
template<typename T1, typename T2>
const std::shared_ptr<std::vector<FormulaT> >& smtrat::lra::Bound< T1, T2 >::pOrigins ( )
const [inline]
```

Returns

15.47.5.34 print()

```
template<typename T1, typename T2>
void smtrat::lra::Bound< T1, T2 >::print (
            bool _withOrigins = false,
            std::ostream & _out = std::cout,
            bool _printTypebool = false ) const
```

Parameters

_withOrigins	
_out	
_printTypebool	

15.47.5.35 pVariable()

```
template<typename T1, typename T2>
Variable<T1, T2>* smtrat::lra::Bound< T1, T2 >::pVariable ( ) const [inline]
```

Returns

15.47.5.36 resetNeqRepresentation()

```
template<typename T1, typename T2>
void smtrat::lra::Bound< T1, T2 >::resetNeqRepresentation ( ) const [inline]
```

15.47.5.37 setComplement()

```
template<typename T1, typename T2>
void smtrat::lra::Bound< T1, T2 >::setComplement (
            const Bound< T1, T2 > * _complement ) const  [inline]
```

15.47.5.38 setNeqRepresentation()

```
template<typename T1, typename T2>
void smtrat::lra::Bound< T1, T2 >::setNeqRepresentation (
            const FormulaT & _constraint ) const  [inline]
```

Parameters

_constraint	

15.47.5.39 toString()

```
template<typename T1, typename T2>
const std::string smtrat::lra::Bound< T1, T2 >::toString ( ) const
```

Returns

15.47.5.40 type()

```
template<typename T1, typename T2>
Type smtrat::lra::Bound< T1, T2 >::type ( ) const  [inline]
```

Returns

15.47.5.41 unmarkAsDeleted()

```
template<typename T1, typename T2>
void smtrat::lra::Bound< T1, T2 >::unmarkAsDeleted ( ) const  [inline]
```

Returns

15.47.5.42 variable()

```
template<typename T1, typename T2>
const Variable<T1, T2>& smtrat::lra::Bound< T1, T2 >::variable ( ) const  [inline]
```

Returns

15.47.6 Friends And Related Function Documentation

15.47.6.1 operator<<

```
template<typename T1, typename T2>
template<typename T3 , typename T4 >
std::ostream& operator<< (
            std::ostream & _ostream,
            const Bound< T3, T4 > & _bound )  [friend]
```

Parameters

_withOrigins	
_out	
_printTypebool	

15.48 smtrat::vb::Bound< T > Class Template Reference

Class for the bound of a variable.

`#include <VariableBounds.h>`

Public Types

- enum Type {
  STRICT_LOWER_BOUND = 0, WEAK_LOWER_BOUND = 1, EQUAL_BOUND = 2, WEAK_UPPER_BOUND = 3,
  STRICT_UPPER_BOUND = 4 }

  The type of a bounds.

Public Member Functions

- Bound (Rational *const _limit, Variable< T > *const _variable, Type _type)

  Constructs this bound.
- ~Bound ()

  Destructs this bound.
- bool operator< (const Bound< T > &_bound) const

  Checks whether the this bound is smaller than the given one.
- void print (std::ostream &_out, bool _withRelation=false) const

  Prints this bound on the given stream.
- const Rational & limit () const
- const Rational * pLimit () const
- bool isInfinite () const
- Type type () const
- bool isUpperBound () const
- bool isLowerBound () const
- Variable< T > * pVariable () const
- const Variable< T > & variable () const
- bool isActive () const
- bool activate (const T &_origin) const

  Adds an origin to this bound.
- bool deactivate (const T &_origin) const

  Removes an origin from this bound.
- const std::set< T, carl::less< T, false > > & origins () const

Friends

- template<typename T1 >
  std::ostream & operator<< (std::ostream &_out, const Bound< T1 > &_bound)

  Prints the bound on the given output stream.

15.48.1 Detailed Description

template<typename T>
class smtrat::vb::Bound< T >

Class for the bound of a variable.

15.48.2 Member Enumeration Documentation

15.48.2.1 Type `template<typename T>`

`enum smtrat::vb::Bound::Type`

The type of a bounds.

Enumerator

STRICT_LOWER_BOUND	
WEAK_LOWER_BOUND	
EQUAL_BOUND	
WEAK_UPPER_BOUND	
STRICT_UPPER_BOUND	

15.48.3 Constructor & Destructor Documentation

15.48.3.1 Bound() `template<typename T>`

```
smtrat::vb::Bound< T >::Bound (
            Rational *const _limit,
            Variable< T > *const _variable,
            Type _type )
```

Constructs this bound.

Parameters

_limit	A pointer to the limit (rational) of the bound. It is NULL, if the limit is not finite.
_variable	The variable to which this bound belongs.
_type	The type of the bound (either it is an equal bound or it is weak resp. strict and upper resp. lower)

15.48.3.2 ~Bound() `template<typename T>`

```
smtrat::vb::Bound< T >::~Bound ( )
```

Destructs this bound.

15.48.4 Member Function Documentation

15.48.4.1 activate() `template<typename T>`

```
bool smtrat::vb::Bound< T >::activate (
            const T & _origin ) const  [inline]
```

Adds an origin to this bound.

Parameters

_origin	The origin to add.

Returns true, if this has activated this bound; false, if the bound was already active before.

15.48.4.2 deactivate() `template<typename T>`

```
bool smtrat::vb::Bound< T >::deactivate (
            const T & _origin ) const  [inline]
```

Removes an origin from this bound.

Parameters

_origin	The origin to add.

Returns true, if this has deactivated this bound; false, if the bound was already inactive before.

15.48.4.3 isActive()

```
template<typename T>
bool smtrat::vb::Bound< T >::isActive ( ) const [inline]
```

Returns true, if this bound is active, which means that there is at least one origin for it left. Note, that origins can be removed belatedly. false, otherwise.

15.48.4.4 isInfinite()

```
template<typename T>
bool smtrat::vb::Bound< T >::isInfinite ( ) const [inline]
```

Returns true, if the bound infinite; false, otherwise.

15.48.4.5 isLowerBound()

```
template<typename T>
bool smtrat::vb::Bound< T >::isLowerBound ( ) const [inline]
```

Returns true, if the bound is a lower bound; false, otherwise.

15.48.4.6 isUpperBound()

```
template<typename T>
bool smtrat::vb::Bound< T >::isUpperBound ( ) const [inline]
```

Returns true, if the bound is an upper bound; false, otherwise.

15.48.4.7 limit()

```
template<typename T>
const Rational& smtrat::vb::Bound< T >::limit ( ) const [inline]
```

Returns A constant reference to the value of the limit. Note, that it must be ensured that the bound is finite before calling this method.

15.48.4.8 operator<()

```
template<typename T>
bool smtrat::vb::Bound< T >::operator< (
            const Bound< T > & _bound ) const
```

Checks whether the this bound is smaller than the given one.

Parameters

_bound	The bound to compare with.

Returns true, if for this bound (A) and the given bound (B) it holds that: A is not inf and B is inf, A smaller than B, where A and B are rationals, A equals B, where A and B are rationals, but A is an equal bound but B is not; false, otherwise.

15.48.4.9 origins()

```
template<typename T>
const std::set<T,carl::less<T,false> >& smtrat::vb::Bound< T >::origins ( ) const  [inline]
```

Returns A constant reference to the set of origins of this bound.

15.48.4.10 pLimit()

```
template<typename T>
const Rational* smtrat::vb::Bound< T >::pLimit ( ) const  [inline]
```

Returns A pointer to the limit of this bound.

15.48.4.11 print()

```
template<typename T>
void smtrat::vb::Bound< T >::print (
            std::ostream & _out,
            bool _withRelation = false ) const
```

Prints this bound on the given stream.

Parameters

_out	The stream to print on.
_withRelation	A flag indicating whether to print also a relation symbol in front of the bound value.

15.48.4.12 pVariable()

```
template<typename T>
Variable<T>* smtrat::vb::Bound< T >::pVariable ( ) const  [inline]
```

Returns A pointer to the variable wrapper considered by this bound.

15.48.4.13 type()

```
template<typename T>
Type smtrat::vb::Bound< T >::type ( ) const  [inline]
```

Returns The type of this bound.

15.48.4.14 variable()

```
template<typename T>
const Variable<T>& smtrat::vb::Bound< T >::variable ( ) const [inline]
```

Returns A constant reference to the variable wrapper considered by this bound.

15.48.5 Friends And Related Function Documentation

15.48.5.1 operator<<

```
template<typename T>
template<typename T1 >
std::ostream& operator<< (
            std::ostream & _out,
            const Bound< T1 > & _bound ) [friend]
```

Prints the bound on the given output stream.

Parameters

_out	The output stream to print on.
_bound	The bound to print.

Returns The output stream after printing the bound on it.

15.49 smtrat::mcsat::fm::Bound Struct Reference

```
#include <ConflictGenerator.h>
```

Public Member Functions

15.49.3.5 r `Rational smtrat::mcsat::fm::Bound::r`

15.50 smtrat::Branching Struct Reference

Stores all necessary information of an branch, which can be used to detect probable infinite loop of branchings.

```
#include <Module.h>
```

Public Member Functions

- Branching (const typename Poly::PolyType &_polynomial, const Rational &_value)

  Constructor.

Data Fields

- Poly::PolyType mPolynomial

  The polynomial to branch at.
- Rational mValue

  The value to branch the polynomial at.
- size_t mRepetitions

  The number of repetitions of the branching.
- int mIncreasing

  Stores whether this the branching of the polynomial has been on an increasing sequence of values (>0), or on a decreasing sequence of values (<0).

15.50.1 Detailed Description Stores all necessary information of an branch, which can be used to detect probable infinite loop of branchings.

15.50.2 Constructor & Destructor Documentation

15.50.2.1 Branching()

```
smtrat::Branching::Branching (
    const typename Poly::PolyType & _polynomial,
    const Rational & _value ) [inline]
```

Constructor.

Parameters

_polynomial	The polynomial to branch at.
_value	The value to branch the polynomial at.

15.50.3 Field Documentation

15.50.3.1 mIncreasing `int smtrat::Branching::mIncreasing`

Stores whether this the branching of the polynomial has been on an increasing sequence of values (>0), or on a decreasing sequence of values (<0).

It is initially zero.

15.50.3.2 mPolynomial `Poly::PolyType smtrat::Branching::mPolynomial`

The polynomial to branch at.

15.50.3.3 mRepetitions `size_t smtrat::Branching::mRepetitions`

The number of repetitions of the branching.

15.50.3.4 mValue `Rational smtrat::Branching::mValue`

The value to branch the polynomial at.

Public Member Functions

- std::string moduleName () const
- BVModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=NULL)

  Constructors.
- ~BVModule ()

  Destructor.
- bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const

- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- size_t evaluateBVFormula (const FormulaT &formula)
- void transferBackendModel () const
- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩ Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩ _premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩ Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩ ::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩ AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩ CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.

- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

Adds a formula to the InformationRelevantFormula.

- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.

- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.

- Manager *const mpManager

  A reference to the manager.

- Model mModel

  Stores the assignment of the current satisfiable result, if existent.

- std::vector< Model > mAllModels

  Stores all satisfying assignments.

- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.

- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.

- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.

- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.

- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.53.4 Member Function Documentation

15.53.4.1 add()

```
bool smtrat::Module::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.53.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
            const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.53.4.3 addCore()

```
template<class Settings >
bool smtrat::BVModule< Settings >::addCore (
            ModuleInput::const_iterator _subformula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.53.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
            const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.53.4.5 addLemma()

```
void smtrat::Module::addLemma (
            const FormulaT & _lemma,
            const LemmaType & _lt = LemmaType::NORMAL,
            const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.53.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.53.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.53.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.53.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.53.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.53.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.53.4.12 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.53.4.13 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]
```

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.53.4.14 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.53.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.53.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.53.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.53.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.53.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.53.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.53.4.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.53.4.22 checkCore()

```
template<class Settings >
Answer smtrat::BVModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.53.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.53.4.24 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.53.4.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.53.4.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.53.4.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.53.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.53.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.53.4.30 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.53.4.31 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.53.4.32 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.53.4.33 constraintsToInform()

```
const carl::FastSet<FormulaT>& smtrat::Module::constraintsTo↩
Inform ( ) const [inline], [inherited]
```

Returns The constraints which the backends must be informed about.

15.53.4.34 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.53.4.35 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.53.4.36 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.53.4.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.53.4.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.53.4.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.53.4.40 evaluateBVFormula()

```
template<class Settings >
size_t smtrat::BVModule< Settings >::evaluateBVFormula (
    const FormulaT & formula ) [protected]
```

15.53.4.41 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceived↩
VariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.53.4.42 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBest↩
Origin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.53.4.43 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.53.4.44 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.53.4.45 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

15.53.4.46 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.53.4.47 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.53.4.48 getBackendsModel()

`void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.53.4.49 getInfeasibleSubsets() [1/2]

`void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.53.4.50 getInfeasibleSubsets() [2/2]

`std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.53.4.51 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.53.4.52 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.53.4.53 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.53.4.54 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.53.4.55 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.53.4.56 getReceivedFormulaSimplified()

```
std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]
```

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.53.4.57 hasLemmas()

```
bool smtrat::Module::hasLemmas ( ) [inline], [inherited]
```

Checks whether this module or any of its backends provides any lemmas.

15.53.4.58 hasValidInfeasibleSubset()

```
bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]
```

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.53.4.59 id()

```
std::size_t smtrat::Module::id ( ) const [inline], [inherited]
```

Returns A unique ID to identify this module instance.

15.53.4.60 infeasibleSubsets()

```
const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]
```

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.53.4.61 inform()

```
bool smtrat::Module::inform (
    const FormulaT & _constraint ) [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.53.4.62 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.53.4.63 informCore()

```
template<class Settings >
bool smtrat::BVModule< Settings >::informCore (
    const FormulaT & _constraint ) [virtual]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented from smtrat::Module.

15.53.4.64 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.53.4.65 init()

```
template<class Settings >
void smtrat::BVModule< Settings >::init ( ) [virtual]
```

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not and will not be called more than once and only before the first runBackends call.

Reimplemented from smtrat::Module.

15.53.4.66 is_minimizing()

```
bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]
```

15.53.4.67 isLemmaLevel()

```
bool smtrat::Module::isLemmaLevel (
    LemmaLevel level ) [protected], [inherited]
```

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.53.4.68 isPreprocessor()

```
bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]
```

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.53.4.69 lemmas()

```
const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline],
[inherited]
```

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.53.4.70 merge()

```
std::vector< FormulaT > smtrat::Module::merge (
    const std::vector< FormulaT > & _vecSetA,
    const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]
```

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.53.4.71 model()

```
const Model& smtrat::Module::model ( ) const [inline], [inherited]
```

Returns The assignment of the current satisfiable result, if existent.

15.53.4.72 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.53.4.73 moduleName()

```
template<typename Settings >
std::string smtrat::BVModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.53.4.74 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

15.53.4.75 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.53.4.76 passedFormulaBegin()

```
ModuleInput::iterator smtrat::Module::passedFormulaBegin ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula. TODO: disable this method

15.53.4.77 passedFormulaEnd()

```
ModuleInput::iterator smtrat::Module::passedFormulaEnd ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula.

15.53.4.78 pPassedFormula()

```
const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline],
[inherited]
```

Returns A pointer to the formula passed to the backends of this module.

15.53.4.79 pReceivedFormula()

```
const ModuleInput* smtrat::Module::pReceivedFormula ( ) const
[inline], [inherited]
```

Returns A pointer to the formula passed to this module.

15.53.4.80 print()

```
void smtrat::Module::print (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.53.4.81 printAllModels()

```
void smtrat::Module::printAllModels (
    std::ostream & _out = std::cout ) [inherited]
```

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.53.4.82 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.53.4.83 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.53.4.84 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.53.4.85 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.53.4.86 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.53.4.87 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.53.4.88 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAsInfeasible↩
Subset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.53.4.89 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.53.4.90 remove()

```
void smtrat::Module::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.53.4.91 removeCore()

```
template<class Settings >
void smtrat::BVModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula ) [virtual]
```

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Reimplemented from smtrat::Module.

15.53.4.92 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
            ModuleInput::iterator _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.53.4.93 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins
(
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.53.4.94 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.53.4.95 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.53.4.96 runBackends() [1/2]

`virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]`

Reimplemented in smtrat::PModule.

15.53.4.97 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.53.4.98 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.53.4.99 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.53.4.100 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.53.4.101 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.53.4.102 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.53.4.103 transferBackendModel()

`template<class Settings > void smtrat::BVModule< Settings >::transferBackendModel ( ) const [protected]`

15.53.4.104 updateAllModels()

`void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.53.4.105 updateLemmas()

`void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.53.4.106 updateModel()

`template<class Settings > void smtrat::BVModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.53.4.107 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.53.5 Field Documentation

15.53.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.53.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.53.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.53.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.53.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.53.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.53.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaToPass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.53.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.53.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.53.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.53.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.53.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.53.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.53.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.53.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.53.5.16 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.53.5.17 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.53.5.18 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

15.53.5.19 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.53.5.20 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.53.5.21 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.53.5.22 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.53.5.23 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.53.5.24 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.54 smtrat::by_address_hasher< IterType > Struct Template Reference

Hash an iterator by the pointed-to address.

```
#include <IterHash.h>
```

Public Types

- typedef std::iterator_traits< IterType >::pointer pointer_type

Public Member Functions

- std::size_t operator() (const IterType &iter) const noexcept

15.54.1 Detailed Description

template<typename IterType>
struct smtrat::by_address_hasher< IterType >

Hash an iterator by the pointed-to address.

15.54.2 Member Typedef Documentation

15.54.2.1 pointer_type `template<typename IterType >`

```
typedef std::iterator_traits<IterType>::pointer smtrat::by_address_hasher< IterType >::pointer_type
```

15.54.3 Member Function Documentation

15.54.3.1 operator()() `template<typename IterType >`

```
std::size_t smtrat::by_address_hasher< IterType >::operator() (
            const IterType & iter ) const [inline], [noexcept]
```

15.68.2.3 encode()

`boost::optional< FormulaT > smtrat::PseudoBoolEncoder::encode ( const ConstraintT & constraint ) [inherited]`

Encodes an arbitrary constraint.

Returns encoded formula

15.68.2.4 encodingSize()

```
Rational smtrat::CardinalityEncoder::encodingSize (
    const ConstraintT & constraint ) [virtual]
```

Reimplemented from smtrat::PseudoBoolEncoder.

15.68.2.5 generateVarChain()

```
FormulaT smtrat::PseudoBoolEncoder::generateVarChain (
    const std::set< carl::Variable > & vars,
    carl::FormulaType type ) [protected], [inherited]
```

15.68.2.6 name()

```
std::string smtrat::CardinalityEncoder::name ( ) [inline], [virtual]
```

Reimplemented from smtrat::PseudoBoolEncoder.

15.68.3 Field Documentation

15.68.3.1 problem_size

```
std::size_t smtrat::PseudoBoolEncoder::problem_size [inherited]
```

15.69 smtrat::cadcells::representation::cell< H > Struct Template Reference

Note: If connected(i) holds, then the indexed root ordering must contain an ordering between the interval bounds.

```
#include <heuristics.h>
```

Static Public Member Functions

- template<typename T >

15.75 smtrat::cadcells::datastructures::CellDescription Class Reference

Holds the description of a cell.

```
#include <roots.h>
```

Public Member Functions

- CellDescription (IndexedRoot bound)
- CellDescription (IndexedRoot lower, IndexedRoot upper)
- CellDescription (Bound, IndexedRoot upper)
- CellDescription (IndexedRoot lower, Bound)
- CellDescription (Bound, Bound)
- CellDescription ()
- bool is_sector () const
- bool is_section () const
- const IndexedRoot & section_defining () const

  In case of a section, the defining indexed root is returned.

- const auto & lower () const

  Returns the lower bound as IndexedRoot if finite or std::nullopt if the lower bound is -oo.

- const auto & upper () const

  Returns the upper bound as IndexedRoot if finite or std::nullopt if the upper bound is oo.

- std::optional< IndexedRoot > lower_defining () const
- std::optional< IndexedRoot > upper_defining () const
- boost::container::flat_set< PolyRef > polys () const

15.75.1 Detailed Description

Holds the description of a cell.

A cell is either a section [xi,xi] or a section (-00,xi), (xi, xi'), (xi, oo) where xi,xi' are indexed roots.

15.75.2 Constructor & Destructor Documentation

15.75.2.1 CellDescription() [1/6]

```
smtrat::cadcells::datastructures::CellDescription::Cell↩
Description (
            IndexedRoot bound ) [inline]
```

15.75.2.2 CellDescription() [2/6]

```
smtrat::cadcells::datastructures::CellDescription::Cell↩
Description (
            IndexedRoot lower,
            IndexedRoot upper ) [inline]
```

15.75.2.3 CellDescription() [3/6]

```
smtrat::cadcells::datastructures::CellDescription::Cell↩
Description (
            Bound ,
            IndexedRoot upper ) [inline]
```

15.75.2.4 CellDescription() [4/6]

```
smtrat::cadcells::datastructures::CellDescription::Cell↩
Description (
            IndexedRoot lower,
            Bound ) [inline]
```

15.75.2.5 CellDescription() [5/6]

```
smtrat::cadcells::datastructures::CellDescription::Cell↩
Description (
            Bound ,
            Bound ) [inline]
```

15.75.2.6 CellDescription() [6/6]

```
smtrat::cadcells::datastructures::CellDescription::Cell↩
Description ( ) [inline]
```

15.75.3 Member Function Documentation

15.75.3.1 is_section()

```
bool smtrat::cadcells::datastructures::CellDescription::is_section ( )
const [inline]
```

15.75.3.2 is_sector()

```
bool smtrat::cadcells::datastructures::CellDescription::is_sector ( )
const [inline]
```

15.75.3.3 lower()

```
const auto& smtrat::cadcells::datastructures::CellDescription::lower ( )
const [inline]
```

Returns the lower bound as IndexedRoot if finite or std::nullopt if the lower bound is -oo.

Asserts that the cell is a sector.

15.75.3.4 lower_defining() `std::optional<IndexedRoot> smtrat::cadcells::datastructures::CellDescription::lower_defining ( ) const [inline]`

15.75.3.5 polys() `boost::container::flat_set<PolyRef> smtrat::cadcells::datastructures::CellDescription::polys ( ) const [inline]`

15.75.3.6 section_defining() `const IndexedRoot& smtrat::cadcells::datastructures::CellDescription::section_defining ( ) const [inline]`

In case of a section, the defining indexed root is returned.

15.75.3.7 upper() `const auto& smtrat::cadcells::datastructures::CellDescription::upper ( ) const [inline]`

Returns the upper bound as IndexedRoot if finite or std::nullopt if the upper bound is oo.

Asserts that the cell is a sector.

15.75.3.8 upper_defining() `std::optional<IndexedRoot> smtrat::cadcells::datastructures::CellDescription::upper_defining ( ) const [inline]`

15.76 smtrat::cadcells::datastructures::CellRepresentation< P > Struct Template Reference

Represents a cell.

```
#include <representation.h>
```

Public Member Functions

- CellRepresentation (SampledDerivationRef< P > &deriv)

Data Fields

- CellDescription description

  Description of a cell.
- IndexedRootOrdering ordering

  An ordering on the roots that protects the cell.
- boost::container::flat_set< PolyRef > equational

  Polynomials that should be projected using the equational constraints projection.
- SampledDerivationRef< P > derivation

  Derivation.

15.76.1 Detailed Description

template<typename P>
struct smtrat::cadcells::datastructures::CellRepresentation< P >

Represents a cell.

15.76.2 Constructor & Destructor Documentation

15.76.2.1 CellRepresentation() template<typename P>

```
smtrat::cadcells::datastructures::CellRepresentation< P >::CellRepresentation (
            SampledDerivationRef< P > & deriv )  [inline]
```

15.76.3 Field Documentation

15.76.3.1 derivation template<typename P>

```
SampledDerivationRef<P> smtrat::cadcells::datastructures::CellRepresentation< P >::derivation
```

Derivation.

15.76.3.2 description template<typename P>

```
CellDescription smtrat::cadcells::datastructures::CellRepresentation< P >::description
```

Description of a cell.

15.76.3.3 equational template<typename P>

```
boost::container::flat_set<PolyRef> smtrat::cadcells::datastructures::CellRepresentation< P
>::equational
```

Polynomials that should be projected using the equational constraints projection.

15.76.3.4 ordering template<typename P>

```
IndexedRootOrdering smtrat::cadcells::datastructures::CellRepresentation< P >::ordering
```

An ordering on the roots that protects the cell.

15.77 delta::Checker Class Reference

This class takes care of calling the actual solver.

```
#include <Checker.h>
```

Public Member Functions

- Checker (const std::string &exec, std::size_t memout, std::size_t timeout, const std::string &original)

  Creates a new checker.
- bool operator() (const Node &n, const std::string &temp) const

  Call the solver with the given node.
- int expectedCode () const

  Return expected exit code.
- std::size_t getKilled () const
- void resetKilled () const
- void resetTimeout (std::size_t t)

15.77.1 Detailed Description

This class takes care of calling the actual solver.

15.77.2 Constructor & Destructor Documentation

15.77.2.1 Checker()

```
delta::Checker::Checker (
            const std::string & exec,
            std::size_t memout,
            std::size_t timeout,
            const std::string & original )  [inline]
```

Creates a new checker.

Parameters

exec	Filename of the solver executable.
timeout	Timeout for a single call to the solver.
original	Filename of the original file to obtain the expected exit code.

15.77.3 Member Function Documentation

15.77.3.1 expectedCode() `int delta::Checker::expectedCode ( ) const [inline]`

Return expected exit code.

Returns Expected exit code.

15.77.3.2 getKilled() `std::size_t delta::Checker::getKilled ( ) const [inline]`

15.77.3.3 operator()() `bool delta::Checker::operator() ( const Node & n, const std::string & temp ) const [inline]`

Call the solver with the given node.

Checks if the exit code is the same as for the original file.

Parameters

n	Input data.
temp	Filename of the temporary file.

Returns If the exit code is still the same.

15.77.3.4 resetKilled() `void delta::Checker::resetKilled ( ) const [inline]`

15.77.3.5 resetTimeout() `void delta::Checker::resetTimeout ( std::size_t t ) [inline]`

15.78 benchmax::slurm::ChunkedSubmitfileProperties Struct Reference

All properties needed to create a submit file.

```
#include <SlurmUtilities.h>
```

Data Fields

- std::string file_suffix

  Suffix for job and submit file.
- std::string filename_jobs

  Filename of the job list file.
- std::string tmp_dir

  Temporary directory for log files.
- carl::settings::duration limit_time

  Time limit in seconds.
- carl::settings::duration grace_time

  Grace time in seconds.
- carl::settings::binary_quantity limit_memory

  Memory limit in megabytes.
- std::size_t array_size

  Array size.
- std::size_t slice_size

  Slice size.
- std::pair< std::size_t, std::size_t > job_range

  This slice size.

15.78.1 Detailed Description

All properties needed to create a submit file.

15.78.2 Field Documentation

15.78.2.1 array_size `std::size_t benchmax::slurm::ChunkedSubmitfileProperties::array_size`

Array size.

15.78.2.2 file_suffix `std::string benchmax::slurm::ChunkedSubmitfileProperties::file_suffix`

Suffix for job and submit file.

15.78.2.3 filename_jobs `std::string benchmax::slurm::ChunkedSubmitfileProperties::filename_jobs`

Filename of the job list file.

15.78.2.4 grace_time `carl::settings::duration benchmax::slurm::ChunkedSubmitfileProperties::grace_time`

Grace time in seconds.

15.78.2.5 job_range `std::pair<std::size_t,std::size_t> benchmax::slurm::ChunkedSubmitfileProperties::job_range`

This slice size.

15.78.2.6 limit_memory `carl::settings::binary_quantity benchmax::slurm::ChunkedSubmitfileProperties::limit_memory`

Memory limit in megabytes.

15.78.2.7 limit_time `carl::settings::duration benchmax::slurm::ChunkedSubmitfileProperties::limit_time`

Time limit in seconds.

15.78.2.8 slice_size `std::size_t benchmax::slurm::ChunkedSubmitfileProperties::slice_size`

Slice size.

15.78.2.9 tmp_dir `std::string benchmax::slurm::ChunkedSubmitfileProperties::tmp_dir`

Temporary directory for log files.

15.81 smtrat::mcsat::ClauseChain Class Reference

An explanation is either a single clause or a chain of clauses, satisfying the following properties:

```
#include <ClauseChain.h>
```

Data Structures

- struct Link

Public Types

- using const_iterator = typename std::vector< Link >::const_iterator

Public Member Functions

- ClauseChain ()
- FormulaT createTseitinVar (const FormulaT &formula)

  Create a Tseitin variable for the given formula.
- void appendPropagating (const FormulaT &&clause, const FormulaT &&impliedTseitinLiteral)

  Append a clause that implies impliedTseitinLiteral under the current assignment.
- void appendConflicting (const FormulaT &&clause)

  Append a conflicting clause (regarding the current assignment).
- void appendOptional (const FormulaT &&clause)

  Append an additional clause which is neither propagating nor conflicting.
- const std::vector< Link > & chain () const
- const_iterator begin () const
- const_iterator end () const
- FormulaT resolve () const

  Performs resolution on the chain.
- FormulaT to_formula () const

  Transforms the clause chain into a formula (containing Tseitin variables).

Static Public Member Functions

- static ClauseChain from_formula (const FormulaT &f, const Model &model, bool with_equivalence)

  Transforms a given Boolean conjunction over AND and OR to CNF via Tseitin-Transformation so that, if the input formula is conflicting under the current assignment, after all clauses in "implications" have been propagated in the given order, the returned formula evaluates to false.

Friends

- std::ostream & operator<< (std::ostream &stream, const ClauseChain &chain)

15.81.1 Detailed Description An explanation is either a single clause or a chain of clauses, satisfying the following properties:

- If the clauses are inserted and propagated in the chain's order, at least the last clause should be conflicting.
- Each conflicting clause is already conflicting after preceding clauses have been inserted and propagated.
- Tseitin vars should be used so that a Tseitin variable C is equivalent to its corresponding subformula F (or at least C -> F).

15.81.2 Member Typedef Documentation

15.81.2.1 const_iterator `using smtrat::mcsat::ClauseChain::const_iterator = typename std::vector<Link>↩ ::const_iterator`

15.81.3 Constructor & Destructor Documentation

15.81.3.1 ClauseChain() `smtrat::mcsat::ClauseChain::ClauseChain ( ) [inline]`

15.81.4 Member Function Documentation

15.81.4.1 appendConflicting() `void smtrat::mcsat::ClauseChain::appendConflicting ( const FormulaT && clause ) [inline]`

Append a conflicting clause (regarding the current assignment).

15.81.4.2 appendOptional() `void smtrat::mcsat::ClauseChain::appendOptional ( const FormulaT && clause ) [inline]`

Append an additional clause which is neither propagating nor conflicting.

Can be used to pass additional knowledge.

15.81.4.3 appendPropagating()

```
void smtrat::mcsat::ClauseChain::appendPropagating (
    const FormulaT && clause,
    const FormulaT && impliedTseitinLiteral ) [inline]
```

Append a clause that implies impliedTseitinLiteral under the current assignment.

Note that impliedTseitinLiteral = ∼v for a Tseitin variable v obtained via createTseitinVar.

15.81.4.4 begin()

```
const_iterator smtrat::mcsat::ClauseChain::begin ( ) const [inline]
```

Returns A constant iterator to the beginning of this chain.

15.81.4.5 chain()

```
const std::vector<Link>& smtrat::mcsat::ClauseChain::chain ( ) const [inline]
```

Returns A vector representing this chain.

15.81.4.6 createTseitinVar()

```
FormulaT smtrat::mcsat::ClauseChain::createTseitinVar (
    const FormulaT & formula ) [inline]
```

Create a Tseitin variable for the given formula.

The returned variable C should be used so that C <-> formula or at least ∼formula -> ∼C

15.81.4.7 end()

```
const_iterator smtrat::mcsat::ClauseChain::end ( ) const [inline]
```

Returns A constant iterator to the end of this chain.

15.81.4.8 from_formula()

```
ClauseChain smtrat::mcsat::ClauseChain::from_formula (
    const FormulaT & f,
    const Model & model,
    bool with_equivalence ) [static]
```

Transforms a given Boolean conjunction over AND and OR to CNF via Tseitin-Transformation so that, if the input formula is conflicting under the current assignment, after all clauses in "implications" have been propagated in the given order, the returned formula evaluates to false.

15.81.4.9 resolve()

```
FormulaT smtrat::mcsat::ClauseChain::resolve ( ) const
```

Performs resolution on the chain.

Uses the last clause for resolution.

Returns A single clause conflicting under the current assignment.

15.81.4.10 to_formula() `FormulaT smtrat::mcsat::ClauseChain::to_formula ( ) const`

Transforms the clause chain into a formula (containing Tseitin variables).

15.81.5 Friends And Related Function Documentation

15.81.5.1 operator<< `std::ostream& operator<< ( std::ostream & stream, const ClauseChain & chain ) [friend]`

Data Structures

- struct SettingsType

Public Types

- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- CNFerModule (const ModuleInput *, Conditionals &, Manager *const =NULL)

  Constructs a CNFerModule.
- ~CNFerModule ()

  Destructs a CNFerModule.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()

- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void updateModel () const

  Updates the current assignment into the model.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const

- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()

- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore (ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore (ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩ Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩ _premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩ Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩ ::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩ AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩ CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.

- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.

- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.

- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.

- Manager *const mpManager

  A reference to the manager.

- Model mModel

  Stores the assignment of the current satisfiable result, if existent.

- std::vector< Model > mAllModels

  Stores all satisfying assignments.

- bool mModelComputed

  True, if the model has already been computed.

- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.85.1 Member Enumeration Documentation

15.85.1.1 LemmaType `enum smtrat::Module::LemmaType : unsigned [strong], [inherited]`

Enumerator

NORMAL	
PERMANENT	

15.85.2 Constructor & Destructor Documentation

15.85.2.1 CNFerModule()

```
smtrat::CNFerModule::CNFerModule (
    const ModuleInput * _formula,
    Conditionals & _conditionals,
    Manager * const _manager = NULL )
```

Constructs a CNFerModule.

15.85.2.2 ~CNFerModule() `smtrat::CNFerModule::~CNFerModule ( )`

Destructs a CNFerModule.

15.85.3 Member Function Documentation

15.85.3.1 add() `bool smtrat::PModule::add ( ModuleInput::const_iterator _subformula ) [inherited]`

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.85.3.2 addConstraintToInform() `void smtrat::Module::addConstraintToInform ( const FormulaT & _constraint ) [protected], [virtual], [inherited]`

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.85.3.3 addCore() `virtual bool smtrat::Module::addCore ( ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]`

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett

smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.85.3.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.85.3.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.85.3.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.85.3.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.85.3.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.85.3.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.85.3.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.85.3.11 allModels() `const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns All satisfying assignments, if existent.

15.85.3.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.85.3.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.85.3.14 appliedPreprocessing() `bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]`

Returns true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

15.85.3.15 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.85.3.16 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.85.3.17 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.85.3.18 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.85.3.19 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.85.3.20 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.85.3.21 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.85.3.22 check()

```
Answer smtrat::PModule::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.85.3.23 checkCore() `Answer smtrat::CNFerModule::checkCore ( ) [virtual]`

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.85.3.24 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.85.3.25 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.85.3.26 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.85.3.27 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.85.3.28 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.85.3.29 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.85.3.30 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.85.3.31 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.85.3.32 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.85.3.33 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.85.3.34 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraintsToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.85.3.35 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.85.3.36 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.85.3.37 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.85.3.38 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.85.3.39 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.85.3.40 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
            ModuleInput::iterator _subformula,
            bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.85.3.41 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.85.3.42 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
            const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.85.3.43 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.85.3.44 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.85.3.45 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

15.85.3.46 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.85.3.47 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.85.3.48 getBackendsModel()

`void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.85.3.49 getInfeasibleSubsets() [1/2]

`void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.85.3.50 getInfeasibleSubsets() [2/2]

`std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.85.3.51 getInformationRelevantFormulas() `const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.85.3.52 getModelEqualities() `std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.85.3.53 getOrigins() [1/3] `void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

15.85.3.54 getOrigins() [2/3] `void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

15.85.3.55 getOrigins() [3/3] `const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.85.3.56 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

15.85.3.57 hasLemmas()

`bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.85.3.58 hasValidInfeasibleSubset()

`bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.85.3.59 id()

`std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.85.3.60 infeasibleSubsets()

`const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.85.3.61 inform()

`bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.85.3.62 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.85.3.63 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.85.3.64 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.85.3.65 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.85.3.66 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.85.3.67 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.85.3.68 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.85.3.69 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.85.3.70 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.85.3.71 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.85.3.72 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.85.3.73 moduleName() `virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns The name of the given module type as name.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::VSModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::GBModule< Settings >, smtrat::IntEqModule< Setti smtrat::CubeLIAModule< Settings >, smtrat::CurryModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IncWidthModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::BEModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::SplitSOSModule< Settings >.

15.85.3.74 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.85.3.75 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

15.85.3.76 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.85.3.77 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.85.3.78 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.85.3.79 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.85.3.80 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.85.3.81 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.85.3.82 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.85.3.83 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.85.3.84 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.85.3.85 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.85.3.86 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.85.3.87 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.85.3.88 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAsInfeasible↩Subset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.85.3.89 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.85.3.90 remove()

```
void smtrat::PModule::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.85.3.91 removeCore()

```
virtual void smtrat::Module::removeCore (
    ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.85.3.92 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.85.3.93 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins
(
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.85.3.94 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.85.3.95 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.85.3.96 runBackends() [1/2]

```
virtual Answer smtrat::PModule::runBackends ( ) [inline],
[virtual], [inherited]
```

Reimplemented from smtrat::Module.

15.85.3.97 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.85.3.98 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.85.3.99 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.85.3.100 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.85.3.101 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint (
    const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.85.3.102 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.85.3.103 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.85.3.104 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.85.3.105 updateModel() `void smtrat::PModule::updateModel ( ) const [virtual], [inherited]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.85.3.106 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.85.4 Field Documentation

15.85.4.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.85.4.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.85.4.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.85.4.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.85.4.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.85.4.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.85.4.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaToPass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.85.4.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module::m↩ FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.85.4.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.85.4.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.85.4.11 mInfeasibleSubsets `std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.85.4.12 mInformedConstraints `carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.85.4.13 mLastBranches `std::vector< Branching > smtrat::Module::mLastBranches = std↩ ::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.85.4.14 mLemmas `std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.85.4.15 mModel `Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.85.4.16 mModelComputed `bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.85.4.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.85.4.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.85.4.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

15.85.4.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.85.4.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.85.4.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.85.4.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.85.4.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.85.4.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.86 smtrat::CoCoAGBModule< Settings > Class Template Reference

`#include <CoCoAGBModule.h>`

Public Types

- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.

- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.

- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.

- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.

- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.

- virtual void updateModel () const

  Updates the model, if the solver has detected the consistency of the received formula, beforehand.

- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.

- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const

- bool isPreprocessor () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- virtual bool addCore (ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.

- virtual Answer checkCore ()

  Checks the received formula for consistency.

- virtual void removeCore (ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.

- Manager *const mpManager

  A reference to the manager.

- Model mModel

  Stores the assignment of the current satisfiable result, if existent.

- std::vector< Model > mAllModels

  Stores all satisfying assignments.

- bool mModelComputed

  True, if the model has already been computed.

- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.

- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.

- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.

- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.

- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.86.1 Member Enumeration Documentation

15.86.1.1 LemmaType `enum smtrat::Module::LemmaType : unsigned [strong], [inherited]`

Enumerator

NORMAL	
PERMANENT	

15.86.2 Member Function Documentation

15.86.2.1 add()

```
bool smtrat::Module::add (
    ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.86.2.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.86.2.3 addCore()

```
virtual bool smtrat::Module::addCore (
    ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >,

smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.86.2.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.86.2.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.86.2.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.86.2.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.86.2.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.86.2.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.86.2.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.86.2.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.86.2.12 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.86.2.13 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const
[inline], [inherited]
```

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.86.2.14 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected],
[inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.86.2.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.86.2.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.86.2.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.86.2.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.86.2.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.86.2.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.86.2.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.86.2.22 checkCore() `Answer smtrat::Module::checkCore ( ) [protected], [virtual], [inherited]`

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::SATModule< Settings >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRAS smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::VSModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::GBModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, smtrat::LVEModule< Settings >, smtrat::ESModule< Settings >, smtrat::GBPPModule< Settings >, smtrat::CNFerModule, smtrat::BEModule< Settings >, smtrat::MCBModule< Settings >, smtrat::PFEModule< Settings >, smtrat::SplitSOSModule< Setti smtrat::EMModule< Settings >, and smtrat::SymmetryModule< Settings >.

15.86.2.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.86.2.24 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.86.2.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.86.2.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.86.2.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.86.2.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.86.2.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.86.2.30 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.86.2.31 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.86.2.32 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.86.2.33 constraintsToInform()

```
const carl::FastSet<FormulaT>& smtrat::Module::constraintsTo↩
Inform ( ) const [inline], [inherited]
```

Returns The constraints which the backends must be informed about.

15.86.2.34 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.86.2.35 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.86.2.36 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.86.2.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.86.2.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.86.2.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.86.2.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceived↩
VariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.86.2.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBest↩
Origin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.86.2.42 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.86.2.43 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.86.2.44 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

15.86.2.45 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.86.2.46 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.86.2.47 getBackendsModel()

`void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.86.2.48 getInfeasibleSubsets() [1/2]

`void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.86.2.49 getInfeasibleSubsets() [2/2]

`std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.86.2.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.86.2.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.86.2.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.86.2.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.86.2.54 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.86.2.55 getReceivedFormulaSimplified()

```
std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]
```

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.86.2.56 hasLemmas()

```
bool smtrat::Module::hasLemmas ( ) [inline], [inherited]
```

Checks whether this module or any of its backends provides any lemmas.

15.86.2.57 hasValidInfeasibleSubset()

```
bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]
```

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.86.2.58 id()

```
std::size_t smtrat::Module::id ( ) const [inline], [inherited]
```

Returns A unique ID to identify this module instance.

15.86.2.59 infeasibleSubsets()

```
const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]
```

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.86.2.60 inform()

```
bool smtrat::Module::inform (
    const FormulaT & _constraint ) [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.86.2.61 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.86.2.62 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.86.2.63 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.86.2.64 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.86.2.65 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.86.2.66 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.86.2.67 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.86.2.68 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.86.2.69 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.86.2.70 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.86.2.71 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.86.2.72 moduleName() `virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns The name of the given module type as name.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::VSModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::GBModule< Settings >, smtrat::IntEqModule< Setti smtrat::CubeLIAModule< Settings >, smtrat::CurryModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IncWidthModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::BEModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::SplitSOSModule< Settings >.

15.86.2.73 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.86.2.74 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

15.86.2.75 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.86.2.76 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.86.2.77 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.86.2.78 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.86.2.79 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.86.2.80 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.86.2.81 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.86.2.82 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.86.2.83 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.86.2.84 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.86.2.85 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.86.2.86 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.86.2.87 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAsInfeasible↩Subset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.86.2.88 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.86.2.89 remove()

```
void smtrat::Module::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.86.2.90 removeCore()

```
virtual void smtrat::Module::removeCore (
    ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.86.2.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.86.2.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins
(
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.86.2.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.86.2.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.86.2.95 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( ) [inline], [protected],
[virtual], [inherited]
```

Reimplemented in smtrat::PModule.

15.86.2.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.86.2.97 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.86.2.98 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.86.2.99 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.86.2.100 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint (
    const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.86.2.101 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.86.2.102 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.86.2.103 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.86.2.104 updateModel() `void smtrat::Module::updateModel ( ) const [virtual], [inherited]`

Updates the model, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::SATModule< Settings >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRAS smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::PModule, smtrat::VSModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, smtrat::LVEModule< Settings >, smtrat::MCBModule< Settings >, smtrat::ESModule< Settings >, and smtrat::GBPPModule< Settings >.

15.86.2.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.86.3 Field Documentation

15.86.3.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.86.3.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.86.3.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.86.3.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.86.3.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.86.3.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.86.3.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaToPass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.86.3.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module::m↩FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.86.3.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.86.3.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.86.3.11 mInfeasibleSubsets `std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.86.3.12 mInformedConstraints `carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.86.3.13 mLastBranches `std::vector< Branching > smtrat::Module::mLastBranches = std↩ ::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.86.3.14 mLemmas `std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.86.3.15 mModel `Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.86.3.16 mModelComputed `bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.86.3.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.86.3.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.86.3.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

15.86.3.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.86.3.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.86.3.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.86.3.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.86.3.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.86.3.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

```

15.90.2.4 operator<()

```
bool smtrat::vs::Condition::operator< (
    const Condition & _condition ) const
```

Checks if the given condition (right hand side) is greater than this condition (left hand side).

Parameters

_condition	The condition to compare with (rhs).

Returns true ,if the given substitution is greater than this substitution; false ,otherwise.

15.90.2.5 operator==()

```
bool smtrat::vs::Condition::operator== (
    const Condition & _condition ) const
```

Checks the equality of a given condition (right hand side) with this condition (left hand side).

Parameters

_condition	The condition to compare with (rhs).

Returns true ,if the given condition is equal to this condition; false ,otherwise.

15.90.2.6 originalConditions()

```
const carl::PointerSet<Condition>& smtrat::vs::Condition::original↩
Conditions ( ) const [inline]
```

15.90.2.7 pOriginalConditions()

```
carl::PointerSet<Condition>* smtrat::vs::Condition::pOriginal↩
Conditions ( ) const [inline]
```

15.90.2.8 print()

```
void smtrat::vs::Condition::print (
    std::ostream & _out = std::cout ) const
```

Prints the condition to an output stream.

Parameters

_out	The output stream, where it should print.

15.90.2.9 recentlyAdded()

```
bool smtrat::vs::Condition::recentlyAdded ( ) const [inline]
```

15.90.2.10 rFlag()

```
bool& smtrat::vs::Condition::rFlag ( ) const [inline]
```

15.90.2.11 rRecentlyAdded()

```
bool& smtrat::vs::Condition::rRecentlyAdded ( ) const [inline]
```

15.90.2.12 rValuation()

```
size_t& smtrat::vs::Condition::rValuation ( ) const [inline]
```

15.90.2.13 valuate()

```
double smtrat::vs::Condition::valuate (
    const carl::Variable & _consideredVariable,
    size_t _maxNumberOfVars,
    bool _preferEquation ) const
```

Valuates the constraint according to a variable (it possibly not contains).

Parameters

_consideredVariable	The variable which is considered in this valuation.
_maxNumberOfVars	

Returns A valuation of the constraint according to an heuristic.

15.90.2.14 valuation() `size_t smtrat::vs::Condition::valuation ( ) const [inline]`

15.90.3 Friends And Related Function Documentation

15.90.3.1 operator<< `std::ostream& operator<< ( std::ostream & _out, const Condition & _condition ) [friend]`

15.91 benchmax::CondorBackend Class Reference

Backend for the HTCondor batch system.

```
#include <CondorBackend.h>
```

Public Member Functions

- void run (const Jobs &, bool)

  Run all tools on all benchmarks.
- bool suspendable () const
- void process_results (const Jobs &jobs, bool check_finished)
- void addResult (const Tool *tool, const fs::path &file, BenchmarkResult &&result)

  Add a result.

Protected Member Functions

- virtual void execute (const Tool *, const fs::path &)

  No-op version of execute.
- virtual void startTool (const Tool *)

  Hook for every tool at the beginning.
- virtual void finalize ()

  Hook to allow for asynchronous backends to wait for jobs to terminate.
- void madeProgress (std::size_t files=1)

  Can be called to give information about the current progress, if available.
- virtual bool collect_results (const Jobs &, bool)
- void sanitize_results (const Jobs &jobs) const
- void write_results (const Jobs &jobs) const

Protected Attributes

- std::size_t mExpectedJobs

  Number of jobs that should be run.
- std::atomic< std::size_t > mFinishedJobs

  Number of jobs that are finished.
- std::atomic< std::size_t > mLastPercent

  Percentage of finished jobs when madeProgress() was last called.

15.91.1 Detailed Description

Backend for the HTCondor batch system.

Currently submits all jobs individually and asynchronously waits for them to finish.

15.91.2 Member Function Documentation

15.91.2.1 addResult()

```
void benchmax::Backend::addResult (
    const Tool * tool,
    const fs::path & file,
    BenchmarkResult && result ) [inline], [inherited]
```

Add a result.

15.91.2.2 collect_results()

```
virtual bool benchmax::Backend::collect_results (
    const Jobs & ,
    bool ) [inline], [protected], [virtual], [inherited]
```

15.91.2.3 execute()

```
virtual void benchmax::CondorBackend::execute (
    const Tool * ,
    const fs::path & ) [inline], [protected], [virtual]
```

No-op version of execute.

Reimplemented from benchmax::Backend.

15.91.2.4 finalize()

```
virtual void benchmax::Backend::finalize ( ) [inline], [protected], [virtual],
[inherited]
```

Hook to allow for asynchronous backends to wait for jobs to terminate.

15.91.2.5 madeProgress()

```
void benchmax::Backend::madeProgress (
    std::size_t files = 1 ) [inline], [protected], [inherited]
```

Can be called to give information about the current progress, if available.

15.91.2.6 process_results()

```
void benchmax::Backend::process_results (
    const Jobs & jobs,
    bool check_finished ) [inline], [inherited]
```

15.91.2.7 run()

```
void benchmax::CondorBackend::run (
    const Jobs & ,
    bool ) [inline]
```

Run all tools on all benchmarks.

15.91.2.8 sanitize_results()

```
void benchmax::Backend::sanitize_results (
    const Jobs & jobs ) const [inline], [protected], [inherited]
```

15.91.2.9 startTool()

```
virtual void benchmax::Backend::startTool (
    const Tool * ) [inline], [protected], [virtual], [inherited]
```

Hook for every tool at the beginning.

Can be used to upload the tool to some remote system.

15.91.2.10 suspendable()

```
bool benchmax::Backend::suspendable ( ) const [inline], [inherited]
```

15.91.2.11 write_results()

```
void benchmax::Backend::write_results (
    const Jobs & jobs ) const [inline], [protected], [inherited]
```

15.91.3 Field Documentation

15.91.3.1 mExpectedJobs

```
std::size_t benchmax::Backend::mExpectedJobs [protected], [inherited]
```

Number of jobs that should be run.

15.91.3.2 mFinishedJobs

```
std::atomic<std::size_t> benchmax::Backend::mFinishedJobs [protected],
[inherited]
```

Number of jobs that are finished.

15.91.3.3 mLastPercent

```
std::atomic<std::size_t> benchmax::Backend::mLastPercent [protected],
[inherited]
```

Percentage of finished jobs when madeProgress() was last called.

15.92 smtrat::mcsat::fm::ConflictGenerator< Comparator > Struct Template Reference

```
#include <ConflictGenerator.h>
```

Public Member Functions

```

15.92.2 Member Function Documentation

15.92.2.1 generateExplanation()

```
template<class Comparator >
template<typename Callback >
void smtrat::mcsat::fm::ConflictGenerator< Comparator >::generateExplanation (
            Callback && callback ) [inline]
```

15.93 smtrat::cad::ConflictGraph Class Reference

Representation of a bipartite graph (C+S, E) of vertices C and S, representing the constraints and samples, respectively.

```
#include <ConflictGraph.h>
```

Public Member Functions

- ConflictGraph (std::size_t constraints)
- std::size_t coveredSamples (std::size_t id) const
- void addSample (const Sample &sample)
- std::size_t getMaxDegreeConstraint () const

  Retrieves the constraint that covers the most samples.
- void selectConstraint (std::size_t id)

  Removes the given constraint and disable all sample points covered by this constraint.
- std::vector< size_t > selectEssentialConstraints ()

  Selects all essential constraints and returns their indices.
- ConflictGraph removeDuplicateColumns ()

  Returns a new ConflictGraph whose adjacency matrix consists only of the unique columns of the adjacency matrix of this graph.
- bool hasRemainingSamples () const

  Checks if there are samples still uncovered.
- std::size_t numSamples () const
- std::size_t numRemainingConstraints () const
- carl::Bitset getData (std::size_t id)
- std::vector< std::pair< std::size_t, carl::Bitset > > getRemainingConstraints ()

Friends

- std::ostream & operator<< (std::ostream &os, const ConflictGraph &cg)

15.93.1 Detailed Description

Representation of a bipartite graph (C+S, E) of vertices C and S, representing the constraints and samples, respectively.

A vertex from C and a vertex from S are connected by an edge in E iff the corresponding constraint conflicts with the corresponding sample point.

15.93.2 Constructor & Destructor Documentation

15.93.2.1 ConflictGraph()

```
smtrat::cad::ConflictGraph::ConflictGraph (
            std::size_t constraints ) [inline]
```

15.93.3 Member Function Documentation

15.93.3.1 addSample()

```
void smtrat::cad::ConflictGraph::addSample (
            const Sample & sample )
```

15.93.3.2 coveredSamples()

```
std::size_t smtrat::cad::ConflictGraph::coveredSamples (
            std::size_t id ) const [inline]
```

15.93.3.3 getData()

```
carl::Bitset smtrat::cad::ConflictGraph::getData (
    std::size_t id )
```

15.93.3.4 getMaxDegreeConstraint()

```
std::size_t smtrat::cad::ConflictGraph::getMaxDegreeConstraint
( ) const
```

Retrieves the constraint that covers the most samples.

15.93.3.5 getRemainingConstraints()

```
std::vector< std::pair< std::size_t, carl::Bitset > >
smtrat::cad::ConflictGraph::getRemainingConstraints ( )
```

15.93.3.6 hasRemainingSamples()

```
bool smtrat::cad::ConflictGraph::hasRemainingSamples ( )
const
```

Checks if there are samples still uncovered.

15.93.3.7 numRemainingConstraints()

```
std::size_t smtrat::cad::ConflictGraph::numRemaining↩
Constraints ( ) const
```

15.93.3.8 numSamples()

```
std::size_t smtrat::cad::ConflictGraph::numSamples ( ) const
```

15.93.3.9 removeDuplicateColumns()

```
ConflictGraph smtrat::cad::ConflictGraph::removeDuplicate↩
Columns ( )
```

Returns a new ConflictGraph whose adjacency matrix consists only of the unique columns of the adjacency matrix of this graph.

15.93.3.10 selectConstraint()

```
void smtrat::cad::ConflictGraph::selectConstraint (
    std::size_t id )
```

Removes the given constraint and disable all sample points covered by this constraint.

15.93.3.11 selectEssentialConstraints()

```
std::vector< std::size_t > smtrat::cad::ConflictGraph↩
::selectEssentialConstraints ( )
```

Selects all essential constraints and returns their indices.

15.93.4 Friends And Related Function Documentation

15.93.4.1 operator<<

15.98 delta::Consumer Class Reference

This class takes care of asynchronous execution of calls to the solver.

```
#include <Consumer.h>
```

Public Member Functions

- Consumer (const std::string &tempPrefix, std::size_t threads, const Checker &checker)

  Constructor.
- ~Consumer ()

  Destructor.
- void consume (const Node &n, const std::string &message, std::size_t num)

  Initiate asynchronous check for the given node.
- bool wait ()

  Wait for at least one job to finish.
- void reset ()

  Reset this executor.
- bool hasResult () const

  Checks if at least one job was successful.
- std::tuple< Node, std::string, std::size_t > getResult ()

  Returns the result, assuming that one exists.
- std::pair< unsigned, unsigned > getProgress () const

  Returns the current progress.

15.98.1 Detailed Description

This class takes care of asynchronous execution of calls to the solver.

15.98.2 Constructor & Destructor Documentation

15.98.2.1 Consumer()

```
delta::Consumer::Consumer (
    const std::string & tempPrefix,
    std::size_t threads,
    const Checker & checker ) [inline]
```

Constructor.

Parameters

tempPrefix	Prefix for temporary files.

15.98.2.2 ~Consumer()

```
delta::Consumer::~Consumer ( ) [inline]
```

Destructor.

15.98.3 Member Function Documentation

15.98.3.1 consume()

```
void delta::Consumer::consume (
    const Node & n,
    const std::string & message,
    std::size_t num ) [inline]
```

Initiate asynchronous check for the given node.

Parameters

n	Node to check.
message	Message.
num	Number of this node in the iteration.

15.98.3.2 getProgress() `std::pair<unsigned, unsigned> delta::Consumer::getProgress ( ) const [inline]`

Returns the current progress.

Returns Pair of finished and total checks.

15.98.3.3 getResult() `std::tuple<Node, std::string, std::size_t> delta::Consumer::getResult ( ) [inline]`

Returns the result, assuming that one exists.

Returns Result.

15.98.3.4 hasResult() `bool delta::Consumer::hasResult ( ) const [inline]`

Checks if at least one job was successful.

Returns If a result is there.

15.98.3.5 reset() `void delta::Consumer::reset ( ) [inline]`

Reset this executor.

Waits for all jobs to finish and resets the internal status.

15.98.3.6 wait() `bool delta::Consumer::wait ( ) [inline]`

Wait for at least one job to finish.

Returns If all jobs have finished.

15.99 smtrat::LRAModule< Settings >::Context Struct Reference

Stores a formula, being part of the received formula of this module, and the position of this formula in the passed formula.

```
#include <LRAModule.h>
```

Public Member Functions

- Context (const FormulaT &_origin, ModuleInput::iterator _pos)

Data Fields

- FormulaT origin

  The formula in the received formula.

- ModuleInput::iterator position

  The position of this formula in the passed formula.

15.99.1 Detailed Description

template<class Settings>
struct smtrat::LRAModule< Settings >::Context

Stores a formula, being part of the received formula of this module, and the position of this formula in the passed formula.

TODO: Maybe it is enough to store a mapping of the formula to the position.

15.99.2 Constructor & Destructor Documentation

15.99.2.1 Context() template<class Settings>

```
smtrat::LRAModule< Settings >::Context::Context (
            const FormulaT & _origin,
            ModuleInput::iterator _pos )  [inline]
```

15.99.3 Field Documentation

15.99.3.1 origin template<class Settings>

```
FormulaT smtrat::LRAModule< Settings >::Context::origin
```

The formula in the received formula.

15.99.3.2 position template<class Settings>

```
ModuleInput::iterator smtrat::LRAModule< Settings >::Context::position
```

The position of this formula in the passed formula.

  Constructors.

- ~ContractionCandidateManager ()
- ContractionCandidate * createCandidate (carl::Variable _lhs, const Poly _rhs, const ConstraintT &_constraint, carl::Variable _derivationVar, Contractor< carl::SimpleNewton > &_contractor, bool _usePropagation)

  Constructor & Functions.

- unsigned getId (const ContractionCandidate *const _candidate) const

  Returns the id of the given contraction candidate.

- ContractionCandidate * getCandidate (unsigned _id) const

  Returns the contraction candidate for the given id.

- void closure (const ContractionCandidate *const _candidate, std::set< const ContractionCandidate * > &↩ _candidates) const

  Calculates the closure of a certain candidate according to the variables contained.

- const std::vector< ContractionCandidate * > & candidates ()

15.102.1 Constructor & Destructor Documentation

15.102.1.1 ContractionCandidateManager() `smtrat::icp::ContractionCandidateManager::Contraction↩ CandidateManager ( )`

Constructors.

15.102.1.2 ~ContractionCandidateManager() `smtrat::icp::ContractionCandidateManager::~Contraction↩ CandidateManager ( ) [inline]`

15.102.2 Member Function Documentation

15.102.2.1 candidates() `const std::vector<ContractionCandidate*>& smtrat::icp::Contraction↩ CandidateManager::candidates ( ) [inline]`

15.102.2.2 closure()

```
void smtrat::icp::ContractionCandidateManager::closure (
    const ContractionCandidate *const _candidate,
    std::set< const ContractionCandidate * > & _candidates ) const
```

Calculates the closure of a certain candidate according to the variables contained.

Parameters

_candidate	

Returns the set of candidates in the closure of _candidate

15.102.2.3 createCandidate()

```
ContractionCandidate * smtrat::icp::ContractionCandidateManager↩
::createCandidate (
    carl::Variable _lhs,
```

```
const Poly _rhs,
const ConstraintT & _constraint,
carl::Variable _derivationVar,
Contractor< carl::SimpleNewton > & _contractor,
bool _usePropagation )
```

Constructor & Functions.

Creates a new candidate with an unique id.

Parameters

_lhs	The slack/nonlinear variable which represents the constraint
_constraint	The constraint which is to be replaced
_derivationVar	The variable from which the derivative is created when performing contraction
_origin	The pointer to the original formula, needed for assertions and removals of subformulas

Returns a pointer to the created contraction candidate

15.102.2.4 getCandidate()

```
ContractionCandidate * smtrat::icp::ContractionCandidateManager↩
::getCandidate (
            unsigned _id ) const
```

Returns the contraction candidate for the given id.

Parameters

↩ ↩ *id*	

Returns the pointer to the contraction candidate

15.102.2.5 getId()

```
unsigned smtrat::icp::ContractionCandidateManager::getId (
            const ContractionCandidate *const _candidate ) const
```

Returns the id of the given contraction candidate.

Parameters

_candidate	

Returns id of the candidate

15.103 smtrat::parser::conversion::Converter< To > Struct Template Reference

15.109.1 Detailed Description

Implements the core theory of the booleans.

15.109.2 Member Typedef Documentation

15.109.2.1 OperatorType `using smtrat::parser::CoreTheory::OperatorType = boost::variant<carl↩::FormulaType>`

15.109.3 Constructor & Destructor Documentation

15.109.3.1 CoreTheory() `smtrat::parser::CoreTheory::CoreTheory ( ParserState * state )`

15.109.4 Member Function Documentation

15.109.4.1 addConstants()

```
void smtrat::parser::CoreTheory::addConstants (
    qi::symbols< char, types::ConstType > & constants ) [static]
```

15.109.4.2 addSimpleSorts()

```
void smtrat::parser::CoreTheory::addSimpleSorts (
    qi::symbols< char, carl::Sort > & sorts ) [static]
```

15.109.4.3 declareVariable()

```
bool smtrat::parser::CoreTheory::declareVariable (
    const std::string & ,
    const carl::Sort & ,
    types::VariableType & ,
    TheoryError & errors ) [virtual]
```

Declare a new variable with the given name and the given sort.

Reimplemented from smtrat::parser::AbstractTheory.

15.109.4.4 expandDistinct()

```
template<typename T , typename Builder >
FormulaT smtrat::parser::AbstractTheory::expandDistinct (
    const std::vector< T > & values,
    const Builder & neqBuilder ) [inline], [inherited]
```

15.109.4.5 functionCall()

```
bool smtrat::parser::CoreTheory::functionCall (
    const Identifier & ,
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors ) [virtual]
```

Resolve another unknown function call.

Reimplemented from smtrat::parser::AbstractTheory.

15.109.4.6 handleDistinct()

```
bool smtrat::parser::CoreTheory::handleDistinct (
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors ) [virtual]
```

Resolve a distinct operator.

Reimplemented from smtrat::parser::AbstractTheory.

15.109.4.7 handleITE()

```
bool smtrat::parser::CoreTheory::handleITE (
    const FormulaT & ,
    const types::TermType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors ) [virtual]
```

Resolve an if-then-else operator.

Reimplemented from smtrat::parser::AbstractTheory.

15.109.4.8 instantiate()

```
virtual bool smtrat::parser::AbstractTheory::instantiate (
    const types::VariableType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Instantiate a variable within a term.

Reimplemented in smtrat::parser::BitvectorTheory, and smtrat::parser::ArithmeticTheory.

15.109.4.9 refreshVariable()

```
virtual bool smtrat::parser::AbstractTheory::refreshVariable (
    const types::VariableType & ,
    types::VariableType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Reimplemented in smtrat::parser::BitvectorTheory.

15.109.4.10 resolveSymbol()

```
virtual bool smtrat::parser::AbstractTheory::resolveSymbol (
    const Identifier & ,
    types::TermType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Resolve a symbol that was not declared within the ParserState.

This might be a symbol that actually uses indices, for example bitvector constants.

Reimplemented in smtrat::parser::BitvectorTheory.

15.109.5 Field Documentation

15.109.5.1 state

```
ParserState* smtrat::parser::AbstractTheory::state  [inherited]
```

15.116 smtrat::cadcells::datastructures::CoveringDescription Class Reference

Describes a covering of the real line by CellDescriptions (given an appropriate sample).

```
#include <roots.h>
```

Public Member Functions

- void add (const CellDescription &c)

  Add a CellDescription to the covering.
- const auto & cells () const

15.116.1 Detailed Description

Describes a covering of the real line by CellDescriptions (given an appropriate sample).

15.116.2 Member Function Documentation

15.116.2.1 add()

```
void smtrat::cadcells::datastructures::CoveringDescription::add (
            const CellDescription & c ) [inline]
```

Add a CellDescription to the covering.

The added cell needs to be the rightmost cell of the already added cells and not be contained in any of these cells (or vice versa).

- The first cell needs to have -oo as left bound.
- The last cell needs to have oo as right bound.
- All cells need to cover the real line under an appropriate sample.
- Evaluated under an appropriate sample, the left bound of the added cell c is strictly greater than the left bounds of already added cells (considering also "strictness" of the bounds).
- The right bound of the added cell c needs to be greater than all right bounds of already added cells (considering also "strictness" of the bounds).

15.116.2.2 cells()

```
const auto& smtrat::cadcells::datastructures::CoveringDescription::cells ( )
const [inline]
```

15.117 smtrat::cadcells::datastructures::CoveringRepresentation< P > Struct Template Reference

Represents a covering over a cell.

```
#include <representation.h>
```

Public Member Functions

- CoveringDescription get_covering () const

  Returns a descriptions of the covering.
- std::vector< SampledDerivationRef< P > > sampled_derivations ()

  Returns the derivations.
- bool is_valid () const

  Checks whether this represents a proper non-redundant covering.

Data Fields

- std::vector< CellRepresentation< P > > cells

  Cells of the covering in increasing order and no cell is contained in another cell.
- IndexedRootOrdering ordering

  An ordering on the roots for the cell boundaries mainting the covering.

15.117.1 Detailed Description

template<typename P>
struct smtrat::cadcells::datastructures::CoveringRepresentation< P >

Represents a covering over a cell.

The cells forming the covering are in increasing order (ordered by lower bound) and no cell is contained in another cell.

15.117.2 Member Function Documentation

15.117.2.1 get_covering() `template<typename P>`

```
CoveringDescription smtrat::cadcells::datastructures::CoveringRepresentation< P >::get_↩
covering ( ) const  [inline]
```

Returns a descriptions of the covering.

15.117.2.2 is_valid() `template<typename P>`

```
bool smtrat::cadcells::datastructures::CoveringRepresentation< P >::is_valid ( ) const  [inline]
```

Checks whether this represents a proper non-redundant covering.

15.117.2.3 sampled_derivations() `template<typename P>`

```
std::vector<SampledDerivationRef<P> > smtrat::cadcells::datastructures::CoveringRepresentation<
P >::sampled_derivations ( )  [inline]
```

Returns the derivations.

15.117.3 Field Documentation

15.117.3.1 cells `template<typename P>`

`std::vector<CellRepresentation<P> > smtrat::cadcells::datastructures::CoveringRepresentation< P >::cells`

Cells of the covering in increasing order and no cell is contained in another cell.

15.117.3.2 ordering `template<typename P>`

`IndexedRootOrdering smtrat::cadcells::datastructures::CoveringRepresentation< P >::ordering`

An ordering on the roots for the cell boundaries mainting the covering.

15.118 smtrat::mcsat::onecellcad::recursive::CoverNullification Struct Reference

`#include <Explanation.h>`

Static Public Attributes

`#include <CSplitModule.h>`

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- CSplitModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

Checks the received formula for consistency.

- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.

- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.

- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩ _premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩ Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩ ::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩ AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩ CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.

- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.

- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.

- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.119.3.1 CSplitModule() `template<class Settings >`

```
smtrat::CSplitModule< Settings >::CSplitModule (
            const ModuleInput * _formula,
            Conditionals & _conditionals,
            Manager * _manager = nullptr )
```

15.119.4 Member Function Documentation

15.119.4.1 add() `bool smtrat::Module::add (`

```
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.119.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.119.4.3 addCore()

```
template<class Settings >
bool smtrat::CSplitModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns False, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; True, otherwise.

Update the variable domain with the asserted bound

Normalize the left hand side of the constraint and turn the relation accordingly

Purifiy and discretize the normalized left hand side to construct the linearization

Check if the asserted relation trivially conflicts with other asserted relations

Reimplemented from smtrat::Module.

15.119.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.119.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline], [inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.119.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.119.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.119.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.119.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.119.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not

yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.119.4.11 allModels() `const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns All satisfying assignments, if existent.

15.119.4.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.119.4.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.119.4.14 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.119.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.119.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.119.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.119.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.119.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.119.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.119.4.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.119.4.22 checkCore()

```
template<class Settings >
Answer smtrat::CSplitModule< Settings >::checkCore ( )  [virtual]
```

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; UNKNOWN, otherwise.

Report unsatisfiability if the already found conflicts are still unresolved

Apply the method only if the asserted formula is not trivially undecidable

Check the asserted formula with the backends

Reimplemented from smtrat::Module.

15.119.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.119.4.24 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.119.4.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.119.4.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.119.4.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.119.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.119.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.119.4.30 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

15.119.4.31 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.119.4.32 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.119.4.33 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.119.4.34 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.119.4.35 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.119.4.36 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.119.4.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.119.4.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.119.4.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.119.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.119.4.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.119.4.42 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.119.4.43 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.119.4.44 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.119.4.45 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.119.4.46 getBackendsAllModels()

```
void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]
```

Stores all models of a backend in the list of all models of this module.

15.119.4.47 getBackendsModel()

```
void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]
```

15.119.4.48 getInfeasibleSubsets() [1/2]

```
void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]
```

Copies the infeasible subsets of the passed formula.

15.119.4.49 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets (
    const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.119.4.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.119.4.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.119.4.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.119.4.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.119.4.54 getOrigins() [3/3]

`const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.119.4.55 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.119.4.56 hasLemmas()

`bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.119.4.57 hasValidInfeasibleSubset()

`bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.119.4.58 id()

`std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.119.4.59 infeasibleSubsets()

`const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.119.4.60 inform()

`bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.119.4.61 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.119.4.62 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.119.4.63 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.119.4.64 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.119.4.65 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.119.4.66 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.119.4.67 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.119.4.68 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.119.4.69 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.119.4.70 model()

`const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.119.4.71 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.119.4.72 moduleName()

```
template<typename Settings >
std::string smtrat::CSplitModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.119.4.73 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.119.4.74 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.119.4.75 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.119.4.76 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.119.4.77 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.119.4.78 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.119.4.79 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.119.4.80 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.119.4.81 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.119.4.82 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const  [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.119.4.83 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.119.4.84 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.119.4.85 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const  [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.119.4.86 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

15.119.4.87 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩
InfeasibleSubset (
            ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.119.4.88 receivedVariable()

```
bool smtrat::Module::receivedVariable (
            carl::Variable::Arg _var ) const [inline], [inherited]
```

15.119.4.89 remove()

```
void smtrat::Module::remove (
            ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.119.4.90 removeCore()

```
template<class Settings >
void smtrat::CSplitModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula ) [virtual]
```

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Update the variable domain with the removed bound

Normalize the left hand side of the constraint and turn the relation accordingly

Retrieve the normalized constraint and mark the separator object as changed

Reimplemented from smtrat::Module.

15.119.4.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.119.4.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected], [inherited]
```

15.119.4.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.119.4.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.119.4.95 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

15.119.4.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.119.4.97 setId()

```
void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.119.4.98 setThreadPriority()

```
void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.119.4.99 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.119.4.100 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.119.4.101 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.119.4.102 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.119.4.103 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.119.4.104 updateModel() `template<class Settings > void smtrat::CSplitModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.119.4.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.119.5 Field Documentation

15.119.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.119.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.119.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.119.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.119.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.119.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.119.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.119.5.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module::m↩FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.119.5.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.119.5.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.119.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.119.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.119.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.119.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.119.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.119.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.119.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.119.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.119.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplitting↩Variables [static], [inherited]`

Reusable splitting variables.

15.119.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.119.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.119.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.119.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.119.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.119.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.120 smtrat::CubeLIAModule< Settings > Class Template Reference

`#include <CubeLIAModule.h>`

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- CubeLIAModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- ~CubeLIAModule ()
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.

- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.

- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.

- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.120.3.1 CubeLIAModule()

```
template<class Settings >
smtrat::CubeLIAModule< Settings >::CubeLIAModule (
            const ModuleInput * _formula,
            Conditionals & _conditionals,
            Manager * _manager = nullptr )
```

15.120.3.2 ~CubeLIAModule()

```
template<class Settings >
smtrat::CubeLIAModule< Settings >::~CubeLIAModule ( )
```

15.120.4 Member Function Documentation

15.120.4.1 add()

```
bool smtrat::Module::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.120.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
            const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.120.4.3 addCore()

```
template<class Settings >
bool smtrat::CubeLIAModule< Settings >::addCore (
            ModuleInput::const_iterator _subformula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.120.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.120.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.120.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.120.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
            ModuleInput::const_iterator _subformula )  [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.120.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.120.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.120.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.120.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.120.4.12 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.120.4.13 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const
[inline], [inherited]
```

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.120.4.14 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected],
[inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.120.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.120.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.120.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.120.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.120.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.120.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.120.4.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.120.4.22 checkCore() `template<class Settings >`

`Answer smtrat::CubeLIAModule< Settings >::checkCore ( ) [virtual]`

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.120.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.120.4.24 checkModel()

`unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.120.4.25 cleanModel()

`void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.120.4.26 clearLemmas()

`void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.120.4.27 clearModel()

`void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.120.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.120.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.120.4.30 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.120.4.31 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.120.4.32 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.120.4.33 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.120.4.34 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.120.4.35 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.120.4.36 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.120.4.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.120.4.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.120.4.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
            ModuleInput::iterator _subformula,
            bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.120.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.120.4.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
            const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.120.4.42 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.120.4.43 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.120.4.44 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

15.120.4.45 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.120.4.46 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.120.4.47 getBackendsModel()

`void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.120.4.48 getInfeasibleSubsets() [1/2]

`void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.120.4.49 getInfeasibleSubsets() [2/2]

`std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.120.4.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.120.4.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.120.4.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.120.4.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.120.4.54 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.120.4.55 getReceivedFormulaSimplified() `std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.120.4.56 hasLemmas() `bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.120.4.57 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.120.4.58 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.120.4.59 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.120.4.60 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.120.4.61 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.120.4.62 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.120.4.63 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.120.4.64 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.120.4.65 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.120.4.66 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.120.4.67 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.120.4.68 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.120.4.69 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.120.4.70 model()

`const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.120.4.71 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.120.4.72 moduleName()

```
template<typename Settings >
std::string smtrat::CubeLIAModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.120.4.73 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.120.4.74 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.120.4.75 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.120.4.76 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.120.4.77 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.120.4.78 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.120.4.79 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.120.4.80 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.120.4.81 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.120.4.82 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const  [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.120.4.83 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.120.4.84 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.120.4.85 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const  [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.120.4.86 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

15.120.4.87 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩
InfeasibleSubset (
            ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.120.4.88 receivedVariable()

```
bool smtrat::Module::receivedVariable (
            carl::Variable::Arg _var ) const [inline], [inherited]
```

15.120.4.89 remove()

```
void smtrat::Module::remove (
            ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.120.4.90 removeCore()

```
template<class Settings >
void smtrat::CubeLIAModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula ) [virtual]
```

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Reimplemented from smtrat::Module.

15.120.4.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.120.4.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected], [inherited]
```

15.120.4.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.120.4.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.120.4.95 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

15.120.4.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.120.4.97 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.120.4.98 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.120.4.99 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.120.4.100 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint (
    const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.120.4.101 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.120.4.102 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.120.4.103 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.120.4.104 updateModel() `template<class Settings > void smtrat::CubeLIAModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.120.4.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.120.5 Field Documentation

15.120.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.120.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.120.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.120.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.120.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.120.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.120.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.120.5.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module::m↩FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.120.5.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.120.5.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.120.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.120.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.120.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.120.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.120.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.120.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.120.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.120.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.120.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplitting↩Variables [static], [inherited]`

Reusable splitting variables.

15.120.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.120.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.120.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.120.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.120.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.120.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.121 smtrat::CurryModule< Settings > Class Template Reference

```
#include <CurryModule.h>
```

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- CurryModule (const ModuleInput ∗_formula, Conditionals &_conditionals, Manager ∗_manager=nullptr)
- ∼CurryModule ()
- bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIAB↩LE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput ∗ pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput ∗ pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module ∗ > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.

- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.

- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.

- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.121.3.1 CurryModule() template<class Settings >

```
smtrat::CurryModule< Settings >::CurryModule (
            const ModuleInput * _formula,
            Conditionals & _conditionals,
            Manager * _manager = nullptr )
```

15.121.3.2 ~CurryModule() template<class Settings >

```
smtrat::CurryModule< Settings >::~CurryModule ( )
```

15.121.4 Member Function Documentation

15.121.4.1 add() bool smtrat::Module::add (

```
            ModuleInput::const_iterator _subformula )  [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.121.4.2 addConstraintToInform() void smtrat::Module::addConstraintToInform (

```
            const FormulaT & _constraint )  [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.121.4.3 addCore() template<class Settings >

```
bool smtrat::CurryModule< Settings >::addCore (
            ModuleInput::const_iterator _subformula )  [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.121.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.121.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.121.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.121.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
            ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.121.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.121.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.121.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.121.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.121.4.12 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.121.4.13 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const
[inline], [inherited]
```

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.121.4.14 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected],
[inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.121.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.121.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.121.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.121.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.121.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.121.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.121.4.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.121.4.22 checkCore()

```
template<class Settings >
Answer smtrat::CurryModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.121.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.121.4.24 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.121.4.25 cleanModel()

```
void smtrat::Module::cleanModel ( ) const [inline], [protected],
[inherited]
```

Substitutes variable occurrences by its model value in the model values of other variables.

15.121.4.26 clearLemmas()

```
void smtrat::Module::clearLemmas ( ) [inline], [inherited]
```

Deletes all yet found lemmas.

15.121.4.27 clearModel()

```
void smtrat::Module::clearModel ( ) const [inline], [protected],
[inherited]
```

Clears the assignment, if any was found.

15.121.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.121.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.121.4.30 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.121.4.31 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.121.4.32 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.121.4.33 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.121.4.34 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.121.4.35 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.121.4.36 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.121.4.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.121.4.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.121.4.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
            ModuleInput::iterator _subformula,
            bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.121.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.121.4.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
            const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.121.4.42 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.121.4.43 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.121.4.44 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

15.121.4.45 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.121.4.46 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.121.4.47 getBackendsModel()

`void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.121.4.48 getInfeasibleSubsets() [1/2]

`void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.121.4.49 getInfeasibleSubsets() [2/2]

`std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.121.4.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.121.4.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.121.4.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.121.4.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.121.4.54 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.121.4.55 getReceivedFormulaSimplified() `std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.121.4.56 hasLemmas() `bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.121.4.57 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.121.4.58 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.121.4.59 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.121.4.60 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.121.4.61 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.121.4.62 informCore()

```
template<class Settings >
bool smtrat::CurryModule< Settings >::informCore (
    const FormulaT & _constraint ) [virtual]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented from smtrat::Module.

15.121.4.63 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.121.4.64 init()

```
template<class Settings >
void smtrat::CurryModule< Settings >::init ( ) [virtual]
```

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not and will not be called more than once and only before the first runBackends call.

Reimplemented from smtrat::Module.

15.121.4.65 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.121.4.66 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.121.4.67 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.121.4.68 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.121.4.69 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.121.4.70 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.121.4.71 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.121.4.72 moduleName()

```
template<typename Settings >
std::string smtrat::CurryModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.121.4.73 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

15.121.4.74 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.121.4.75 passedFormulaBegin()

```
ModuleInput::iterator smtrat::Module::passedFormulaBegin ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula. TODO: disable this method

15.121.4.76 passedFormulaEnd()

```
ModuleInput::iterator smtrat::Module::passedFormulaEnd ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula.

15.121.4.77 pPassedFormula()

```
const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline],
[inherited]
```

Returns A pointer to the formula passed to the backends of this module.

15.121.4.78 pReceivedFormula()

```
const ModuleInput* smtrat::Module::pReceivedFormula ( ) const
[inline], [inherited]
```

Returns A pointer to the formula passed to this module.

15.121.4.79 print()

```
void smtrat::Module::print (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.121.4.80 printAllModels()

```
void smtrat::Module::printAllModels (
    std::ostream & _out = std::cout ) [inherited]
```

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.121.4.81 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.121.4.82 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.121.4.83 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.121.4.84 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.121.4.85 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.121.4.86 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.121.4.87 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.121.4.88 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.121.4.89 remove()

```
void smtrat::Module::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.121.4.90 removeCore()

```
template<class Settings >
void smtrat::CurryModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula ) [virtual]
```

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Reimplemented from smtrat::Module.

15.121.4.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
            ModuleInput::iterator _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.121.4.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.121.4.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.121.4.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.121.4.95 runBackends() [1/2]

`virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]`

Reimplemented in smtrat::PModule.

15.121.4.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.121.4.97 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.121.4.98 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.121.4.99 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.121.4.100 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.121.4.101 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.121.4.102 updateAllModels()

`void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.121.4.103 updateLemmas()

`void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.121.4.104 updateModel()

`template<class Settings > void smtrat::CurryModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.121.4.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.121.5 Field Documentation

15.121.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.121.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.121.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.121.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.121.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.121.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.121.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.121.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.121.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.121.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.121.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.121.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.121.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.121.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.121.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.121.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.121.5.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.121.5.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.121.5.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

15.121.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.121.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.121.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.121.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.121.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.121.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.122 smtrat::CycleEnumerator< FHG, Collector > Struct Template Reference

This class encapsulates an algorithm for enumerating all cycles.

```
#include <ForwardHyperGraph.h>
```

Public Member Functions

- CycleEnumerator (const FHG &fhg, Collector &c)

  Constructor from a graph and a collector object.
- bool findAll ()

  Start the search for all cycles. Returns whether the search was finished (true) or aborted (false).

15.122.1 Detailed Description

template<typename FHG, typename Collector>
struct smtrat::CycleEnumerator< FHG, Collector >

This class encapsulates an algorithm for enumerating all cycles.

This class implements an adaption of the algorithm described in **[Johnson75]**. Unlike the algorithm described there, this version works on forward hypergraphs as implemented by ForwardHyperGraph.

Although the algorithm works recursively, this implementation can be used somewhat iteratively. The cycles are given to the caller using an collector functor. If this functor returns true, the search for more cycles is aborted immediately. Due to this pattern, there is no need to store the cycles within this class and thus the memory usage is minimized.

15.122.2 Constructor & Destructor Documentation

15.122.2.1 CycleEnumerator()

```
template<typename FHG , typename Collector >
smtrat::CycleEnumerator< FHG, Collector >::CycleEnumerator (
            const FHG & fhg,
            Collector & c )  [inline]
```

Constructor from a graph and a collector object.

15.122.3 Member Function Documentation

15.122.3.1 findAll()

```
template<typename FHG , typename Collector >
bool smtrat::CycleEnumerator< FHG, Collector >::findAll ( )
```

Start the search for all cycles. Returns whether the search was finished (true) or aborted (false).

15.123 benchmax::Database Class Reference

Dummy database that effectively disables storing to database. Set BENCHMAX_DATABASE to actually use a database.

```
#include <Database.h>
```

Public Types

- using Index = std::size_t

  Dummy index type.

Public Member Functions

- Index addTool (const Tool ∗)

  Dummy.

```

Dummy.

15.124 benchmax::DBAL Class Reference

```
#include <Database_mysqlconnector.h>
```

Public Types

- using Index = std::size_t

  Indec type.
- using Statement = std::unique_ptr< sql::PreparedStatement >

  Statement type.
- using Results = std::unique_ptr< sql::ResultSet >

  Results type.
- typedef mysqlpp::sql_bigint_unsigned Index
- typedef mysqlpp::Query Statement
- typedef mysqlpp::StoreQueryResult Results

Public Member Functions

- bool connect (const std::string &db, const std::string &host, const std::string &user, const std::string &password)

  Connect to the given database.
- Statement prepare (const std::string &query)

  Prepare a statement.
- Results execute (Statement &stmt)

  Execute a statement without arguments.
- Results execute (Statement &stmt, const std::string &a1)

  Execute a statement with a single string.
- Results execute (Statement &stmt, const std::string &a1, std::size_t a2)

  Execute a statement with a string and a number.
- Results execute (Statement &stmt, const std::string &a1, const std::string &a2, const Index &a3)

  Execute a statement with two strings and an index.

- Results execute (Statement &stmt, int a1, std::size_t a2, std::size_t a3, const Index &a4, const Index &a5, const Index &a6)

  Execute a statement with an int, two numbers and three indices.
- template<typename... Args>
  Index insert (const std::string &query, const Args &... args)

  Insert some data and return the new index.
- template<typename... Args>
  Results select (const std::string &query, const Args &... args)

  Select some data.
- std::size_t size (const Results &res)

  Return the size of the results.
- Index getIndex (const Results &res, const std::string &name)

  Get the index of some name within the results.
- bool connect (const std::string &db, const std::string &host, const std::string &user, const std::string &password)
- Statement prepare (const std::string &query)
- template<typename... Args>

  Results select (const std::string &query, const Args &... args)
- std::size_t size (const Results &res)
- Index getIndex (const Results &res, const std::string &name)

15.124.1 Member Typedef Documentation

15.124.1.1 Index [1/2] `typedef mysqlpp::sql_bigint_unsigned benchmax::DBAL::Index`

15.124.1.2 Index [2/2] `using benchmax::DBAL::Index = std::size_t`

Indec type.

15.124.1.3 Results [1/2] `typedef mysqlpp::StoreQueryResult benchmax::DBAL::Results`

15.124.1.4 Results [2/2] `using benchmax::DBAL::Results = std::unique_ptr<sql::ResultSet>`

Results type.

15.124.1.5 Statement [1/2] `typedef mysqlpp::Query benchmax::DBAL::Statement`

15.124.1.6 Statement [2/2] `using benchmax::DBAL::Statement = std::unique_ptr<sql::Prepared↩ Statement>`

Statement type.

15.124.2 Member Function Documentation

15.124.2.1 connect() [1/2]

```
bool benchmax::DBAL::connect (
    const std::string & db,
    const std::string & host,
    const std::string & user,
    const std::string & password ) [inline]
```

15.124.2.2 connect() [2/2]

```
bool benchmax::DBAL::connect (
    const std::string & db,
    const std::string & host,
    const std::string & user,
    const std::string & password ) [inline]
```

Connect to the given database.

15.124.2.3 execute() [1/6]

```
Results benchmax::DBAL::execute (
    Statement & stmt ) [inline]
```

Execute a statement without arguments.

15.124.2.4 execute() [2/6]

```
template<typename... Args>
void benchmax::DBAL::execute (
    Statement & stmt,
    const Args &... args ) [inline]
```

15.124.2.5 execute() [3/6]

```
Results benchmax::DBAL::execute (
    Statement & stmt,
    const std::string & a1 ) [inline]
```

Execute a statement with a single string.

15.124.2.6 execute() [4/6]

```
Results benchmax::DBAL::execute (
    Statement & stmt,
    const std::string & a1,
    const std::string & a2,
    const Index & a3 ) [inline]
```

Execute a statement with two strings and an index.

15.124.2.7 execute() [5/6]

```
Results benchmax::DBAL::execute (
    Statement & stmt,
    const std::string & a1,
    std::size_t a2 ) [inline]
```

Execute a statement with a string and a number.

15.124.2.8 execute() [6/6]

```
Results benchmax::DBAL::execute (
    Statement & stmt,
    int a1,
    std::size_t a2,
    std::size_t a3,
    const Index & a4,
    const Index & a5,
    const Index & a6 ) [inline]
```

Execute a statement with an int, two numbers and three indices.

15.124.2.9 getIndex() [1/2]

```
Index benchmax::DBAL::getIndex (
    const Results & res,
    const std::string & name ) [inline]
```

15.124.2.10 getIndex() [2/2]

```
Index benchmax::DBAL::getIndex (
    const Results & res,
    const std::string & name ) [inline]
```

Get the index of some name within the results.

15.124.2.11 insert() [1/2]

```
template<typename... Args>
Index benchmax::DBAL::insert (
    const std::string & query,
    const Args &... args ) [inline]
```

15.124.2.12 insert() [2/2]

```
template<typename... Args>
Index benchmax::DBAL::insert (
    const std::string & query,
    const Args &... args ) [inline]
```

Insert some data and return the new index.

15.124.2.13 prepare() [1/2]

```
Statement benchmax::DBAL::prepare (
    const std::string & query ) [inline]
```

15.124.2.14 prepare() [2/2]

```
Statement benchmax::DBAL::prepare (
    const std::string & query ) [inline]
```

Prepare a statement.

15.124.2.15 select() [1/2]

```
template<typename... Args>
Results benchmax::DBAL::select (
    const std::string & query,
    const Args &... args ) [inline]
```

15.124.2.16 select() [2/2] template<typename... Args>

```
Results benchmax::DBAL::select (
            const std::string & query,
            const Args &... args ) [inline]
```

Select some data.

15.124.2.17 size() [1/2] std::size_t benchmax::DBAL::size (

```
            const Results & res ) [inline]
```

15.124.2.18 size() [2/2] std::size_t benchmax::DBAL::size (

```
            const Results & res ) [inline]
```

Return the size of the results.

15.125 smtrat::parser::DecimalParser Struct Reference

Parses decimals: `numeral.0*numeral`

```
#include <Lexicon.h>
```

nullified (
    PolyRef poly ) [inline]
```

15.137.3.3 add_root()

```
void smtrat::cadcells::datastructures::Delineation::add_root (
    RAN root,
    IndexedRoot ir_root ) [inline]
```

15.137.3.4 delineate_cell()

```
auto smtrat::cadcells::datastructures::Delineation::delineate_cell (
    const RAN & sample ) const [inline]
```

Computes the bounds of the interval around the given sample w.r.t.

this delineation.

15.137.3.5 empty()

```
bool smtrat::cadcells::datastructures::Delineation::empty ( ) const [inline]
```

15.137.3.6 nonzero()

```
const auto& smtrat::cadcells::datastructures::Delineation::nonzero ( )
const [inline]
```

The set of polynomials without roots.

15.137.3.7 nullified()

```
const auto& smtrat::cadcells::datastructures::Delineation::nullified ( )
const [inline]
```

The set of nullified polynomials.

15.137.3.8 roots() `const auto& smtrat::cadcells::datastructures::Delineation::roots ( ) const [inline]`

Returns the underlying root map, which is a set of real algebraic numbers to indexed root expressions.

  bool operator== (const DerivationRef< P > &lhs, const DerivationRef< P > &rhs)
- template<typename P >
  bool operator< (const DerivationRef< P > &lhs, const DerivationRef< P > &rhs)

15.143.1 Detailed Description

template<typename Properties>
class smtrat::cadcells::datastructures::DerivationRef< Properties >

A reference to a derivation, which is either.

- a BaseDerivation (a set of properties for each level)
- a DelineatedDerivation (a BaseDerivation with an underlying SampledDerivation on which the properties can be delineated)
- a SampledDerivation (a DelineatedDerivation with an underlying SampledDerivation plus a sample on the current level such that a delineated interval can be computed)

15.143.1.1 Memory management Memory management is based on std::shared_ptr. A SampledDerivation holds a shared pointer to a DelineatedDerivation, which in turn holds a shared pointer to BaseDerivation. The BaseDerivation holds a DerivationRef to the underlying derivation. Note that not all combinations are legal; i.e. the underlying derivation of a delineated derivation must be a sampled derivation.

15.143.2 Constructor & Destructor Documentation

15.143.2.1 DerivationRef() [1/3] template<typename Properties>

```

15.150.1 Detailed Description

template<typename T>
class smtrat::dynarray< T >

dynarray is similar to std::vector, but has only a reduced interface.

Moreover, it releases its memory to a dynarray_allocator in its destructor and supports an optimized consume method to move-add all elements from some dynarray to another, and also a swap-to-end remove method. It is to be used in contexts where dynamic arrays have to be allocated and freed relatively frequently.

15.150.2 Member Typedef Documentation

15.150.2.1 iterator `template<typename T>`

```
typedef T* smtrat::dynarray< T >::iterator
```

15.150.2.2 pointer `template<typename T>`

```
typedef T* smtrat::dynarray< T >::pointer
```

15.150.2.3 reference `template<typename T>`

```
typedef T& smtrat::dynarray< T >::reference
```

15.150.2.4 value_type `template<typename T>`

```
typedef T smtrat::dynarray< T >::value_type
```

15.155.1 Detailed Description

template<typename Settings>
template<typename EdgeType>
struct smtrat::EQModule< Settings >::graph_info::edge_list_type< EdgeType >

Implements a list of edges.

This is similar to a vector of edge-pointers, but allocates pointers from a freelist and supports O(1) removal by storing the index of an edge in this list inside the edge.

15.155.2 Member Typedef Documentation

- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore (ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore (ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()

- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.

- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.

- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.

- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.

- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.157.4 Member Function Documentation

15.157.4.1 add() bool smtrat::PModule::add (ModuleInput::const_iterator _subformula) [inherited]

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.157.4.2 addConstraintToInform() void smtrat::Module::addConstraintToInform (const FormulaT & _constraint) [protected], [virtual], [inherited]

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.157.4.3 addCore() virtual bool smtrat::Module::addCore (ModuleInput::const_iterator *formula*) [inline], [protected], [virtual], [inherited]

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting

smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.157.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.157.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.157.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.157.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.157.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.157.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.157.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.157.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.157.4.12 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.157.4.13 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const
[inline], [inherited]
```

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.157.4.14 appliedPreprocessing()

```
bool smtrat::PModule::appliedPreprocessing ( ) const [inline],
[inherited]
```

Returns true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

15.157.4.15 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.157.4.16 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.157.4.17 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.157.4.18 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.157.4.19 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.

Parameters

_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.157.4.20 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.157.4.21 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.157.4.22 check()

```
Answer smtrat::PModule::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.157.4.23 checkCore()

```
template<class Settings >
Answer smtrat::EMModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.157.4.24 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.157.4.25 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.157.4.26 cleanModel()

```
void smtrat::Module::cleanModel ( ) const [inline], [protected],
[inherited]
```

Substitutes variable occurrences by its model value in the model values of other variables.

15.157.4.27 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.157.4.28 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.157.4.29 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.157.4.30 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.157.4.31 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.157.4.32 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.157.4.33 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.157.4.34 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.157.4.35 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.157.4.36 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.157.4.37 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.157.4.38 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.157.4.39 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.157.4.40 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
            ModuleInput::iterator _subformula,
            bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.157.4.41 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.157.4.42 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
            const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.157.4.43 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.157.4.44 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.157.4.45 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

15.157.4.46 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.157.4.47 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.157.4.48 getBackendsModel()

`void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.157.4.49 getInfeasibleSubsets() [1/2]

`void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.157.4.50 getInfeasibleSubsets() [2/2]

`std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.157.4.51 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.157.4.52 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.157.4.53 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.157.4.54 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.157.4.55 getOrigins() [3/3]

`const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.157.4.56 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

15.157.4.57 hasLemmas()

`bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.157.4.58 hasValidInfeasibleSubset()

`bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.157.4.59 id()

`std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.157.4.60 infeasibleSubsets()

`const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.157.4.61 inform()

`bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.157.4.62 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.157.4.63 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.157.4.64 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.157.4.65 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.157.4.66 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.157.4.67 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.157.4.68 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.157.4.69 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.157.4.70 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.157.4.71 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.157.4.72 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.157.4.73 moduleName() `virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns The name of the given module type as name.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::VSModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::GBModule< Settings >, smtrat::IntEqModule< Setti smtrat::CubeLIAModule< Settings >, smtrat::CurryModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IncWidthModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::BEModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::SplitSOSModule< Settings >.

15.157.4.74 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.157.4.75 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

15.157.4.76 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.157.4.77 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.157.4.78 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.157.4.79 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.157.4.80 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.157.4.81 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.157.4.82 printInfeasibleSubsets()

`void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.157.4.83 printModel()

`void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.157.4.84 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.157.4.85 printReceivedFormula()

`void smtrat::Module::printReceivedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.157.4.86 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.157.4.87 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.157.4.88 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.157.4.89 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.157.4.90 remove()

```
void smtrat::PModule::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.157.4.91 removeCore()

`virtual void smtrat::Module::removeCore ( ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.157.4.92 removeOrigin()

`std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin ( ModuleInput::iterator _formula, const FormulaT & _origin ) [inline], [protected], [inherited]`

15.157.4.93 removeOrigins()

`std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩ Origins ( ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected], [inherited]`

15.157.4.94 rPassedFormula()

`const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]`

Returns A reference to the formula passed to the backends of this module.

15.157.4.95 rReceivedFormula()

`const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]`

Returns A reference to the formula passed to this module.

15.157.4.96 runBackends() [1/2]

`virtual Answer smtrat::PModule::runBackends ( ) [inline], [virtual], [inherited]`

Reimplemented from smtrat::Module.

15.157.4.97 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.157.4.98 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.157.4.99 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.157.4.100 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.157.4.101 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.157.4.102 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.157.4.103 updateAllModels()

`void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.157.4.104 updateLemmas()

`void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.157.4.105 updateModel()

`void smtrat::PModule::updateModel ( ) const [virtual], [inherited]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.157.4.106 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.157.5 Field Documentation

15.157.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.157.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.157.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.157.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.157.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.157.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.157.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.157.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.157.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.157.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.157.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.157.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.157.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.157.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.157.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.157.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.157.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.157.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.157.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

15.157.5.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.157.5.21 mSmallerMusesCheckCounter

`unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.157.5.22 mSolverState

`std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.157.5.23 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheoryPropagations [protected], [inherited]`

15.157.5.24 mUsedBackends

`std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.157.5.25 mVariableCounters

`std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.158 smtrat::EQGraph< VertexName > Struct Template Reference

```
#include <EQGraph.h>
```

Public Types

- using vec = boost::vecS

15.158.1 Member Typedef Documentation

15.158.1.1 Graph

```
template<typename VertexName>
using smtrat::EQGraph< VertexName >::Graph = boost::adjacency_list<vec, vec, undirected,
vertex_property>
```

15.158.1.2 MaybePath

```
template<typename VertexName>
using smtrat::EQGraph< VertexName >::MaybePath = std::optional<std::vector<PathEdge> >
```

15.158.1.3 PathEdge

```
template<typename VertexName>
using smtrat::EQGraph< VertexName >::PathEdge = std::pair<VertexName, VertexName>
```

15.158.1.4 undirected

```
template<typename VertexName>
using smtrat::EQGraph< VertexName >::undirected = boost::undirectedS
```

15.158.1.5 vec

```
template<typename VertexName>
using smtrat::EQGraph< VertexName >::vec = boost::vecS
```

15.158.1.6 Vertex

```
template<typename VertexName>
using smtrat::EQGraph< VertexName >::Vertex = typename boost::graph_traits<Graph>::vertex_↩
descriptor
```

15.158.1.7 vertex_property

```
template<typename VertexName>
using smtrat::EQGraph< VertexName >::vertex_property = boost::property<vertex_properties_t,
VertexName>
```

15.158.2 Member Function Documentation

15.158.2.1 add_edge()

```
template<typename VertexName>
void smtrat::EQGraph< VertexName >::add_edge (
            VertexName const & a,
            VertexName const & b )  [inline], [noexcept]
```

15.158.2.2 add_vertex()

```
template<typename VertexName>
void smtrat::EQGraph< VertexName >::add_vertex (
            VertexName const & name )  [inline], [noexcept]
```

15.158.2.3 get_path() [1/2]

```
template<typename VertexName>
MaybePath smtrat::EQGraph< VertexName >::get_path (
            VertexName const & a,
            VertexName const & b )  [inline], [noexcept]
```

15.158.2.4 get_path() [2/2]

```
template<typename VertexName>
MaybePath smtrat::EQGraph< VertexName >::get_path (
            VertexName const & a,
            VertexName const & b,
            size_t bound )  [inline], [noexcept]
```

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- EQModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=NULL)

  Constructors.
- ~EQModule ()

  Destructor.
- bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- void process_merge_lists ()

  parts of the public interface that are not part of the general module interface
- const term_type * find_representative (const term_type &term)

  find a "canonical" representative for some term
- std::size_t get_class (const term_type &term)

  returns the component-component-level class of some term
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.

- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.

- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.

- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const

- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > && _premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩ Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩ ::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > && _premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩ AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩ CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

PERMANENT	

15.159.3 Constructor & Destructor Documentation

15.159.3.1 EQModule() `template<class Settings >`

```
smtrat::EQModule< Settings >::EQModule (
            const ModuleInput * _formula,
            Conditionals & _conditionals,
            Manager * _manager = NULL )
```

Constructors.

15.159.3.2 ~EQModule() `template<class Settings >`

```
smtrat::EQModule< Settings >::~EQModule ( )
```

Destructor.

15.159.4 Member Function Documentation

15.159.4.1 add()

```
bool smtrat::Module::add (
    ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.159.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.159.4.3 addCore()

```
template<class Settings >
bool smtrat::EQModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.159.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.159.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline], [inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.159.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.159.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.159.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.159.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.159.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not

yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.159.4.11 allModels()

`const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns All satisfying assignments, if existent.

15.159.4.12 anAnswerFound()

`bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.159.4.13 answerFound()

`const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.159.4.14 backendsModel()

`const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.159.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.159.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.159.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.159.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.159.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.159.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.159.4.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.159.4.22 checkCore()

```
template<class Settings >
Answer smtrat::EQModule< Settings >::checkCore ( )  [virtual]
```

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.159.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
            std::vector< FormulaSetT >::const_iterator _infsubset,
            const std::string & _filename = "smaller_muses",
            unsigned _maxSizeDifference = 1 ) const  [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.159.4.24 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.159.4.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.159.4.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.159.4.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.159.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.159.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.159.4.30 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

15.159.4.31 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.159.4.32 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.159.4.33 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.159.4.34 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.159.4.35 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.159.4.36 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.159.4.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.159.4.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.159.4.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.159.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.159.4.41 find_representative()

```
template<typename Settings >
auto smtrat::EQModule< Settings >::find_representative (
            const term_type & term )
```

find a "canonical" representative for some term

15.159.4.42 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBest↩
Origin (
            const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.159.4.43 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformula↩
ToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.159.4.44 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module↩
::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.159.4.45 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
            const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.159.4.46 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset
( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.159.4.47 get_class()

```
template<typename Settings >
std::size_t smtrat::EQModule< Settings >::get_class (
            const term_type & term )
```

returns the component-component-level class of some term

15.159.4.48 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.159.4.49 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.159.4.50 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.159.4.51 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::getInfeasible↩ Subsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.159.4.52 getInformationRelevantFormulas() `const std::set< FormulaT > & smtrat::Module::get↩ InformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.159.4.53 getModelEqualities() `std::list< std::vector< carl::Variable > > smtrat::Module↩ ::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.159.4.54 getOrigins() [1/3] `void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

15.159.4.55 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.159.4.56 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.159.4.57 getReceivedFormulaSimplified()

```
std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]
```

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.159.4.58 hasLemmas()

```
bool smtrat::Module::hasLemmas ( ) [inline], [inherited]
```

Checks whether this module or any of its backends provides any lemmas.

15.159.4.59 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.159.4.60 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.159.4.61 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.159.4.62 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.159.4.63 informBackends() `void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.159.4.64 informCore()

```
template<class Settings >
bool smtrat::EQModule< Settings >::informCore (
            const FormulaT & _constraint )  [virtual]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented from smtrat::Module.

15.159.4.65 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const  [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.159.4.66 init()

```
template<class Settings >
void smtrat::EQModule< Settings >::init ( )  [virtual]
```

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not and will not be called more than once and only before the first runBackends call.

Reimplemented from smtrat::Module.

15.159.4.67 is_minimizing()

```
bool smtrat::Module::is_minimizing ( ) const  [inline], [inherited]
```

15.159.4.68 isLemmaLevel()

```
bool smtrat::Module::isLemmaLevel (
            LemmaLevel level )  [protected], [inherited]
```

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.159.4.69 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.159.4.70 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.159.4.71 merge()

```
std::vector< FormulaT > smtrat::Module::merge (
    const std::vector< FormulaT > & _vecSetA,
    const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]
```

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.159.4.72 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.159.4.73 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.159.4.74 moduleName()

```
template<typename Settings>
std::string smtrat::EQModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.159.4.75 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

15.159.4.76 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.159.4.77 passedFormulaBegin()

```
ModuleInput::iterator smtrat::Module::passedFormulaBegin ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula. TODO: disable this method

15.159.4.78 passedFormulaEnd()

```
ModuleInput::iterator smtrat::Module::passedFormulaEnd ( )
[inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula.

15.159.4.79 pPassedFormula()

```
const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline],
[inherited]
```

Returns A pointer to the formula passed to the backends of this module.

15.159.4.80 pReceivedFormula()

```
const ModuleInput* smtrat::Module::pReceivedFormula ( ) const
[inline], [inherited]
```

Returns A pointer to the formula passed to this module.

15.159.4.81 print()

```
void smtrat::Module::print (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.159.4.82 printAllModels()

```
void smtrat::Module::printAllModels (
    std::ostream & _out = std::cout ) [inherited]
```

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.159.4.83 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.159.4.84 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.159.4.85 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.159.4.86 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.159.4.87 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.159.4.88 process_merge_lists()

```
template<typename Settings>
void smtrat::EQModule< Settings >::process_merge_lists ( )
```

parts of the public interface that are not part of the general module interface

15.159.4.89 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.159.4.90 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.159.4.91 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.159.4.92 remove()

```
void smtrat::Module::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.159.4.93 removeCore()

```
template<class Settings >
void smtrat::EQModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula ) [virtual]
```

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Reimplemented from smtrat::Module.

15.159.4.94 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
            ModuleInput::iterator _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.159.4.95 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.159.4.96 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.159.4.97 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.159.4.98 runBackends() [1/2]

`virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]`

Reimplemented in smtrat::PModule.

15.159.4.99 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.159.4.100 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.159.4.101 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.159.4.102 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.159.4.103 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.159.4.104 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.159.4.105 updateAllModels()

`void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.159.4.106 updateLemmas()

`void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.159.4.107 updateModel()

`template<class Settings > void smtrat::EQModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.159.4.108 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.159.5 Field Documentation

15.159.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.159.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.159.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.159.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.159.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.159.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.159.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.159.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.159.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.159.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.159.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.159.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.159.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.159.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.159.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.159.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.159.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.159.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.159.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

15.159.5.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.159.5.21 mSmallerMusesCheckCounter

`unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.159.5.22 mSolverState

`std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.159.5.23 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheoryPropagations [protected], [inherited]`

15.159.5.24 mUsedBackends

`std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.159.5.25 mVariableCounters

`std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.160 smtrat::EQPreprocessingModule< Settings > Class Template Reference

`#include <EQPreprocessingModule.h>`

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- EQPreprocessingModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=NULL)

  Constructors.
- ~EQPreprocessingModule ()

  Destructor.
- void updateModel () const

  Updates the model, if the solver has detected the consistency of the received formula, beforehand.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const

- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- virtual bool addCore (ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.

- virtual void removeCore (ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())

- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

Stores the constraints which the backends must be informed about.

- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.

- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

```
template<class Settings >
smtrat::EQPreprocessingModule< Settings >::~EQPreprocessingModule ( )
```

Destructor.

15.160.4 Member Function Documentation

15.160.4.1 add()

```
bool smtrat::Module::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-

formulas; true, otherwise.

15.160.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.160.4.3 addCore()

```
virtual bool smtrat::Module::addCore (
    ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.160.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.160.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline], [inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.160.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.160.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.160.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.160.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.160.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.160.4.11 allModels() `const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns All satisfying assignments, if existent.

15.160.4.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.160.4.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.160.4.14 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.160.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.160.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.160.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.160.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.160.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.160.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.160.4.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.160.4.22 checkCore()

```
template<class Settings >
Answer smtrat::EQPreprocessingModule< Settings >::checkCore ( )  [virtual]
```

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.160.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
            std::vector< FormulaSetT >::const_iterator _infsubset,
            const std::string & _filename = "smaller_muses",
            unsigned _maxSizeDifference = 1 ) const  [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.160.4.24 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.160.4.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.160.4.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.160.4.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.160.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.160.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.160.4.30 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.160.4.31 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.160.4.32 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.160.4.33 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.160.4.34 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.160.4.35 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.160.4.36 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.160.4.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.160.4.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.160.4.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.160.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.160.4.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.160.4.42 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.160.4.43 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.160.4.44 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.160.4.45 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.160.4.46 getBackendsAllModels()

```
void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]
```

Stores all models of a backend in the list of all models of this module.

15.160.4.47 getBackendsModel()

```
void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]
```

15.160.4.48 getInfeasibleSubsets() [1/2]

```
void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]
```

Copies the infeasible subsets of the passed formula.

15.160.4.49 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets (
    const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.160.4.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.160.4.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.160.4.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.160.4.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.160.4.54 getOrigins() [3/3]

`const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.160.4.55 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.160.4.56 hasLemmas()

`bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.160.4.57 hasValidInfeasibleSubset()

`bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.160.4.58 id()

`std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.160.4.59 infeasibleSubsets()

`const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.160.4.60 inform()

`bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.160.4.61 informBackends()

`void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.160.4.62 informCore()

`virtual bool smtrat::Module::informCore ( const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.160.4.63 informedConstraints()

`const carl::FastSet<FormulaT>& smtrat::Module::informedConstraints ( ) const [inline], [inherited]`

Returns The position of the first constraint of which no backend has been informed about.

15.160.4.64 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.160.4.65 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.160.4.66 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.160.4.67 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.160.4.68 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.160.4.69 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.160.4.70 model()

```
const Model& smtrat::Module::model ( ) const [inline], [inherited]
```

Returns The assignment of the current satisfiable result, if existent.

15.160.4.71 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.160.4.72 moduleName()

```
template<typename Settings >
std::string smtrat::EQPreprocessingModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.160.4.73 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

15.160.4.74 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.160.4.75 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.160.4.76 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.160.4.77 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.160.4.78 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.160.4.79 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.160.4.80 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.160.4.81 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.160.4.82 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const  [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.160.4.83 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.160.4.84 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.160.4.85 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const  [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.160.4.86 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

15.160.4.87 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

15.160.4.88 receivedVariable()

`bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

15.160.4.89 remove()

`void smtrat::Module::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.160.4.90 removeCore()

`virtual void smtrat::Module::removeCore ( ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.160.4.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.160.4.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.160.4.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.160.4.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.160.4.95 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( ) [inline],
[protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

15.160.4.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.160.4.97 setId()

```
void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.160.4.98 setThreadPriority()

```
void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.160.4.99 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.160.4.100 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.160.4.101 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.160.4.102 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.160.4.103 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.160.4.104 updateModel() `template<typename Settings > void smtrat::EQPreprocessingModule< Settings >::updateModel ( ) const [virtual]`

Updates the model, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented from smtrat::Module.

15.160.4.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.160.5 Field Documentation

15.160.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.160.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.160.5.3 mBackendsFoundAnswer

`std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.160.5.4 mConstraintsToInform

`carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.160.5.5 mFinalCheck

`bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.160.5.6 mFirstPosInLastBranches

`std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.160.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.160.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::m↩FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.160.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.160.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.160.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.160.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.160.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.160.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.160.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.160.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.160.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.160.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.160.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

15.160.5.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.160.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.160.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.160.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.160.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.160.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

Public Member Functions

- ESModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=NULL)
- ~ESModule ()
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.

- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- virtual bool addCore (ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.

- virtual void removeCore (ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()

- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩ _premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩ Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩ ::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩ AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩ CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.

- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.

- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.

- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.164.4 Member Function Documentation

15.164.4.1 add() `bool smtrat::PModule::add ( ModuleInput::const_iterator _subformula ) [inherited]`

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.164.4.2 addConstraintToInform() `void smtrat::Module::addConstraintToInform ( const FormulaT & _constraint ) [protected], [virtual], [inherited]`

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.164.4.3 addCore() `virtual bool smtrat::Module::addCore ( ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]`

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.164.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.164.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.164.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.164.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.164.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.164.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.164.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.164.4.11 allModels()

`const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns All satisfying assignments, if existent.

15.164.4.12 anAnswerFound()

`bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.164.4.13 answerFound()

`const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.164.4.14 appliedPreprocessing()

`bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]`

Returns true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

15.164.4.15 backendsModel()

`const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.164.4.16 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.164.4.17 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.164.4.18 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() )  [inline],
[protected], [inherited]
```

15.164.4.19 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false )  [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.164.4.20 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P
>> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
```

```
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() )  [inline],
[protected], [inherited]
```

15.164.4.21 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P
>> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.164.4.22 check()

```
Answer smtrat::PModule::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.164.4.23 checkCore()

```
template<class Settings >
Answer smtrat::ESModule< Settings >::checkCore ( )  [virtual]
```

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.164.4.24 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.164.4.25 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.164.4.26 cleanModel()

```
void smtrat::Module::cleanModel ( ) const [inline], [protected],
[inherited]
```

Substitutes variable occurrences by its model value in the model values of other variables.

15.164.4.27 clearLemmas()

```
void smtrat::Module::clearLemmas ( ) [inline], [inherited]
```

Deletes all yet found lemmas.

15.164.4.28 clearModel()

```
void smtrat::Module::clearModel ( ) const [inline], [protected],
[inherited]
```

Clears the assignment, if any was found.

15.164.4.29 clearModels()

```
void smtrat::Module::clearModels ( ) const [inline], [protected],
[inherited]
```

Clears all assignments, if any was found.

15.164.4.30 clearPassedFormula()

```
void smtrat::Module::clearPassedFormula ( ) [protected],
[inherited]
```

15.164.4.31 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.164.4.32 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.164.4.33 collectTheoryPropagations()

```
void smtrat::Module::collectTheoryPropagations ( ) [inherited]
```

15.164.4.34 constraintsToInform()

```
const carl::FastSet<FormulaT>& smtrat::Module::constraints↩
ToInform ( ) const [inline], [inherited]
```

Returns The constraints which the backends must be informed about.

15.164.4.35 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.164.4.36 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.164.4.37 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.164.4.38 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.164.4.39 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.164.4.40 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.164.4.41 excludeNotReceivedVariablesFromModel()

`void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]`

Excludes all variables from the current model, which do not occur in the received formula.

15.164.4.42 findBestOrigin()

`std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin ( const std::vector< FormulaT > & _origins ) const [protected], [inherited]`

Parameters

_origins	

Returns

15.164.4.43 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.164.4.44 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.164.4.45 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

15.164.4.46 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.164.4.47 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.164.4.48 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.164.4.49 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.164.4.50 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::getInfeasible↩ Subsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.164.4.51 getInformationRelevantFormulas() `const std::set< FormulaT > & smtrat::Module::get↩ InformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.164.4.52 getModelEqualities() `std::list< std::vector< carl::Variable > > smtrat::Module↩ ::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.164.4.53 getOrigins() [1/3] `void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

15.164.4.54 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.164.4.55 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.164.4.56 getReceivedFormulaSimplified()

```
std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]
```

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

15.164.4.57 hasLemmas()

```
bool smtrat::Module::hasLemmas ( ) [inline], [inherited]
```

Checks whether this module or any of its backends provides any lemmas.

15.164.4.58 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.164.4.59 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.164.4.60 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.164.4.61 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.164.4.62 informBackends() `void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.164.4.63 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.164.4.64 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.164.4.65 init()

```
void smtrat::Module::init ( ) [virtual], [inherited]
```

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.164.4.66 is_minimizing()

```
bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]
```

15.164.4.67 isLemmaLevel()

```
bool smtrat::Module::isLemmaLevel (
    LemmaLevel level ) [protected], [inherited]
```

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.164.4.68 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.164.4.69 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.164.4.70 merge()

```
std::vector< FormulaT > smtrat::Module::merge (
    const std::vector< FormulaT > & _vecSetA,
    const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]
```

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.164.4.71 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.164.4.72 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.164.4.73 moduleName()

`virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns The name of the given module type as name.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::VSModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::GBModule< Settings >, smtrat::IntEqModule< Setti smtrat::CubeLIAModule< Settings >, smtrat::CurryModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IncWidthModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::BEModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::SplitSOSModule< Settings >.

15.164.4.74 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.164.4.75 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

15.164.4.76 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.164.4.77 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.164.4.78 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.164.4.79 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.164.4.80 print()

```
void smtrat::Module::print (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.164.4.81 printAllModels()

```
void smtrat::Module::printAllModels (
    std::ostream & _out = std::cout ) [inherited]
```

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.164.4.82 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.164.4.83 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.164.4.84 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.164.4.85 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.164.4.86 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.164.4.87 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.164.4.88 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.164.4.89 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.164.4.90 remove()

```
void smtrat::PModule::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.164.4.91 removeCore()

```
virtual void smtrat::Module::removeCore (
    ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.164.4.92 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.164.4.93 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.164.4.94 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.164.4.95 rReceivedFormula() `const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]`

Returns A reference to the formula passed to this module.

15.164.4.96 runBackends() [1/2] `virtual Answer smtrat::PModule::runBackends ( ) [inline], [virtual], [inherited]`

Reimplemented from smtrat::Module.

15.164.4.97 runBackends() [2/2] `Answer smtrat::PModule::runBackends ( bool _final, bool _full, carl::Variable _objective ) [virtual], [inherited]`

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.164.4.98 setId() `void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]`

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.164.4.99 setThreadPriority() `void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]`

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.164.4.100 solverState() `Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.164.4.101 splitUnequalConstraint() `void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.164.4.102 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.164.4.103 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.164.4.104 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.164.4.105 updateModel() `template<class Settings >`
`void smtrat::ESModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.164.4.106 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.164.5 Field Documentation

15.164.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.164.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.164.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.164.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.164.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.164.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.164.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaToPass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.164.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.164.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.164.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.164.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.164.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.164.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.164.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.164.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.164.5.16 mModelComputed `bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.164.5.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.164.5.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.164.5.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

15.164.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.164.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.164.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.164.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.164.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.164.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.165 smtrat::uf_impl::estimator< IteratorType, IsRandomAccess > Struct Template Reference

Distance estimation for a range delimited by iterators; if the given iterators are random access, returns the result of std::distance in the estimate_distance function.

```
#include <union_find.h>
```

Static Public Member Functions

- static std::size_t estimate_distance (IteratorType begin, IteratorType end) noexcept

15.165.1 Detailed Description

template<typename IteratorType, bool IsRandomAccess = std::is_convertible< typename std::iterator_traits<IteratorType>::iterator_category, std::random_access_iterator_tag >::value>
struct smtrat::uf_impl::estimator< IteratorType, IsRandomAccess >

Distance estimation for a range delimited by iterators; if the given iterators are random access, returns the result of std::distance in the estimate_distance function.

Otherwise, it simply returns 0.

15.165.2 Member Function Documentation

15.165.2.1 estimate_distance()

```
template<typename IteratorType , bool IsRandomAccess = std::is↩
_convertible< typename std::iterator_traits<IteratorType>::iterator_category, std::random_↩
access_iterator_tag >::value>
static std::size_t smtrat::uf_impl::estimator< IteratorType, IsRandomAccess >::estimate_↩
distance (
            IteratorType begin,
            IteratorType end )  [inline], [static], [noexcept]
```

15.166 smtrat::uf_impl::estimator< IteratorType, false > Struct Template Reference

```
#include <union_find.h>
```

Static Public Member Functions

- static constexpr std::size_t estimate_distance (IteratorType, IteratorType) noexcept

15.166.1 Member Function Documentation

15.166.1.1 estimate_distance()

```
template<typename IteratorType >
static constexpr std::size_t smtrat::uf_impl::estimator< IteratorType, false >::estimate_↩
distance (
            IteratorType ,
            IteratorType  )  [inline], [static], [constexpr], [noexcept]
```

15.167 smtrat::ExactlyOneCommanderEncoder Class Reference

```
#include <ExactlyOneCommanderEncoder.h>
```

Public Member Functions

- ExactlyOneCommanderEncoder ()
- Rational encodingSize (const ConstraintT &constraint)
- bool canEncode (const ConstraintT &constraint)
- std::string name ()
- boost::optional< FormulaT > encode (const ConstraintT &constraint)

  Encodes an arbitrary constraint.

Data Fields

- std::size_t problem_size

Protected Member Functions

- boost::optional< FormulaT > doEncode (const ConstraintT &constraint)
- FormulaT generateVarChain (const std::set< carl::Variable > &vars, carl::FormulaType type)

15.167.1 Constructor & Destructor Documentation

15.167.1.1 ExactlyOneCommanderEncoder() `smtrat::ExactlyOneCommanderEncoder::ExactlyOne↩CommanderEncoder ( ) [inline]`

15.167.2 Member Function Documentation

15.167.2.1 canEncode() `bool smtrat::ExactlyOneCommanderEncoder::canEncode ( const ConstraintT & constraint ) [virtual]`

Implements smtrat::PseudoBoolEncoder.

15.167.2.2 doEncode() `boost::optional< FormulaT > smtrat::ExactlyOneCommanderEncoder::do↩Encode ( const ConstraintT & constraint ) [protected], [virtual]`

Implements smtrat::PseudoBoolEncoder.

15.167.2.3 encode() `boost::optional< FormulaT > smtrat::PseudoBoolEncoder::encode ( const ConstraintT & constraint ) [inherited]`

Encodes an arbitrary constraint.

Returns encoded formula

15.167.2.4 encodingSize() `Rational smtrat::ExactlyOneCommanderEncoder::encodingSize ( const ConstraintT & constraint ) [virtual]`

Reimplemented from smtrat::PseudoBoolEncoder.

15.167.2.5 generateVarChain() `FormulaT smtrat::PseudoBoolEncoder::generateVarChain ( const std::set< carl::Variable > & vars, carl::FormulaType type ) [protected], [inherited]`

15.167.2.6 name() `std::string smtrat::ExactlyOneCommanderEncoder::name ( ) [inline], [virtual]`

Reimplemented from smtrat::PseudoBoolEncoder.

15.167.3 Field Documentation

15.167.3.1 problem_size `std::size_t smtrat::PseudoBoolEncoder::problem_size [inherited]`

`#include <Explanation.h>`

Public Member Functions

- std::optional< mcsat::Explanation > operator() (const mcsat::Bookkeeping &data, carl::Variable var, const FormulasT &reason, bool) const

  We construct a formula 'E -> I', i.e.

15.174.1 Member Function Documentation

15.174.1.1 operator()()

```
std::optional< mcsat::Explanation > smtrat::mcsat::nlsat::Explanation↩
::operator() (
            const mcsat::Bookkeeping & data,
            carl::Variable var,
            const FormulasT & reason,
            bool ) const
```

We construct a formula 'E -> I', i.e.

'e1 & e2 ... en -> i', called "Explanation", in its clausal form '-e1 v -e2 ... en v i', where e1, e2.. are `reason` Atoms and CAD cell bound atoms, and i is the `implication`. It "explains" why the assignment point in `data` is inconsistent with the `reason` atoms/constraints and the implication in that it constructs a whole region of assignments points, which the assignment point in `data` is a part of.

Parameters

variableOrdering	Determine the order of variables, e.g. x1, x2, .. x10
data	Represent the assigned variables and their assigned values in different representations. These are a prefix of the `variableOrdering`, e.g. x1, x2, .. x5
var	The smallest/first variable in the `variableOrdering` that is not assigned by `data`, e.g. x6
reason	A collection of atoms that are inconsistent together or imply the `implication`. These atoms mention only variables x1, x2.. x6 (some atom definitely mentions x6) and possibly x7..x10 if they are irrelevant and "vanish" under the assignment in `data`, e.g. x1∗x7+x6=0 (for x1 := 0) or x6∗(x7^2+1)>0 (equiv to x6>0, since x7^2+1 > 0)

- void generateExplanation (const FormulaT &impliedAtom, std::vector< FormulasT > &explainAtomsinLvls) const

  Construct explanation in non-clausal form (without the impliedAtom/implication).

- mcsat::Explanation getExplanation (const FormulaT &impliedAtom) const

  Compute explanation in clausal form.

15.178.1 Constructor & Destructor Documentation

15.178.1.1 ExplanationGenerator()

```
smtrat::mcsat::nlsat::ExplanationGenerator::Explanation↩
Generator (
            const std::vector< FormulaT > & constraints,
            const std::vector< carl::Variable > & vars,
            carl::Variable ,
            const Model & model )  [inline]
```

15.178.2 Member Function Documentation

15.178.2.1 generateExplanation()

```
void smtrat::mcsat::nlsat::ExplanationGenerator::generate↩
Explanation (
            const FormulaT & impliedAtom,
            std::vector< FormulasT > & explainAtomsinLvls ) const  [inline]
```

Construct explanation in non-clausal form (without the impliedAtom/implication).

It consists of atomic formulas as expressions for cell component bounds and the constraintAtoms for which a CAD was constructed. Each cell component creates zero, one or two explanation atoms. The impliedAtom is not added to facilitate conversion into a clausal form afterwards.

15.178.2.2 getExplanation()

```
mcsat::Explanation smtrat::mcsat::nlsat::ExplanationGenerator↩
::getExplanation (
            const FormulaT & impliedAtom ) const  [inline]
```

Compute explanation in clausal form.

- using Valuation = std::vector< double >

Public Member Functions

- void addFeature (Extractor &&e, std::size_t level, double weight)
- Valuation valuateVariable (const Objects &o, carl::Variable v) const
- std::vector< carl::Variable > sortVariables (const Objects &o, std::vector< carl::Variable > vars) const

Data Fields

- std::vector< std::tuple< Extractor, std::size_t, double > > mFeatures

15.188.1 Detailed Description

template<typename Objects>
struct smtrat::mcsat::variableordering::detail::FeatureCollector< Objects >

This class manages features that are used to valuate variables on objects.

Each feature consists of a valuation function, a level and a weight. All feature valuations of a certain level are combined linearly using the respective weights. Valuations are then compared lexicographically.

15.188.2 Member Typedef Documentation

- template<typename T2 >
  CONSTEXPR bool operator== (const fixedsize_allocator< T2 > &) const NOEXCEPT
- template<typename T2 >
  CONSTEXPR bool operator!= (const fixedsize_allocator< T2 > &) const NOEXCEPT

15.189.1 Detailed Description

template<typename T>
class smtrat::fixedsize_allocator< T >

An allocator meant to be used for containers that typically allocate single objects or nodes, such as sets, maps and linked lists.

For any allocation that allocates more than one element at once, this falls back to std::allocator. With this allocator, free consists of two single pointer operations only. Allocate is almost always as cheap as free.

15.189.2 Constructor & Destructor Documentation

15.189.2.1 fixedsize_allocator() [1/3]

```
template<typename T >
smtrat::fixedsize_allocator< T >::fixedsize_allocator ( ) [inline]

reference
```

15.194 smtrat::impl::fixedsize_allocator_size_helper< T, Size > Class Template Reference

```
#include <alloc.h>
```

15.195 smtrat::fixedsize_freelist< ChunkSizeShift > Class Template Reference

Implements a fixed-(at-compile-time)-size allocator based on a free list embedded in the space of currently unused objects.

```
#include <alloc.h>
```

Public Member Functions

- fixedsize_freelist ()
- ~fixedsize_freelist ()
- void * alloc ()

  Allocate an object of size 1<<ChunkSizeShift.
- void free (void *ptr) NOEXCEPT

  Freeing means just prepending the free'd element to the front of the freelist.

15.195.1 Detailed Description

template<std::size_t ChunkSizeShift>
class smtrat::fixedsize_freelist< ChunkSizeShift >

Implements a fixed-(at-compile-time)-size allocator based on a free list embedded in the space of currently unused objects.

15.195.2 Constructor & Destructor Documentation

15.195.2.1 fixedsize_freelist()

```
template<std::size_t ChunkSizeShift>
smtrat::fixedsize_freelist< ChunkSizeShift >::fixedsize_freelist ( ) [inline], [explicit]
```

15.195.2.2 ~fixedsize_freelist()

```
template<std::size_t ChunkSizeShift>
smtrat::fixedsize_freelist< ChunkSizeShift >::~fixedsize_freelist ( ) [inline]
```

15.195.3 Member Function Documentation

15.195.3.1 alloc()

```
template<std::size_t ChunkSizeShift>
void* smtrat::fixedsize_freelist< ChunkSizeShift >::alloc ( ) [inline]
```

Allocate an object of size 1<<ChunkSizeShift.

First, try to return the first entry on the freelist.

If that is empty, try forward-allocation (allocating the next element on the current page that has never been allocated before.)

Otherwise, go to the next page.

If there is no next page, allocate a new page with malloc. This page has twice the space of the previous page.

Start forward-allocation phase on the new page.

15.195.3.2 free()

```
template<std::size_t ChunkSizeShift>
void smtrat::fixedsize_freelist< ChunkSizeShift >::free (
            void * ptr ) [inline]
```

Freeing means just prepending the free'd element to the front of the freelist.

15.196 smtrat::impl::fixedsize_freelists< SizeCurrent, SizeMax, LowEnough > Class Template Reference

Publicly derive from all fixedsize_freelist types with chunk sizes between SizeCurrent and SizeMax.

```
#include <alloc.h>
```

15.196.1 Detailed Description

template<std::size_t SizeCurrent, std::size_t SizeMax, bool LowEnough = (SizeCurrent < SizeMax)>
class smtrat::impl::fixedsize_freelists< SizeCurrent, SizeMax, LowEnough >

Publicly derive from all fixedsize_freelist types with chunk sizes between SizeCurrent and SizeMax.

```
smtrat::FormulaWithOrigins::FormulaWithOrigins (
    const FormulaWithOrigins & )
```

15.201.3 Member Function Documentation

15.201.3.1 deducted() `bool smtrat::FormulaWithOrigins::deducted ( ) const [inline]`

Returns The deduction flag, which indicates, that this formula g is a direct sub-formula of a conjunction of formulas (and g f_1 .. f_n), and, that (implies (and f_1 .. f_n) g) holds.

15.201.3.2 formula() `const FormulaT& smtrat::FormulaWithOrigins::formula ( ) const [inline]`

Returns A constant reference to the formula.

15.201.3.3 hasOrigins() `bool smtrat::FormulaWithOrigins::hasOrigins ( ) const [inline]`

Returns true, if this sub-formula of the module input has origins.

15.201.3.4 origins() `const FormulasT& smtrat::FormulaWithOrigins::origins ( ) const [inline]`

Returns A constant reference to the origins.

15.201.3.5 setDeducted() `void smtrat::FormulaWithOrigins::setDeducted ( bool _deducted ) const [inline]`

Sets the deduction flag to the given value.

Parameters

_deducted	The value to set the deduction flag to.

15.201.4 Friends And Related Function Documentation

15.201.4.1 ModuleInput `friend class ModuleInput [friend]`

15.201.4.2 operator< `bool operator< ( const FormulaWithOrigins & _fwoA, const FormulaWithOrigins & _fwoB ) [friend]`

Parameters

_fwoA	The first formula with origins to compare.
_fwoB	The second formula with origins to compare.

Returns true, if the formula of the first formula with origins is less than the formula of the second formula with origins; false, otherwise.

15.201.4.3 operator==

```
bool operator== (
    const FormulaWithOrigins & _fwoA,
    const FormulaWithOrigins & _fwoB ) [friend]
```

Parameters

_fwoA	The first formula with origins to compare.
_fwoB	The second formula with origins to compare.

Returns true, if the formula of the first formula with origins and the formula of the second formula with origins are equal; false, otherwise.

15.202 smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices > Class Template Reference

This class implements a forward hypergraph.

`#include <ForwardHyperGraph.h>`

Data Structures

- struct Edge

  Internal type of an edge.

Public Types

- using Vertex = std::size_t

  Internal type of a vertex.

Public Member Functions

- Vertex newVertex (const VertexProperty &vp)

  Returns a new vertex that is labeled with the given vertex property.
- Edge & newEdge (Vertex source, const EdgeProperty &ep)

  Creates a new edge where the given vertex is the incoming vertex that is labeled with the given edge property.
- Edge & newEdge (const VertexProperty &source, const EdgeProperty &ep)

  Creates a new edge where the given vertex is the incoming vertex that is labeled with the given edge property.
- const VertexProperty & operator[] (Vertex v) const

  Retrieves the vertex property for the given vertex.
- VertexProperty & operator[] (Vertex v)

  Retrieves the vertex property for the given vertex.
- const std::vector< Edge > & out (Vertex v) const

  Retrieves all outgoing edges for the given vertex.
- const std::vector< Edge > & out (const VertexProperty &v) const

  Retrieves all outgoing edges for the given vertex.
- Vertex begin () const

  Returns the first vertex.
- Vertex end () const

  Returns the past-the-last vertex.
- std::size_t size () const

  Returns the number of vertices.
- void toDot (const std::string &filename) const

  Writes a representation of this graph to the given file.

Friends

- template<typename VP , typename EP >
  std::ostream & operator<< (std::ostream &os, const ForwardHyperGraph< VP, EP > &fhg)

  Writes a textual representation of this graph to the given stream.

15.202.1 Detailed Description

template<typename VertexProperty, typename EdgeProperty, bool UniqueVertices = true>
class smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >

This class implements a forward hypergraph.

We define a hypergraph to be a graph structure (V,E) where V is a set of vertices and $E \subseteq 2^V$ a set of hyperedges. A hyperedge can connect an arbitrary number of vertices.

If a hypergraph is directed if every edge $e \in E$ is partitioned into $I(e)$ and $O(e)$ that are sets of incoming vertices and outgoing vertices, respectively. A forward hypergraph is directed and every edge has only a single incoming vertices, that is $|I(e)| = 1$. Note that we store edges as a mapping from the incoming vertex to a set of outgoing vertices and thus do not have an explicit incoming vertex in our edge representation.

This implementation of a forward hypergraph accepts arbitrary labels (called properties) for both vertices and edges. It relies on a dense list of vertices that are internally labeled starting from zero. Therefore, removal of vertices is not supported.

If the third template parameter UniqueVertices is set to true (being the default), we make sure that every vertex is unique with respect to its property. To make this possible, a vertex property may not be changed in this case which is enforced using a static assertion. No requirements are imposed on the edge properties.

This class supports both printing a simple text representation and writing a description to a dot file.

15.202.2 Member Typedef Documentation

15.202.2.1 Vertex

```
template<typename VertexProperty, typename EdgeProperty, bool UniqueVertices
= true>
using smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::Vertex =
std::size_t
```

Internal type of a vertex.

15.202.3 Member Function Documentation

15.202.3.1 begin()

```
template<typename VertexProperty, typename EdgeProperty, bool Unique↩
Vertices = true>
Vertex smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::begin ( )
const [inline]
```

Returns the first vertex.

15.202.3.2 end()

```
template<typename VertexProperty, typename EdgeProperty, bool UniqueVertices
= true>
Vertex smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::end ( )
const [inline]
```

Returns the past-the-last vertex.

15.202.3.3 newEdge() [1/2]

```
template<typename VertexProperty, typename EdgeProperty, bool
UniqueVertices = true>
Edge& smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::newEdge (
            const VertexProperty & source,
            const EdgeProperty & ep )  [inline]
```

Creates a new edge where the given vertex is the incoming vertex that is labeled with the given edge property.

15.202.3.4 newEdge() [2/2]

```
template<typename VertexProperty, typename EdgeProperty, bool
UniqueVertices = true>
Edge& smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::newEdge (
            Vertex source,
            const EdgeProperty & ep )  [inline]
```

Creates a new edge where the given vertex is the incoming vertex that is labeled with the given edge property.

15.202.3.5 newVertex()

```
template<typename VertexProperty, typename EdgeProperty, bool Unique↩
Vertices = true>
Vertex smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::newVertex (
            const VertexProperty & vp )  [inline]
```

Returns a new vertex that is labeled with the given vertex property.

If UniqueVertices is set to true and a vector with the given property already exists, this vector is returned.

15.202.3.6 operator[]() [1/2]

```
template<typename VertexProperty, typename EdgeProperty, bool
UniqueVertices = true>
VertexProperty& smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >↩
::operator[] (
            Vertex v )  [inline]
```

Retrieves the vertex property for the given vertex.

This method is disabled if UniqueVertices is set to true.

15.202.3.7 operator[]() [2/2]

```
template<typename VertexProperty, typename EdgeProperty, bool
UniqueVertices = true>
const VertexProperty& smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices
>::operator[] (
            Vertex v ) const  [inline]
```

Retrieves the vertex property for the given vertex.

15.202.3.8 out() [1/2]

```
template<typename VertexProperty, typename EdgeProperty, bool Unique↩
Vertices = true>
const std::vector<Edge>& smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, Unique↩
Vertices >::out (
            const VertexProperty & v ) const  [inline]
```

Retrieves all outgoing edges for the given vertex.

15.202.3.9 out() [2/2]

```
template<typename VertexProperty, typename EdgeProperty, bool UniqueVertices = true>
const std::vector<Edge>& smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::out (
            Vertex v ) const [inline]
```

Retrieves all outgoing edges for the given vertex.

15.202.3.10 size()

```
template<typename VertexProperty, typename EdgeProperty, bool UniqueVertices = true>
std::size_t smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::size ( ) const [inline]
```

Returns the number of vertices.

15.202.3.11 toDot()

```
template<typename VertexProperty, typename EdgeProperty, bool UniqueVertices = true>
void smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::toDot (
            const std::string & filename ) const
```

Writes a representation of this graph to the given file.

15.202.4 Friends And Related Function Documentation

15.202.4.1 operator<<

```
template<typename VertexProperty, typename EdgeProperty, bool UniqueVertices = true>
template<typename VP , typename EP >
std::ostream& operator<< (
            std::ostream & os,
            const ForwardHyperGraph< VP, EP > & fhg ) [friend]
```

Writes a textual representation of this graph to the given stream.

15.203 smtrat::FouMoModule< Settings > Class Template Reference

A module which applies the Fourier-Motzkin algorithm.

```
#include <FouMoModule.h>
```

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- FouMoModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=NULL)
- ~FouMoModule ()
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.

- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.

- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.

- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.

- Manager *const mpManager

  A reference to the manager.

- Model mModel

  Stores the assignment of the current satisfiable result, if existent.

- std::vector< Model > mAllModels

  Stores all satisfying assignments.

- bool mModelComputed

  True, if the model has already been computed.

- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.

- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.

- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.

- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.

- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.203.1 Detailed Description

template<typename Settings>
class smtrat::FouMoModule< Settings >

A module which applies the Fourier-Motzkin algorithm.

15.203.2 Member Typedef Documentation

15.203.2.1 SettingsType

```
template<typename Settings >
typedef Settings smtrat::FouMoModule< Settings >::SettingsType
```

15.203.3 Member Enumeration Documentation

15.203.3.1 LemmaType

```
enum smtrat::Module::LemmaType : unsigned [strong], [inherited]
```

Enumerator

NORMAL	
PERMANENT	

15.203.4 Constructor & Destructor Documentation

15.203.4.1 FouMoModule()

```
template<class Settings >
smtrat::FouMoModule< Settings >::FouMoModule (
            const ModuleInput * _formula,
            Conditionals & _conditionals,
            Manager * _manager = NULL )
```

15.203.4.2 ~FouMoModule()

```
template<typename Settings >
smtrat::FouMoModule< Settings >::~FouMoModule ( ) [inline]
```

15.203.5 Member Function Documentation

15.203.5.1 add()

```
bool smtrat::Module::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.203.5.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
            const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.203.5.3 addCore()

```
template<class Settings >
bool smtrat::FouMoModule< Settings >::addCore (
            ModuleInput::const_iterator _subformula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.203.5.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
            const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.203.5.5 addLemma()

```
void smtrat::Module::addLemma (
            const FormulaT & _lemma,
            const LemmaType & _lt = LemmaType::NORMAL,
            const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.203.5.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.203.5.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.203.5.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.203.5.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.203.5.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.203.5.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const  [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.203.5.12 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const  [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.203.5.13 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]
```

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.203.5.14 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.203.5.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.203.5.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.203.5.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.203.5.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.203.5.19 branchAt() [5/6] `template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>`

```
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.203.5.20 branchAt() [6/6] `template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>`

```
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.203.5.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.203.5.22 checkCore()

```
template<class Settings >
Answer smtrat::FouMoModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.203.5.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.203.5.24 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.203.5.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.203.5.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.203.5.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.203.5.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.203.5.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.203.5.30 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

15.203.5.31 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.203.5.32 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.203.5.33 constraintsToInform()

```
const carl::FastSet<FormulaT>& smtrat::Module::constraints↩
ToInform ( ) const [inline], [inherited]
```

Returns The constraints which the backends must be informed about.

15.203.5.34 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.203.5.35 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.203.5.36 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.203.5.37 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.203.5.38 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.203.5.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.203.5.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceived↩
VariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.203.5.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBest↩
Origin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.203.5.42 firstSubformulaToPass() `ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.203.5.43 firstUncheckedReceivedSubformula() `ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.203.5.44 freeSplittingVariable() `static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

15.203.5.45 generateTrivialInfeasibleSubset() `void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.203.5.46 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.203.5.47 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.203.5.48 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.203.5.49 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.203.5.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.203.5.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.203.5.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.203.5.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.203.5.54 getOrigins() [3/3]

`const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.203.5.55 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.203.5.56 hasLemmas()

`bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.203.5.57 hasValidInfeasibleSubset()

`bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.203.5.58 id()

`std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.203.5.59 infeasibleSubsets()

`const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.203.5.60 inform()

`bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.203.5.61 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.203.5.62 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.203.5.63 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.203.5.64 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.203.5.65 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.203.5.66 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.203.5.67 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.203.5.68 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.203.5.69 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.203.5.70 model()

`const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.203.5.71 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.203.5.72 moduleName()

```
template<typename Settings >
std::string smtrat::FouMoModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.203.5.73 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.203.5.74 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.203.5.75 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.203.5.76 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.203.5.77 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.203.5.78 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.203.5.79 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.203.5.80 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.203.5.81 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.203.5.82 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const  [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.203.5.83 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.203.5.84 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.203.5.85 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const  [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.203.5.86 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

15.203.5.87 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

15.203.5.88 receivedVariable()

`bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

15.203.5.89 remove()

`void smtrat::Module::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.203.5.90 removeCore()

`template<class Settings > void smtrat::FouMoModule< Settings >::removeCore ( ModuleInput::const_iterator _subformula ) [virtual]`

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Reimplemented from smtrat::Module.

15.203.5.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.203.5.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.203.5.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.203.5.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.203.5.95 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( ) [inline],
[protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

15.203.5.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.203.5.97 setId()

```
void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.203.5.98 setThreadPriority()

```
void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.203.5.99 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.203.5.100 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.203.5.101 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.203.5.102 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.203.5.103 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.203.5.104 updateModel() `template<class Settings > void smtrat::FouMoModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.203.5.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.203.6 Field Documentation

15.203.6.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.203.6.2 mAllModels

`std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.203.6.3 mBackendsFoundAnswer

`std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.203.6.4 mConstraintsToInform

`carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.203.6.5 mFinalCheck

`bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.203.6.6 mFirstPosInLastBranches

`std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.203.6.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.203.6.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::m↩FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.203.6.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.203.6.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.203.6.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.203.6.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.203.6.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.203.6.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.203.6.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.203.6.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.203.6.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.203.6.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.203.6.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplitting↩Variables [static], [inherited]`

Reusable splitting variables.

15.203.6.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.203.6.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.203.6.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.203.6.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.203.6.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.203.6.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.204 smtrat::qe::fm::FourierMotzkinQE Class Reference

Provides a simple implementation for Fourier Motzkin variable elimination for linear, existentially quantified constraints.

```
#include <FourierMotzkinQE.h>
```

Public Types

- using FormulaPartition = std::vector< std::vector< FormulaT > >

Public Member Functions

- FourierMotzkinQE (const FormulaT &qfree, const QEQuery &quantifiers)
- FormulaT eliminateQuantifiers ()

15.204.1 Detailed Description

Provides a simple implementation for Fourier Motzkin variable elimination for linear, existentially quantified constraints.

15.204.2 Member Typedef Documentation

15.204.2.1 FormulaPartition `using smtrat::qe::fm::FourierMotzkinQE::FormulaPartition = std↩ ::vector<std::vector<FormulaT> >`

15.204.3 Constructor & Destructor Documentation

15.204.3.1 FourierMotzkinQE()

```
smtrat::qe::fm::FourierMotzkinQE::FourierMotzkinQE (
    const FormulaT & qfree,
    const QEQuery & quantifiers ) [inline]
```

15.204.4 Member Function Documentation

15.204.4.1 eliminateQuantifiers()

```
FormulaT smtrat::qe::fm::FourierMotzkinQE::eliminateQuantifiers
( )
```

15.205 smtrat::FPPModule< Settings > Class Template Reference

```
#include <FPPModule.h>
```

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- FPPModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=NULL)
- ~FPPModule ()
- bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.

- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())

- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

PERMANENT	

15.205.3 Constructor & Destructor Documentation

15.205.3.1 FPPModule()

```
template<class Settings >
smtrat::FPPModule< Settings >::FPPModule (
            const ModuleInput * _formula,
            Conditionals & _conditionals,
            Manager * _manager = NULL )
```

15.205.3.2 ~FPPModule()

```
template<class Settings >
smtrat::FPPModule< Settings >::~FPPModule ( )
```

15.205.4 Member Function Documentation

15.205.4.1 add()

```
bool smtrat::PModule::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.205.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.205.4.3 addCore()

```
template<class Settings >
bool smtrat::FPPModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.205.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.205.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.205.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.205.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.205.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.205.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.205.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.205.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const  [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.205.4.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.205.4.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.205.4.14 appliedPreprocessing() `bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]`

Returns true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

15.205.4.15 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.205.4.16 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.205.4.17 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.205.4.18 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.205.4.19 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.205.4.20 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.205.4.21 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.205.4.22 check()

```
Answer smtrat::PModule::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.205.4.23 checkCore()

```
template<class Settings >
Answer smtrat::FPPModule< Settings >::checkCore ( )  [virtual]
```

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.205.4.24 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
            std::vector< FormulaSetT >::const_iterator _infsubset,
            const std::string & _filename = "smaller_muses",
            unsigned _maxSizeDifference = 1 ) const  [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.205.4.25 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.205.4.26 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.205.4.27 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.205.4.28 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.205.4.29 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.205.4.30 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.205.4.31 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

15.205.4.32 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.205.4.33 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.205.4.34 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.205.4.35 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.205.4.36 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.205.4.37 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.205.4.38 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.205.4.39 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.205.4.40 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.205.4.41 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceived↩
VariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.205.4.42 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.205.4.43 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.205.4.44 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.205.4.45 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.205.4.46 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.205.4.47 getBackendsAllModels()

```
void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]
```

Stores all models of a backend in the list of all models of this module.

15.205.4.48 getBackendsModel()

```
void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]
```

15.205.4.49 getInfeasibleSubsets() [1/2]

```
void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]
```

Copies the infeasible subsets of the passed formula.

15.205.4.50 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets (
    const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.205.4.51 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.205.4.52 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.205.4.53 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.205.4.54 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.205.4.55 getOrigins() [3/3] const FormulaT& smtrat::Module::getOrigins (ModuleInput::const_iterator _formula) const [inline], [protected], [inherited]

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.205.4.56 getReceivedFormulaSimplified() std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

15.205.4.57 hasLemmas() bool smtrat::Module::hasLemmas ( ) [inline], [inherited]

Checks whether this module or any of its backends provides any lemmas.

15.205.4.58 hasValidInfeasibleSubset() bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.205.4.59 id() std::size_t smtrat::Module::id ( ) const [inline], [inherited]

Returns A unique ID to identify this module instance.

15.205.4.60 infeasibleSubsets() const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.205.4.61 inform() bool smtrat::Module::inform (const FormulaT & _constraint) [inherited]

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.205.4.62 informBackends()

```
void smtrat::Module::informBackends (
    const FormulaT & _constraint ) [inline], [protected], [inherited]
```

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.205.4.63 informCore()

```
template<class Settings >
bool smtrat::FPPModule< Settings >::informCore (
    const FormulaT & _constraint ) [virtual]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented from smtrat::Module.

15.205.4.64 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.205.4.65 init()

```
template<class Settings >
void smtrat::FPPModule< Settings >::init ( ) [virtual]
```

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not and will not be called more than once and only before the first runBackends call.

Reimplemented from smtrat::Module.

15.205.4.66 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.205.4.67 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.205.4.68 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.205.4.69 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.205.4.70 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.205.4.71 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.205.4.72 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.205.4.73 moduleName()

```
virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]
```

Returns The name of the given module type as name.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::VSModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::GBModule< Settings >, smtrat::IntEqModule< Setti smtrat::CubeLIAModule< Settings >, smtrat::CurryModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IncWidthModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::BEModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::SplitSOSModule< Settings >.

15.205.4.74 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

15.205.4.75 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.205.4.76 passedFormulaBegin()

```
ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]
```

Returns An iterator to the end of the passed formula. TODO: disable this method

15.205.4.77 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.205.4.78 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.205.4.79 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.205.4.80 print()

```
void smtrat::Module::print (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.205.4.81 printAllModels()

```
void smtrat::Module::printAllModels (
    std::ostream & _out = std::cout ) [inherited]
```

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.205.4.82 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.205.4.83 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.205.4.84 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.205.4.85 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.205.4.86 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.205.4.87 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

15.205.4.88 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

15.205.4.89 receivedVariable()

`bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

15.205.4.90 remove()

`void smtrat::PModule::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.205.4.91 removeCore()

`template<class Settings > void smtrat::FPPModule< Settings >::removeCore ( ModuleInput::const_iterator _subformula ) [virtual]`

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Reimplemented from smtrat::Module.

15.205.4.92 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.205.4.93 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected], [inherited]
```

15.205.4.94 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.205.4.95 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.205.4.96 runBackends() [1/2]

```
virtual Answer smtrat::PModule::runBackends ( ) [inline], [virtual], [inherited]
```

Reimplemented from smtrat::Module.

15.205.4.97 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.205.4.98 setId() `void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]`

Sets this modules unique ID to identify itself.

Parameters

↩ _id	The id to set this module's id to.

15.205.4.99 setThreadPriority() `void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]`

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.205.4.100 solverState() `Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.205.4.101 splitUnequalConstraint() `void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.205.4.102 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.205.4.103 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.205.4.104 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.205.4.105 updateModel() `template<class Settings > void smtrat::FPPModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.205.4.106 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.205.5 Field Documentation

15.205.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.205.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.205.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.205.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.205.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.205.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.205.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩ Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.205.5.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module::m↩ FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.205.5.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.205.5.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.205.5.11 mInfeasibleSubsets `std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.205.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.205.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.205.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.205.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.205.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.205.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.205.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.205.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

15.205.5.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.205.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.205.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.205.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.205.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.205.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.206 smtrat::freelist< T > Class Template Reference

Implements a fixed-(at-runtime)-size allocator based on a free list embedded in the space of currently unused objects.

```
#include <alloc.h>
```

Public Member Functions

- freelist ()
- freelist (std::size_t chunk_size_)
- ~freelist ()
- template<typename... Args>
  T & emplace (Args &&... args)
- void * alloc ()

  Allocate an object of size 1<<mSizeShift.
- void free (void *ptr) NOEXCEPT

  Freeing means just prepending the free'd element to the front of the freelist.
- void clear () NOEXCEPT

  Invalidate ALL entries allocated using this allocator.

15.206.1 Detailed Description

template<typename T>
class smtrat::freelist< T >

Implements a fixed-(at-runtime)-size allocator based on a free list embedded in the space of currently unused objects.

Caution: Do not use this with types that need their destructor to be called, only for trivial types (like pointers, iterators, scalar values, ...). Otherwise, do not use the clear() method and call the destructor before free().

15.206.2 Constructor & Destructor Documentation

15.206.2.1 freelist() [1/2] template<typename T>

```
smtrat::freelist< T >::freelist ( ) [inline], [explicit]
```

15.206.2.2 freelist() [2/2] template<typename T>

```
smtrat::freelist< T >::freelist (
            std::size_t chunk_size_ ) [inline], [explicit]
```

15.206.2.3 ~freelist() template<typename T>

```
smtrat::freelist< T >::~freelist ( ) [inline]
```

15.206.3 Member Function Documentation

15.206.3.1 alloc() template<typename T>

```
void* smtrat::freelist< T >::alloc ( ) [inline]
```

Allocate an object of size 1<<mSizeShift.

First, try to return the first entry on the freelist.

If that is empty, try forward-allocation (allocating the next element on the current page that has never been allocated before.)

Otherwise, go to the next page.

If there is no next page, allocate a new page with malloc. This page has twice the space of the previous page.

Start forward-allocation phase on the new page.

15.206.3.2 clear() template<typename T>

```
void smtrat::freelist< T >::clear ( ) [inline]
```

Invalidate ALL entries allocated using this allocator.

Note that this does not call the destructor of any elements, and does not return any memory to the OS.

15.206.3.3 emplace() template<typename T>

```
template<typename... Args>
T& smtrat::freelist< T >::emplace (
            Args &&... args ) [inline]
```

15.206.3.4 free() template<typename T>

```
void smtrat::freelist< T >::free (
            void * ptr )  [inline]
```

Freeing means just prepending the free'd element to the front of the freelist.

15.207 smtrat::mcsat::FullParallelExplanation< Backends > Struct Template Reference

This explanation executes all given explanation parallel in multiple threads and waits until every single one has finished, returning the result of the first listed explanation.

```
#include <FullParallelExplanation.h>
```

15.207.1 Detailed Description

template<typename... Backends>
struct smtrat::mcsat::FullParallelExplanation< Backends >

This explanation executes all given explanation parallel in multiple threads and waits until every single one has finished, returning the result of the first listed explanation.

15.208 smtrat::cad::FullSampleComparator< Iterator, Strategy > Struct Template Reference

```
#include <SampleComparator.h>
```

15.209 smtrat::cad::FullSampleComparator< Iterator, FullSampleCompareStrategy::T > Struct Template Reference

```
#include <SampleComparator.h>
```

15.210 smtrat::cad::FullSampleComparator< Iterator, FullSampleCompareStrategy::Type > Struct Template Reference

```
#include <SampleComparator.h>
```

15.211 smtrat::cad::FullSampleComparator< Iterator, FullSampleCompareStrategy::Value > Struct Template Reference

```
#include <SampleComparator.h>
```

15.212 smtrat::parser::FunctionInstantiator Struct Reference

```
#include <FunctionInstantiator.h>
```

Public Member Functions

- virtual ~FunctionInstantiator ()
- template<typename T >
  bool convert (const std::vector< types::TermType > &from, std::vector< T > &to) const
- template<typename T >

- virtual bool operator() (const std::vector< types::TermType > &, types::TermType &, TheoryError &errors) const

15.212.1 Constructor & Destructor Documentation

15.212.1.1 ~FunctionInstantiator()

`virtual smtrat::parser::FunctionInstantiator::~FunctionInstantiator ( ) [inline], [virtual]`

15.212.2 Member Function Documentation

15.212.2.1 convert() [1/2]

```
template<typename T >
bool smtrat::parser::FunctionInstantiator::convert (
            const std::vector< types::TermType > & from,
            std::vector< T > & to ) const [inline]
```

15.212.2.2 convert() [2/2]

```
template<typename T >
bool smtrat::parser::FunctionInstantiator::convert (
            const std::vector< types::TermType > & from,
            std::vector< T > & to,
            TheoryError & errors ) const [inline]
```

15.212.2.3 operator()()

```
virtual bool smtrat::parser::FunctionInstantiator::operator() (
            const std::vector< types::TermType > & ,
            types::TermType & ,
            TheoryError & errors ) const [inline], [virtual]
```

15.213 smtrat::GBModule< Settings > Class Template Reference

A solver module based on Groebner basis.

```
#include <GBModule.h>
```

Public Types

- typedef Settings SettingsType
- typedef Settings::Order Order
- typedef Settings::PolynomialWithReasons GBPolynomial
- typedef Settings::MultivariateIdeal Ideal
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- GBModule (const ModuleInput *const, Conditionals &, Manager *const =NULL)
- virtual ~GBModule ()
- bool addCore (ModuleInput::const_iterator _formula)

  Adds the constraint to the known constraints of the module.
- virtual Answer checkCore ()

  A theory call to the GBModule.
- void removeCore (ModuleInput::const_iterator _formula)

  Removes the constraint from the GBModule.
- void printStateHistory ()
- void printRewriteRules ()
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.

- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.

- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.

- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.

- virtual void updateModel () const

  Updates the model, if the solver has detected the consistency of the received formula, beforehand.

- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.

- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()

- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- bool constraintByGB (carl::Relation cr)
- void pushBacktrackPoint (ModuleInput::const_iterator btpoint)

  To implement backtrackability, we save the current state after each equality we add.
- void popBacktrackPoint (ModuleInput::const_iterator btpoint)

  Pops all states from the stack until the state which we had before the constraint was added.
- bool saveState ()
- FormulasT generateReasons (const carl::BitVector &reasons)

  Generate reason sets from reason vectors.
- FormulaSetT generateReasonSet (const carl::BitVector &reasons)

  Generate reason sets from reason vectors.
- void passGB ()

  Add the equalities from the Groebner basis to the passed formula.

- void knownConstraintDeduction (const std::list< std::pair< carl::BitVector, carl::BitVector > > &deductions)
- void newConstraintDeduction ()
- void factorisedConstraintDeduction (const std::list< GBPolynomial > &factorisation, const carl::BitVector &reasons)
- GBPolynomial transformIntoEquality (ModuleInput::const_iterator constraint)

  Transforms a given inequality to a polynomial such that p = 0 is equivalent to the given constraint.
- GBPolynomial callGroebnerToSDP (const Ideal &gb)
- bool iterativeVariableRewriting ()

  With the new groebner basis, we search for radical-members which then can be added to the GB.
- bool findTrivialFactorisations ()

  A method which looks for polynomials which have trivial factors.
- void processNewConstraint (ModuleInput::const_iterator _formula)

  Method which updates internal data structures to reflect the added formula.
- void handleConstraintToGBQueue (ModuleInput::const_iterator _formula)

  Method which adds constraint to the GB-process.
- void handleConstraintNotToGB (ModuleInput::const_iterator _formula)

  Method which adds constraints to our internal datastructures without adding them to the GB.
- void removeReceivedFormulaFromNewInequalities (ModuleInput::const_iterator _formula)

  Removes a received formula from the list of new inequalities.
- void removeSubformulaFromPassedFormula (ModuleInput::iterator _formula)

  This function is overwritten such that it is visible to the InequalitiesTable.
- GBPolynomial rewriteVariable (const GBPolynomial &, const carl::Variable &, const TermT &, const BitVector &)
- bool validityCheck ()

  A validity check of the data structures which can be used to assert valid behaviour.
- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩ Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩ _premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())

- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- Settings::Groebner mBasis

  The current Groebner basis.
- InequalitiesTable< Settings > mInequalities

  The inequalities table for handling inequalities.
- std::vector< ModuleInput::const_iterator > mBacktrackPoints

  The vector of backtrack points, which has pointers to received constraints.
- std::list< GBModuleState< Settings > > mStateHistory

  Saves the relevant history to support backtracking.
- bool mRecalculateGB

  After popping in the history, it might be necessary to recalculate. This flag indicates this.
- std::list< typename InequalitiesTable< Settings >::Rows::iterator > mNewInequalities

  A list of inequalities which were added after the last consistency check.
- groebner::RewriteRules mRewriteRules

  The rewrite rules for the variables.
- std::map< size_t, carl::Variable > mAdditionalVarMap
- FormulasT mGbEqualities

  A workaround to associate equalities in the passed formula originating from the gb (in contrast to those which originate from simplified formulae)
- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.

- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

Friends

- class InequalitiesTable< Settings >

15.213.1 Detailed Description

template<class Settings>
class smtrat::GBModule< Settings >

A solver module based on Groebner basis.

Details can be found in my Bachelor Thesis "On Groebner Bases in SMT-Compliant Decision Procedures"

Author Sebastian Junges

15.213.5 Member Function Documentation

15.213.5.1 add() bool smtrat::Module::add (

```
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.213.5.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.213.5.3 addCore()

```
template<class Settings >
bool smtrat::GBModule< Settings >::addCore (
    ModuleInput::const_iterator _formula ) [virtual]
```

Adds the constraint to the known constraints of the module.

This includes scanning variables as well as transforming inequalities, if this is enabled.

Parameters

_formula	A REALCONSTRAINT which should be regarded by the next theory call.

Returns true

Reimplemented from smtrat::Module.

15.213.5.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.213.5.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.213.5.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.213.5.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.213.5.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.213.5.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.213.5.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.213.5.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const  [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.213.5.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.213.5.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.213.5.14 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.213.5.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.213.5.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.213.5.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.213.5.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.213.5.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.213.5.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.213.5.21 callGroebnerToSDP()

```
template<class Settings>
GBPolynomial smtrat::GBModule< Settings >::callGroebnerToSDP (
            const Ideal & gb ) [protected]
```

15.213.5.22 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.213.5.23 checkCore()

```
template<class Settings >
Answer smtrat::GBModule< Settings >::checkCore ( ) [virtual]
```

A theory call to the GBModule.

The exact working of this module depends on the settings in GBSettings.

Returns (TRUE,FALSE,UNKNOWN) dependent on the asserted constraints.

TODO fix this

Reimplemented from smtrat::Module.

15.213.5.24 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
            std::vector< FormulaSetT >::const_iterator _infsubset,
            const std::string & _filename = "smaller_muses",
            unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.213.5.25 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.213.5.26 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.213.5.27 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.213.5.28 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.213.5.29 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.213.5.30 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.213.5.31 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

15.213.5.32 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.213.5.33 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.213.5.34 constraintByGB()

```
template<class Settings >
bool smtrat::GBModule< Settings >::constraintByGB (
            carl::Relation cr )  [protected]
```

15.213.5.35 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const  [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.213.5.36 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
            const FormulaT &  ) const  [inline], [virtual], [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.213.5.37 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
            const FormulaT & _formula ) const  [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.213.5.38 deinform()

```
void smtrat::Module::deinform (
            const FormulaT & _constraint )  [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.213.5.39 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.213.5.40 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.213.5.41 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.213.5.42 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.213.5.43 factorisedConstraintDeduction()

```
template<class Settings>
void smtrat::GBModule< Settings >::factorisedConstraintDeduction (
            const std::list< GBPolynomial > & factorisation,
            const carl::BitVector & reasons ) [protected]
```

15.213.5.44 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
            const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.213.5.45 findTrivialFactorisations()

```
template<class Settings >
bool smtrat::GBModule< Settings >::findTrivialFactorisations ( ) [protected]
```

A method which looks for polynomials which have trivial factors.

15.213.5.46 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.213.5.47 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.213.5.48 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
            const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.213.5.49 generateReasons()

```
template<class Settings >
FormulasT smtrat::GBModule< Settings >::generateReasons (
            const carl::BitVector & reasons ) [protected]
```

Generate reason sets from reason vectors.

Parameters

reasons	The reasons vector.

Returns The reason set.

15.213.5.50 generateReasonSet()

```
template<class Settings >
FormulaSetT smtrat::GBModule< Settings >::generateReasonSet (
            const carl::BitVector & reasons ) [protected]
```

Generate reason sets from reason vectors.

Parameters

reasons	The reasons vector.

Returns The reason set.

15.213.5.51 generateTrivialInfeasibleSubset()

```
void smtrat::Module::generateTrivialInfeasibleSubset
( ) [inline], [protected], [inherited]
```

Stores the trivial infeasible subset being the set of received formulas.

15.213.5.52 getBackendsAllModels()

```
void smtrat::Module::getBackendsAllModels ( ) const [protected],
[inherited]
```

Stores all models of a backend in the list of all models of this module.

15.213.5.53 getBackendsModel()

```
void smtrat::Module::getBackendsModel ( ) const [protected],
[inherited]
```

15.213.5.54 getInfeasibleSubsets() [1/2]

```
void smtrat::Module::getInfeasibleSubsets ( ) [protected],
[inherited]
```

Copies the infeasible subsets of the passed formula.

15.213.5.55 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasible↩
Subsets (
            const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.213.5.56 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.213.5.57 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.213.5.58 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.213.5.59 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.213.5.60 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
            ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.213.5.61 getReceivedFormulaSimplified()

```
std::pair< bool, FormulaT > smtrat::Module::get↩
ReceivedFormulaSimplified ( ) [virtual], [inherited]
```

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

15.213.5.62 handleConstraintNotToGB()

```
template<class Settings >
void smtrat::GBModule< Settings >::handleConstraintNotToGB (
            ModuleInput::const_iterator _formula ) [protected]
```

Method which adds constraints to our internal datastructures without adding them to the GB.

E.g. inequalities are added to the inequalitiestable.

Parameters

_formula	

15.213.5.63 handleConstraintToGBQueue()

```
template<class Settings >
void smtrat::GBModule< Settings >::handleConstraintToGBQueue (
            ModuleInput::const_iterator _formula ) [protected]
```

Method which adds constraint to the GB-process.

Parameters

_formula	

15.213.5.64 hasLemmas() `bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.213.5.65 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.213.5.66 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.213.5.67 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.213.5.68 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.213.5.69 informBackends() `void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.213.5.70 informCore()

`virtual bool smtrat::Module::informCore ( const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.213.5.71 informedConstraints()

`const carl::FastSet<FormulaT>& smtrat::Module::informedConstraints ( ) const [inline], [inherited]`

Returns The position of the first constraint of which no backend has been informed about.

15.213.5.72 init()

`void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.213.5.73 is_minimizing()

`bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.213.5.74 isLemmaLevel()

`bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.213.5.75 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.213.5.76 iterativeVariableRewriting() `template<class Settings >`
`bool smtrat::GBModule< Settings >::iterativeVariableRewriting ( ) [protected]`

With the new groebner basis, we search for radical-members which then can be added to the GB.

Returns

TODO fix this

15.213.5.77 knownConstraintDeduction() `template<class Settings >`
```
void smtrat::GBModule< Settings >::knownConstraintDeduction (
            const std::list< std::pair< carl::BitVector, carl::BitVector > > & deductions )
[protected]
```

15.213.5.78 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.213.5.79 merge()
```
std::vector< FormulaT > smtrat::Module::merge (
            const std::vector< FormulaT > & _vecSetA,
            const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]
```

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.213.5.80 model()

```
const Model& smtrat::Module::model ( ) const [inline], [inherited]
```

Returns The assignment of the current satisfiable result, if existent.

15.213.5.81 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.213.5.82 moduleName()

```
template<class Settings>
std::string smtrat::GBModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns The name of the given module type as name.

Reimplemented from smtrat::Module.

15.213.5.83 newConstraintDeduction()

```
template<class Settings >
void smtrat::GBModule< Settings >::newConstraintDeduction ( ) [protected]
```

15.213.5.84 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

15.213.5.85 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

15.213.5.86 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.213.5.87 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.213.5.88 passGB()

```
template<class Settings >
void smtrat::GBModule< Settings >::passGB ( ) [protected]
```

Add the equalities from the Groebner basis to the passed formula.

Adds the reason vector.

15.213.5.89 popBacktrackPoint()

```
template<class Settings >
void smtrat::GBModule< Settings >::popBacktrackPoint (
            ModuleInput::const_iterator btpoint ) [protected]
```

Pops all states from the stack until the state which we had before the constraint was added.

Then, we make new states with all equalities which were added afterwards.

Parameters

a	pointer in the received formula to the constraint which will be removed.

15.213.5.90 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.213.5.91 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.213.5.92 print()

```
void smtrat::Module::print (
            const std::string & _initiation = "***" ) const [inherited]
```

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.213.5.93 printAllModels()

```
void smtrat::Module::printAllModels (
    std::ostream & _out = std::cout ) [inherited]
```

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.213.5.94 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.213.5.95 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.213.5.96 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.213.5.97 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const  [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.213.5.98 printRewriteRules()

```
template<class Settings>
void smtrat::GBModule< Settings >::printRewriteRules ( )
```

15.213.5.99 printStateHistory()

```
template<class Settings>
void smtrat::GBModule< Settings >::printStateHistory ( )
```

15.213.5.100 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const  [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.213.5.101 processNewConstraint()

```
template<class Settings >
void smtrat::GBModule< Settings >::processNewConstraint (
    ModuleInput::const_iterator _formula )  [protected]
```

Method which updates internal data structures to reflect the added formula.

Parameters

_formula	

15.213.5.102 pushBacktrackPoint()

```
template<class Settings >
void smtrat::GBModule< Settings >::pushBacktrackPoint (
    ModuleInput::const_iterator btpoint )  [protected]
```

To implement backtrackability, we save the current state after each equality we add.

Parameters

btpoint	The equality we have removed

15.213.5.103 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

15.213.5.104 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

15.213.5.105 receivedVariable()

`bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

15.213.5.106 remove()

`void smtrat::Module::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

15.213.5.107 removeCore()

`template<class Settings > void smtrat::GBModule< Settings >::removeCore ( ModuleInput::const_iterator _formula ) [virtual]`

Removes the constraint from the GBModule.

Notice: Whenever a constraint is removed which was not asserted before, this leads to an unwanted error. A general approach for this has to be found.

Parameters

_formula	the constraint which should be removed.

Reimplemented from smtrat::Module.

15.213.5.108 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
            ModuleInput::iterator _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.213.5.109 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.213.5.110 removeReceivedFormulaFromNewInequalities()

```
template<class Settings >
void smtrat::GBModule< Settings >::removeReceivedFormulaFromNewInequalities (
            ModuleInput::const_iterator _formula ) [protected]
```

Removes a received formula from the list of new inequalities.

It assumes that there is only one such element in the list.

Parameters

_formula	

15.213.5.111 removeSubformulaFromPassedFormula()

```
template<class Settings >
void smtrat::GBModule< Settings >::removeSubformulaFromPassedFormula (
            ModuleInput::iterator _formula ) [protected]
```

This function is overwritten such that it is visible to the InequalitiesTable.

For more details take a look at Module::eraseSubformulaFromPassedFormula(..)

Parameters

_formula	

15.213.5.112 rewriteVariable()

```
template<class Settings>
GBPolynomial smtrat::GBModule< Settings >::rewriteVariable (
            const GBPolynomial & ,
            const carl::Variable & ,
            const TermT & ,
            const BitVector & ) [inline], [protected]
```

15.213.5.113 rPassedFormula() `const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]`

Returns A reference to the formula passed to the backends of this module.

15.213.5.114 rReceivedFormula() `const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]`

Returns A reference to the formula passed to this module.

15.213.5.115 runBackends() [1/2] `virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]`

Reimplemented in smtrat::PModule.

15.213.5.116 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.213.5.117 saveState()

```
template<class Settings >
bool smtrat::GBModule< Settings >::saveState ( ) [protected]
```

Returns

15.213.5.118 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ _↩ *id*	The id to set this module's id to.

15.213.5.119 setThreadPriority()

`void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]`

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.213.5.120 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.213.5.121 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.213.5.122 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.213.5.123 transformIntoEquality() template<class Settings >

GBModule< Settings >::GBPolynomial smtrat::GBModule< Settings >::transformIntoEquality (ModuleInput::const_iterator *constraint*) [protected]

Transforms a given inequality to a polynomial such that p = 0 is equivalent to the given constraint.

This is done by inserting an additional variable which has an index which is given by the id of the given inequality.

Parameters

constraint	a pointer to the inequality

Returns The polynomial which represents the equality.

15.213.5.124 updateAllModels() void smtrat::Module::updateAllModels ( ) [virtual], [inherited]

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.213.5.125 updateLemmas() void smtrat::Module::updateLemmas ( ) [inherited]

Stores all lemmas of any backend of this module in its own lemma vector.

15.213.5.126 updateModel() void smtrat::Module::updateModel ( ) const [virtual], [inherited]

Updates the model, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::SATModule< Settings >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRAS smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::PModule, smtrat::VSModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, smtrat::LVEModule< Settings >, smtrat::MCBModule< Settings >, smtrat::ESModule< Settings >, and smtrat::GBPPModule< Settings >.

15.213.5.127 usedBackends() const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.213.5.128 validityCheck() template<class Settings >

bool smtrat::GBModule< Settings >::validityCheck ( ) [protected]

A validity check of the data structures which can be used to assert valid behaviour.

Returns true, iff the backtrackpoints are valid.

15.213.6 Friends And Related Function Documentation

15.213.6.1 InequalitiesTable< Settings > template<class Settings>

friend class InequalitiesTable< Settings > [friend]

15.213.7 Field Documentation

15.213.7.1 mAdditionalVarMap template<class Settings>

std::map<size_t, carl::Variable> smtrat::GBModule< Settings >::mAdditionalVarMap [protected]

15.213.7.2 mAllBackends std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]

The backends of this module which have been used.

15.213.7.3 mAllModels std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]

Stores all satisfying assignments.

15.213.7.4 mBackendsFoundAnswer std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.213.7.5 mBacktrackPoints template<class Settings>

std::vector<ModuleInput::const_iterator> smtrat::GBModule< Settings >::mBacktrackPoints [protected]

The vector of backtrack points, which has pointers to received constraints.

15.213.7.6 mBasis template<class Settings>

Settings::Groebner smtrat::GBModule< Settings >::mBasis [protected]

The current Groebner basis.

15.213.7.7 mConstraintsToInform carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]

Stores the constraints which the backends must be informed about.

15.213.7.8 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.213.7.9 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.213.7.10 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩ Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.213.7.11 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module::m↩ FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.213.7.12 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.213.7.13 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.213.7.14 mGbEqualities `template<class Settings> FormulasT smtrat::GBModule< Settings >::mGbEqualities [protected]`

A workaround to associate equalities in the passed formula originating from the gb (in contrast to those which originate from simplified formulae)

15.213.7.15 mInequalities `template<class Settings> InequalitiesTable<Settings> smtrat::GBModule< Settings >::mInequalities [protected]`

The inequalities table for handling inequalities.

15.213.7.16 mInfeasibleSubsets `std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.213.7.17 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.213.7.18 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩ ::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.213.7.19 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.213.7.20 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.213.7.21 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.213.7.22 mNewInequalities

`template<class Settings> std::list<typename InequalitiesTable<Settings>::Rows::iterator> smtrat::GBModule< Settings >::mNewInequalities [protected]`

A list of inequalities which were added after the last consistency check.

15.213.7.23 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.213.7.24 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.213.7.25 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

15.213.7.26 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.213.7.27 mRecalculateGB

`template<class Settings> bool smtrat::GBModule< Settings >::mRecalculateGB [protected]`

After popping in the history, it might be necessary to recalculate. This flag indicates this.

15.213.7.28 mRewriteRules

`template<class Settings> groebner::RewriteRules smtrat::GBModule< Settings >::mRewriteRules [protected]`

The rewrite rules for the variables.

15.213.7.29 mSmallerMusesCheckCounter

`unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.213.7.30 mSolverState

`std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.213.7.31 mStateHistory

`template<class Settings> std::list<GBModuleState<Settings> > smtrat::GBModule< Settings >::mStateHistory [protected]`

Saves the relevant history to support backtracking.

15.213.7.32 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.213.7.33 mUsedBackends

`std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.213.7.34 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.214 smtrat::GBModuleState< Settings > Class Template Reference

A class to save the current state of a GBModule.

```
#include <GBModuleState.h>
```

Public Member Functions

- GBModuleState ()
- GBModuleState (const typename Settings::Groebner &basisCalculation, const std::map< carl::Variable, std::pair< TermT, carl::BitVector > > &rewrites)
- const Settings::Groebner & getBasis () const
- const std::map< carl::Variable, std::pair< TermT, carl::BitVector > > & getRewriteRules () const

Protected Attributes

- const Settings::Groebner mBasis

  The state of the basis.
- const std::map< carl::Variable, std::pair< TermT, carl::BitVector > > mRewrites

15.214.1 Detailed Description

template<typename Settings>
class smtrat::GBModuleState< Settings >

A class to save the current state of a GBModule.

Used for backtracking-support

15.214.2 Constructor & Destructor Documentation

15.214.2.1 GBModuleState() [1/2] `template<typename Settings > smtrat::GBModuleState< Settings >::GBModuleState ( ) [inline]`

15.214.2.2 GBModuleState() [2/2] `template<typename Settings > smtrat::GBModuleState< Settings >::GBModuleState ( const typename Settings::Groebner & basisCalculation, const std::map< carl::Variable, std::pair< TermT, carl::BitVector > > & rewrites ) [inline]`

15.214.3 Member Function Documentation

15.214.3.1 getBasis() `template<typename Settings > const Settings::Groebner& smtrat::GBModuleState< Settings >::getBasis ( ) const [inline]`

15.214.3.2 getRewriteRules() `template<typename Settings > const std::map<carl::Variable, std::pair<TermT, carl::BitVector> >& smtrat::GBModuleState< Settings >::getRewriteRules ( ) const [inline]`

15.214.4 Field Documentation

15.214.4.1 mBasis `template<typename Settings >`

`const Settings::Groebner smtrat::GBModuleState< Settings >::mBasis [protected]`

The state of the basis.

15.214.4.2 mRewrites `template<typename Settings >`

`const std::map<carl::Variable, std::pair<TermT, carl::BitVector> > smtrat::GBModuleState< Settings >::mRewrites [protected]`

15.215 smtrat::GBPPModule< Settings > Class Template Reference

`#include <GBPPModule.h>`

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- GBPPModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- ~GBPPModule ()
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore (ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore (ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())

- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

```
template<class Settings >
smtrat::GBPPModule< Settings >::~GBPPModule ( )
```

15.215.4 Member Function Documentation

15.215.4.1 add()

```
bool smtrat::PModule::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.215.4.2 addConstraintToInform()

`void smtrat::Module::addConstraintToInform ( const FormulaT & _constraint ) [protected], [virtual], [inherited]`

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.215.4.3 addCore()

`virtual bool smtrat::Module::addCore ( ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]`

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.215.4.4 addInformationRelevantFormula()

`void smtrat::Module::addInformationRelevantFormula ( const FormulaT & formula ) [protected], [inherited]`

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.215.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.215.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.215.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.215.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.215.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.215.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.215.4.11 allModels()

`const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns All satisfying assignments, if existent.

15.215.4.12 anAnswerFound()

`bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.215.4.13 answerFound()

`const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.215.4.14 appliedPreprocessing()

`bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]`

Returns true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

15.215.4.15 backendsModel()

`const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.215.4.16 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.215.4.17 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.215.4.18 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() )  [inline],
[protected], [inherited]
```

15.215.4.19 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false )  [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.215.4.20 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P
>> = carl::dummy>
bool smtrat::Module::branchAt (
    const typename P::PolyType & _poly,
```

```
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() )  [inline],
[protected], [inherited]
```

15.215.4.21 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P
>> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false )  [inline], [protected], [inherited]
```

15.215.4.22 check()

```
Answer smtrat::PModule::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.215.4.23 checkCore()

```
template<class Settings >
Answer smtrat::GBPPModule< Settings >::checkCore ( )  [virtual]
```

Checks the received formula for consistency.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.215.4.24 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.215.4.25 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.215.4.26 cleanModel()

```
void smtrat::Module::cleanModel ( ) const [inline], [protected],
[inherited]
```

Substitutes variable occurrences by its model value in the model values of other variables.

15.215.4.27 clearLemmas()

```
void smtrat::Module::clearLemmas ( ) [inline], [inherited]
```

Deletes all yet found lemmas.

15.215.4.28 clearModel()

```
void smtrat::Module::clearModel ( ) const [inline], [protected],
[inherited]
```

Clears the assignment, if any was found.

15.215.4.29 clearModels()

```
void smtrat::Module::clearModels ( ) const [inline], [protected],
[inherited]
```

Clears all assignments, if any was found.

15.215.4.30 clearPassedFormula()

```
void smtrat::Module::clearPassedFormula ( ) [protected],
[inherited]
```

15.215.4.31 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.215.4.32 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.215.4.33 collectTheoryPropagations()

```
void smtrat::Module::collectTheoryPropagations ( ) [inherited]
```

15.215.4.34 constraintsToInform()

```
const carl::FastSet<FormulaT>& smtrat::Module::constraints↩
ToInform ( ) const [inline], [inherited]
```

Returns The constraints which the backends must be informed about.

15.215.4.35 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.215.4.36 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.215.4.37 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.215.4.38 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.215.4.39 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.215.4.40 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.215.4.41 excludeNotReceivedVariablesFromModel()

`void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]`

Excludes all variables from the current model, which do not occur in the received formula.

15.215.4.42 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

15.215.4.43 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.215.4.44 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.215.4.45 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

15.215.4.46 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.215.4.47 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.215.4.48 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.215.4.49 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.215.4.50 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::getInfeasible↩ Subsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.215.4.51 getInformationRelevantFormulas() `const std::set< FormulaT > & smtrat::Module::get↩ InformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.215.4.52 getModelEqualities() `std::list< std::vector< carl::Variable > > smtrat::Module↩ ::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.215.4.53 getOrigins() [1/3] `void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

15.215.4.54 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.215.4.55 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.215.4.56 getReceivedFormulaSimplified()

```
std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]
```

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

15.215.4.57 hasLemmas()

```
bool smtrat::Module::hasLemmas ( ) [inline], [inherited]
```

Checks whether this module or any of its backends provides any lemmas.

15.215.4.58 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.215.4.59 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.215.4.60 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.215.4.61 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.215.4.62 informBackends() `void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.215.4.63 informCore()

```
virtual bool smtrat::Module::informCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.215.4.64 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns The position of the first constraint of which no backend has been informed about.

15.215.4.65 init()

```
void smtrat::Module::init ( ) [virtual], [inherited]
```

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.215.4.66 is_minimizing()

```
bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]
```

15.215.4.67 isLemmaLevel()

```
bool smtrat::Module::isLemmaLevel (
    LemmaLevel level ) [protected], [inherited]
```

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.215.4.68 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.215.4.69 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.215.4.70 merge()

```
std::vector< FormulaT > smtrat::Module::merge (
    const std::vector< FormulaT > & _vecSetA,
    const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]
```

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.215.4.71 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.215.4.72 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.215.4.73 moduleName()

`virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns The name of the given module type as name.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::VSModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::GBModule< Settings >, smtrat::IntEqModule< Setti smtrat::CubeLIAModule< Settings >, smtrat::CurryModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IncWidthModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::BEModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::SplitSOSModule< Settings >.

15.215.4.74 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.215.4.75 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

15.215.4.76 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.215.4.77 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.215.4.78 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.215.4.79 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.215.4.80 print()

```
void smtrat::Module::print (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.215.4.81 printAllModels()

```
void smtrat::Module::printAllModels (
    std::ostream & _out = std::cout ) [inherited]
```

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.215.4.82 printInfeasibleSubsets()

```
void smtrat::Module::printInfeasibleSubsets (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.215.4.83 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.215.4.84 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.215.4.85 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.215.4.86 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.215.4.87 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.215.4.88 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.215.4.89 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.215.4.90 remove()

```
void smtrat::PModule::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.215.4.91 removeCore()

```
virtual void smtrat::Module::removeCore (
    ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

Reimplemented in smtrat::SATModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::VSModule< Settings >, smtrat::PFEModule< Settings >, smtrat::EQModule< Setting smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::CSplitModule< Settings >, smtrat::ICEModule< Settings >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::PBPPModule< Sett smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::IntEqModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::IncWidthModule< Settings >, and smtrat::GBModule< Settings >.

15.215.4.92 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

15.215.4.93 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

15.215.4.94 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.215.4.95 rReceivedFormula() `const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]`

Returns A reference to the formula passed to this module.

15.215.4.96 runBackends() [1/2] `virtual Answer smtrat::PModule::runBackends ( ) [inline], [virtual], [inherited]`

Reimplemented from smtrat::Module.

15.215.4.97 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.215.4.98 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.215.4.99 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.215.4.100 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.215.4.101 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.215.4.102 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.215.4.103 updateAllModels()

`void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.215.4.104 updateLemmas()

`void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.215.4.105 updateModel() template<class Settings >
void smtrat::GBPPModule< Settings >::updateModel ( ) const [virtual]

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.215.4.106 usedBackends() const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.215.5 Field Documentation

15.215.5.1 mAllBackends std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]

The backends of this module which have been used.

15.215.5.2 mAllModels std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]

Stores all satisfying assignments.

15.215.5.3 mBackendsFoundAnswer std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.215.5.4 mConstraintsToInform carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]

Stores the constraints which the backends must be informed about.

15.215.5.5 mFinalCheck bool smtrat::Module::mFinalCheck [protected], [inherited]

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.215.5.6 mFirstPosInLastBranches std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]

The beginning of the cyclic buffer storing the last branches.

15.215.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaToPass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.215.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.215.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.215.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.215.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.215.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.215.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.215.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.215.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.215.5.16 mModelComputed `bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.215.5.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.215.5.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.215.5.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

15.215.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.215.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.215.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.215.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.215.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.215.5.25 mVariableCounters

`std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

`#include <ICEModule.h>`

Public Types

- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- ICEModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- ~ICEModule ()
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.

- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.

- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void updateModel () const

  Updates the current assignment into the model.

- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.

- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.

- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.

- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.

- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const

- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- void clearPassedFormula ()

- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.

- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.

- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.

- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.

- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

15.232.4 Member Function Documentation

15.232.4.1 add() bool smtrat::PModule::add (ModuleInput::const_iterator _subformula) [inherited]

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.232.4.2 addConstraintToInform() void smtrat::Module::addConstraintToInform (const FormulaT & _constraint) [protected], [virtual], [inherited]

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.232.4.3 addCore() template<class Settings >

bool smtrat::ICEModule< Settings >::addCore (ModuleInput::const_iterator _subformula) [virtual]

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.232.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.232.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.232.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.232.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.232.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.232.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.232.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.232.4.11 allModels() `const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns All satisfying assignments, if existent.

15.232.4.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.232.4.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.232.4.14 appliedPreprocessing() `bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]`

Returns true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

15.232.4.15 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.232.4.16 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.232.4.17 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.232.4.18 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

15.232.4.19 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.232.4.20 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.232.4.21 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.232.4.22 check()

```
Answer smtrat::PModule::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.232.4.23 checkCore() `template<class Settings >`
`Answer smtrat::ICEModule< Settings >::checkCore ( ) [virtual]`

Checks the received formula for consistency.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.232.4.24 checkInfSubsetForMinimality()
```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.232.4.25 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.232.4.26 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.232.4.27 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.232.4.28 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.232.4.29 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.232.4.30 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.232.4.31 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.232.4.32 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.232.4.33 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.232.4.34 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.232.4.35 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.232.4.36 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

15.232.4.37 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

15.232.4.38 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]
```

The inverse of informing about a constraint.

All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

15.232.4.39 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns The index of the smallest (regarding the size of the sets) element of origins

15.232.4.40 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
            ModuleInput::iterator _subformula,
            bool _ignoreOrigins = false )  [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.232.4.41 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const  [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

15.232.4.42 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
            const std::vector< FormulaT > & _origins ) const  [protected], [inherited]
```

Parameters

_origins	

Returns

15.232.4.43 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const  [inline], [inherited]
```

Returns The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.232.4.44 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns The position of the first (by this module) unchecked sub-formula of the received formula.

15.232.4.45 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

15.232.4.46 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

15.232.4.47 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

15.232.4.48 getBackendsModel()

`void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

15.232.4.49 getInfeasibleSubsets() [1/2]

`void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

15.232.4.50 getInfeasibleSubsets() [2/2]

`std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns The infeasible subsets the given backend provides.

15.232.4.51 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns Set of all formulas

15.232.4.52 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.

The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns Equivalence classes.

15.232.4.53 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.232.4.54 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

15.232.4.55 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns The origins of the passed formula at the given position.

15.232.4.56 getReceivedFormulaSimplified() `std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

15.232.4.57 hasLemmas() `bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

15.232.4.58 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

15.232.4.59 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns A unique ID to identify this module instance.

15.232.4.60 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

15.232.4.61 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

15.232.4.62 informBackends()

`void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

15.232.4.63 informCore()

`virtual bool smtrat::Module::informCore ( const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.

It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::FPPModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

15.232.4.64 informedConstraints()

`const carl::FastSet<FormulaT>& smtrat::Module::informedConstraints ( ) const [inline], [inherited]`

Returns The position of the first constraint of which no backend has been informed about.

15.232.4.65 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.

This method must not be called twice and only before the first runBackends call.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::PBPPModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::BVModule< Settings >, smtrat::CurryModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::FPPModule< Settings >.

15.232.4.66 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

15.232.4.67 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

15.232.4.68 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

15.232.4.69 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns A constant reference to the lemmas being valid formulas this module or its backends made.

15.232.4.70 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.

({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns The vector being the two given vectors merged.

15.232.4.71 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns The assignment of the current satisfiable result, if existent.

15.232.4.72 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns true, if there is no variable assigned by both models; false, otherwise.

15.232.4.73 moduleName() `virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns The name of the given module type as name.

Reimplemented in smtrat::EQModule< Settings >, smtrat::EQModule< EQSettingsForPreprocessing >, smtrat::IntBlastModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::STropModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::EQPreprocessingModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::VSModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::BVModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::GBModule< Settings >, smtrat::IntEqModule< Setti smtrat::CubeLIAModule< Settings >, smtrat::CurryModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IncWidthModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::BEModule< Settings >, smtrat::NRAILModule< Settings >, and smtrat::SplitSOSModule< Settings >.

15.232.4.74 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

15.232.4.75 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

15.232.4.76 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula. TODO: disable this method

15.232.4.77 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns An iterator to the end of the passed formula.

15.232.4.78 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to the backends of this module.

15.232.4.79 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns A pointer to the formula passed to this module.

15.232.4.80 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

15.232.4.81 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.232.4.82 printInfeasibleSubsets()

`void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

15.232.4.83 printModel()

`void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

15.232.4.84 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

15.232.4.85 printReceivedFormula()

`void smtrat::Module::printReceivedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

15.232.4.86 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

15.232.4.87 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

15.232.4.88 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

15.232.4.89 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

15.232.4.90 remove()

```
void smtrat::PModule::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.

However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

15.232.4.91 removeCore() template<class Settings >

```
void smtrat::ICEModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula )  [virtual]
```

Removes the subformula of the received formula at the given position to the considered ones of this module.

Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

Reimplemented from smtrat::Module.

15.232.4.92 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
            ModuleInput::iterator _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

15.232.4.93 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

15.232.4.94 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const  [inline],
[inherited]
```

Returns A reference to the formula passed to the backends of this module.

15.232.4.95 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns A reference to the formula passed to this module.

15.232.4.96 runBackends() [1/2]

```
virtual Answer smtrat::PModule::runBackends ( )  [inline],
[virtual], [inherited]
```

Reimplemented from smtrat::Module.

15.232.4.97 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
            bool _final,
            bool _full,
            carl::Variable _objective )  [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.232.4.98 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

15.232.4.99 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

15.232.4.100 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

15.232.4.101 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint (
    const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

15.232.4.102 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns The priority of this module to get a thread for running its check procedure.

15.232.4.103 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.

Reimplemented in smtrat::SATModule< Settings >.

15.232.4.104 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

15.232.4.105 updateModel() `void smtrat::PModule::updateModel ( ) const [virtual], [inherited]`

Updates the current assignment into the model.

Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.

Reimplemented from smtrat::Module.

15.232.4.106 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.232.5 Field Documentation

15.232.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

15.232.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

15.232.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

15.232.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

15.232.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

15.232.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

15.232.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩ Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

15.232.5.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module::m↩ FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

15.232.5.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.232.5.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

15.232.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

15.232.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

15.232.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

15.232.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

15.232.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

15.232.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

15.232.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

15.232.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

15.232.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplitting↩Variables [static], [inherited]`

Reusable splitting variables.

15.232.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

15.232.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

15.232.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

15.232.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

15.232.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

15.232.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

15.233 smtrat::ICPModule< Settings > Class Template Reference

`#include <ICPModule.h>`

Data Structures

- struct comp

  Typedefs:

- struct formulaPtrComp
- struct linearVariable
- struct weights

Public Types

- typedef carl::FastPointerMap< Poly *, weights > WeightMap
- typedef Settings SettingsType
- enum LemmaType : unsigned { LemmaType::NORMAL = 0, LemmaType::PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- ICPModule (const ModuleInput ∗, Conditionals &, Manager ∗const =NULL)

  Constructors:
- ∼ICPModule ()

  Destructor:
- bool informCore (const FormulaT &)

  Informs the module about the given constraint.
- bool addCore (ModuleInput::const_iterator)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator)

  Removes everything related to the given sub-formula of the received formula.
- Answer checkCore ()

  Checks the received formula for consistency.
- void updateModel () const

  Updates the model, if the solver has detected the consistency of the received formula, beforehand.
- EvalRationalIntervalMap getCurrentBoxAsIntervals () const
- FormulasT getCurrentBoxAsFormulas () const
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput ∗ pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput ∗ pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const

- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.

- void clearLemmas ()

  Deletes all yet found lemmas.

- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.

- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.

- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.

- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.

- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.

- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.

- virtual void deinformCore (const FormulaT &_constraint)

  The inverse of informing about a constraint.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.

- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.

- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.

- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.

- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.

- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.

- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branching↩Value) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&↩_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩::vector< FormulaT >())
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormula↩AsPremise=false)
- template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
  bool branchAt (const typename P::PolyType &_poly, bool _integral, const Rational &_value, bool _left↩CaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.

- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.

- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

```
smtrat::ICPModule< Settings >::~ICPModule ( )
```

Destructor:

15.233.4 Member Function Documentation

15.233.4.1 add() bool smtrat::Module::add (

```
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

15.233.4.2 addConstraintToInform() void smtrat::Module::addConstraintToInform (

```
            const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

15.233.4.3 addCore()

```
template<class Settings >
bool smtrat::ICPModule< Settings >::addCore (
            ModuleInput::const_iterator formula ) [virtual]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

Reimplemented from smtrat::Module.

15.233.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
            const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

15.233.4.5 addLemma()

```
void smtrat::Module::addLemma (
            const FormulaT & _lemma,
            const LemmaType & _lt = LemmaType::NORMAL,
            const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

15.233.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

15.233.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.

Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

15.233.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.

Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.233.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.233.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

15.233.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const  [inline],
[inherited]
```

Returns All satisfying assignments, if existent.

15.233.4.12 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const  [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns True, if one of them has determined a result.

15.233.4.13 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]
```

Returns A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

15.233.4.14 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

15.233.4.15 branchAt() [1/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.233.4.16 branchAt() [2/6]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.233.4.17 branchAt() [3/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.233.4.18 branchAt() [4/6]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

15.233.4.19 branchAt() [5/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false,
            const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

15.233.4.20 branchAt() [6/6]

```
template<typename P = Poly, carl::EnableIf< carl::needs_cache< P >> = carl::dummy>
bool smtrat::Module::branchAt (
            const typename P::PolyType & _poly,
            bool _integral,
            const Rational & _value,
            std::vector< FormulaT > && _premise,
            bool _leftCaseWeak = true,
            bool _preferLeftCase = true,
            bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

15.233.4.21 check()

```
Answer smtrat::Module::check (
            bool _final = false,
            bool _full = true,
            carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.

Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

15.233.4.22 checkCore()

```
template<class Settings >
Answer smtrat::ICPModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

15.233.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

15.233.4.24 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

15.233.4.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

15.233.4.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

15.233.4.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

15.233.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

15.233.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

15.233.4.30 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

15.233.4.31 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.

If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

15.233.4.32 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

15.233.4.33 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns The constraints which the backends must be informed about.

15.233.4.34 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns 0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)
