0.1 SMT-RAT

This is the documentation of SMT-RAT, an Open Source C++ Toolbox for Strategic and Parallel SMT Solving. On this page, you can find introductory information on how to obtain and compile SMT-RAT and a traditional doxygen API documentation. The documentation comes in three flavours:

- API documentation as HTML: the regular web-based doxygen documentation is generated by `make doc-apidoc-html` into `build/doc/apidoc-html/` and online at https://ths-rwth.↩ github.io/smtrat.
- API documentation as PDF: (almost) the full doxygen documentation as a pdf file is generated by `make doc-apidoc-pdf` into `build/doc/doc_smtrat-*.pdf` and online here.
- Manual as PDF: only the manual, suitable for reading as an introduction into SMT-RAT, is generated by `make doc-manual` into `build/doc/manual_smtrat-*.pdf` and online here.

Note that all the information of the manual is contained in the API documentation (both HTML and PDF) as well. It is much more compact, though, and may thus be more approachable as an introduction. However, references to classes do not work in the manual (as the class documentation is not contained).

If you want to use SMT-RAT and want to know how to get and install it, have a look at Installation. It covers the most important steps including obtaining the actual source code, obtaining dependencies, building the library and running our test suite.

If you already use SMT-RAT and want to dig deeper or submit new code, you can additionally browse in Developers information. It contains information about supplementary features like our logging framework and some basic guidelines for our code like how we use doxygen.

Note that this documentation is, and will probably still be for quite some time, work in progress. If you feel that some topic that is important to you is missing or some explanation is unclear, please let us know!

0.2 Installation

0.2.1 Requirements

SMT-RAT is build and tested on Linux. While MacOS is a secondary target (and should work on the most recent version), we do not target Windows yet. Please contact us if you are interested in changing that.

To build and use SMT-RAT, you need the following other software:

- `git` to checkout the git repository.
- `g++` or `clang` to compile.
- `cmake` to generate the make files.

Optional dependencies

- `ccmake` to set cmake flags.
- `doxygen` and `doxygen-latex` to build the documentation.

Additionally, SMT-RAT requires a few external libraries, which are installed automatically by CMake if no local version is available:

- `carl` from http://smtrat.github.io/carl/ (automatically built locally if necessary).
- `boost` (the boost version from CArL is used).

When installing the dependencies, make sure that you meet the following version requirements:

- `g++` >= 11
- `clang` >= 13

0.2.2 Download

Here are archived versions of SMT-RAT for download:

- latest

0.2.3 Configuration

SMT-RAT is configured with cmake. To prepare the build and perform the configuration run the following, starting from the root folder of SMT-RAT:

```
$ mkdir build && cd build && cmake ..
$ ccmake ..
```

`ccmake` will show the cmake variables. [TODO: document important cmake variables]

0.2.4 Build

To build SMT-RAT use `make` in the build folder:

```
$ make smtrat-shared
```

Relevant targets you may want to build individually include:

- `smtrat-shared`: Builds the (dynamically linked) executable SMT solver
- `smtrat-static`: Builds the (statically linked) executable SMT solver
- `smtrat`: Builds both `smtrat-shared` and `smtrat-static`.
- `doc-html`: Builds the doxygen documentation as HTML.
- `doc-pdf`: Builds the doxygen documentation as PDF.
- `doc`: Builds both `doc-html` and `doc-pdf`.
- `benchmax`: Builds the benchmarking tool.

0.2.5 Check build

You can now find an executable `smtrat-shared` in the build directory. It shows some usage information if you run `./smtrat-shared --help`. To run it on an SMT-LIB file, simply run

```
$ ./smtrat-shared example.smt2
```

0.3 System architecture

0.3.1 Different libraries

THe different parts of SMT-RAT are split into multiple libraries (in the sense of a shared object library) that are responsible for the following tasks:

- `smtrat-analyzer`: static analysis of input formulae;
- `smtrat-cad`: back all CAD-based techniques;
- `smtrat-common`: common definitions and includes;
- `smtrat-max-smt`: takes care of max SMT queries;
- `smtrat-mcsat`: utilities for the MCSAT-based solver;
- `smtrat-modules`: all regular SMT-RAT modules;
- `smtrat-optimization`: takes care of optimization queries;
- `smtrat-qe`: methods for quantifier elimination;
- `smtrat-solver`: core solving infrastructure;
- `smtrat-strategies`: strategies for SMT solving;
- `smtrat-unsat-cores`: takes care of unsat core computations.

All of these yield a library, while a full-fledged SMT solver is build from the `cli/` path, in particular the `cli/smtratSolver.cpp`.

0.3.2 Software design

The architecture of SMT-RAT puts its focus on modularity and composability of different solving techniques. Every solving technique, for example SAT solving or the simplex method, is encapsulated in a (derivation of the) module class. These modules are composed to a strategy that governs which modules are used in what order. The execution of a strategy is incumbent upon the manager, that also offers an interface for basic SMT solving to the outside.

More advanced solving techniques like quantifier elimination, computing unsatisfiable cores, or tackling max SMT and optimization queries are implemented as individual components in the frontend. The frontend implements (most of) an SMT-LIB compatible interface and can either be used by a generic SMT-LIB parser, or an external tool. This structure is shown in the following picture.

The parser itself is implemented in `cli/parser/` and run from `cli/tools/execute_smtlib.h`. The template argument `Executor` is usually instantiated with the executor from `cli/tools/Executor.h` which corresponds to the frontend. The components in the frontend are taken from the respective SMT-RAT libraries.

The manager is a generic class from `smtrat-solver/Manager.h` that every strategy (from `smtrat-strategies/`) inherits from and only constructs the strategy graph in its constructor. The strategy graph is at the core of the composition of SMT-RAT modules and the following picture shows how a single module is embedded in a strategy.

Every module has (a pointer to) a set of received formulae that represent its input and a set of passed formulae that represent the formula that is passed on to some backend. The module may "solve" the query from its input on its own, or it may pass (one or more) queries to its backends (in this case B-1, B-2 and B-3). Arrows to backends may be labeled with conditions that restrict whether this particular backend can be used, for example checking whether the passed formulae are linear, contain integer variables or bit-vector formulae.

When a module issues a backend call the manager identifies all suitable backend modules (where the condition evaluates to `true`) and calls all backend modules on the passed formulae. This happens either sequentially (until one backend module solves the query) or in parallel.

0.3.3 Modules

A module m holds a set of formulas, called its set of received formulas and denoted by $C_{rcv}(m)$. The main function of a module is `check(bool full)`, which either decides whether $C_{rcv}(m)$ is satisfiable or not, returning `SAT` or `UNSAT`, respectively, or returns `UNKNOWN`. A set of formulas is semantically defined by their conjunction. If the function's argument `full` is set to `false`, the underlying procedure of m is allowed to omit hard obstacles during solving at the cost of returning `UNKNOWN` in more cases. We can manipulate $C_{rcv}(m)$ by adding (removing) formulas φ to (from) it with `add(\f$\varphi\f$)` (`remove(\f$\varphi\f$)`). Usually, $C_{rcv}(m)$ is only slightly changed between two consecutive `check` calls, hence, the solver's performance can be significantly improved if a module works incrementally and supports backtracking. In case m determines the unsatisfiability of $C_{rcv}(m)$, it has to compute at least one preferably small infeasible subset $C_{inf}(m) \subseteq C_{rcv}(m)$. Moreover, a module can specify *lemmas*, which are valid formulas. They encapsulate information which can be extracted from a module's internal state and propagated among other modules. Furthermore, a module itself can ask other modules for the satisfiability of its *set of passed formulas* denoted by $C_{pas}(m)$, if it invokes the procedure `runBackends(bool full)` (controlled by the manager). It thereby delegates work to modules that may be more suitable for the problem at hand.

0.3.4 Strategy

SMT-RAT allows a user to decide how to compose the modules. For this purpose we provide a graphical user interface, where the user can create a *strategy* specifying this composition. A strategy is a directed tree $T := (V, E)$ with a set V of modules as nodes and $E \subseteq V \times \Omega \times \Sigma \times V$, with Ω being the set of *conditions* and Σ being the set of *priority values*. A condition is an arbitrary Boolean combination of formula properties, such as propositions about the Boolean structure of the formula, e.g., whether it is in conjunctive normal form (CNF), about the constraints, \eg whether it contains equations, or about the polynomials, e.g., whether they are linear. Furthermore, each edge carries a unique priority value from $\Sigma = \{1, \ldots, |E|\}$.

0.3.5 Manager

The manager holds the strategy and the SMT solver's input formula C_{input}. Initially, the manager calls the method `check` of the module m_r given by the root of the strategy with $C_{rcv}(m_r) = C_{input}$. Whenever a module $m \in V$ calls `runBackends`, the manager adds a solving task (σ, m, m') to its priority queue Q of solving tasks (ordered by the priority value), if there exists an edge $(m, \omega, \sigma, m') \in E$ in the strategy such that ω holds for $C_{pas}(m)$. If a processor p on the machine where SMT-RAT is executed on is available, the first solving task of Q is assigned to p and popped from Q. The manager thereby starts the method `check` of m' with $C_{rcv}(m') = C_{pas}(m)$ and passes the result (including infeasible subsets and lemmas) back to m. The module m can now benefit in its solving and reasoning process from this shared information. Note that a strategy-based composition of modules works incrementally and supports backtracking not just within one module but as a whole. This is realized by a mapping in each module m of its passed formulas $\varphi \in C_{pas}(m)$ to sets $R_1, \ldots, R_n \subseteq C_{rcv}(m)$ such that each R_i forms a reason why m included φ in $C_{pas}(m)$ to ask for its satisfiability. In order to exploit the incrementality of the modules, all parallel executed backends terminate in a consistent state (instead of just being killed), if one of them finds an answer.

0.3.6 Procedures implemented as modules

The heart of an SMT solver usually forms a SAT solver. In SMT-RAT, the module SATModule abstracts the received formulae to propositional logic and uses the efficient SAT solver MiniSat **[minisat]** to find a Boolean assignment of the abstraction. It invokes `runBackends` where the passed formulae of the SATModule contain the constraints abstracted by the assigned Boolean variables in a less-lazy fashion **[sebastiani2007lazy]**. [Todo: Make a concise description here, refer to extensive discussion of modules]

0.3.7 Infeasible subsets and lemmas

Infeasible subsets and lemmas, which contain only formulas from $C_{pas}(SATModule)$ of a preceding SATModule, prune its Boolean search space and hence the number of theory calls. Smaller infeasible subsets are usually more advantageous, because they make larger cuts in the search space. We call lemmas containing new constraints inventive lemmas (non-inventive otherwise). They might enlarge the Boolean search space, but they can reduce the complexity of later theory calls. When using inventive lemmas, it is important to ensure that the set possible constraints introduced in such lemmas is finite for a given module and a given input formula. Otherwise, the termination of this procedure cannot be guaranteed. In general, any module might contribute lemmas and all preceding modules in the solving hierarchy can directly involve them in their search for satisfiability.

0.4 Modules

In this chapter we explain how to implement further modules. A module is a derivation of the class `Module` and we give an introduction to its members, interfaces and auxiliary methods in the following of this chapter. A new module and, hence, the corresponding C++ source and header files can be easily created when using the script `writeModules.py`. Its single argument is the module's name and the script creates a new folder in `src/lib/modules/` containing the source and header file with the interfaces yet to implement. Furthermore, it is optional to create the module having a template parameter forming a settings object as explained in sec↩ :auxfunctions. A new module should be created only this way, as the script takes care of a correct integration of the corresponding code into SMT-RAT. A module can be deleted belatedly by just removing the complete folder it is implemented in.

0.4.1 Main members of a module

Here is an overview of the most important members of the class `Module`.

- `vector<FormulasT> mInfeasibleSubsets`: stores the infeasible subsets of the so far received formulas, if the module determined that their conjunction is not satisfiable.
- `Manager* const mpManager`: a pointer to the manager which maintains the allocation of modules (including this one) to other modules, when they call a backend for a certain formula.
- `const ModuleInput* mpReceivedFormula`: the received formula stores the conjunction of the so far received formulas, which this module considers for a satisfiability check. These formulas are of the type FormulaT and the ModuleInput is basically a list of such formulas, which never contains a formula more than once.
- `ModuleInput* mpPassedFormula`: the passed formula stores the conjunction of the formulas which this module passes to a backend to be solved for satisfiability. There are dedicated methods to change this member, which are explained in the following.

The received formula of a module is the passed formula of the preceding module. The owner is the preceding module, hence, a module has only read access to its received formula. The `ModuleInput` also stores a mapping of a sub-formula in the passed formula of a module to its origins in the received formula of the same module. Why this mapping is essential and how we can construct it is explained in Section sec:runbackend.

0.4.2 Interfaces to implement

In the following we explain which methods must be implemented in order to fill the module's interfaces with life. All these methods are the core implementation and wrapped by the actual interfaces. This way the developer of a new module needs only to take care about the implementation of the actual procedure for the satisfiability check. All infrastructure-related actions are performed by the actual interface.

0.4.2.1 Informing about a constraint

```
bool MyModule::informCore( const Formula& _constraint )
{
    // Write the implementation here.
}
```

Informs the module about the existence of the given constraint (actually it is a formula wrapping a constraint) usually before it is actually added to this module for consideration of a later satisfiability check. At least it can be expected, that this method is called, before a formula containing the given constraint is added to this module for consideration of a later satisfiability check. This information might be useful for the module, e.g., for the initialization of the data structures it uses. If the module can already decide whether the given constraint is not satisfiable itself, it returns `false` otherwise `true`.

0.4.2.2 Adding a received formula

```
bool MyModule::addCore( const ModuleInput::const_iterator )
{
    // Write the implementation here.
}
```

Adds the formula at the given position in the conjunction of received formulas, meaning that this module has to include this formula in the next satisfiability check. If the module can already decide (with very low effort) whether the given formula is not satisfiable in combination with the already received formulas, it returns `false` otherwise `true`. This is usually determined using the solving results this module has stored after the last consistency checks. In the most cases the implementation of a new module needs some initialization in this method.

0.4.2.3 Removing a received formula

```
void MyModule::removeCore( const ModuleInput::iterator )
{
    // Write the implementation here.
}
```

Removes the formula at the given position from the received formula. Everything, which has been stored in this module and depends on this formula must be removed.

0.4.2.4 Checking for satisfiability

```
Answer MyModule::checkCore( bool )
{
    // Write the implementation here.
}
```

Implements the actual satisfiability check of the conjunction of formulas, which are in the received formula. There are three options how this module can answer: it either determines that the received formula is satisfiable and returns `true`, it determines unsatisfiability and returns `false`, or it cannot give a conclusive answer and returns `UNKNOWN`. A module has also the opportunity to reason about the conflicts occurred, if it determines unsatisfiability. For this purpose it has to store at least one infeasible subset of the set of so far received formulas. If the method `check` is called with its argument being `false`, this module is allowed to omit hard obstacles during solving at the cost of returning `UNKNOWN` in more cases, we refer to as a *lightweight check*.

0.4.2.5 Updating the model/satisfying assignment

```
void MyModule::updateModel()
{
    // Write the implementation here.
}
```

If this method is called, the last result of a satisfiability check was `true` and no further formulas have been added to the received formula, this module needs to fill its member `mModel` with a model. This model must be complete, that is all variables and uninterpreted functions occurring in the received formula must be assigned to a value of their corresponding domain. It might be necessary to involve the backends using the method `getBackendsModel()` (if they have been asked for the satisfiability of a sub-problem). It stores the model of one backend into the model of this module.

0.4.3 Running backend modules

Modules can always call a backend in order to check the satisfiability of any conjunction of formulas. Fortunately, there is no need to manage the assertion of formulas to or removing of formulas from the backend. This would be even more involved as we do allow changing the backend if it is appropriate (more details to this are explained in Chapter chapter:composingats. Running the backend is done in two steps:

1. Change the passed formula to the formula which should be solved by the backend. Keep in mind, that the passed formula could still contain formulas of the previous backend call.
2. Call `runBackends(full)`, where `full` being `false` means that the backends have to perform a lightweight check.

The first step is a bit more tricky, as we need to know which received formulas led to a passed formula. For this purpose the `ModuleInput` maintains a mapping from a passed sub-formula to one or more conjunctions of received sub-formulas. We give a small example. Let us assume that a module has so far received the following constraints (wrapped in formulas)

$$c_0 : x \leq 0,\ c_1 : x \geq 0,\ c_2 : x = 0$$

and combines the first two constraints c_0 and c_1 to c_2. Afterwards it calls its backend on the only remaining constraint, that means the passed formula contains only $c_2 : x = 0$. The mapping of c_2 in the passed formula to the received sub-formulas it stems from then is

$$c_2 \ \mapsto\ (c_0 \wedge c_1,\ c_2).$$

The mapping is maintained automatically and offers two methods to add formulas to the passed formulas:

```
pair<ModuleInput::iterator,bool> addReceivedSubformulaToPassedFormula(ModuleInput::const_iterator)
```

Adds the formula at the given posititon in the received formula to the passed formulas. The mapping to its *original formulas* contains only the set consisting of the formula at the given position in the received formula.

```
pair<ModuleInput::iterator,bool> addSubformulaToPassedFormula(const Formula&)
pair<ModuleInput::iterator,bool> addSubformulaToPassedFormula(const Formula&, const Formula&)
pair<ModuleInput::iterator,bool> addSubformulaToPassedFormula(const Formula&, shared_ptr<vector<FormulaT>>&)
```

Adds the given formula to the passed formulas. It is mapped to the given conjunctions of origins in the received formula. The second argument (if it exists) must only consist of formulas in the received formula.

It returns a pair of a position in the passed formula and a `bool`. The `bool` is `true`, if the formula at the given position in the received formula has been added to the passed formula, which is only the case, if this formula was not yet part of the passed formula. Otherwise, the `bool` is `false`. The returned position in the passed formula points to the just added formula.

The vector of conjunctions of origins can be passed as a shared pointer, which is due to a more efficient manipulation of these origins. Some of the current module implementations directly change this vector and thereby achieve directly a change in the origins of a passed formula. \end{itemize} If, by reason of a later removing of received formulas, there is no conjunction of original formulas of a passed formula left (empty conjunction are removed), this passed formula will be automatically removed from the backends and the passed formula. That does also mean, that if we add a formula to the passed formula without giving any origin (which is done by the first version of `add↩SubformulaToPassedFormula`), the next call of `removeSubformula` of this module removes this formula from the passed formula. Specifying received formulas being the origins of a passed formula highly improves the incremental solving performance, so we recommend to do so.

The second step is really just calling `runBackends` and processing its return value, which can be `True`, `False`, or `Unknown`.

0.4.4 Auxiliary functions

The Module class provides a rich set of methods for the analysis of the implemented procedures in a module and debugging purposes. Besides all the printing methods, which print the contents of a member of this module to the given output stream, SMT-RAT helps to maintain the correctness of new modules during their development. It therefore provides methods to store formulas with their assumed satisfiability status in order to check them belatedly by any SMT solver which is capable to parse `.smt2` files and solve the stored formula. To be able to use the following methods, the compiler flag `SMTRAT_DEVOPTION_Validation` must be activated, which can be easily achieved when using, e.g., `ccmake`.

- `void checkInfSubsetForMinimality(vector<FormulasT>::const_iterator, const string&, unsigned) const` This method checks the infeasible subset at the given position for minimality, that is it checks whether there is a subset of it having maximally n elements less while still being infeasible. As for some approaches it is computationally too hard to provide always a minimal infeasible subset, they rather provide infeasible subsets not necessarily being minimal. This method helps to analyze how close the size of the encountered infeasible subsets is to a minimal one.
- Another important feature during the development of a new module is the collection of statistics. The script `writeModules.py` for the creation of a new module automatically adds a class to maintain statistics in the same folder in which the module itself is located. The members of this class store the statistics usually represented by primitive data types as integers and floats. They can be extended as one pleases and be manipulated by methods, which have also to be implemented in this class. SMT-RAT collects and prints these statistics automatically, if its command line interface is called with the option `--statistics` or `-s`.
- If the script `writeModules.py` for the creation of a new module is called with the option `-s`, the module has also a template parameter being a settings object. The different settings objects are stored in the settings file again in the same folder as the module is located. Each of these setting objects assigns all settings, which are usually of type `bool`, to values. The name of these objects must be of the form XYSettingsN, if the module is called XYModule and with N being preferably a positive integer. Fulfilling these requirements, the settings to compile this module with, can be chosen, e.g. with `ccmake`, by setting the compiler flag `SMTRAT_XY_Settings` to N. Within the implementation of the module, its settings can then be accessed using its template parameter `Settings`. If, for instance, we want to change the control flow of the implemented procedure in the new module depending on a setting `mySetting` being `true`, we write the following:

```
..
if(Settings::mySettings)
{
    ..
}
..
```

This methodology assures that the right control flow is chosen during compilation and, hence, before runtime.

SMT-RAT contributes a toolbox for composing an SMT compliant solver for its supported logics, that means it is incremental, supports backtracking and provides reasons for inconsistency. The resulting solver is either a fully operative SMT solver, which can be applied directly on `.smt2` files, or a theory solver, which can be embedded into an SMT solver in order to extend its supported logics by those provided by SMT-RAT.

We are talking about composition and toolbox, as SMT-RAT contains implementations of many different procedures to tackle, \eg \supportedLogics, each of them embedded in a module with uniform interfaces. These modules form the tools in the toolbox and it is dedicated to a user how to use them for solving an SMT formula.

In Section sec::strategy we have already introduced a strategy and in the following of this chapter we give a brief introduction to the existing modules equipped with an estimation of their input-based performances.

0.4.5 Existing module implementation

Available modules

0.4.6 Available modules

SMT-RAT comes with the following modules that are documented in some more detail below:

BEModule BVModule CNFerModule CSplitModule CoCoAGBModule CubeLIAModule CurryModule EMModule ESModule FPPModule FouMoModule GBModule GBPPModule ICEModule ICPModule IncWidthModule IntBlastModule IntEqModule LRAModule LVEModule MCBModule NRAILModule NewCADModule NewCovering↩ Module PBGaussModule PBPPModule PFEModule SATModule STropModule SplitSOSModule SymmetryModule UFCegarModule UnionFindModule VSModule

0.4.6.1 BEModule

0.4.6.2 BVModule

This module implements an encoder for bitvector formulae to propositional logic. It is described in more detail in **?**.

0.4.6.3 CNFerModule

Transforms its received formula into conjunctive normal form CNF.

0.4.6.3.0.1 Efficiency The worst case complexity of this module is polynomial in the number of operators in the formula to transform.

0.4.6.4 CSplitModule

Implements solving for nonlinear integer arithmetic using incremental linearization. This module was implemented in **?** based on **?**.

0.4.6.5 CoCoAGBModule

Uses Gröbner bases for theory solving, very much like smtrat::GBModule. However, for the underlying implementation of Gröbner bases, this module does not use carl::groebner but CoCoALib.

0.4.6.6 CubeLIAModule

Implements cube-based tests for linear integer arithmetic based on **?**.

0.4.6.7 CurryModule

Implements curryfiyng preprcessing as described in **?**.

0.4.6.8 EMModule

This module addempts to eliminate multiple factors from equations and inequations.

0.4.6.9 ESModule

Uses equations (or Boolean assertions) to eliminate variables from the remaining formula. Let the formula have the form $e \wedge \varphi$', then we use knowledge gained from e to simplify φ'. If e is an arithmetic equation such that we can rewrite it to the form $x = t$ (with x a variable) then we substitute t for x into φ'. Otherwise we simply replace e with $true$ in φ'. This is done recursively in the formula.

0.4.6.10 FPPModule

This module implements a generic preprocessing facility. It runs a given strategy on the input and retrieves the simplified formula using the facilities of the Manager class. This process is iterated until a fix point is reached – no further simplification was done by the strategy – or a predefined number of iterations was performed. The resulting simplified formula is then forwarded to the backend.

The strategy should be a linear sequence of preprocessing modules, as passing simplified formulas back to the caller is not possible in a meaningful way for general Module classes.

0.4.6.11 FouMoModule

Implements the SMT compliant Fourier-Motzkin algorithm. Hence, this module can decide the consistency of any conjunction consisting only of linear real arithmetic constraints. Furthermore, it might also find the consistency of a conjunction of constraints even if they are not all linear e.g. in the case of a monomial x^i (where i is a positive integer) only occuring in the shape of this monomial. Such a monomial is subsequently eliminated as common linear variables are eliminated. One can tune a threshold parameter in order to determine when, regarding the size of the considered constraints, this module shall call the backends. In the latter case, the backends are called with the constraint set that is obtained after eliminating a certain number of variables.

0.4.6.11.1 Integer arithmetic One can also use this approach for (linear) integer arithmetic as unsatisfiability over the real domain implies unsatisfiability over the integer domain. In addition to that, one can heuristically try to construct integer solutions by considering the lowest upper and the highest lower bound of a variable that can be derived from the respective elimination step. Note that this approach is incomplete.

0.4.6.12 GBModule

Implements the Gröbner bases based procedure as presented in **?**. In general, this procedure can detect only the unsatisfiability of a conjunction of equations. This module also supports the usage of these equations to further simplify all constraints in the conjunction of constraints forming its input and passes these simplified constraints to its backends. However, it cannot be guaranteed that backends perform better on the simplified constraints than on the constraints before simplification.

0.4.6.12.0.1 Efficiency The worst case complexity of the underlying procedure is exponential in the number of variables of the input constraints. In the case that the conjunction of constraints to check for satisfiability contains equations, this module can be more efficient than other modules for NRA on finding out inconsistency.

0.4.6.13 GBPPModule

Uses Gröbner basis computations to simplify the input formula. The underlying implementation of Gröbner bases is used from carl::groebner.

The fundamental idea is as follows: Separate the input formula into equalities and inequalities and compute the Gröbner basis of the equalities. Now we can replace the equalities with the Gröbner basis (if this "seems easier") and also simplify the inequalities using the Gröbner basis.

0.4.6.14 ICEModule

This module tries to find simple chains of inequalities that can be combined to form a cycle. It converts constraints of the form $x \geq y + z$ to a hypergraph (with an edge going from x to y, z) and uses the coefficients as edge weights. If this hypergraph contains cycles, these can be used to infer additional constraints on the individual variables. In particular, zero cycles induce equality of variables while negative cycles reveal conflicts.

0.4.6.15 ICPModule

Implements a combination of interval constraint propagation equipped with a Newton-based contraction **?** and LRA solving, for which we use our LRAModule. The implementation is inspired by **?**, but additionally interacts with backends in order to exploit their efficiency on examples, where ICP fails. It thereby incorporates the possibility to invoke lightweight checks and highly benefits from the backends being optimized for small domains as, e.g. described in **?**. This module tries to lift splitting decisions as well as lemmas encoding a nonzero contraction to a preceding SATModule. It ensures an efficient processing of these decisions, which are this way shared with other modules.

0.4.6.15.0.1 Efficiency It is very difficult to give a conclusive statement about the efficiency of ICP. Usually, it performs better, if the domains of all variables are bounded intervals, preferably with a small diameter. It might also benefit from a higher number of constraints, as this introduces more chances for the propagation. However, more constraints mean also more overhead.

0.4.6.16 IncWidthModule

This module is meant to be used for solving nonlinear integer arithmetic problems by encoding them into bitvector arithmetic formulas (as done in smtrat::IntBlastModule), as described in **?** and **?**, both (heavily) inspired by **?**. This approach heavily benefits from knowing bounds on individual variables, both in terms of its ability to find infeasibility and its performance in general.

In this module, we use smtrat::ICPModule to infer new bounds and call the backend incrementally with growing bounds until the computed upper bounds are met.

0.4.6.17 IntBlastModule

This module implements encoding nonlinear integer arithmetic problems into bitvector arithmetic formulas as described in **?** and **?**, both (heavily) inspired by **?**.

0.4.6.18 IntEqModule

Implements the SMT compliant equation elimination method presented in **?**. Hence, this module either determines that the equations of an instance are unsatisfiable or calculates a certain number of substitutions for variables. The latter can be used to eliminate the equations by substituting every variable for which a substitution exists by its substitution. The set of constraints that we obtain with this procedure, not containing equations anymore, is passed to the backends.

0.4.6.19 LRAModule

Implements the SMT compliant simplex method presented in **?**. Hence, this module can decide the consistency of any conjunction consisting only of linear real arithmetic constraints. Furthermore, it might also find the consistency of a conjunction of constraints even if they are not all linear and calls a backend after removing some redundant linear constraints, if the linear constraints are satisfiable and the found solution does not satisfy the non-linear constraints. Note that the smtrat::LRAModule might need to communicate a lemma/tautology to a preceding smtrat::SATModule, if it receives a constraint with the relation symbol $\neq$ and the strategy needs for this reason to define a smtrat::SATModule at any position before an smtrat::LRAModule.

0.4.6.19.0.1 Integer arithmetic In order to find integer solutions, this module applies, depending on which settings are used, branch-and-bound, the construction of Gomory cuts and the generation of cuts from proofs **?**. It is also supported to combine these approaches. Note that for all of them the smtrat::LRAModule needs to communicate a lemma/tautology to a preceding SATModule and the strategy needs for this reason to define a SATModule at any position before an smtrat::LRAModule.

0.4.6.19.0.2 Efficiency The worst case complexity of the implemented approach is exponential in the number of variables occurring in the problem to solve. However, in practice, it performs much faster, and the worst case applies only on very artificial examples. This module outperforms any module implementing a method that is designed for solving formulas with non-linear constraints. If the received formula contains integer valued variables, the aforementioned methods might not terminate.

0.4.6.20 LVEModule

This module aims to eliminate lone variables that only occur once. We call a variable a lone variable if it only occurs in a single constraint. Furthermore we only try to eliminate the variable if this constraint is a top-level constraint.

0.4.6.21 MCBModule

This module attempts to detect logic structures that essentially encode a multiple-choice on an arithmetic variable. It extracts this information and translates it to a Boolean structure, thereby eliminating the arithmetic variable.

0.4.6.22 NRAILModule

This module implements incremental linearization as described in **?**, roughly following **?** and **?**. In addition, it implements an ICP-based axiom instantiation.

0.4.6.23 NewCADModule

This module is based on the implementation in smtrat::cad. It is described in **?** in some detail.

0.4.6.24 PBGaussModule

This module tries to simplify pseudo-Boolean problems using Gauss as described in **?**.

0.4.6.25 PBPPModule

This module implements a variety of preprocessing techniques for pseudo-Boolean problems. Many of them are based on **?**.

0.4.6.26 PFEModule

Implements factor elimination in polynomials based on factorization and variable bounds.

Given a constraint $p \sim 0$ with $\sim \in \{=, \neq, \geq, >, \leq, <\}$ and bounds b on the variables in p, the module does the following: It computes a factor q such that $p = q \cdot r$ and evaluates q on the intervals represented by the bounds. If the resulting interval $q(b)$ if sign-invariant, the constraint can be simplified or additional constraints can be added. We consider an interval to be sign-invariant, if it is positive, semi-positive, zero, semi-negative or negative.

0.4.6.26.0.1 Simplifications

The following simplifications are done for for $q \cdot r \sim 0$:

$\sim$	$q(b) > 0$	$q(b) \geq 0$	$q(b) = 0$	$q(b) < 0$	$q(b) \leq 0$
$=$	$p := r$	$f := q = 0 \vee r = 0$	$p := 0$	$p := r$	$f := q = 0 \vee r = 0$
$\neq$	$p := r$	$f := q > 0 \wedge r \neq 0$	$p := 0$	$p := r$	$f := q < 0 \wedge r \neq 0$
$\geq$	$p := r$	$f := q = 0 \vee r \geq 0$	$p := 0$	$c := r \leq 0$	$f := q = 0 \vee r \leq 0$
$>$	$p := r$	$f := q > 0 \wedge r > 0$	$p := 0$	$c := r < 0$	$f := q < 0 \wedge r < 0$
$\leq$	$p := r$	$f := q = 0 \vee r \leq 0$	$p := 0$	$c := r \geq 0$	$f := q = 0 \vee r \geq 0$
$<$	$p := r$	$f := q > 0 \wedge r < 0$	$p := 0$	$c := r > 0$	$f := q < 0 \wedge r > 0$

Notation: $p := p$' replaces the polynomial, $c := p$' ~ 0 replaces the whole constraint by a new one and $f := f$' replaces the constraint by a new formula.

To maximize the cases where $q(b)$ actually is sign-invariant, we proceed as follows. We compute a factorization of p, that is a number of polynomials p_i such that $p = \prod_{i=1}^{k} p_i$. We now separate all p_i into two sets: P_q for all sign-invariant p_i and P_r for all other p_i. Thereby, we set $q = \prod_{t \in P_q} t$ and $r = \prod_{t \in P_r}$ and know that $q(b)$ is sign-invariant.

Instead of computing $q(b)$ once again afterwards, we can determine the type of sign-invariance of $q(b)$ from the types of sign-invariances of the factors from P_q. Assume that we start with a canonical factor 1 and a sign-invariance of $>$, we can iteratively combine them like this:

0.4.6.26.0.2 Combining types of sign-invariance Combining two types of sign-invariance is done as follows:

$\cdot$	$>$	$\geq$	$=$	$\leq$	$<$
$>$	$>$	$\geq$	$=$	$\leq$	$<$
$\geq$	$\geq$	$\geq$	$=$	$\leq$	$\leq$
$=$	$=$	$=$	$=$	$=$	$=$
$\leq$	$\leq$	$\leq$	$=$	$\geq$	$\geq$
$<$	$<$	$\leq$	$=$	$\geq$	$>$

0.4.6.27 SATModule

This module abstracts it's received formula, being any SMT formula of the supported logics of \smtrat, to it's Boolean skeleton. It thereby replaces all constraints in the formula by fresh Boolean variables. The resulting propositional formula is then solved with \minisat~**[where]** after each completed decision level the constraints belonging to the assigned Boolean variables are checked for consistency by the backends of this module. In the case of inconsistency, the infeasible subsets of the backends are abstracted and then involved in the search for a satisfying solution.

0.4.6.27.0.1 Efficiency Even though the worst case complexity of this procedure, not considering the complexity of the backend calls, is exponential in the number of variables in the abstracted formula, the procedure is in practice more efficient than any of the theory modules. Hence, it does clearly not form a bottleneck of the SMT solving. However, one should aim at reducing the number and complexity of the theory (backend) calls of this module, which might be influenced by infeasible subsets, which are small and/or involve constraints of earlier decision levels in the SAT solving, and lemmas, which either prune the search space of the SAT solving or ease subsequent theory calls.

0.4.6.28 STropModule

Implements the subtropical satisfiability method as described in **?** based on **?**.

0.4.6.29 SplitSOSModule

Splits the left hand side of constraints according to their sum-of-squares decomposition.

0.4.6.30 SymmetryModule

This module tries to recognize syntactic symmetries in the input formula and adds symmetry breaking constraints. The core functionality is provided by CArL through carl::formula::breakSymmetries() which internally encodes the formula as a graph and uses bliss to find automorphisms on this graph.

0.4.6.30.0.1 Efficiency Finding automorphisms is as difficult as determining whether two graphs are isomorphic, and it is not known whether this problem can be solved in polynomial or exponential time. In practice, current solvers like bliss perform very good on large graphs and we therefore assume this module to be sufficiently fast.

0.4.6.31 UFCegarModule

This module implements a CEGAR-approach for solving uninterpreted functions (or rather reducing uninterpreted functions to equality logic).

0.4.6.32 UnionFindModule

This module implements a theory solver for equality logic based on a persistent union find structure (based on the immer library).

0.4.6.33 VSModule

Implements the virtual substitution method for a conjunction of constraints as described in **?**. This module supports incremental calls, efficient backtracking and infeasible subset generation. Note, that the infeasible subsets are often very small but not necessarily minimal. The implemented approach is not complete, as it maybe cannot decide the satisfiability of a conjunction containing a constraint, which involves a variable with degree 3 or more. Note, that even if no constraint of such form occurs in the received formula, this module might not be able to determine the consistency of its received formula, as it could create constraints of this form in its solving process. Nevertheless, the implemented approach is efficient compared to other approaches for non-linear real arithmetic conjunctions, and therefore well-suited to be used for solving conjunctions of non-linear real arithmetic constraints before complete approaches have their try. In combination with a backend, this module tries to solve the given problem and calls the backend on problems with less variables.

0.4.6.33.0.1 Efficiency The worst case complexity of this approach is exponential in the number of real arithmetic variables occurring in the conjunction to solve. It performs especially good on almost linear instances and slightly prefers problems only containing constraints with the relation symbols $\leq$, $\geq$ and $=$. It is often the case, that even if the conjunction to solve contains many not suited constraints, this module can determine the consistency on the basis of a well suited subset of the constraints in this conjunction.

0.5 Strategies

To compose modules to a solver, strategies are used. Strategies are represented as trees of modules where the input file is passed to the root module. Every module can issue calls to its **backend modules** (via `runBackends`) which then calls its child modules in the strategy on the formula this module has put in the passed formulas. If no backend module exists, the call returns `unknown`.

A Strategy is specified by deriving from the Manager class and settings its strategy in the constructor using the `setStrategy` member function. A simple example, supporting only propositional logic, would look like this:

```
class PureSAT: public Manager {
    public:
    PureSAT(): Manager() {
        setStrategy(
            addBackend<SATModule<SATSettings1>>()
        );
    }
};
```

Each module is added to the strategy tree using `addBackend<Module class>` where the module class is usually a template that is instantiated with some settings. A slightly more complex, where the SATModule has the NewCADModule available for theory calls, might look as follows:

```
class CADOnly: public Manager {
    public:
    CADOnly(): Manager() {
        setStrategy(
            addBackend<SATModule<SATSettings1>>(
                addBackend<NewCADModule<NewCADSettingsFOS>>()
            )
        );
    }
};
```

Note that the arguments to `setStrategy` and `addBackend` can not only be a single element, but an `initializer_list` of multiple backends as well. In this case the backends are called in order until one returns a conclusive result (that is: not `unknown`). If SMT-RAT was configured to allow for parallel execution, the backends are executed in parallel and the result of the first backend to terminate is used.

```
class CADVSICP: public Manager {
    public:
    CADVSICP(): Manager() {
        setStrategy(
            addBackend<SATModule<SATSettings1>>({
                addBackend<NewCADModule<NewCADSettingsFOS>>(
                    addBackend<VSModule<VSSettings234>>()
                ),
                addBackend<ICPModule<ICPSettings1>>()
            })
        );
    }
};
```

Finally, we can also attach conditions to individual backends to restrict their applicability. For example, we can construct a strategy that uses separate sub-strategies for linear and nonlinear problems:

```
class RealSolver: public Manager {
    static bool is_nonlinear(carl::Condition condition) {
        return (carl::PROP_CONTAINS_NONLINEAR_POLYNOMIAL <= condition);
    }
    static bool is_linear(carl::Condition condition) {
        return !(carl::PROP_CONTAINS_NONLINEAR_POLYNOMIAL <= condition);
    }
    public:
    RealSolver(): Manager() {
        setStrategy({
            addBackend<FPPModule<FPPSettings1>>(
                addBackend<SATModule<SATSettings1>>(
                    addBackend<ICPModule<ICPSettings1>>(
                        addBackend<VSModule<VSSettings234>>(
                            addBackend<NewCADModule<NewCADSettingsFOS>>()
                        )
                    )
                )
            ).condition( &is_nonlinear ),
            addBackend<FPPModule<FPPSettings1>>(
                addBackend<SATModule<SATSettings1>>(
                    addBackend<LRAModule<LRASettings1>>()
                )
            ).condition( &is_linear )
        });
    }
};
```

0.6 Using SMT-RAT

SMT-RAT can be used in two ways, either as a standalone solver or as a C++ library within some other software.

0.6.1 Standalone solver

Before actually compiling SMT-RAT into a binary, an appropriate strategy should be selected. While a number of strategies are available, it sometimes makes sense to craft a strategy for the specific problem at hand. Please refer to Strategies on how to create strategies. To select a strategy use `ccmake` to set the `SMTRAT_Strategy` variable accordingly and then build the solver binary using `make smtrat-shared`. Use `./smtrat-shared --strategy` to check whether the desired strategy is used.

The solver binary can now be used to solve input in the `smt2` format, either given as a filename or on standard input:

```
./smtrat-shared <input file>
cat <input file> | ./smtrat-shared -
```

Note that the solver binary can perform many other tasks as well that we discuss below. Some of these are enabled (or disabled) by a set of `cmake` options of the form `CLI_ENABLE_*` and the currently available ones can be obtained as follows:

```
$ ./smtrat-shared --help
Usage: ./smtrat-shared [options] input-file

Core settings:
  --help                                show help
  --info                                show some basic information about this
                                        binary
  --version                             show the version of this binary
  --settings                            show the settings that are used
  --cmake-options                       show the cmake options during
                                        compilation
  --strategy                            show the configured strategy
  --license                             show the license
  -c [ --config ] arg                   load config from the given config file

Solver settings:
  --preprocess                          only preprocess the input
  --pp-output-file arg                  store the preprocessed input to this
                                        file
  --to-cnf-dimacs                       transform formula to cnf as dimacs
  --to-cnf-smtlib                       transform formula to cnf as smtlib
  --print-model                         print a model if the input is
                                        satisfiable
  --print-all-models                    print all models of the input

Validation settings:
  --validation.export-smtlib            store validation formulas to smtlib
                                        file
  --validation.smtlib-filename arg (=validation.smt2)
                                        filename of smtlib output
  --validation.channel arg              add a channel to be considered

Module settings:
  --module.parameter arg                add a parameter for modules (key=value)

Parser settings:
  --dimacs                              parse input file as dimacs file
  --opb                                 parse input file as OPB file
  --input-file arg                      path of the input file
  --disable-uf-flattening               disable flattening of nested
                                        uninterpreted functions
  --disable-theory                      disable theory construction

Analysis settings:
  --analyze.enabled                     enable formula analyzer
  --analyze.projections arg (=none)     which CAD projections to analyze (all,
                                        collins, hong, mccallum,
                                        mccallum_partial, lazard, brown, none)

CAD Preprocessor settings:
  --cad.pp.no-elimination               disable variable elimination
  --cad.pp.no-resultants                disable resultant rule
```

0.6.1.1 Formula analysis

One sometimes wants to only obtain certain information about the given formula, usually for statistical purposes. SMT-RAT exposes a formula analyzer that gives a number of properties of the formula.

```
$ ./smtrat-shared --analyze.enabled <input file>
```

0.6.1.2 Preprocessing

While many SMT-RAT strategies employ certain preprocessing techniques, it is sometimes convenient to apply this preprocessing ahead of time, for example to normalize the inputs. The result is either printed or written to an output file if `--pp-output-file` is given.

```
$ ./smtrat-shared --preprocess --pp-output-file <output file> <input file>
```

0.6.1.3 Quantifier elimination

NOTE: This feature is currently not maintained. Expect bugs and wrong answers. This feature is disabled in the default build of SMT-RAT.

Instead of regular SMT solving, SMT-RAT can also perform quantifier elimination tasks as described in **[Neuhaeuser2018]**. This technique is used when the SMTLIB file contains a `eliminate-quantifiers` command like `(eliminate-quantifiers (exists x y) (forall z))`.

0.6.1.4 DIMACS solving

For purely propositional formulae (i.e. SAT solving) one usually uses the (much more compact) DIMACS format instead of SMT-LIB. Note that SMT-RAT still uses the configured strategy to solve the given input instead of only a SAT solver, allowing to use custom preprocessing techniques.

```
$ ./smtrat-shared --dimacs <input file>
```

0.6.1.5 Pseudo-Boolean solving

Another interesting solving task is concerned with pseudo-Boolean formulae where Boolean variables are used in arithmetic constraints (and implicitly considered as being integers over just zero and one). A special input format called OPB exists (rather similar to DIMACS) that can be read and solved with a strategy based on **?** as follows:

```
$ ./smtrat-shared --opb <input file>
```

0.6.1.6 Optimization

For many applications, one wants not only some feasible solution but rather an optimal solution with respect to some objective function. This is used when the SMTLIB file contains one or more `(minimize)` or `(maximize)` commands with semantics similar to what is described for `z3`.

0.6.2 Embedding in other software

Instead of using SMT-RAT as a standalone solver, it can also be embedded in other software.

0.6.2.1 Interface

The easiest way is to embed a certain strategy.

If for instance the SMT solver based on the strategy of `RatOne` shall be used (we can also choose any self-composed strategy here), we can create it as follows:

```
smtrat::RatOne yourSolver = smtrat::RatOne();
```

As all strategies are derived from the Manager class, we can thus use the Manager interface. The most important methods are the following:

- `bool inform( const FormulaT& )` Informs the solver about a constraint, wrapped by the given formula. Optimally, the solver should be informed about all constraints, which it will receive eventually, before any of them is added as part of a formula with the interface `add(..)`. The method returns `false` if it is easy to decide (for any module used in this solver), whether the constraint itself is inconsistent.
- `bool add( const FormulaT& )` Adds the given formula to the conjunction of formulas, which will be considered for the next satisfiability check. The method returns `false`, if it is easy to decide whether the just added formula is not satisfiable in the context of the already added formulas. Note, that only a very superficial and cheap satisfiability check is performed and mainly depends on solutions of previous consistency checks. In the most cases this method returns `true`, but in the case it does not the corresponding infeasible subset(s) can be obtained by `infeasibleSubsets()`.
- `Answer check( bool )` This method checks the so far added formulas for satisfiability. If, for instance we extend an SMT solver by a theory solver composed with SMT-RAT, these formulas are only constraints. The answer can either be `SAT`, if satisfiability has been detected, or `UNSAT`, if the formulas are not satisfiable, and `UNKNOWN`, if the composition cannot give a conclusive answer. If the answer has been `SAT`, we get the model, satisfying the conjunction of the given formulas, using `model()` and, if it has been `UNSAT`, we can obtain infeasible subsets by `infeasibleSubsets()`. If the answer is `UNKNOWN`, the composed solver is either incomplete (which highly depends on the strategy but for QF_NRA it is actually always possible to define a strategy for a complete SMT-RAT solver) or it communicates lemmas/tautologies, which can be obtained applying `lemmas()`. If we embed, e.g., a theory solver composed with SMT-RAT into an SMT solver, these lemmas can be used in its sat solving process in the same way as infeasible subsets are used. The strategy of an SMT solver composed with SMT-RAT has to involve a `SATModule` before any theory module is used (It is possible to define a strategy using conditions in a way, that we achieve an SMT solver, even if for some cases no `SATModule` is involved before a theory module is applied.) and, therefore, the SMT solver never communicates these lemmas as they are already processed by the `SATModule`. A better explanation on the modules and the strategy can be found in `system architecture`. If the Boolean argument of the function `check` is `false`, the composed solver is allowed to omit hard obstacles during solving at the cost of returning `UNKNOWN` in more cases.
- `void push()` Pushes a backtrack point to the stack of backtrack points.
- `bool pop()` Pops a backtrack point from the stack of backtrack points and undoes everything which has been done after adding that backtrack point. It returns `false` if no backtrack point is on the stack. Note, that SMT-RAT supports incrementality, that means, that by removing everything which has been done after adding a backtrack point, we mean, that all intermediate solving results which only depend on the formulas to remove are deleted. It is highly recommended not to remove anything, which is going to be added directly afterwards.
- `const std::vector<FormulasT>& infeasibleSubsets() const` Returns one or more reasons for the unsatisfiability of the considered conjunction of formulas of this SMT-RAT composition. A reason is an infeasible subset of the sub-formulas of this conjunction.
- `const Model& model() const` Returns an assignment of the variables, which occur in the so far added formulas, to values of their domains, such that it satisfies the conjunction of these formulas. Note, that an assignment is only provided if the conjunction of so far added formulas is satisfiable. Furthermore, when solving non-linear real arithmetic formulas the assignment could contain other variables or freshly introduced variables.

- `std::vector<FormulaT> lemmas() const` Returns valid formulas, which we call lemmas. For instance the `ICPModule` might return lemmas being splitting decisions, which need to be processed in, e.g., a SAT solver. A *splitting decision* has in general the form `(c_1 and ... and c_n) -> (p <= r or p > r)` where c_1, .., c_n are constraints of the set of currently being checked constraints (forming a *premise*), p is a polynomial (in the most cases consisting only of one variable) and r being a rational number. Hence, splitting decisions always form a tautology. We recommend to use the `ICPModule` only in strategies with a preceding `SATModule`. The same holds for the `LRAModule`, `VSModule`, and `CADModule` if used on QF_NIA formulas. Here, again, splitting decisions might be communicated.

Of course, the Manager interface contains more methods that can be found at Manager.

0.6.2.2 Syntax of formulas

The class Formula represents SMT formulas, which are defined according to the following abstract grammar

$$
\begin{array}{lcccccccccc}
p & ::= & a & | & b & | & x & | & (p+p) & | & (p \cdot p) & | & (p^e) \\
v & ::= & u & | & x & & & & & & & & \\
s & ::= & f(v,\ldots,v) & | & u & | & x & & & & & & \\
e & ::= & s = s & & & & & & & & & & \\
c & ::= & p = 0 & | & p < 0 & | & p \leq 0 & | & p > 0 & | & p \geq 0 & | & p \neq 0 \\
\varphi & ::= & c & | & (\neg\varphi) & | & (\varphi \wedge \varphi) & | & (\varphi \vee \varphi) & | & (\varphi \rightarrow \varphi) & | & \\
 & & (\varphi \leftrightarrow \varphi) & | & (\varphi \oplus \varphi) & & & & & & & &
\end{array}
$$

where a is a rational number, e is a natural number greater one, b is a *Boolean variable* and the *arithmetic variable* x is an inherently existential quantified and either real- or integer-valued. We call p a *polynomial* and use a multivariate polynomial with rationals as coefficients to represent it. The $*$uninterpreted function f is of a certain *order* $o(f)$ and each of its $o(f)$ arguments are either an arithmetic variable or an *uninterpreted variable* u, which is also inherently existential quantified, but has no domain specified. Than an *uninterpreted equation* e has either an uninterpreted function, an uninterpreted variable or an arithmetic variable as left-hand respectively right-hand side. A *constraint* c compares a polynomial to zero, using a *relation symbol*. Furthermore, we keep constraints in a normalized representation to be able to differ them better.

0.6.2.3 Boolean combinations of constraints and Boolean variables

For more information, check out the docs of `CArL`.

A formula is stored as a directed acyclic graph, where the intermediate nodes represent the Boolean operations on the sub-formulas represented by the successors of this node. The leaves (nodes without successor) contain either a Boolean variable, a constraint or an uninterpreted equality. Equal formulas, that is formulas being leaves and containing the same element or formulas representing the same operation on the same sub-formulas, are stored only once.

The construction of formulas, which are represented by the FormulaT class, is mainly based on the presented abstract grammar. A formula being a leaf wraps the corresponding objects representing a Boolean variable, a constraint or an uninterpreted equality. A Boolean combination of Boolean variables, constraints and uninterpreted equalities consists of a Boolean operator and the sub-formulas it interconnects. For this purpose we either firstly create a set of formulas containing all sub-formulas and then construct the Formula or (if the formula shall not have more than three sub-formulas) construct the formula directly passing the operator and sub-formulas. Formulas, constraints and uninterpreted equalities are non-mutable, once they are constructed.

We give a small example constructing the formula

$$(\neg b \ \wedge \ x^2 - y < 0 \ \wedge \ 4x + y - 8y^7 = 0) \ \rightarrow \ (\neg(x^2 - y < 0) \ \vee \ b),$$

with the Boolean variable b and the real-valued variables x and y, for demonstration. Furthermore, we construct the UF formula

$$v = f(u, u) \ \oplus \ w \neq u$$

with u, v and w being uninterpreted variables of not specified domains S and T, respectively, and f is an uninterpreted function with not specified domain $T^{S \times S}$.

Firstly, we show how to create real valued (integer valued analogously with `VT_INT`), Boolean and uninterpreted variables:

```
carl::Variable x = smtrat::newVariable( "x", carl::VariableType::VT_REAL );
carl::Variable y = smtrat::newVariable( "y", carl::VariableType::VT_REAL );
carl::Variable b = smtrat::newVariable( "b", carl::VariableType::VT_BOOL );
carl::Variable u = smtrat::newVariable( "u", carl::VariableType::VT_UNINTERPRETED );
carl::Variable v = smtrat::newVariable( "v", carl::VariableType::VT_UNINTERPRETED );
carl::Variable w = smtrat::newVariable( "w", carl::VariableType::VT_UNINTERPRETED );
```

Uninterpreted variables, functions and function instances combined in equations or inequalities comparing them are constructed the following way.

```
carl::Sort sortS = smtrat::newSort( "S" );
carl::Sort sortT = smtrat::newSort( "T" );
carl::UVariable uu( u, sortS );
carl::UVariable uv( v, sortT );
carl::UVariable uw( w, sortS );
carl::UninterpretedFunction f = smtrat::newUF( "f", sortS, sortS, sortT );
carl::UFInstance f1 = smtrat::newUFInstance( f, uu, uw );
carl::UEquality ueqA( uv, f1, false );
carl::UEquality ueqB( uw, uu, true );
```

Next we see an example how to create polynomials, which form the left-hand sides of the constraints:

```
smtrat::Poly px( x );
smtrat::Poly py( y );
smtrat::Poly lhsA = px.pow(2) - py;
smtrat::Poly lhsB = smtrat::Rational(4) * px + py - smtrat::Rational(8) * py.pow(7);
```

Constraints can then be constructed as follows:

```
smtrat::ConstraintT constraintA( lhsA, carl::Relation::LESS );
smtrat::ConstraintT constraintB( lhsB, carl::Relation::EQ );
```

Now, we can construct the atoms of the Boolean formula

```
smtrat::FormulaT atomA( constraintA );
smtrat::FormulaT atomB( constraintB );
smtrat::FormulaT atomC( b );
smtrat::FormulaT atomD( ueqA );
smtrat::FormulaT atomE( ueqB );
```

and the formulas itself (either with a set of arguments or directly):

```
smtrat::FormulasT subformulasA;
subformulasA.insert( smtrat::FormulaT( carl::FormulaType::NOT, atomC ) );
subformulasA.insert( atomA );
subformulasA.insert( atomB );
smtrat::FormulaT phiA( carl::FormulaType::AND, std::move(subformulasA) );
smtrat::FormulaT phiB( carl::FormulaType::NOT, atomA )
smtrat::FormulaT phiC( carl::FormulaType::OR, phiB, atomC );
smtrat::FormulaT phiD( carl::FormulaType::IMPLIES, phiA, phiC );
smtrat::FormulaT phiE( carl::FormulaType::XOR, atomD, atomE );
```

Note, that $\wedge$ and $\vee$ are n-ary constructors, $\neg$ is a unary constructor and all the other Boolean operators are binary.

0.6.2.4 Normalized constraints

A normalized constraint has the form

$$a_1 \overbrace{x_{1,1}^{e_{1,1}} \cdot \ldots \cdot x_{1,k_1}^{e_{1,k_1}}}^{m_1} + \ldots + a_n \overbrace{x_{n,1}^{e_{n,1}} \cdot \ldots \cdot x_{n,k_n}^{e_{n,k_n}}}^{m_n} + d \sim 0$$

with $n \geq 0$, the $*$ ith coefficient$*$ a_i being an integral number ($\neq 0$), d being a integral number, x_{i,j_i} being a real- or integer-valued variable and e_{i,j_i} being a natural number greater zero (for all $1 \leq i \leq n$ and $1 \leq j_i \leq k_i$). Furthermore, it holds that $x_{i,j_i} \neq x_{i,l_i}$ if $j_i \neq l_i$ (for all $1 \leq i \leq n$ and $1 \leq j_i, l_i \leq k_i$) and $m_{i_1} \neq m_{i_2}$ if $i_1 \neq i_2$ (for all $1 \leq i_1, i_2 \leq n$). If n is 0 then d is 0 and $\sim$ is either $=$ or $<$. In the former case we have the normalized representation of any variable-free consistent constraint, which semantically equals `true`, and in the latter case we have the normalized representation of any variable-free inconsistent constraint, which semantically equals `false`. Note that the monomials and the variables in them are ordered according the \polynomialOrder of \carl. Moreover, the first coefficient of a normalized constraint (with respect to this order) is always positive and the greatest common divisor of $a_1, \ldots, a_n, d$ is 1. If all variable are integer valued the constraint is further simplified to

$$\frac{a_1}{g} \cdot m_1 + \ldots + \frac{a_n}{g} \cdot m_n + d' \sim' 0,$$

where g is the greatest common divisor of $a_1, \ldots, a_n$,

$$\sim' = \begin{cases} \leq, & if \sim is < \\ \geq, & if \sim is > \\ \sim, & otherwise \end{cases}$$

and

$$d' = \begin{cases} \lceil \frac{d}{g} \rceil & if \sim' is \leq \\ \lfloor \frac{d}{g} \rfloor & if \sim' is \geq \\ \frac{d}{g} & otherwise \end{cases}$$

If additionally $\frac{d}{g}$ is not integral and $\sim'$ is $=$, the constraint is simplified $0 < 0$, or if $\sim'$ is $\neq$, the constraint is simplified $0 = 0$.

We do some further simplifications, such as the elimination of multiple roots of the left-hand sides in equations and inequalities with the relation symbol $\neq$, e.g., $x^3 = 0$ is simplified to $x = 0$. We also simplify constraints whose left-hand sides are obviously positive (semi)/negative (semi) definite, e.g., $x^2 \leq 0$ is simplified to $x^2 = 0$, which again can be simplified to $x = 0$ according to the first simplification rule.

0.6.2.5 Linking

[Todo: example how linking works]

0.7 Other tools

0.7.1 Benchmarking

Alongside SMT-RAT, `benchmax` allows to easily run solvers on benchmarks and export the results. See Benchmax for more information.

0.7.2 Delta debugging

Delta debugging describes a generic debugging approach based on automated testing. Given a program and an input that provokes a certain behavior (for example an error) delta debugging is the process of iteratively changing the input, retaining the specific behavior. Usually, as the ultimate goal is a minimal example that triggers some bug by the application of a set of transformation rules.

Note: Our legacy delta tool has been moved to `its own repository`.

0.7.2.1 Using ddSMT

Currently, we recommend using `ddSMT` as the state-of-the-art tool for delta debugging.

For a complete guide, we refer to the `documentation of ddSMT`.

Here, we give instructions for the most common use cases when developing with SMT-RAT. There are mainly two common scenarios where we use delta debugging: If there is a failing assertion or if SMT-RAT returns a wrong result. For these scenarios, we provide wrapper scripts preparing the input to ddsmt properly.

First, install `ddSMT` and `z3`:
```
pip3 install ddsmt
sudo apt install z3
```

In case of a *failing assertion* on `in_file.smt2`, run
```
~/src/smtrat/utilities/ddsmt/ddsmt-assertion in_file.smt2 out_file.smt2 path_to_solver
```

In case SMT-RAT returns a *wrong result* on `in_file.smt2`, run
```
~/src/smtrat/utilities/ddsmt/ddsmt-wrong in_file.smt2 out_file.smt2 path_to_solver
```

0.7.3 Analyzer

The `smtrat-analyzer` library can analyze static properties input formulas (such as number of variables, degrees, CAD projections, ...).

To use it from the CLI, build smtrat using `CLI_ENABLE_ANALYZER=ON` and `SMTRAT_DEVOPTION_Statistics=ON`. A single input file can be analyzed by running `./smtrat --analyze.enabled --stats.print input.smt2`; properties will be printed as statistics object, note that the solver will not be called. For further options, see `./smtrat --help`.

To collect properties of all formulas of a benchmark sets, the analyzer can be used with `benchmax`. To do so, specify add the binary as an `smtrat-analyzer` solver; for more information, see the `benchmax` subpage.

0.7.4 Preprocessing

WIP

0.7.5 Benchmax

Benchmax is a tool for automated benchmarking. Though it was developed and is primary used for testing SMT solvers, it aims to be agnostic of the tools and formats as good as possible.

Its fundamental model is to load a list of tools and a list of benchmarks, run every tool with every benchmark, obtain the results and output all the results. While the benchmarks are fixed to a single file, we allow to choose between different tool interfaces, execution backends and output formats.

0.7.5.1 General usage

Benchmax could be called as follows:
```
./benchmax -T 1m -M 4Gi -S /path/to/smtrat-static -X out.xml -b ssh --ssh.node user@127.0.0.1@5\#9 -D
       /path/to/benchmark/set
```

This will run benchmax with the SMT-RAT tool at `/path/to/smtrat-static` on the `/path/to/benchmark/set` with a time limit of 1 minute and a memory limit of 4 gigabyte. The resulst will be written to `out.xml`. The execution is done on an SSH backend on localhost with 9 connections and executing 5 parallel jobs per connection.

It is recommended to use static builds to avoid issues with missing libraries.

For more information, run `./benchmax --help`.

0.7.5.1.1 Collecting statistics Some tools like SMT-RAT or Z3 can provide statistics about the solving process for each individual benchmark. By using the `-s` respectively `--statistics`, statistics are collected and stored in the output file.

0.7.5.1.1.1 Large output It is recommended to aggregate statistics as much as possible inside SMT-RAT. However, if the output might get large, you might want to use `--use-tmp` to prevent benchmax running out of memory.

0.7.5.1.2 Working with the results In the SMT-RAT repository, two utilites for converting the result XML file are included:

- `utilities/benchmax/xml2ods.py` for converting it to a *Flat XML LibreOffice Calc Sheet*.
- An XML filter `utilities/benchmax/OOCImporter.xsl` for converting it to a *Flat XML LibreOffice Calc Sheet*.
- `utilities/benchmax/evaluation` is a small python library for importing the results into Python (or a Jupyter notebook), inspecting the results and preparing plots. For more information, see Benchmax python utility.

0.7.5.1.3 Using a solver with options To pass options to the tested tool, use a string consisting of the path to the tool and the required options instead of only the path. In the example above, if we wanted to use the SMT-RAT tool at `/path/to/smtrat-static` with some option `--op` and argument `arg`, we would call

```
./benchmax -T 1m -M 4Gi -S "/path/to/smtrat-static -op arg" -X ...
```

(`...` being the same as before).

0.7.5.2 Tools

A tool represents a binary that can be executed on some input files. It is responsible for deciding whether it can be applied to some given file, building a command line to execute it and retrieve additional results from `stdout` or `stderr`.

The generic tool class `benchmax::Tool` can be used as a default. It will run the given binary on any input file and benchmax records the exit code as well as the runtime.

If more information is needed a new tool class can be derived that overrides or extends the default behaviour. Some premade tools are available (and new ones should be easy to create):

- benchmax::MathSAT
- benchmax::Minisatp
- benchmax::SMTRAT
- benchmax::SMTRAT_OPB
- benchmax::Z3

0.7.5.3 Backends

A backend offers the means to run the tasks in a specific manner. A number of different backends are implemented that allow for using benchmax in various scenarios.

0.7.5.3.1 LocalBackend The LocalBackend can be used to execute benchmarks on a local machine easily. It does not allow for any parallelization but simply executes all tasks sequentially.

0.7.5.3.2 SlurmBackend The SlurmBackend employs the Slurm workload manager to run benchmarks on a cluster. It essentially collects all tasks that shall be run in a file and creates an appropriate slurm submit file. It then submits this job, waits for it to finish and collects the results from the output files.

The Slurm backend supports starting (`--mode execute`) and collecting results (`--mode collect`) separately, thus avoiding the need for running benchmax in a screen.

0.7.5.3.3 SSHBackend The SSHBackend can be used if you have multiple workers that can be reached via ssh (essentially a cluster without a batch job system). It allows to configure one or more computing nodes and manually schedules all the jobs on the different computing nodes.

Using `--ssh.node`, a node is specified in the format `<user>[:<password>]@<hostname>[:<port = 22>][@<cores = 1>][#<connections = 1>]`; benchmax will then connect to the specified server with given credentials `connections` times and will run `cores` threads per connection. Thus, the number of overall parallel threads equals `connections * cores` (note that enough memory should be available on the node).

By setting the flag `--ssh.resolvedeps`, dependencies (i.e. dynamic libraries) are resolved and uploaded with the solver.

0.7.5.3.4 CondorBackend (unstable) The CondorBackend is aimed at the HTCondor batch system and works similar to the SlurmBackend. Note however that this backend is not well tested and we therefore consider it unstable.

0.7.5.4 Troubleshooting

- If benchmax terminates due to a segmentation fault without any message, then it probably exceeded available memory. A common error is that SMT-RAT has produced too much logging output. To fix this, simply build SMT-RAT with `LOGGING=OFF`.

0.7.5.5 Benchmax python utility

This tool allows loading XML files from Benchmax into a pandas dataframe, inspecting the results and visualizing them.

This is useful for working with the results in a Jupyter notebook.

Dependencies:

- `pandas`
- matplotlib
- pillow
- numpy
- `tikzplotlib`

```
pip3 install pandas matplotlib tikzplotlib numpy pillow
```

0.7.5.5.1 Loading XMLs into a pandas dataframe First, install this directory as python library; e.g. on Ubuntu

```
cd ~/.local/lib/python3.8/site-packages/ # path to your python site-packages directory
ln -s ~/src/smtrat/utilities/benchmax/ # path to the benchmax utility
```

In your Jupyter notebook:

```
import benchmax.evaluation as ev
df = ev.xml_to_pandas("path_to/stats_file.xml", {"smtrat-static": "solver_name"},
       ["statistics_name_1","statistics_name_2"]) # second and third parameter is optional
```

or, to load multiplle XMLs into one:

```
import benchmax.evaluation as ev
df = ev.xmls_to_pandas({"path_to/stats_file_1.xml": {"smtrat-static": "solver_name_1"},
       "path_to/stats_file_2.xml": {"smtrat-static": "solver_name_2"}},
       ["statistics_name_1","statistics_name_2"]) # second parameter is optional
```

This will create a dataframe with columns `(solver_name_1, "answer")`, `(solver_name_1, "runtime")`, `(solver_name_1, "statistics_name_1")` etc (as multi-index).

0.7.5.5.2 Computing a virtual best solver A virtual best is a solver that behaves optimal on each input w.r.t. a set of solvers. It is computed by selecting for each benchmark instance the solver with shortest running time.

To compute the virtual best solver named `VB` w.r.t. `solver1`,`solver2` and `solver3` and considering statistics `statistics_name_1`.

```
df = df.join(ev.virtual_best(df, ["solver1","solver2","solver3"], "VB", ['statistics_name_1']))
```

0.7.5.5.3 Plotting We provide the `performance_profile` and `scatter_plot` functions to easily generate a performance profiles and scatter plots.

0.7.5.5.4 Show a summary of an XML file There are several methods for quickly inspecting the results of a run provided. For instance, the following script can be used to view a summary of a singel XML file and to show instances with wrong results or segmentation faults:

```
#!/usr/bin/env python3
import benchmax.evaluation as ev
import sys
df = ev.xml_to_pandas(sys.argv[1])
ev.inspect(df)
```

SMT-RAT provides a small utility script for showing a summary of one or more XML files:

```
~/Code/smtrat/utilities/benchmax/view.py result_1.xml result_2.xml
```

0.7.5.5.5 Exporting data to Latex

0.7.5.5.5.1 Pandas dataframe to latex table `df.to_latex(buf='file.tex')`

0.7.5.5.5.2 matplotlib to tikz plot see `tikzplotlib`

0.8 Developers information

- Code style
- Documentation
- Settings
- Logging
- Statistics and timing
- Testing
- Validation
- Checkpoints
- Finding and Reporting Bugs
- Tools

0.8.1 Code style

Please follow the code style rules from CArL documentation.

For SMT-RAT, we follow a different rule for naming files and namespaces:

- Every file should represent a *module*.
- Every (sub-)folder has its own namespace.

0.8.2 Documentation

For SMT-RAT, there are two sources of documentation: the in-source API documentation and the more manual-like documentation (you are reading right now). While the in-source API documentation is generated based on the doxygen comments from the actual source files, the manual is generated from the markdown files in `doc/markdown/`.

0.8.2.0.1 Writing documentation Note that some of the documentation may be incomplete or rendered incorrectly, especially if you use an old version of doxygen. Here is a list of known problems:

- Comments in code blocks (see below) may not work correctly (e.g. with doxygen 1.8.1.2). See `here` for a workaround. This will however look ugly for newer doxygen versions, hence we do not use it.
- Files with `static_assert` statements will be incomplete. A `patch` is pending and will hopefully make it into doxygen 1.8.9.
- Member groups (usually used to group operators) may or may not work. There still seem to be a few cases where doxygen `messes up`.
- Documenting unnamed parameters is not possible. A corresponding `ticket` exists for several years.

0.8.2.0.2 Literature references Literature references should be provided when appropriate by citing references from the bibtex database located at `doc/literature.bib` using the `@cite` command. The labels are the last name of the first author and the four-digit year. In case of duplicates, we append lowercase letters.

These references can be used with `@cite label`, for example like this:

```
/**
 * Checks whether the polynomial is unit normal
 * @see @cite GCL92, page 39
 * @return If polynomial is normal.
 */
bool is_normal() const;
```

0.8.2.1 Code comments

0.8.2.1.1 File headers

```
/**
 * @file <filename>
 * @ingroup <groupid1>
 * @ingroup <groupid2>
 * @author <author1>
 * @author <author2>
 *
 * [ Short description ]
 */
```

Descriptions may be omitted when the file contains a single class, either implementation or declaration.

0.8.2.1.2 Namespaces Namespaces are documented in a separate file, found at '/doc/markdown/codedocs/namespaces.dox'

0.8.2.1.3 Class headers

```
/**
 * @ingroup <groupid>
 * [ Description ]
 * @see <reference>
 * @see <OtherClass>
 */
```

0.8.2.1.4 Method headers

```
/**
 * [ Usage Description ]
 * @param <p1> [ Short description for first parameter ]
 * @param <p2> [ Short description for second parameter ]
 * @return [ Short description of return value ]
 * @see <reference>
 * @see <otherMethod>
 */
```

These method headers are written directly above the method declaration. Comments about the implementation are written above the or inside the implementation.

The `see` command is used likewise as for classes.

0.8.2.1.5 Method groups There are some cases when documenting each method is tedious and meaningless, for example operators. In this case, we use doxygen method groups.

For member operators (for example `operator+=`), this works as follows:

```
/// @name In-place addition operators
/// @{
/**
 * Add something to this polynomial and return the changed polynomial.
 * @param rhs Right hand side.
 * @return Changed polynomial.
 */
MultivariatePolynomial& operator+=(const MultivariatePolynomial& rhs);
MultivariatePolynomial& operator+=(const Term<Coeff>& rhs);
MultivariatePolynomial& operator+=(const Monomial& rhs);
MultivariatePolynomial& operator+=(Variable::Arg rhs);
MultivariatePolynomial& operator+=(const Coeff& rhs);
/// @}
```

0.8.2.2 Writing out-of-source documentation

Documentation not directly related to the source code is written in Markdown format, and is located in `/doc/markdown/`.

0.8.3 Settings

As described in sec::modules, each module has a settings template parameter.

0.8.3.0.1 Dynamic settings These settings are considered at compile time. For certain purposes, it is unhandy to recompile SMT-RAT for every parameter. For this, module parameters can be set

- via the command line using `--module.parameter key1=value1 --module.parameter key2=value2 ...` or
- via the `set-option` command of SMT-LIB: `(set-option :key "value")` (note that you need to pass every value as a string, even if it represents a number!).

These parameters can be accessed (most appropriately in a settings object of a module) via `int my_setting = settings_module().get("my_module.my_setting", 2)` or `std::string my_setting = settings_module().get("my_module.my_setting", "default_value")`. Note that the second parameter is the default value also specifying the type of the setting to which it is parsed.

0.8.4 Logging

0.8.4.0.1 Logging frontend The frontend for logging is defined in logging.h.

It provides the following macros for logging:

- SMTRAT_LOG_TRACE(channel, msg)
- SMTRAT_LOG_DEBUG(channel, msg)
- SMTRAT_LOG_INFO(channel, msg)
- SMTRAT_LOG_WARN(channel, msg)
- SMTRAT_LOG_ERROR(channel, msg)
- SMTRAT_LOG_FATAL(channel, msg)
- SMTRAT_LOG_FUNC(channel, args)
- SMTRAT_LOG_FUNC(channel, args, msg)
- SMTRAT_LOG_ASSERT(channel, condition, msg)
- SMTRAT_LOG_NOTIMPLEMENTED()
- SMTRAT_LOG_INEFFICIENT()

Where the arguments mean the following:

- `channel`: A string describing the context. For example `"smtrat.parser"`.
- `msg`: The actual message as an expression that can be sent to a std::stringstream. For example `"foo: " << foo`.
- `args`: A description of the function arguments as an expression like `msg`.
- `condition`: A boolean expression that can be passed to `assert()`.

Typically, logging looks like this:

```
bool checkStuff(Object o, bool flag) {
    SMTRAT_LOG_FUNC("smtrat", o << ", " << flag);
    bool result = o.property(flag);
    SMTRAT_LOG_TRACE("smtrat", "Result: " << result);
    return result;
}
```

Logging is enabled (or disabled) by the `LOGGING` macro in CMake. The log levels for each channel can be configured in the `configure_logging()` method in `cli/smtratSolver.cpp`.

0.8.5 Statistics and timing

0.8.5.0.1 Statistics SMT-RAT has the ability to collect statistics after the solving process is finished.

For enabling this feature, the `SMTRAT_DEVOPTION_Statistics` needs to be turned on in the CMake settings.

0.8.5.0.1.1 Collecting statistics A statistics object can be created by inheriting from `Statistics.h`:

```
#pragma once
#include <smtrat-common/statistics/Statistics.h>
#ifdef SMTRAT_DEVOPTION_Statistics
namespace smtrat {
namespace myModule {
class MyStatistics : public Statistics {
private:
    std::size_t mCounter = 0;
public:
    void collect() { // called after the solving process to collect statistics
        Statistics::addKeyValuePair("counter", mCounter);
    }
    void count() { // user defined
        ++mCounter;
    }
};
}
}
#endif
```

Note that neither the key nor the value are allowed to contain spaces, `(` or `)`.

This is then instantiated by calling

```
#ifdef SMTRAT_DEVOPTION_Statistics
auto& myStatistics = statistics_get<myModule::MyStatistics>("MyModuleName");
#endif
```

or, as shortcut

```
SMTRAT_STATISTICS_INIT(myModule::MyStatistics, myStatistics, "MyModuleName")
```

and statistics can be collected by calling the user defined operations (e.g. `myStatistics.count()`).

All statistics-related code should be encapsulated by the `SMTRAT_DEVOPTION_Statistics` flag. Alternatively, code can be encapsulated in `SMTRAT_STATISTICS_CALL()`.

0.8.5.0.2 Timing The statistics framework has the ability to easily collect timings.

The following code will measure the total running time of the code block as well as the number of times the code block was executed:

```
class MyStatistics : public Statistics {
private:
    carl::statistics::timer mTimer;

public:
    void collect() {
        Statistics::addKeyValuePair("timer", mTimer);
    }
    auto& timer() {
        return mTimer;
    }
};

SMTRAT_STATISTICS_INIT(myModule::MyStatistics, myStatistics, "MyModuleName")

SMTRAT_TIME_START(start);
// expensive code
SMTRAT_TIME_FINISH(myStatistics.timer(), start);
```

The measured timings will then appear alongside the statistics.

Note that the resolution of these measurements is in 1 millisecond. Thus, be careful when interpreting results; especially, it measured code blocks should be big enough.

0.8.6 Testing

SMT-RAT and CArL use `GoogleTest` for unit testing. To do so, go to the `src/tests/` folder and create a test analogously to the other tests (i.e. creating a new folder, adapting the `CMakeList.txt` in the new folder and in the `tests` folder). *Note that in the SMT-RAT repository are some obsolete tests.*

0.8.6.0.1 Utilities For creating CArL data structure in unit tests, we refer to `carl-io/parser/Parser.h`.

0.8.7 Validation

For debugging purposes, it can be useful to verify intermediate results (explanations, lemmas, etc) using an external SMT solver. SMT-RAT allows to store formulas during the solving process which are written to a `smt2` file once the solving process is finished.

0.8.7.0.1 Enabling this feature For enabling this feature, the `SMTRAT_DEVOPTION_Validation` needs to be turned on in the CMake settings.

0.8.7.0.2 Logging formulas The API allows to create a *validation point* with a given channel and a name. The channel and name should identify the validation point uniquely. The channel (e.g. `smtrat.modules.vs`) can be used to turn on and off validation points (similarly to logging channels) while the name (e.g. `substitution_result`) further distinguishes validation points within a channel.

To initialize a validation point with channel and name and store its reference to a variable, use

```
SMTRAT_VALIDATION_INIT(channel, variable);
```

Hint: to put it in a static variable, use

```
SMTRAT_VALIDATION_INIT_STATIC(channel, variable);
```

To an initialized validation point stored in a variable, we can add a formula to be assumed to be satisfiable (consistent = true) or unsatisfiable (consistent = false). Each formula added to a validation point gets a unique index (given incrementally), which is also logged in the given channel with debug level.

```
SMTRAT_VALIDATION_ADD_TO(variable, name, formula, consistent);
```

To combine the two steps above, use:

```
SMTRAT_VALIDATION_ADD(channel, name, formula, consistent);
```

0.8.7.0.3 Command line usage By appending the command line parameter `--validation.export-smtlib`, the formulas are stored to an smtlib file (by default `validation.smt2`, can be customized using `--validation.smtlib-filename`).

Note that all channels of interest need to be activated explicitly with `--validation.channel channel1 --validation.channel channel2 ...`. Furthermore, `--validation.channel path.to` will activate all channels starting with `path.to`, i.e. `path.to.channel1`, `path.to.channel2` etc.

0.8.7.0.4 Segmentation faults Note that the formulas are only written to a file if smtrat terminates without an segmentation fault. If there is an assertion failing, set `DEVELOPER=OFF` in cmake.

0.8.8 Checkpoints

Checkpoints are useful for debugging a run of SMT-RAT, i.e. if an implementation of SMT-RAT behaves the same as some other implementation or some pseudocode.

To do so, we can insert checkpoints with a channel, a name, and a list of arguments of arbitrary type into the code. During a run, a sequence of checkpoints is produced which represent a run of the algorithm. We then can specify test cases which set up a reference run and then start the solver on an according input. SMT-RAT will then check during this run whether all checkpoints are hit in the correct order and will give output on that.

0.8.8.0.1 Enabling this feature You need to turn on the CMake option `SMTRAT_DEVOPTION_Checkpoints`.

0.8.8.0.2 Specyfing checkpoints Insert

```
SMTRAT_CHECKPOINT("channel_name", "checkpoint_name", parameter1, parameter2, ...);
```

into the code.

0.8.8.0.3 Setting up a reference run Create a test case in `src/test`. Include `#include <smtrat-common/smtrat-co` and add checkpoints using

```
SMTRAT_ADD_CHECKPOINT("channel_name", "checkpoint_name", false, parameter1, parameter2, ...)
```

or

```
SMTRAT_ADD_CHECKPOINT("channel_name", "checkpoint_name", true, parameter1, parameter2, ...)
```

to assert that a checkpoint is reached.

Afterwards, run the respective SMT-RAT code.

You can clear all checkpoints of a channel using

```
SMTRAT_CLEAR_CHECKPOINT("channel_name");
```

to reset a channel, that is, removing all checkpoints and resetting the pointer.

0.8.9 Finding and Reporting Bugs

This page is meant as a guide for the case that you find a bug or any unexpected behaviour. We consider any of the following events a (potential) bug:

- SMT-RAT crashes.
- A library used through SMT-RAT crashes.
- SMT-RAT gives incorrect results.
- SMT-RAT does not terminate (for reasonably sized inputs).
- SMT-RAT does not provide a method or functionality that should be available according to this documentation.
- SMT-RAT does not provide a method or functionality that you consider crucial or trivial for some of the datastructures.
- Compiling SMT-RAT fails.
- Compiling your code using SMT-RAT fails and you are pretty sure that you use SMT-RAT according to this documentation.

In any of the above cases, make sure that:

- You have installed all necessary dependencies in the required versions.
- You work on something that is similar to a system listed as supported platform at getting_started.
- You can (somewhat reliably) reproduce the error with a (somewhat) clean build of SMT-RAT. (i.e., you did not screw up the CMake flags, see build_cmake for more information)
- You compile either with `CMAKE_BUILD_TYPE=DEBUG` or `DEVELOPER=ON`. This will give additional warnings during compilation and enable assertions during runtime. This will slow down SMT-RAT significantly, but detect errors before an actual crash happens and give a meaningful error message in many cases.

If you are unable to solve issue yourself or you find the issue to be an actual bug in SMT-RAT, please do not hesitate to contact us. You can either contact us via email (if you suspect a configuration or usage issue on your side) or create a ticket in our bug tracker (if you suspect an error that is to be fixed by us). The bug tracker is available at https://github.com/ths-rwth/smtrat/issues.

When sending us a mail or creating a ticket, please provide us with:

- Your system specifications, including versions of compilers and libraries listed in the dependencies.
- The SMT-RAT version (release version of git commit id).
- A minimal working example.
- A description of what you would expect to happen.
- A description of what actually happens.

0.9 README

This is dead code.

The expressions were meant as an alternative to carl::Formula. Instead of having own theory constraints for each theory, here, everything is stored in a single tree structure. This would make theory combinations easier (think of a variable being interpreted both as uninterpreted and as arithmetic variable); furthermore, handling ite expression is easer: currently, we need to resolve ite expressions within the theory in the parser, leading to bad performance on some examples.

0.10 NewCoveringModule #and

Author: Philip Kroll (Philip.Kroll@rwth-aachen.de)

0.10.1 Introduction

New implementation of the CDCAC algorithm, also called the covering algorithm. The basic implementation is based on the paper Deciding the Consistency of Non-Linear Real Arithmetic Constraints with a Conflict Driven Search Using Cylindrical Algebraic Coverings. In short↩ : The algorithm is a variant of Cylindrical Algebraic Decomposition (CAD) adapted for satisfiability, where solution candidates (sample points) are constructed incrementally, either until a satisfying sample is found or sufficient samples have been sampled to conclude unsatisfiability. The choice of samples is guided by the input constraints and previous conflicts.

0.10.2 Usage

In this implementation as much code as possible from src/smtrat-cadcells. This also includes the projection operators implemented in src/smtrat-cadcells/operators and the representation heuristics implemented in src/smtrat-cadcells/representation. We also reuse the code from src/smtrat-mcsat/variableordering/VariableOrdering.h to calculate the used variable ordering. Change of the strategy to calculate the variable ordering, the used heuristics or the used projection operator, can be done by changing the respective settings in src/smtrat-modules/New↩ CoveringModule/NewCoveringSettings.h

0.10.3 Efficiency

The implementation also supports backtracking and incrementality, both of which are not covered in detail by the paper. The following cases are possible depending on what the previous result of the Covering Algorithm was :

- Previous result was SAT, i.e. a satisfying assignment was found and the cached coverings for all dimensions are partial
  - addConstraintSAT() is called with the new constraint and these are checked for satisfiability. The lowest level with an unsatisfied new constraints is returned. This also means that when all constraints SAT is concluded and no calculations are done.
  - removeConstraintSAT() is called with constraints that have to be removed from the cached partial coverings for all dimensions. This only makes the covering smaller, and the assignment is still satisfying.
- Previous result was UNSAT, i.e. the stored covering for level 0 is complete and thus no satisfying assignment could be found.
  - addConstraintUNSAT() is called with the new constraint. As the covering is unsatisfiable anyways these constraints are just added without further calculations.
  - removeConstraintUNSAT() is called with constraints that have to be removed from the cached complete coverings all dimensions.

0.11 Todo List

Global smtrat::parser::QualifiedIdentifierParser::checkQualification (const Identifier &identifier, const carl::Sort &) const

Check what can be checked here.

Global smtrat::parser::Theories::defineFunction (const std::string &name, const std::vector< types::↩ VariableType > &arguments, const carl::Sort &sort, const types::TermType &definition)

check that definition matches the sort

0.12 Hierarchical Index

0.13 Data Structure Index

0.13.1 Data Structures

Here are the data structures with brief descriptions:

smtrat::AbstractModuleFactory . . . 232
smtrat::parser::AbstractTheory
Base class for all theories . . . 232
smtrat::cad::sample_compare::absvalue . . . 235
smtrat::analyzer::AnalysisSettings . . . 235
smtrat::analyzer::AnalyzerStatistics . . . 236
smtrat::covering_ng::formula::node_ds::AND . . . 236
smtrat::AnnotatedBVTerm . . . 236
smtrat::cadcells::representation::approximation::ApxCriteria . . . 237
smtrat::cadcells::representation::approximation::ApxSettings . . . 238
benchmax::slurm::ArchiveProperties
All properties needed to archive log files . . . 240
smtrat::parser::ArithmeticTheory
Implements the theory of arithmetic, including LRA, LIA, NRA and NIA . . . 241
smtrat::parser::types::ArithmeticTheory
Types of the arithmetic theory . . . 244
smtrat::execution::Assertion . . . 244
smtrat::cad::preprocessor::AssignmentCollector . . . 244
smtrat::mcsat::arithmetic::AssignmentFinder . . . 246
smtrat::mcsat::smtaf::AssignmentFinder< Settings > . . . 246
smtrat::mcsat::arithmetic::AssignmentFinder_ctx . . . 246
smtrat::mcsat::arithmetic::AssignmentFinder_detail . . . 247
smtrat::mcsat::smtaf::AssignmentFinder_SMT . . . 248
smtrat::cadcells::datastructures::detail::AssignmentProperties . . . 249
smtrat::parser::Attribute
Represents an Attribute . . . 249
smtrat::parser::AttributeParser . . . 250
smtrat::parser::AttributeValueParser . . . 251
smtrat::AxiomFactory . . . 252
benchmax::Backend
Base class for all backends . . . 253
smtrat::Backend< Settings > . . . 255
smtrat::BackendLink . . . 257
smtrat::BackendSynchronisation . . . 258
smtrat::Backtrackable< UnionFind > . . . 259
smtrat::mcsat::onecell::Base . . . 260
smtrat::cadcells::datastructures::BaseDerivation< Properties >
A BaseDerivation has a level and a set of properties of this level, and an underlying derivation representing the lower levels . . . 261
smtrat::cad::BaseProjection< Settings > . . . 263
smtrat::cad::BaseSettings . . . 268
smtrat::expression::simplifier::BaseSimplifier . . . 269
smtrat::cad::Origin::BaseType . . . 271
smtrat::mcsat::onecell::BCApproximationSettings . . . 273
smtrat::mcsat::onecell::BCFilteredAllSelectiveSettings . . . 273
smtrat::mcsat::onecell::BCFilteredAllSettings . . . 274
smtrat::mcsat::onecell::BCFilteredBoundsSettings . . . 274
smtrat::mcsat::onecell::BCFilteredSamplesSettings . . . 275
smtrat::mcsat::onecell::BCFilteredSettings . . . 275
smtrat::mcsat::onecell::BCSettings . . . 276
smtrat::BEModule< Settings > . . . 276
benchmax::BenchmarkResult
Results for a single benchmark run . . . 302

benchmax::BenchmarkSet
A set of benchmarks from some common base directory . . . 304
benchmax::settings::BenchmarkSettings
Settings for benchmarks . . . 305
smtrat::Bimap< Class, FirstKeyType, FirstKeyName, SecondKeyType, SecondKeyName >
Container that stores expensive to construct objects and allows the fast lookup with respect to two independent keys within the objects . . . 306
smtrat::expression::BinaryExpression . . . 308
smtrat::parser::BinaryParser
Parses binaries: `#b[01]+` . . . 309
smtrat::parser::BitvectorTheory
Implements the theory of bitvectors . . . 310
smtrat::parser::types::BitvectorTheory
Types of the theory of bitvectors . . . 312
smtrat::BlastedConstr . . . 313
smtrat::BlastedPoly . . . 314
smtrat::mcsat::Bookkeeping
Represent the trail, i.e . . . 315
smtrat::covering_ng::formula::node_ds::BOOL . . . 317
smtrat::parser::BooleanEncodingTheory
Implements the theory of bitvectors . . . 317
Minisat::BoolOption . . . 320
smtrat::cadcells::datastructures::Bound
Bound type of a SymbolicInterval . . . 321
smtrat::lra::Bound< T1, T2 >
Stores a bound, which could be an upper "<= b" or a lower bound ">= b" for a bound value b . 322
smtrat::mcsat::fm::Bound . . . 331
smtrat::vb::Bound< T >
Class for the bound of a variable . . . 332
smtrat::Branching
Stores all necessary information of an branch, which can be used to detect probable infinite loop of branchings . . . 337
smtrat::BVAnnotation . . . 338
smtrat::BVDirectEncoder . . . 340
smtrat::BVModule< Settings > . . . 340
smtrat::cad::CAD< Settings > . . . 368
smtrat::qe::cad::CAD< Settings > . . . 371
smtrat::cad::CADConstraints< BT > . . . 373
smtrat::cad::CADCore< CH > . . . 377
smtrat::cad::CADCore< CoreHeuristic::BySample > . . . 377
smtrat::cad::CADCore< CoreHeuristic::EnumerateAll > . . . 378
smtrat::cad::CADCore< CoreHeuristic::Interleave > . . . 378
smtrat::cad::CADCore< CoreHeuristic::PreferProjection > . . . 379
smtrat::cad::CADCore< CoreHeuristic::PreferSampling > . . . 379
smtrat::qe::cad::CADElimination . . . 379
smtrat::cad::CADPreprocessor . . . 380
smtrat::cad::CADPreprocessorSettings . . . 381
smtrat::qe::cad::CADSettings . . . 382
smtrat::CardinalityEncoder . . . 383
smtrat::cadcells::representation::cell< H >
Note: If connected(i) holds, then the indexed root ordering must contain an ordering between the interval bounds . . . 384
smtrat::cadcells::representation::cell< CellHeuristic::BIGGEST_CELL > . . . 385
smtrat::cadcells::representation::cell< CellHeuristic::BIGGEST_CELL_APPROXIMATION > . . . 385
smtrat::cadcells::representation::cell< CellHeuristic::BIGGEST_CELL_EW > . . . 385
smtrat::cadcells::representation::cell< CellHeuristic::CHAIN_EQ > . . . 386
smtrat::cadcells::representation::cell< CellHeuristic::LOWEST_DEGREE_BARRIERS > . . . 386
smtrat::cadcells::representation::cell< CellHeuristic::LOWEST_DEGREE_BARRIERS_EQ > . . . 386

smtrat::cadcells::representation::cell< CellHeuristic::LOWEST_DEGREE_BARRIERS_EW > 387
smtrat::cadcells::operators::properties::cell_connected 387
smtrat::cadcells::representation::approximation::CellApproximator 388
smtrat::cadcells::datastructures::CellRepresentation< P >
Represents a cell 388
benchmax::slurm::ChunkedSubmitfileProperties
All properties needed to create a submit file 389
Minisat::Clause 391
Minisat::ClauseAllocator 393
smtrat::mcsat::ClauseChain
An explanation is either a single clause or a chain of clauses, satisfying the following properties: 396
smtrat::sat::detail::ClauseChecker 398
smtrat::CMakeOptionPrinter 399
Minisat::CMap< T > 399
smtrat::CNFerModule 400
smtrat::CoCoAGBModule< Settings > 427
smtrat::CollectionWithOrigins< Element, Origin > 454
smtrat::ICPModule< Settings >::comp
Typedefs: 455
smtrat::cadcells::datastructures::CompoundMaxMin
Represents the maximum function of the contained indexed root functions 456
smtrat::cadcells::datastructures::CompoundMinMax
Represents the minimum function of the contained indexed root functions 456
smtrat::vs::Condition 457
benchmax::CondorBackend
Backend for the HTCondor batch system 459
smtrat::mcsat::fm::ConflictGenerator< Comparator > 462
smtrat::cad::ConflictGraph
Representation of a bipartite graph (C+S, E) of vertices C and S, representing the constraints and samples, respectively 462
smtrat::parser::Theories::ConstantAdder
Helper functor for addConstants() method 464
smtrat::covering_ng::formula::node_ds::CONSTRAINT 465
smtrat::cad::CADConstraints< BT >::ConstraintComparator 465
smtrat::cad::preprocessor::ConstraintUpdate 465
smtrat::ConstrTree 466
smtrat::LRAModule< Settings >::Context
Stores a formula, being part of the received formula of this module, and the position of this formula in the passed formula 466
smtrat::icp::ContractionCandidate 467
smtrat::icp::contractionCandidateComp 472
smtrat::icp::ContractionCandidateManager 472
smtrat::parser::conversion::Converter< To > 474
smtrat::parser::conversion::Converter< FormulaT > 474
smtrat::parser::conversion::Converter< Poly > 475
smtrat::parser::conversion::Converter< types::BVTerm > 475
benchmax::settings::CoreSettings
Core settings 476
smtrat::settings::CoreSettings 477
smtrat::parser::CoreTheory
Implements the core theory of the booleans 478
smtrat::parser::types::CoreTheory
Types of the core theory 480
smtrat::cadcells::representation::covering< H > 481
smtrat::mcsat::arithmetic::Covering
Semantics: The space is divided into a number of intervals: (-oo,a)[a,a](a,b)[b,b](b,oo) A bit is set if the constraints refutes the corresponding interval 481
smtrat::cadcells::representation::covering< CoveringHeuristic::BIGGEST_CELL_COVERING > 483

smtrat::cadcells::representation::covering< CoveringHeuristic::BIGGEST_CELL_COVERING_EW > . . 483
smtrat::cadcells::representation::covering< CoveringHeuristic::BIGGEST_CELL_COVERING_MIN_TDEG > 483
smtrat::cadcells::representation::covering< CoveringHeuristic::CHAIN_COVERING > 484
smtrat::cadcells::datastructures::CoveringDescription
Describes a covering of the real line by SymbolicIntervals (given an appropriate sample) . . . 484
smtrat::CoveringNGModule< Settings > 485
smtrat::cadcells::datastructures::CoveringRepresentation< P >
Represents a covering over a cell 511
smtrat::covering_ng::CoveringResult< op > 512
smtrat::mcsat::onecellcad::recursive::CoverNullification 514
smtrat::CSplitModule< Settings > 514
smtrat::CubeLIAModule< Settings > 540
smtrat::CurryModule< Settings > 567
smtrat::CycleEnumerator< FHG, Collector >
This class encapsulates an algorithm for enumerating all cycles 595
benchmax::Database
Dummy database that effectively disables storing to database. Set BENCHMAX_DATABASE to actually use a database 596
benchmax::DBAL 598
smtrat::parser::DecimalParser
Parses decimals: `numeral.0*numeral` 601
Minisat::DeepEqual< K > 601
Minisat::DeepHash< K > 602
smtrat::mcsat::fm::DefaultComparator
Does not order anything 602
smtrat::mcsat::fm::DefaultSettings 603
smtrat::mcsat::smtaf::DefaultSettings 603
smtrat::mcsat::vs::DefaultSettings 603
smtrat::cad::projection_compare::degree 604
smtrat::mcsat::onecellcad::recursive::DegreeAscending 604
smtrat::analyzer::DegreeCollector 604
smtrat::mcsat::onecellcad::recursive::DegreeDescending 605
smtrat::cadcells::datastructures::DelineatedDerivation< Properties >
A DelineatedDerivation is a BaseDerivation with a Delineation and an underlying SampledDerivation 605
smtrat::cadcells::datastructures::Delineation
Represents the delineation of a set of polynomials (at a sample), that is 607
smtrat::cadcells::datastructures::DelineationInterval
An interval of a delineation 609
smtrat::mcsat::icp::Dependencies 610
smtrat::cadcells::datastructures::DerivationRef< Properties >
A reference to a derivation, which is either 611
smtrat::mcsat::onecellcad::recursive::DontCoverNullification 613
smtrat::cad::debug::DotSubgraph 614
Minisat::DoubleOption 614
Minisat::DoubleRange 616
smtrat::expression::simplifier::DuplicateSimplifier 617
smtrat::DynamicPriorityQueue< T, Compare > 618
smtrat::cad::ProjectionGlobalInformation::ECData 620
smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::Edge
Internal type of an edge 621
smtrat::ElementWithOrigins< Element, Origin > 622
smtrat::EMModule< Settings > 623
smtrat::subtropical::Encoding 649
smtrat::EQGraph< VertexName > 650
Minisat::Equal< K > 653
smtrat::parser::ErrorHandler 653

smtrat::ESModule< Settings > . . . 653
smtrat::ExactlyOneCommanderEncoder . . . 679
smtrat::execution::ExecutionState . . . 681
smtrat::Executor< Strategy > . . . 684
smtrat::covering_ng::formula::ExhaustiveImplicants . . . 690
smtrat::mcsat::fm::Explanation< Settings > . . . 692
smtrat::mcsat::icp::Explanation . . . 692
smtrat::mcsat::nlsat::Explanation . . . 692
smtrat::mcsat::onecell::Explanation . . . 693
smtrat::mcsat::onecellcad::levelwise::Explanation< Setting1, Setting2 > . . . 694
smtrat::mcsat::onecellcad::recursive::Explanation< Setting1, Setting2 > . . . 694
smtrat::mcsat::vs::Explanation . . . 694
smtrat::mcsat::nlsat::ExplanationGenerator . . . 695
smtrat::mcsat::vs::ExplanationGenerator< Settings > . . . 695
smtrat::expression::Expression . . . 696
smtrat::expression::ExpressionContent . . . 699
smtrat::expression::ExpressionConverter . . . 700
smtrat::expression::ExpressionModifier . . . 701
smtrat::expression::ExpressionPool . . . 702
smtrat::parser::ParserState::ExpressionScope . . . 704
smtrat::expression::ExpressionTypeChecker< T > . . . 704
smtrat::expression::ExpressionVisitor . . . 705
smtrat::covering_ng::formula::node_ds::FALSE . . . 706
smtrat::mcsat::FastParallelExplanation< Backends >
This explanation executes all given explanation in parallel processes and waits for the fastest explanation, returning the fastest delivered explanation, terminating all other parallel processes 706
smtrat::mcsat::variableordering::detail::FeatureCollector< Objects >
This class manages features that are used to valuate variables on objects . . . 706
smtrat::parser::FixedWidthConstant< T >
Represents a constant of a fixed width . . . 708
smtrat::parseformula::FormulaCollector . . . 708
smtrat::ICPModule< Settings >::formulaPtrComp . . . 714
smtrat::FormulaWithOrigins
Stores a formula along with its origins . . . 715
smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >
This class implements a forward hypergraph . . . 717
smtrat::FouMoModule< Settings >
A module which applies the Fourier-Motzkin algorithm . . . 720
smtrat::qe::fm::FourierMotzkinQE
Provides a simple implementation for Fourier Motzkin variable elimination for linear, existentially quantified constraints . . . 748
smtrat::FPPModule< Settings > . . . 749
smtrat::mcsat::FullParallelExplanation< Backends >
This explanation executes all given explanation parallel in multiple threads and waits until every single one has finished, returning the result of the first listed explanation . . . 777
smtrat::cad::FullSampleComparator< Iterator, Strategy > . . . 777
smtrat::cad::FullSampleComparator< Iterator, FullSampleCompareStrategy::T > . . . 777
smtrat::cad::FullSampleComparator< Iterator, FullSampleCompareStrategy::Type > . . . 777
smtrat::cad::FullSampleComparator< Iterator, FullSampleCompareStrategy::Value > . . . 777
smtrat::parser::FunctionInstantiator . . . 777
smtrat::GBModule< Settings >
A solver module based on Groebner basis . . . 778
smtrat::GBModuleState< Settings >
A class to save the current state of a GBModule . . . 809
smtrat::GBPPModule< Settings > . . . 810
Minisat::Hash< K > . . . 838
std::hash< const smtrat::expression::ExpressionContent * > . . . 839
std::hash< smtrat::expression::BinaryExpression > . . . 839

std::hash< smtrat::expression::Expression > . . . 839
std::hash< smtrat::expression::ITEExpression > . . . 839
std::hash< smtrat::expression::NaryExpression > . . . 840
std::hash< smtrat::expression::QuantifierExpression > . . . 840
std::hash< smtrat::expression::UnaryExpression > . . . 840
std::hash< smtrat::lra::Variable< T1, T2 > >
Implements std::hash for sort value . . . 840
std::hash< smtrat::vs::Substitution > . . . 841
std::hash< std::vector< T > > . . . 841
std::hash_combiner . . . 842
Minisat::Heap< Comp > . . . 842
smtrat::parser::HexadecimalParser
Parses hexadecimals: `#x[0-9a-fA-F]+` . . . 844
smtrat::icp::HistoryNode . . . 845
smtrat::ICEModule< Settings > . . . 849
smtrat::ICPModule< Settings > . . . 876
smtrat::icp::IcpVariable . . . 903
smtrat::icp::icpVariableComp . . . 906
smtrat::parser::Identifier . . . 906
smtrat::parser::IdentifierParser . . . 908
smtrat::cad::debug::IDSanitizer . . . 908
smtrat::covering_ng::formula::node_ds::IFF . . . 909
smtrat::mcsat::fm::IgnoreCoreSettings . . . 909
smtrat::IncWidthModule< Settings > . . . 909
smtrat::parser::IndexedFunctionInstantiator . . . 935
smtrat::cadcells::datastructures::IndexedRoot
Represents the i-th root of a multivariate polynomial at its main variable (given an appropriate sample) . . . 936
smtrat::cadcells::datastructures::IndexedRootOrdering
Describes an ordering of IndexedRoots . . . 937
smtrat::cadcells::datastructures::IndexedRootRelation
A relation between two roots . . . 938
smtrat::InequalitiesTable< Settings >
Datastructure for the GBModule . . . 939
smtrat::lra::Bound< T1, T2 >::Info
Stores some additional information for a bound . . . 942
smtrat::mcsat::InformationGetter . . . 943
smtrat::parser::Instantiator< V, T > . . . 945
smtrat::parser::InstructionHandler . . . 947
Minisat::Int64Range . . . 952
smtrat::IntBlastModule< Settings > . . . 953
smtrat::IntEqModule< Settings >
A module which checks whether the equations contained in the received (linear integer) formula have a solution . . . 980
smtrat::cadcells::representation::util::IntervalCompare< T > . . . 1008
smtrat::covering_ng::IntervalCompare< op >
Sorts interval by their lower bounds . . . 1008
smtrat::mcsat::icp::IntervalPropagation . . . 1009
Minisat::IntOption . . . 1009
Minisat::IntRange . . . 1011
smtrat::is_sample_outside< S > . . . 1011
smtrat::is_sample_outside< IsSampleOutsideAlgorithm::DEFAULT > . . . 1012
smtrat::is_variant< T >
States whether a given type is a `boost::variant` . . . 1012
smtrat::expression::ITEExpression . . . 1012
benchmax::RandomizationAdaptor< T >::iterator . . . 1013
smtrat::ModuleInput::IteratorCompare . . . 1014

benchmax::Jobs
Represents a set of jobs, constructed as the cartesian product of a set of tools and a set of benchmarks . . . 1014
smtrat::parser::KeywordParser
Parses keywords: `:simple_symbol` . . . 1015
Minisat::lbool . . . 1016
smtrat::mcsat::onecell::LDBFilteredAllSelectiveSettings . . . 1017
smtrat::mcsat::onecell::LDBSettings . . . 1017
smtrat::lra::Tableau< Settings, T1, T2 >::LearnedBound . . . 1018
smtrat::Module::Lemma . . . 1019
Minisat::LessThan_default< T > . . . 1020
smtrat::cad::projection_compare::level . . . 1020
smtrat::cad::sample_compare::level . . . 1020
smtrat::cad::ProjectionLevelInformation::LevelInfo . . . 1021
smtrat::mcsat::onecellcad::levelwise::LevelwiseCAD . . . 1022
smtrat::LevelWiseInformation< Settings > . . . 1024
smtrat::cad::LiftingTree< Settings > . . . 1027
smtrat::resource::Limiter . . . 1030
smtrat::ICPModule< Settings >::linearVariable . . . 1031
smtrat::mcsat::ClauseChain::Link . . . 1031
Minisat::Lit . . . 1032
benchmax::LocalBackend
This backend simply runs files sequentially on the local machine . . . 1033
smtrat::LOG . . . 1035
smtrat::parser::LogicParser . . . 1036
smtrat::LongFormulaEncoder . . . 1036
smtrat::LRAModule< Settings >
A module which performs the Simplex method on the linear part of it's received formula . . . 1037
smtrat::LVEModule< Settings > . . . 1070
smtrat::Manager
Base class for solvers . . . 1095
Minisat::Map< K, D, H, E > . . . 1104
benchmax::MathSAT
Tool wrapper for MathSAT for SMT-LIB . . . 1106
smtrat::mcsat::fm::MaxSizeComparator
This heuristic chooses the explanation excluding the largest interval . . . 1108
smtrat::MaxSMT< Solver, Strategy > . . . 1109
smtrat::maxsmt::MaxSMTBackend< Solver, Strategy > . . . 1110
smtrat::maxsmt::MaxSMTBackend< Solver, MaxSMTStrategy::FU_MALIK_INCREMENTAL > . . . 1110
smtrat::maxsmt::MaxSMTBackend< Solver, MaxSMTStrategy::LINEAR_SEARCH > . . . 1110
smtrat::maxsmt::MaxSMTBackend< Solver, MaxSMTStrategy::MSU3 > . . . 1111
smtrat::MCBModule< Settings > . . . 1111
smtrat::mcsat::MCSATBackend< Settings > . . . 1137
smtrat::mcsat::MCSATMixin< Settings > . . . 1139
smtrat::expression::simplifier::MergeSimplifier . . . 1145
smtrat::covering_ng::formula::Minimal . . . 1146
benchmax::Minisat
Tool wrapper for a Minisat solver . . . 1147
benchmax::Minisatp
Tool wrapper for the Minisatp solver for pseudo-Boolean problems . . . 1150
smtrat::mcsat::fm::MinSizeComparator
This heuristic chooses the explanation excluding the smallest interval . . . 1152
smtrat::mcsat::fm::MinVarCountComparator
This heuristic tries to minimize the number of variables occuring in the explanation . . . 1153
smtrat::cad::MISGeneration< heuristic > . . . 1153
smtrat::MixedSignEncoder . . . 1154
smtrat::cad::ModelBasedProjection< incrementality, backtracking, Settings > . . . 1156

smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >
This class implements a projection that supports no incrementality and expects backtracking to be in order . . . 1161
smtrat::Module
A base class for all kind of theory solving methods . . . 1167
smtrat::ModuleFactory< Module > . . . 1193
smtrat::ModuleInput
The input formula a module has to consider for it's satisfiability check . . . 1194
smtrat::settings::ModuleSettings . . . 1200
smtrat::Module::ModuleStatistics . . . 1201
smtrat::subtropical::Moment
Represents the normal vector component and the sign variable assigned to a variable in an original constraint . . . 1202
smtrat::MonomialMappingByVariablePool . . . 1202
smtrat::expression::NaryExpression . . . 1203
smtrat::expression::simplifier::NegationSimplifier . . . 1204
smtrat::NewCADModule< Settings > . . . 1205
smtrat::NewCoveringModule< Settings > . . . 1233
benchmax::ssh::Node
Specification of a compuation node for the SSH backend . . . 1263
smtrat::covering_ng::formula::node_ds::Node . . . 1264
smtrat::covering_ng::formula::node_ds::NodeContent . . . 1265
smtrat::mcsat::onecellcad::recursive::NoHeuristic . . . 1266
smtrat::covering_ng::CoveringResult< op >::NONE . . . 1266
smtrat::covering_ng::formula::node_ds::NOT . . . 1266
smtrat::NRAILModule< Settings > . . . 1267
smtrat::parser::NumeralParser
Parses numerals: `(0 | [1-9][0-9]*)` . . . 1293
smtrat::lra::Numeric . . . 1294
smtrat::execution::Objective . . . 1300
Minisat::OccLists< Idx, Vec, Deleted > . . . 1300
smtrat::mcsat::onecellcad::OneCellCAD . . . 1301
benchmax::settings::OperationSettings
Operation settings . . . 1303
smtrat::Optimization< Solver > . . . 1304
Minisat::Option . . . 1305
Minisat::Option::OptionLt . . . 1307
smtrat::covering_ng::formula::node_ds::OR . . . 1307
smtrat::cad::Origin
This class represents one or more origins of some object . . . 1307
smtrat::cad::preprocessor::Origins . . . 1310
Minisat::OutOfMemoryException . . . 1311
smtrat::parser::OutputWrapper . . . 1311
Minisat::Map< K, D, H, E >::Pair . . . 1311
smtrat::mcsat::ParallelExplanation< Backends > . . . 1312
smtrat::parser::ParserSettings . . . 1312
smtrat::parser::ParserState . . . 1312
smtrat::PBGaussModule< Settings > . . . 1316
smtrat::PBPPModule< Settings > . . . 1345
smtrat::PersistentUnionFind . . . 1373
smtrat::PFEModule< Settings > . . . 1375
smtrat::PModule . . . 1402
smtrat::cadcells::operators::properties::poly_additional_root_outside . . . 1428
smtrat::cadcells::operators::properties::poly_irreducible_semi_sgn_inv . . . 1429
smtrat::cadcells::operators::properties::poly_irreducible_sgn_inv . . . 1430
smtrat::cadcells::operators::properties::poly_ord_inv . . . 1430
smtrat::cadcells::operators::properties::poly_ord_inv_base . . . 1431
smtrat::cadcells::operators::properties::poly_pdel . . . 1432

smtrat::cadcells::operators::properties::poly_semi_sgn_inv . . . 1432
smtrat::cadcells::operators::properties::poly_sgn_inv . . . 1433
smtrat::cadcells::representation::util::PolyDelineation . . . 1434
smtrat::cadcells::representation::util::PolyDelineations . . . 1434
smtrat::cad::ProjectionPolynomialInformation::PolyInfo . . . 1434
smtrat::cad::PolynomialComparator< PolynomialGetter > . . . 1435
smtrat::cad::PolynomialLiftingQueue< PolynomialGetter > . . . 1435
smtrat::cadcells::datastructures::PolyPool
A pool for polynomials . . . 1437
smtrat::cadcells::datastructures::detail::PolyProperties . . . 1438
smtrat::cadcells::datastructures::PolyRef
Refers to a polynomial . . . 1439
smtrat::PolyTree . . . 1439
smtrat::PolyTreeContent . . . 1440
smtrat::PolyTreePool . . . 1441
smtrat::cad::Preprocessor . . . 1442
smtrat::cad::PreprocessorSettings . . . 1443
benchmax::settings::PresetSettings . . . 1444
smtrat::PriorityQueue< T, Compare > . . . 1444
smtrat::cad::Projection< incrementality, backtracking, Settings > . . . 1446
smtrat::qe::cad::Projection< Settings > . . . 1451
smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings > . . . 1457
smtrat::cad::Projection< Incrementality::FULL, BT, Settings > . . . 1463
smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >
This class implements a projection that supports no incrementality and expects backtracking to be in order . . . 1468
smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >
This class implements a projection that supports no incrementality and allows backtracking to be out of order . . . 1474
smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings > . . . 1480
smtrat::cad::projection_compare::ProjectionComparator< Strategy > . . . 1485
smtrat::cad::projection_compare::ProjectionComparator< ProjectionCompareStrategy::D > . . . 1485
smtrat::cad::projection_compare::ProjectionComparator< ProjectionCompareStrategy::ID > . . . 1486
smtrat::cad::projection_compare::ProjectionComparator< ProjectionCompareStrategy::LD > . . . 1486
smtrat::cad::projection_compare::ProjectionComparator< ProjectionCompareStrategy::PD > . . . 1486
smtrat::cad::projection_compare::ProjectionComparator< ProjectionCompareStrategy::SD > . . . 1486
smtrat::cad::projection_compare::ProjectionComparator_impl< Args > . . . 1487
smtrat::cad::ProjectionGlobalInformation . . . 1487
smtrat::cad::ProjectionInformation . . . 1488
smtrat::cad::ProjectionLevelInformation . . . 1490
smtrat::cad::ProjectionOperator . . . 1491
smtrat::cad::ProjectionPolynomialInformation . . . 1492
smtrat::cadcells::datastructures::Projections
Encapsulates all computations on polynomials . . . 1493
smtrat::cadcells::operators::mccallum_filtered_impl::PropertiesSet . . . 1495
smtrat::cadcells::operators::PropertiesSet< Op > . . . 1496
smtrat::cadcells::operators::PropertiesSet< op::mccallum > . . . 1496
smtrat::cadcells::datastructures::PropertiesT< Ts >
Set of properties . . . 1496
smtrat::cadcells::datastructures::PropertiesT< T, Ts... > . . . 1497
smtrat::cadcells::datastructures::PropertiesTContent< T, is_flag > . . . 1497
smtrat::cadcells::datastructures::PropertiesTContent< T, false > . . . 1497
smtrat::cadcells::datastructures::PropertiesTContent< T, true > . . . 1497
smtrat::cadcells::datastructures::property_hash< T > . . . 1497
smtrat::PseudoBoolEncoder
Base class for a PseudoBoolean Encoder . . . 1498
smtrat::PseudoBoolNormalizer . . . 1499
smtrat::parser::QEParser . . . 1500

smtrat::parser::QualifiedIdentifierParser . . . 1501
smtrat::expression::QuantifierExpression . . . 1501
smtrat::parser::QuantifierParser . . . 1502
Minisat::Queue< T > . . . 1502
smtrat::mcsat::icp::QueueEntry . . . 1503
benchmax::RandomizationAdaptor< T >
Provides iteration over a given std::vector in a pseudo-randomized order . . . 1504
smtrat::RationalCapsule . . . 1505
smtrat::parser::RationalPolicies
Specialization of qi::real_policies for a Rational . . . 1506
smtrat::mcsat::onecellcad::RealAlgebraicPoint< Number >
Represent a multidimensional point whose components are algebraic reals . . . 1506
smtrat::mcsat::onecellcad::recursive::RecursiveCAD . . . 1508
smtrat::cad::projection::Reducta< Poly >
Construct the set of reducta of the given polynomial . . . 1512
Minisat::RegionAllocator< T > . . . 1513
smtrat::parser::ErrorHandler::result< typename > . . . 1515
smtrat::cad::preprocessor::ResultantRule . . . 1515
benchmax::Results
Stores results for for whole benchmax run . . . 1516
smtrat::RNSEncoder . . . 1517
smtrat::cadcells::operators::properties::root_ordering_holds . . . 1518
smtrat::cadcells::operators::properties::root_well_def . . . 1519
smtrat::cadcells::datastructures::RootFunction . . . 1519
smtrat::mcsat::arithmetic::RootIndexer< RANT > . . . 1521
smtrat::cad::Sample . . . 1522
smtrat::cad::sample_compare::SampleComparator< Iterator, Strategy > . . . 1524
smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::LS > . . . 1525
smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::LT > . . . 1525
smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::LTA > . . . 1525
smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::LTS > . . . 1525
smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::LTSA > . . . 1526
smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::S > . . . 1526
smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::T > . . . 1526
smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::TLSA > . . . 1527
smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::TS > . . . 1527
smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::TSA > . . . 1527
smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::Type > . . . 1528
smtrat::cad::sample_compare::SampleComparator< Iterator, SampleCompareStrategy::Value > . . . 1528
smtrat::cad::sample_compare::SampleComparator_impl< It, Args > . . . 1529
smtrat::cadcells::datastructures::SampledDerivation< Properties >
A SampledDerivation is a DelineatedDerivation with a sample and an DelineationInterval w.r.t . 1529
smtrat::SampledDerivationRefCompare . . . 1532
smtrat::cad::SampleIteratorQueue< Iterator, Comparator > . . . 1532
smtrat::covering_ng::sampling< S > . . . 1533
smtrat::sampling< S > . . . 1534
smtrat::covering_ng::sampling< SamplingAlgorithm::LOWER_UPPER_BETWEEN_SAMPLING > . . . 1534
smtrat::sampling< SamplingAlgorithm::LOWER_UPPER_BETWEEN_SAMPLING > . . . 1534
smtrat::SATModule< Settings >
Implements a module performing DPLL style SAT checking . . . 1535
smtrat::parser::ScriptParser< Callee > . . . 1567
smtrat::parser::ParserState::ScriptScope . . . 1569
smtrat::mcsat::onecellcad::Section
Represent a cell's (closed-interval-boundary) component along th k-th axis . . . 1570
smtrat::onecellcad::recursive::Section
Represent a cell's closed-interval-boundary object along one single axis by an irreducible, multivariate polynomial of level k . . . 1570
smtrat::mcsat::onecellcad::levelwise::SectionHeuristic1 . . . 1571

smtrat::mcsat::onecellcad::levelwise::SectionHeuristic2 . . . 1571
smtrat::mcsat::onecellcad::levelwise::SectionHeuristic3 . . . 1571
smtrat::mcsat::onecellcad::Sector
Represent a cell's open-interval boundary object along one single axis by two irreducible, multivariate polynomials of level k . . . 1572
smtrat::onecellcad::recursive::Sector
Represent a cell's open-interval boundary object along one single axis by two irreducible, multivariate polynomials of level k . . . 1572
smtrat::mcsat::onecellcad::levelwise::SectorHeuristic1 . . . 1573
smtrat::mcsat::onecellcad::levelwise::SectorHeuristic2 . . . 1573
smtrat::mcsat::onecellcad::levelwise::SectorHeuristic3 . . . 1574
smtrat::subtropical::Separator
Represents the class of all original constraints with the same left hand side after a normalization 1574
smtrat::mcsat::SequentialAssignment< Backends > . . . 1575
smtrat::mcsat::SequentialExplanation< Backends > . . . 1575
benchmax::settings::Settings
Generic class to manage runtime settings . . . 1575
smtrat::settings::Settings . . . 1575
smtrat::SettingsComponents . . . 1575
benchmax::SettingsParser
Generic class to manage settings parsing using boost::program_options . . . 1575
smtrat::SettingsParser . . . 1575
smtrat::CNFerModule::SettingsType . . . 1576
smtrat::parser::SExpressionParser . . . 1576
smtrat::parser::SExpressionSequence< T > . . . 1576
smtrat::ShortFormulaEncoder . . . 1577
benchmax::simple_parser . . . 1578
smtrat::parser::Theories::SimpleSortAdder
Helper functor for addSimpleSorts() method . . . 1579
smtrat::parser::SimpleSymbolParser
Parses symbols: `simple_symbol` | `quoted_symbol` where . . . 1580
smtrat::expression::simplifier::Simplifier . . . 1581
smtrat::expression::simplifier::SimplifierChainCaller< chainID > . . . 1581
smtrat::expression::simplifier::SimplifierChainCaller< 0 > . . . 1581
smtrat::expression::simplifier::SingletonSimplifier . . . 1582
smtrat::cad::sample_compare::size . . . 1583
smtrat::parser::Skipper . . . 1583
benchmax::SlurmBackend
Backend for the Slurm workload manager . . . 1584
benchmax::settings::SlurmBackendSettings
Settings for the Slurm backend . . . 1586
smtrat::parser::SMTLIBParser . . . 1587
benchmax::SMTRAT
Tool wrapper for SMT-RAT for SMT-LIB . . . 1590
benchmax::SMTRAT_Analyzer
Tool wrapper for SMT-RAT for SMT-LIB . . . 1593
benchmax::SMTRAT_OPB
Adapts the SMTRAT solver for OPB files . . . 1595
smtrat::execution::SoftAssertion . . . 1598
smtrat::settings::SolverSettings . . . 1598
smtrat::parser::SortedVariableParser . . . 1599
smtrat::parser::SortParser . . . 1600
smtrat::parser::SpecConstantParser . . . 1600
smtrat::SplitSOSModule< Settings > . . . 1601
benchmax::SSHBackend . . . 1628
benchmax::settings::SSHBackendSettings
Settings for SSH backend . . . 1630

benchmax::ssh::SSHConnection
A wrapper class that manages a single SSH connection as specified in a Node object (with all its channels) . . . 1631
smtrat::vs::State . . . 1633
smtrat::StaticUnionFind . . . 1657
smtrat::statistics::StatisticsSettings . . . 1658
smtrat::StrategyGraph . . . 1658
Minisat::StringOption . . . 1660
smtrat::parser::StringParser
Parses strings: "."+" with escape sequences \\" and \\\\ . . . 1661
smtrat::STropModule< Settings > . . . 1661
benchmax::slurm::SubmitfileProperties
All properties needed to create a submit file . . . 1688
smtrat::vs::Substitution . . . 1689
smtrat::vs::substitutionPointerEqual . . . 1693
smtrat::vs::substitutionPointerHash . . . 1693
smtrat::cadcells::datastructures::SymbolicInterval
A symbolic interal whose bounds are defined by indexed root expressions . . . 1693
smtrat::parser::SymbolParser . . . 1695
smtrat::SymmetryModule< Settings > . . . 1696
smtrat::lra::Tableau< Settings, T1, T2 > . . . 1722
smtrat::lra::TableauEntry< T1, T2 > . . . 1740
smtrat::cadcells::datastructures::TaggedIndexedRoot . . . 1743
smtrat::mcsat::onecellcad::TagPoly
Tagged Polynomials . . . 1744
smtrat::Task . . . 1744
smtrat::parser::TermParser . . . 1745
smtrat::mcsat::vs::helper::TestCandidate . . . 1747
smtrat::parser::Theories
Combines all implemented theories and provides a single interface to interact with all theories at once . . . 1747
smtrat::parser::TheoryError . . . 1750
smtrat::mcsat::TheoryLevel . . . 1751
smtrat::Module::TheoryPropagation . . . 1752
smtrat::TheoryVarSchedulerStatic< vot >
Schedules theory variables statically . . . 1753
smtrat::ThreadPool . . . 1757
smtrat::cad::debug::TikzBasePrinter . . . 1757
smtrat::cad::debug::TikzDAGPrinter . . . 1758
smtrat::cad::debug::TikzHistoryPrinter . . . 1760
smtrat::cad::debug::TikzTreePrinter . . . 1761
benchmax::Tool
Base class for any tool . . . 1762
benchmax::settings::ToolSettings
Tool-related settings . . . 1766
smtrat::TotalizerEncoder
TotalizerEncoder implements the Totalizer encoding as described in "Incremental Cardinality Constraints for MaxSAT" by Martins et al https://doi.org/10.1007/978-3-319-10428-7↩_39 . . . 1767
smtrat::TotalizerTree . . . 1769
smtrat::covering_ng::formula::node_ds::TRUE . . . 1769
smtrat::cad::projection_compare::type . . . 1769
smtrat::cad::sample_compare::type . . . 1769
smtrat::UFCegarModule< Settings > . . . 1770
smtrat::expression::UnaryExpression . . . 1797
smtrat::cad::debug::UnifiedData . . . 1797
smtrat::parser::types::UninterpretedTheory
Types of the theory of equalities and uninterpreted functions . . . 1798

smtrat::parser::UninterpretedTheory
Implements the theory of equalities and uninterpreted functions . . . 1799
smtrat::UnionFindInterface< T, Implementation > . . . 1802
smtrat::UnionFindModule< Settings > . . . 1803
smtrat::SATModule< Settings >::UnorderedClauseLookup::UnorderedClauseHasher . . . 1830
smtrat::UnsatCore< Solver, Strategy > . . . 1830
smtrat::unsatcore::UnsatCoreBackend< Solver, Strategy > . . . 1831
smtrat::unsatcore::UnsatCoreBackend< Solver, UnsatCoreStrategy::ModelExclusion >
Implements an easy strategy to obtain an unsatisfiable core . . . 1831
smtrat::vs::unsignedTripleCmp . . . 1832
smtrat::parser::UserFunctionInstantiator . . . 1833
smtrat::validation::ValidationCollector . . . 1834
smtrat::validation::ValidationPoint . . . 1834
smtrat::validation::ValidationPrinter< SOF > . . . 1835
smtrat::validation::ValidationSettings . . . 1835
smtrat::lra::Value< T > . . . 1836
smtrat::lra::Variable< T1, T2 > . . . 1843
smtrat::vb::Variable< T >
Class for a variable . . . 1854
smtrat::vb::VariableBounds< T >
Class to manage the bounds of a variable . . . 1857
smtrat::VariableCapsule . . . 1864
smtrat::mcsat::variableordering::VariableIDs . . . 1865
smtrat::VariableRewriteRule . . . 1865
smtrat::parser::conversion::VariantConverter< Res >
Converts variants to some type using the Converter class . . . 1866
smtrat::VariantMap< Key, Value >
This class is a specialization of `std::map` where the keys are of arbitrary type and the values are of type `boost::variant` . . . 1868
smtrat::parser::conversion::VariantVariantConverter< Res >
Converts variants to another variant type not using the Converter class . . . 1870
smtrat::VarSchedulerBase
Base class for variable schedulers . . . 1871
smtrat::VarSchedulerFixedRandom . . . 1874
smtrat::VarSchedulerMcsatActivityPreferTheory< vot >
Activity-based scheduler preferring initially theory variables . . . 1877
smtrat::VarSchedulerMcsatBase
Base class for all MCSAT variable scheduler . . . 1880
smtrat::VarSchedulerMcsatBooleanFirst< vot >
Variable scheduling that all decides Boolean variables first before deciding any theory variable 1884
smtrat::VarSchedulerMcsatTheoryFirst< TheoryScheduler >
Variable scheduling that all decides theory variables first before deciding any Boolean variable 1887
smtrat::VarSchedulerMcsatUnivariateClausesOnly< TheoryScheduler, respectActivities >
Decides only Constraints occuring in clauses that are univariate in the current theory variable while the theory ordering is static . . . 1891
smtrat::VarSchedulerMcsatUnivariateConstraintsOnly< lookahead, vot >
Decides only Constraints univariate in the current theory variable while the theory ordering is static . . . 1895
smtrat::VarSchedulerMinisat
Minisat's activity-based variable scheduling . . . 1898
smtrat::VarSchedulerRandom
Random scheduler . . . 1902
smtrat::VarSchedulerSMTTheoryGuided< theory_conflict_guided_decision_heuristic >
Scheduler for SMT, implementing theory guided heuristics . . . 1905
Minisat::vec< T > . . . 1908
smtrat::parser::conversion::VectorVariantConverter< Res >
Converts a vector of variants to a vector of some type using the Converter class . . . 1911

smtrat::subtropical::Vertex
Represents a term of an original constraint and assigns him a rating variable if a weak separator is searched . . . 1912
smtrat::VSModule< Settings > . . . 1913
Minisat::Watcher
[Minisat related code] . . . 1942
smtrat::ICPModule< Settings >::weights . . . 1943
benchmax::XMLWriter
Writes results to a xml file . . . 1944
smtrat::covering_ng::formula::node_ds::XOR . . . 1944
benchmax::Z3
Tool wrapper for Z3 for SMT-LIB . . . 1944

0.14 Namespace Documentation

0.14.1 benchmax Namespace Reference

Namespaces

- settings
- slurm
- ssh

Data Structures

- class Backend

  Base class for all backends.
- class CondorBackend

  Backend for the HTCondor batch system.
- class RandomizationAdaptor

  Provides iteration over a given std::vector in a pseudo-randomized order.
- class Jobs

  Represents a set of jobs, constructed as the cartesian product of a set of tools and a set of benchmarks.
- class LocalBackend

  This backend simply runs files sequentially on the local machine.
- class SlurmBackend

  Backend for the Slurm workload manager.
- class SSHBackend
- class BenchmarkSet

  A set of benchmarks from some common base directory.
- struct BenchmarkResult

  Results for a single benchmark run.
- class Database

  Dummy database that effectively disables storing to database. Set BENCHMAX_DATABASE to actually use a database.
- class DBAL
- class Results

  Stores results for for whole benchmax run.
- class XMLWriter

  Writes results to a xml file.
- class SettingsParser

  Generic class to manage settings parsing using boost::program_options.
- class MathSAT

  Tool wrapper for MathSAT for SMT-LIB.

- class Minisat

  Tool wrapper for a Minisat solver.
- class Minisatp

  Tool wrapper for the Minisatp solver for pseudo-Boolean problems.
- class simple_parser
- class SMTRAT

  Tool wrapper for SMT-RAT for SMT-LIB.
- class SMTRAT_Analyzer

  Tool wrapper for SMT-RAT for SMT-LIB.
- class SMTRAT_OPB

  Adapts the SMTRAT solver for OPB files.
- class Tool

  Base class for any tool.
- class Z3

  Tool wrapper for Z3 for SMT-LIB.

Typedefs

- using Job = std::pair< const Tool *, std::filesystem::path >

  Typedef for a job, consisting of a tool and an input file.
- using ToolPtr = std::unique_ptr< Tool >

  A std::unique_ptr to a Tool.
- using Tools = std::vector< ToolPtr >

  A vector of ToolPtr.

Functions

- template<typename Backend >
  void execute_backend (const std::string &name, const Jobs &jobs)
- void run_backend (const std::string &backend, const Jobs &jobs)

  Runs a given backend on a list of tools and benchmarks.
- const auto & settings_slurm ()

  Return the Slurm settings.
- const auto & settings_ssh ()

  Return the SSH settings.
- BenchmarkSet loadBenchmarks ()

  Loads benchmark files from directory specified in settings.
- const auto & settings_benchmarks ()

  Return the benchmark settings.
- void logging_configure ()

  Configure default logging for benchmax.
- void logging_quiet ()

  Configure quiet logging for benchmax.
- void logging_verbose ()

  Configure verbose logging for benchmax.
- std::ostream & operator<< (std::ostream &os, const BenchmarkResult &results)

  Streaming operator for BenchmarkResult.
- const auto & settings_preset ()

  Return the Slurm settings.
- template<typename T >
  const auto & settings_get (const std::string &name)

  Helper function to obtain settings by name and type.

- const auto & settings_core ()

  Retrieved core settings.
- const auto & settings_operation ()

  Retrieved operation settings.
- bool is_system_lib (std::string path)
- std::ostream & operator<< (std::ostream &os, const Tool &tool)

  Streaming operator for a generic tool.
- template<typename T >
  void createTools (const std::vector< std::filesystem::path > &arguments, Tools &tools)

  Create tools of a given type T from a list of binaries and store them in tools.
- Tools loadTools ()

  Load all tools from the tool settings.
- const auto & settings_tools ()

  Returns the tool settings.
- int call_program (const std::string &commandline, std::string &stdout, bool print_to_stdout=false)

  Runs an external program from some command line and records the output to stdout.
- std::filesystem::path common_prefix (const std::filesystem::path &p1, const std::filesystem::path &p2)

  Computes the common prefix of two paths.
- std::filesystem::path common_prefix (const std::vector< std::filesystem::path > &s, bool skip_last=true)

  Computes the common prefix of a list of paths.
- std::filesystem::path common_prefix (const std::initializer_list< std::vector< std::filesystem::path >> &s, bool skip_last=true)

  Computes the common prefix of multiple lists of paths.
- std::filesystem::path remove_prefix (const std::filesystem::path &s, const std::filesystem::path &prefix)

  Remove a prefix from a path.
- bool is_extension (const std::filesystem::path &path, const std::string &extension)

  Checks whether the extension of the filename is as specified.
- std::size_t parse_peak_memory (const std::string &output)

0.14.1.1 Typedef Documentation

0.14.1.1.1 Job `using benchmax::Job = typedef std::pair<const Tool*, std::filesystem::path>`

Typedef for a job, consisting of a tool and an input file.

0.14.1.1.2 ToolPtr `using benchmax::ToolPtr = typedef std::unique_ptr<Tool>`

A std::unique_ptr to a Tool.

0.14.1.1.3 Tools `using benchmax::Tools = typedef std::vector<ToolPtr>`

A vector of ToolPtr.

0.14.1.2 Function Documentation

0.14.1.2.1 call_program()

```
int benchmax::call_program (
    const std::string & commandline,
    std::string & stdout,
    bool print_to_stdout = false ) [inline]
```

Runs an external program from some command line and records the output to stdout.
Prints the program output and records it at the same time if print_to_stdout is set to true.

Parameters

commandline	Program to execute.
stdout	Standard output.
print_to_stdout	Also print if true.

Returns

Exit code of the program.

0.14.1.2.2 common_prefix() [1/3]

```
std::filesystem::path benchmax::common_prefix (
    const std::filesystem::path & p1,
    const std::filesystem::path & p2 ) [inline]
```

Computes the common prefix of two paths.

0.14.1.2.3 common_prefix() [2/3]

```
std::filesystem::path benchmax::common_prefix (
    const std::initializer_list< std::vector< std::filesystem::path >> & s,
    bool skip_last = true ) [inline]
```

Computes the common prefix of multiple lists of paths.
skip_last specifies whether the last part if the path (usually the filename) may be part of the prefix.

0.14.1.2.4 common_prefix() [3/3]

```
std::filesystem::path benchmax::common_prefix (
    const std::vector< std::filesystem::path > & s,
    bool skip_last = true ) [inline]
```

Computes the common prefix of a list of paths.
skip_last specifies whether the last part if the path (usually the filename) may be part of the prefix.

0.14.1.2.5 createTools()

```
template<typename T >
void benchmax::createTools (
    const std::vector< std::filesystem::path > & arguments,
    Tools & tools )
```

Create tools of a given type T from a list of binaries and store them in tools.

0.14.1.2.6 execute_backend()

```
template<typename Backend >
void benchmax::execute_backend (
    const std::string & name,
    const Jobs & jobs )
```

0.14.1.2.7 is_extension()

```
bool benchmax::is_extension (
    const std::filesystem::path & path,
    const std::string & extension ) [inline]
```

Checks whether the extension of the filename is as specified.

0.14.1.2.8 is_system_lib()

```
bool benchmax::is_system_lib (
    std::string path ) [inline]
```

0.14.1.2.9 loadBenchmarks()

```
BenchmarkSet benchmax::loadBenchmarks ( )
```

Loads benchmark files from directory specified in settings.

0.14.1.2.10 loadTools() `Tools benchmax::loadTools ( )`

Load all tools from the tool settings.

0.14.1.2.11 logging_configure() `void benchmax::logging_configure ( ) [inline]`

Configure default logging for benchmax.

0.14.1.2.12 logging_quiet() `void benchmax::logging_quiet ( ) [inline]`

Configure quiet logging for benchmax.

0.14.1.2.13 logging_verbose() `void benchmax::logging_verbose ( ) [inline]`

Configure verbose logging for benchmax.

0.14.1.2.14 operator<<() [1/2]

```
std::ostream& benchmax::operator<< (
    std::ostream & os,
    const BenchmarkResult & results ) [inline]
```

Streaming operator for BenchmarkResult.

0.14.1.2.15 operator<<() [2/2]

```
std::ostream& benchmax::operator<< (
    std::ostream & os,
    const Tool & tool ) [inline]
```

Streaming operator for a generic tool.

0.14.1.2.16 parse_peak_memory()

```
std::size_t benchmax::parse_peak_memory (
    const std::string & output ) [inline]
```

0.14.1.2.17 remove_prefix()

```
std::filesystem::path benchmax::remove_prefix (
    const std::filesystem::path & s,
    const std::filesystem::path & prefix ) [inline]
```

Remove a prefix from a path.

0.14.1.2.18 run_backend()

```
void benchmax::run_backend (
    const std::string & backend,
    const Jobs & jobs )
```

Runs a given backend on a list of tools and benchmarks.

Parameters

backend	Backend name.
tools	List of tools.
benchmarks	List of benchmarks.

0.14.1.2.19 settings_benchmarks() `const auto& benchmax::settings_benchmarks ( ) [inline]`

Return the benchmark settings.

0.14.1.2.20 settings_core() `const auto& benchmax::settings_core ( ) [inline]`

Retrieved core settings.

0.14.1.2.21 settings_get() `template<typename T >`

```
const auto& benchmax::settings_get (
            const std::string & name ) [inline]
```

Helper function to obtain settings by name and type.

0.14.1.2.22 settings_operation() `const auto& benchmax::settings_operation ( ) [inline]`

Retrieved operation settings.

0.14.1.2.23 settings_preset() `const auto& benchmax::settings_preset ( ) [inline]`

Return the Slurm settings.

0.14.1.2.24 settings_slurm() `const auto& benchmax::settings_slurm ( ) [inline]`

Return the Slurm settings.

0.14.1.2.25 settings_ssh() `const auto& benchmax::settings_ssh ( ) [inline]`

Return the SSH settings.

0.14.1.2.26 settings_tools() `const auto& benchmax::settings_tools ( ) [inline]`

Returns the tool settings.

0.14.2 benchmax::settings Namespace Reference

Data Structures

- struct SlurmBackendSettings

  Settings for the Slurm backend.
- struct SSHBackendSettings

  Settings for SSH backend.
- struct BenchmarkSettings

  Settings for benchmarks.
- struct PresetSettings
- struct CoreSettings

  Core settings.
- struct OperationSettings

  Operation settings.
- struct Settings

  Generic class to manage runtime settings.
- struct ToolSettings

  Tool-related settings.

Functions

- void registerSlurmBackendSettings (SettingsParser *parser)

  Registers Slurm settings with the settings parser.
- void registerSSHBackendSettings (SettingsParser *parser)

  Registers SSH settings with settings parser.

- bool finalize_benchmark_settings (BenchmarkSettings &s, const boost::program_options::variables_map &)

  Postprocess benchmark settings.
- void registerBenchmarkSettings (SettingsParser *parser)

  Registers benchmark settings with the settings parser.
- bool finalize_preset_settings (PresetSettings &s, boost::program_options::variables_map &values)

  Postprocess preset settings.
- void registerPresetSettings (SettingsParser *parser)

  Registers preset settings with the settings parser.
- bool finalize_tool_settings (ToolSettings &s, const boost::program_options::variables_map &)

  Postprocess settings to compute common prefix.
- void registerToolSettings (SettingsParser *parser)

  Registers tool settings with the settings parser.

0.14.2.1 Function Documentation

0.14.2.1.1 finalize_benchmark_settings()

```
bool benchmax::settings::finalize_benchmark_settings (
    BenchmarkSettings & s,
    const boost::program_options::variables_map & )
```

Postprocess benchmark settings.

0.14.2.1.2 finalize_preset_settings()

```
bool benchmax::settings::finalize_preset_settings (
    PresetSettings & s,
    boost::program_options::variables_map & values )
```

Postprocess preset settings.

0.14.2.1.3 finalize_tool_settings()

```
bool benchmax::settings::finalize_tool_settings (
    ToolSettings & s,
    const boost::program_options::variables_map & )
```

Postprocess settings to compute common prefix.

0.14.2.1.4 registerBenchmarkSettings()

```
void benchmax::settings::registerBenchmarkSettings (
    SettingsParser * parser )
```

Registers benchmark settings with the settings parser.

0.14.2.1.5 registerPresetSettings()

```
void benchmax::settings::registerPresetSettings (
    SettingsParser * parser )
```

Registers preset settings with the settings parser.

0.14.2.1.6 registerSlurmBackendSettings()

```
void benchmax::settings::registerSlurmBackendSettings
(
    SettingsParser * parser )
```

Registers Slurm settings with the settings parser.

0.14.2.1.7 registerSSHBackendSettings()

```
void benchmax::settings::registerSSHBackendSettings (
    SettingsParser * parser )
```

Registers SSH settings with settings parser.

0.14.2.1.8 registerToolSettings() `void benchmax::settings::registerToolSettings ( SettingsParser * parser )`

Registers tool settings with the settings parser.

0.14.3 benchmax::slurm Namespace Reference

Data Structures

- struct ArchiveProperties

  All properties needed to archive log files.
- struct SubmitfileProperties

  All properties needed to create a submit file.
- struct ChunkedSubmitfileProperties

  All properties needed to create a submit file.

Functions

- void archive_log_files (const ArchiveProperties &p)

  Put all log files into an archive.
- std::vector< fs::path > collect_result_files (const fs::path &basedir)

  Collects all result files in the given base directory for this job id.
- std::string generate_submit_file (const SubmitfileProperties &p)

  Generate a submit file for Slurm with the given properties.
- std::string generate_submit_file_chunked (const ChunkedSubmitfileProperties &p)
- int parse_job_id (const std::string &output)

  Parses the job id from the output of `sbatch`.
- std::string parse_result_info (const std::string &content, const std::string &name)

  Parse a single result information from the output.
- void remove_log_files (const std::vector< fs::path > &files, bool remove)

  Remove the given list of files.
- void clear_directory (const fs::path &basedir)

  Clear log files from directory.
- bool is_job_finished (int jobid)

  Checks if the given job is finished.
- template<typename Jobs >
  void generate_jobs_file (const std::string &filename, std::pair< std::size_t, std::size_t > range, const Jobs &jobs)

0.14.3.1 Function Documentation

0.14.3.1.1 archive_log_files() `void benchmax::slurm::archive_log_files ( const ArchiveProperties & p )`

Put all log files into an archive.

0.14.3.1.2 clear_directory() `void benchmax::slurm::clear_directory ( const fs::path & basedir )`

Clear log files from directory.

Parameters

basedir	Base directory to search in.

0.14.3.1.3 collect_result_files()

```
std::vector< fs::path > benchmax::slurm::collect_result_files (
    const fs::path & basedir )
```

Collects all result files in the given base directory for this job id.

Parameters

basedir	Base directory to search in.
jobid	ID of slurm job.

Returns

List of result files.

0.14.3.1.4 generate_jobs_file()

```
template<typename Jobs >
void benchmax::slurm::generate_jobs_file (
    const std::string & filename,
    std::pair< std::size_t, std::size_t > range,
    const Jobs & jobs )
```

0.14.3.1.5 generate_submit_file()

```
std::string benchmax::slurm::generate_submit_file (
    const SubmitfileProperties & p )
```

Generate a submit file for Slurm with the given properties.

Parameters

p	Collection of all information needed.

Returns

The filename of the submit file.

0.14.3.1.6 generate_submit_file_chunked()

```
std::string benchmax::slurm::generate_submit_file_↩
chunked (
    const ChunkedSubmitfileProperties & p )
```

0.14.3.1.7 is_job_finished()

```
bool benchmax::slurm::is_job_finished (
    int jobid )
```

Checks if the given job is finished.

Parameters

jobid	The job id.

Returns

True if the job is completed.

0.14.3.1.8 parse_job_id()

```
int benchmax::slurm::parse_job_id (
    const std::string & output )
```

Parses the job id from the output of `sbatch`.

Parameters

output	Output of `sbatch`.

Returns

Slurm job id.

0.14.3.1.9 parse_result_info()

```
std::string benchmax::slurm::parse_result_info (
    const std::string & content,
    const std::string & name )
```

Parse a single result information from the output.

Parameters

content	Result information output.
name	Information to be parsed.

Returns

Information specified in the output.

0.14.3.1.10 remove_log_files()

```
void benchmax::slurm::remove_log_files (
    const std::vector< fs::path > & files,
    bool remove )
```

Remove the given list of files.

Parameters

files	List of files.
remove	Boolean flag whether to actually remove files.

0.14.4 benchmax::ssh Namespace Reference

Data Structures

- struct Node

  Specification of a compuation node for the SSH backend.
- class SSHConnection

  A wrapper class that manages a single SSH connection as specified in a Node object (with all its channels).

Data Structures

- struct is_variant

  States whether a given type is a `boost::variant`.
- struct **is_variant**< **boost::variant**< **BOOST_VARIANT_ENUM_PARAMS(U)**> >

  States that `boost::variant` *is indeed a* `boost::variant`.
- struct **is_variant**< **const boost::variant**< **BOOST_VARIANT_ENUM_PARAMS(U)**> >

  States that `const boost::variant` *is indeed a* `boost::variant`.
- class VariantMap

  This class is a specialization of `std::map` *where the keys are of arbitrary type and the values are of type* `boost↩::variant`.
- struct CMakeOptionPrinter
- class Executor
- class PriorityQueue
- class DynamicPriorityQueue
- class SettingsComponents
- class SettingsParser
- class MaxSMT

- class BEModule
- class BVDirectEncoder
- class BVModule
- class CNFerModule
- class CoCoAGBModule
- class CoveringNGModule
- class Bimap

  Container that stores expensive to construct objects and allows the fast lookup with respect to two independent keys within the objects.
- class CSplitModule
- class CubeLIAModule
- class CurryModule
- class EMModule
- class ESModule
- class FouMoModule

  A module which applies the Fourier-Motzkin algorithm.
- class FPPModule
- class GBModule

  A solver module based on Groebner basis.
- class GBModuleState

  A class to save the current state of a GBModule.
- class InequalitiesTable

  Datastructure for the GBModule.
- class VariableRewriteRule
- class GBPPModule
- class ForwardHyperGraph

  This class implements a forward hypergraph.
- struct CycleEnumerator

  This class encapsulates an algorithm for enumerating all cycles.
- class ICEModule
- class ICPModule
- class IncWidthModule
- class BVAnnotation
- class AnnotatedBVTerm
- class BlastedPoly
- class BlastedConstr
- class ConstrTree
- class ElementWithOrigins
- class CollectionWithOrigins
- class IntBlastModule
- class PolyTree
- class PolyTreeContent
- class PolyTreePool
- class IntEqModule

  A module which checks whether the equations contained in the received (linear integer) formula have a solution.
- class LRAModule

  A module which performs the Simplex method on the linear part of it's received formula.
- class LVEModule
- class MCBModule
- class NewCADModule
- class Backend
- struct SampledDerivationRefCompare
- class LevelWiseInformation

- class NewCoveringModule
- struct sampling
- struct is_sample_outside
- struct sampling< SamplingAlgorithm::LOWER_UPPER_BETWEEN_SAMPLING >
- struct is_sample_outside< IsSampleOutsideAlgorithm::DEFAULT >
- class RationalCapsule
- class VariableCapsule
- class AxiomFactory
- class LOG
- class MonomialMappingByVariablePool
- class NRAILModule
- class PBGaussModule
- class CardinalityEncoder
- class ExactlyOneCommanderEncoder
- class LongFormulaEncoder
- class MixedSignEncoder
- class PseudoBoolEncoder

  Base class for a PseudoBoolean Encoder.
- class PseudoBoolNormalizer
- class RNSEncoder
- class ShortFormulaEncoder
- class TotalizerEncoder

  TotalizerEncoder implements the Totalizer encoding as described in "Incremental Cardinality Constraints for MaxSAT" by Martins et al `https://doi.org/10.1007/978-3-319-10428-7_39`.
- class TotalizerTree
- class PBPPModule
- class PFEModule
- class VarSchedulerMcsatBase

  Base class for all MCSAT variable scheduler.
- class TheoryVarSchedulerStatic

  Schedules theory variables statically.
- class VarSchedulerMcsatBooleanFirst

  Variable scheduling that all decides Boolean variables first before deciding any theory variable.
- class VarSchedulerMcsatTheoryFirst

  Variable scheduling that all decides theory variables first before deciding any Boolean variable.
- class VarSchedulerMcsatUnivariateConstraintsOnly

  Decides only Constraints univariate in the current theory variable while the theory ordering is static.
- class VarSchedulerMcsatUnivariateClausesOnly

  Decides only Constraints occuring in clauses that are univariate in the current theory variable while the theory ordering is static.
- class VarSchedulerMcsatActivityPreferTheory

  Activity-based scheduler preferring initially theory variables.
- class SATModule

  Implements a module performing DPLL style SAT checking.
- class VarSchedulerBase

  Base class for variable schedulers.
- class VarSchedulerMinisat

  Minisat's activity-based variable scheduling.
- class VarSchedulerFixedRandom
- class VarSchedulerRandom

  Random scheduler.
- class VarSchedulerSMTTheoryGuided

  Scheduler for SMT, implementing theory guided heuristics.

- class SplitSOSModule
- class STropModule
- class SymmetryModule
- class UFCegarModule
- struct EQGraph
- struct UnionFindInterface
- struct StaticUnionFind
- struct PersistentUnionFind
- struct Backtrackable
- class UnionFindModule
- class VSModule
- class Optimization
- class Manager

  Base class for solvers.
- struct Branching

  Stores all necessary information of an branch, which can be used to detect probable infinite loop of branchings.
- class Module

  A base class for all kind of theory solving methods.
- class FormulaWithOrigins

  Stores a formula along with its origins.
- class ModuleInput

  The input formula a module has to consider for it's satisfiability check.
- class PModule
- struct AbstractModuleFactory
- struct ModuleFactory
- class BackendLink
- class StrategyGraph
- class Task
- class BackendSynchronisation
- class ThreadPool
- class UnsatCore

Enumerations

- enum LemmaLevel { NONE = 0 , NORMAL = 1 , ADVANCED = 2 }
- enum Answer {
  SAT = 0 , UNSAT = 1 , UNKNOWN = 2 , ABORTED = 3 ,
  OPTIMAL = 4 }

  An enum with the possible answers a Module can give.
- enum class MaxSMTStrategy { FU_MALIK_INCREMENTAL , MSU3 , LINEAR_SEARCH }
- enum CoveringStatus { partial = 0 , full = 1 , unknown = 2 , failed = 3 }
- enum SamplingAlgorithm { LOWER_UPPER_BETWEEN_SAMPLING }
- enum IsSampleOutsideAlgorithm { DEFAULT }
- enum class TheoryGuidedDecisionHeuristicLevel : unsigned { CONFLICT_FIRST , SATISFIED_FIRST , DISABLED }
- enum class UnsatCoreStrategy { ModelExclusion }

Functions

- int handle_basic_options (const SettingsParser &parser)
- const auto & settings_parser ()
- bool parseSMT2File (parser::InstructionHandler &handler, bool queueInstructions, std::istream &input)
- int convert_to_cnf_dimacs (const std::string &, const std::string &)
- int convert_to_cnf_smtlib (const std::string &, const std::string &)
- std::ostream & operator<< (std::ostream &os, CMakeOptionPrinter cmop)

- constexpr CMakeOptionPrinter CMakeOptions (bool advanced=false) noexcept
- template<typename Executor >
  bool parseInput (const std::string &pathToInputFile, Executor &e, bool &queueInstructions)
- template<typename Executor >
  int executeFile (const std::string &pathToInputFile, Executor &e)

  Parse the file and save it in formula.
- int analyze_file (const std::string &)
- template<typename Strategy >
  int run_dimacs_file (Strategy &, const std::string &)
- template<typename Strategy >
  int run_opb_file (Strategy &, const std::string &)
- FormulaT parse_smtlib (const std::string &)
- FormulaT parse_formula (const std::string &filename)

  Loads the smt2 file specified in filename and returns the formula.
- int preprocess_file (const std::string &filename, const std::string &outfile)

  Loads the smt2 file specified in filename and runs the preprocessing strategy.
- const auto & settings_analyzer ()
- analyzer::AnalyzerStatistics & analyze_formula (const FormulaT &f)
- template<typename TT , typename C >
  std::ostream & operator<< (std::ostream &os, const PriorityQueue< TT, C > &pq)
- const settings::Settings & Settings ()
- const auto & settings_core ()
- const auto & settings_solver ()
- const auto & settings_module ()
- template<typename T >
  auto & statistics_get (const std::string &name)
- const auto & settings_statistics ()
- bool is_sat (Answer a)
- std::ostream & operator<< (std::ostream &os, Answer a)
- auto & validation_get (const std::string &channel, const std::string &file, int line)
- const auto & settings_validation ()
- void visiting (const Expression &expr)
- void testExpression ()
- std::ostream & operator<< (std::ostream &os, MaxSMTStrategy ucs)
- std::ostream & operator<< (std::ostream &os, const CoveringStatus &status)
- template<typename Settings >
  std::ostream & operator<< (std::ostream &os, const LevelWiseInformation< Settings > &levelWise↩ Information)
- std::string get_name (SamplingAlgorithm samplingAlgorithm)
- std::string get_name (IsSampleOutsideAlgorithm samplingAlgorithm)
- FormulaT createZeroOne (carl::Variable xVariable, carl::Variable yVariable, carl::Variable zVariable)
- FormulaT createZeroTwo (carl::Variable xVariable, carl::Variable yVariable, carl::Variable zVariable)
- FormulaT createZeroThree (carl::Variable xVariable, carl::Variable yVariable, carl::Variable zVariable)
- FormulasT createZero (smtrat::VariableCapsule variableCapsule)
- FormulaT createTangentPlaneNEQOne (carl::Variable xVariable, carl::Variable yVariable, carl::Variable z↩ Variable, Rational aRational)
- FormulaT createTangentPlaneNEQTwo (carl::Variable xVariable, carl::Variable yVariable, carl::Variable z↩ Variable, Rational bRational)
- FormulaT createTangentPlaneNEQThree (carl::Variable xVariable, carl::Variable yVariable, carl::Variable z↩ Variable, Rational aRational, Rational bRational)
- FormulaT createTangentPlaneNEQFour (carl::Variable xVariable, carl::Variable yVariable, carl::Variable z↩ Variable, Rational aRational, Rational bRational)
- FormulasT createTangentPlaneNEQ (VariableCapsule variableCapsule, RationalCapsule rationalCapsule)
- FormulaT createTangentPlaneEQOne (carl::Variable xVariable, carl::Variable yVariable, carl::Variable z↩ Variable, Rational aRational)

- FormulaT createTangentPlaneEQTwo (carl::Variable xVariable, carl::Variable yVariable, carl::Variable z↩ Variable, Rational aRational)
- FormulasT createTangentPlaneEQ (VariableCapsule variableCapsule, RationalCapsule rationalCapsule)
- const smtrat::VariableCapsule extractVariables (MonomialMapIterator monomialIterator)
- Model createAbsoluteValuedModel (Model linearizedModel)
- carl::Variable createAuxiliaryVariable (carl::Variable variable)

  create an auxiliary variable e.g.
- FormulaT generateAbsFormula (carl::Variable variable, carl::Variable aux_variable)

  | x1 | = (and (=> (x1 >= 0) (y1 = x1)) (=> (x1 < 0) (y1 = -x1)))
- FormulaT generateAbsFormula (carl::Variable variableLeft, carl::Variable variableRight, carl::Relation relation)

  | x1 | <= | x1 | = (and (=> (x1 >= 0) (y1 = x1)) (=> (x1 < 0) (y1 = -x1)) (=> (x2 >= 0) (y2 = x2)) (=> (x2 < 0) (y2 = -x2)) (y1 <= y2))
- FormulaT createEquivalentToOriginalMonotonicityOne (smtrat::VariableCapsule variableCapsule, smtrat::VariableCapsule variableCapsuleInner)
- FormulaT createEquivalentToOriginalMonotonicityTwo (smtrat::VariableCapsule variableCapsule, smtrat::VariableCapsule variableCapsuleInner)
- FormulaT createEquivalentToOriginalMonotonicityThree (smtrat::VariableCapsule variableCapsule, smtrat::VariableCapsule variableCapsuleInner)
- RationalCapsule extractRationalCapsule (VariableCapsule variableCapsule, Model linearizedModel)
- FormulaT createOriginalMonotonicityOne (smtrat::VariableCapsule variableCapsule, smtrat::VariableCapsule variableCapsuleInner)
- FormulaT createOriginalMonotonicityTwo (smtrat::VariableCapsule variableCapsule, smtrat::VariableCapsule variableCapsuleInner)
- FormulaT createOriginalMonotonicityThree (smtrat::VariableCapsule variableCapsule, smtrat::VariableCapsule variableCapsuleInner)
- FormulasT createMonotonicity (VariableCapsule variableCapsuleOuter, VariableCapsule variableCapsule↩ Inner, Model absoluteValuedModel)
- FormulaT createCongruence (smtrat::VariableCapsule variableCapsuleOuter, smtrat::VariableCapsule variableCapsuleInner)
- FormulaT createICPGreaterOne (VariableCapsule variableCapsule, RationalCapsule rationalCapsule)
- FormulaT createICPGreaterTwo (VariableCapsule variableCapsule, RationalCapsule rationalCapsule)
- FormulasT createICPGreater (VariableCapsule variableCapsule, RationalCapsule rationalCapsule)
- FormulaT createICPLess (VariableCapsule variableCapsule, RationalCapsule rationalCapsule)
- bool abEqualcCheck (VariableCapsule variableCapsuleOuter, Model linearizedModel)
- bool abGreatercCheck (RationalCapsule rationalCapsule)
- bool abLesscCheck (RationalCapsule rationalCapsule)
- RationalCapsule generateAbcPrimeForICP (RationalCapsule rationalCapsule, bool isGreater)
- bool isAnyRationalIsZero (RationalCapsule rationalCapsule)
- Rational factorial (Rational n)
- Rational factorial (std::size_t)
- std::ostream & operator<< (std::ostream &os, Module::LemmaType lt)
- template<typename AnnotationType >
  void annotateFormula (const FormulaT &, const std::vector< AnnotationType > &)
- std::ostream & operator<< (std::ostream &os, const ModuleInput &mi)
- bool isCondition (carl::Condition _condition)
- template<typename Module >
  std::ostream & operator<< (std::ostream &os, const ModuleFactory< Module > &mf)
- std::ostream & operator<< (std::ostream &os, UnsatCoreStrategy ucs)

Variables

- static const Model EMPTY_MODEL = Model()
- static constexpr int COMMANDER_GROUP_SIZE = 4

0.14.7.1 Detailed Description

Class to create the formulas for axioms.
Class to create a substitution object.
Class to create a state object.
Class to create a condition object.

0.14.7.2 Typedef Documentation

0.14.7.2.1 BacktrackableClasses `using smtrat::BacktrackableClasses = typedef EQClasses< Backtrackable< PersistentUnionFind > >`

0.14.7.2.2 Classes `using smtrat::Classes = typedef BacktrackableClasses`

0.14.7.2.3 Conditionals `typedef std::vector< std::atomic_bool * > smtrat::Conditionals`
A vector of atomic bool pointers.

0.14.7.2.4 ConditionEvaluation `typedef bool(* smtrat::ConditionEvaluation) (carl::Condition)`

0.14.7.2.5 ConditionFunction `typedef std::function<bool(carl::Condition)> smtrat::ConditionFunction`

0.14.7.2.6 ConstraintsT `using smtrat::ConstraintsT = typedef carl::Constraints<Poly>`

0.14.7.2.7 ConstraintT `using smtrat::ConstraintT = typedef carl::Constraint<Poly>`

0.14.7.2.8 ContractionCandidates `typedef std::set<icp::ContractionCandidate*, icp::contractionCandidateComp> smtrat::ContractionCandidates`

0.14.7.2.9 DoubleInterval `using smtrat::DoubleInterval = typedef carl::Interval<double>`

0.14.7.2.10 EQClasses `template<typename Impl >`
`using smtrat::EQClasses = typedef UnionFindInterface< Type, Impl >`

0.14.7.2.11 EvalDoubleIntervalMap `using smtrat::EvalDoubleIntervalMap = typedef std::map<carl↩ ::Variable, DoubleInterval>`

0.14.7.2.12 EvalRationalIntervalMap `using smtrat::EvalRationalIntervalMap = typedef std::map<carl↩ ::Variable, RationalInterval>`

0.14.7.2.13 Expression `typedef expression::Expression smtrat::Expression`

0.14.7.2.14 Expressions `typedef expression::Expressions smtrat::Expressions`

0.14.7.2.15 Factorization `using smtrat::Factorization = typedef std::map<Poly, carl::uint>`

0.14.7.2.16 Formula_Origins `typedef std::map< FormulaT, std::shared_ptr< std::vector<FormulaT> > > smtrat::Formula_Origins`

0.14.7.2.17 FormulaOrigins `typedef std::map<FormulaT, std::shared_ptr<std::vector<FormulaT> > > smtrat::FormulaOrigins`

0.14.7.2.18 FormulaSetT `using smtrat::FormulaSetT = typedef carl::FormulaSet<Poly>`

0.14.7.2.19 FormulasMultiT `using smtrat::FormulasMultiT = typedef std::multiset<FormulaT>`

0.14.7.2.20 FormulasT `using smtrat::FormulasT = typedef carl::Formulas<Poly>`

0.14.7.2.21 FormulaT `using smtrat::FormulaT = typedef carl::Formula<Poly>`

0.14.7.2.22 InfinityValue `using smtrat::InfinityValue = typedef carl::InfinityValue`

0.14.7.2.23 Integer `using smtrat::Integer = typedef carl::IntegralType<Rational>::type`

0.14.7.2.24 Model `using smtrat::Model = typedef carl::Model<Rational, Poly>`

0.14.7.2.25 ModelPolynomialSubstitution `using smtrat::ModelPolynomialSubstitution = typedef carl::ModelPolynomialSubstitution<Rational, Poly>`

0.14.7.2.26 ModelSubstitution `using smtrat::ModelSubstitution = typedef carl::ModelSubstitution<Rational, Poly>`

0.14.7.2.27 ModelValue `using smtrat::ModelValue = typedef carl::ModelValue<Rational, Poly>`

0.14.7.2.28 ModelVariable `using smtrat::ModelVariable = typedef carl::ModelVariable`

0.14.7.2.29 MonomialMap `typedef std::unordered_map<carl::Variable, carl::Monomial::Arg> smtrat::MonomialMap`

0.14.7.2.30 MonomialMapIterator `typedef std::unordered_map<carl::Variable, carl::Monomial::↩ Arg>::iterator smtrat::MonomialMapIterator`

0.14.7.2.31 MultivariateRootT `using smtrat::MultivariateRootT = typedef carl::Multivariate↩ Root<Poly>`

0.14.7.2.32 ObjectiveValues `using smtrat::ObjectiveValues = typedef std::vector<std::pair<std↩::variant<Poly,std::string>, Model::mapped_type> >`

0.14.7.2.33 Poly `using smtrat::Poly = typedef carl::MultivariatePolynomial<Rational>`

0.14.7.2.34 Priority `using smtrat::Priority = typedef std::vector<std::size_t>`

0.14.7.2.35 RAN `using smtrat::RAN = typedef carl::IntRepRealAlgebraicNumber<Rational>`

0.14.7.2.36 Rational `using smtrat::Rational = typedef mpq_class`

0.14.7.2.37 RationalAssignment `using smtrat::RationalAssignment = typedef carl::Assignment<Rational>`

0.14.7.2.38 RationalInterval `using smtrat::RationalInterval = typedef carl::Interval<Rational>`

0.14.7.2.39 SingleFormulaOrigins `typedef std::pair<FormulaT, std::shared_ptr<std::vector<FormulaT>> > smtrat::SingleFormulaOrigins`

0.14.7.2.40 SqrtEx `using smtrat::SqrtEx = typedef carl::SqrtEx<Poly>`

0.14.7.2.41 StaticClasses `using smtrat::StaticClasses = typedef EQClasses< StaticUnionFind >`

0.14.7.2.42 Statistics `using smtrat::Statistics = typedef carl::statistics::Statistics`

0.14.7.2.43 TermT `using smtrat::TermT = typedef carl::Term<Rational>`

0.14.7.2.44 thread_priority `using smtrat::thread_priority = typedef std::pair<std::size_t, std↩::size_t>`

0.14.7.2.45 Type `using smtrat::Type = typedef carl::UVariable`

0.14.7.2.46 VariableAssignmentT `using smtrat::VariableAssignmentT = typedef carl::Variable↩Assignment<Poly>`

0.14.7.2.47 VariableComparisonT `using smtrat::VariableComparisonT = typedef carl::Variable↩Comparison<Poly>`

0.14.7.2.48 VariableUpperLower

`typedef std::map<carl::Variable, std::pair< std::vector<SingleFormulaOrigins> std::vector<SingleFormulaOrigins> > > smtrat::VariableUpperLower`

0.14.7.3 Enumeration Type Documentation

0.14.7.3.1 Answer

`enum smtrat::Answer`

An enum with the possible answers a Module can give.

Enumerator

SAT	
UNSAT	
UNKNOWN	
ABORTED	
OPTIMAL	

0.14.7.3.2 CoveringStatus

`enum smtrat::CoveringStatus`

Enumerator

partial	
full	
unknown	
failed	

0.14.7.3.3 IsSampleOutsideAlgorithm

`enum smtrat::IsSampleOutsideAlgorithm`

Enumerator

DEFAULT	

0.14.7.3.4 LemmaLevel

`enum smtrat::LemmaLevel`

Enumerator

NONE	
NORMAL	
ADVANCED	

0.14.7.3.5 MaxSMTStrategy

`enum smtrat::MaxSMTStrategy [strong]`

Enumerator

FU_MALIK_INCREMENTAL	
MSU3	
LINEAR_SEARCH	

0.14.7.3.6 SamplingAlgorithm `enum smtrat::SamplingAlgorithm`

Enumerator

LOWER_UPPER_BETWEEN_SAMPLING	

0.14.7.3.7 TheoryGuidedDecisionHeuristicLevel `enum smtrat::TheoryGuidedDecisionHeuristicLevel : unsigned [strong]`

Enumerator

CONFLICT_FIRST	
SATISFIED_FIRST	
DISABLED	

0.14.7.3.8 UnsatCoreStrategy `enum smtrat::UnsatCoreStrategy [strong]`

Enumerator

ModelExclusion	

0.14.7.4 Function Documentation

0.14.7.4.1 abEqualcCheck()

```
bool smtrat::abEqualcCheck (
    VariableCapsule variableCapsuleOuter,
    Model linearizedModel )
```

0.14.7.4.2 abGreatercCheck()

```
bool smtrat::abGreatercCheck (
    RationalCapsule rationalCapsule )
```

0.14.7.4.3 abLesscCheck()

```
bool smtrat::abLesscCheck (
    RationalCapsule rationalCapsule )
```

0.14.7.4.4 analyze_file()

```
int smtrat::analyze_file (
    const std::string & )
```

0.14.7.4.5 analyze_formula()

```
analyzer::AnalyzerStatistics & smtrat::analyze_formula (
    const FormulaT & f )
```

0.14.7.4.6 annotateFormula()

```
template<typename AnnotationType >
void smtrat::annotateFormula (
            const FormulaT & ,
            const std::vector< AnnotationType > &  )
```

0.14.7.4.7 CMakeOptions()

```
constexpr CMakeOptionPrinter smtrat::CMakeOptions (
            bool advanced = false )  [constexpr], [noexcept]
```

0.14.7.4.8 convert_to_cnf_dimacs()

```
int smtrat::convert_to_cnf_dimacs (
            const std::string & ,
            const std::string &  )
```

0.14.7.4.9 convert_to_cnf_smtlib()

```
int smtrat::convert_to_cnf_smtlib (
            const std::string & ,
            const std::string &  )
```

0.14.7.4.10 createAbsoluteValuedModel()

```
Model smtrat::createAbsoluteValuedModel (
            Model linearizedModel )
```

0.14.7.4.11 createAuxiliaryVariable()

```
carl::Variable smtrat::createAuxiliaryVariable (
            carl::Variable variable )
```

create an auxiliary variable e.g.
aux_<Variable Name>

Parameters

variable	the variable for which auxiliary variable to be created

Returns

created auxiliary variable

0.14.7.4.12 createCongruence()

```
FormulaT smtrat::createCongruence (
            smtrat::VariableCapsule variableCapsuleOuter,
            smtrat::VariableCapsule variableCapsuleInner )
```

0.14.7.4.13 createEquivalentToOriginalMonotonicityOne()

```
FormulaT smtrat::createEquivalentTo↩
OriginalMonotonicityOne (
            smtrat::VariableCapsule variableCapsule,
            smtrat::VariableCapsule variableCapsuleInner )
```

0.14.7.4.14 createEquivalentToOriginalMonotonicityThree()

```
FormulaT smtrat::createEquivalentTo↩
OriginalMonotonicityThree (
            smtrat::VariableCapsule variableCapsule,
            smtrat::VariableCapsule variableCapsuleInner )
```

0.14.7.4.15 createEquivalentToOriginalMonotonicityTwo()

```
FormulaT smtrat::createEquivalentTo↩
OriginalMonotonicityTwo (
    smtrat::VariableCapsule variableCapsule,
    smtrat::VariableCapsule variableCapsuleInner )
```

0.14.7.4.16 createICPGreater()

```
FormulasT smtrat::createICPGreater (
    VariableCapsule variableCapsule,
    RationalCapsule rationalCapsule )
```

0.14.7.4.17 createICPGreaterOne()

```
FormulaT smtrat::createICPGreaterOne (
    VariableCapsule variableCapsule,
    RationalCapsule rationalCapsule )
```

0.14.7.4.18 createICPGreaterTwo()

```
FormulaT smtrat::createICPGreaterTwo (
    VariableCapsule variableCapsule,
    RationalCapsule rationalCapsule )
```

0.14.7.4.19 createICPLess()

```
FormulaT smtrat::createICPLess (
    VariableCapsule variableCapsule,
    RationalCapsule rationalCapsule )
```

0.14.7.4.20 createMonotonicity()

```
FormulasT smtrat::createMonotonicity (
    VariableCapsule variableCapsuleOuter,
    VariableCapsule variableCapsuleInner,
    Model absoluteValuedModel )
```

0.14.7.4.21 createOriginalMonotonicityOne()

```
FormulaT smtrat::createOriginalMonotonicityOne (
    smtrat::VariableCapsule variableCapsule,
    smtrat::VariableCapsule variableCapsuleInner )
```

0.14.7.4.22 createOriginalMonotonicityThree()

```
FormulaT smtrat::createOriginalMonotonicityThree (
    smtrat::VariableCapsule variableCapsule,
    smtrat::VariableCapsule variableCapsuleInner )
```

0.14.7.4.23 createOriginalMonotonicityTwo()

```
FormulaT smtrat::createOriginalMonotonicityTwo (
    smtrat::VariableCapsule variableCapsule,
    smtrat::VariableCapsule variableCapsuleInner )
```

0.14.7.4.24 createTangentPlaneEQ()

```
FormulasT smtrat::createTangentPlaneEQ (
    VariableCapsule variableCapsule,
    RationalCapsule rationalCapsule )
```

0.14.7.4.25 createTangentPlaneEQOne()

```
FormulaT smtrat::createTangentPlaneEQOne (
    carl::Variable xVariable,
    carl::Variable yVariable,
```

```
carl::Variable zVariable,
Rational aRational )
```

0.14.7.4.26 createTangentPlaneEQTwo()

```
FormulaT smtrat::createTangentPlaneEQTwo (
carl::Variable xVariable,
carl::Variable yVariable,
carl::Variable zVariable,
Rational aRational )
```

0.14.7.4.27 createTangentPlaneNEQ()

```
FormulasT smtrat::createTangentPlaneNEQ (
VariableCapsule variableCapsule,
RationalCapsule rationalCapsule )
```

0.14.7.4.28 createTangentPlaneNEQFour()

```
FormulaT smtrat::createTangentPlaneNEQFour (
carl::Variable xVariable,
carl::Variable yVariable,
carl::Variable zVariable,
Rational aRational,
Rational bRational )
```

0.14.7.4.29 createTangentPlaneNEQOne()

```
FormulaT smtrat::createTangentPlaneNEQOne (
carl::Variable xVariable,
carl::Variable yVariable,
carl::Variable zVariable,
Rational aRational )
```

0.14.7.4.30 createTangentPlaneNEQThree()

```
FormulaT smtrat::createTangentPlaneNEQThree (
carl::Variable xVariable,
carl::Variable yVariable,
carl::Variable zVariable,
Rational aRational,
Rational bRational )
```

0.14.7.4.31 createTangentPlaneNEQTwo()

```
FormulaT smtrat::createTangentPlaneNEQTwo (
carl::Variable xVariable,
carl::Variable yVariable,
carl::Variable zVariable,
Rational bRational )
```

0.14.7.4.32 createZero()

```
FormulasT smtrat::createZero (
smtrat::VariableCapsule variableCapsule )
```

0.14.7.4.33 createZeroOne()

```
FormulaT smtrat::createZeroOne (
carl::Variable xVariable,
carl::Variable yVariable,
carl::Variable zVariable )
```

0.14.7.4.34 createZeroThree()

```
FormulaT smtrat::createZeroThree (
    carl::Variable xVariable,
    carl::Variable yVariable,
    carl::Variable zVariable )
```

0.14.7.4.35 createZeroTwo()

```
FormulaT smtrat::createZeroTwo (
    carl::Variable xVariable,
    carl::Variable yVariable,
    carl::Variable zVariable )
```

0.14.7.4.36 executeFile()

```
template<typename Executor >
int smtrat::executeFile (
    const std::string & pathToInputFile,
    Executor & e )
```

Parse the file and save it in formula.

Parameters

pathToInputFile	The path to the input smt2 file.
formula	A pointer to the formula object which holds the parsed input afterwards.
options	Save options from the smt2 file here.

0.14.7.4.37 extractRationalCapsule()

```
RationalCapsule smtrat::extractRationalCapsule (
    VariableCapsule variableCapsule,
    Model linearizedModel )
```

0.14.7.4.38 extractVariables()

```
const smtrat::VariableCapsule smtrat::extractVariables (
    MonomialMapIterator monomialIterator )
```

0.14.7.4.39 factorial() [1/2]

```
Rational smtrat::factorial (
    Rational n )
```

0.14.7.4.40 factorial() [2/2]

```
Rational smtrat::factorial (
    std::size_t n )
```

0.14.7.4.41 generateAbcPrimeForICP()

```
RationalCapsule smtrat::generateAbcPrimeForICP (
    RationalCapsule rationalCapsule,
    bool isGreater )
```

0.14.7.4.42 generateAbsFormula() [1/2]

```
FormulaT smtrat::generateAbsFormula (
    carl::Variable variable,
    carl::Variable aux_variable )
```

| x1 | = (and (=> (x1 >= 0) (y1 = x1)) (=> (x1 < 0) (y1 = -x1)))

Parameters

variable	

Returns

0.14.7.4.43 generateAbsFormula() [2/2]

```
FormulaT smtrat::generateAbsFormula (
    carl::Variable variableLeft,
    carl::Variable variableRight,
    carl::Relation relation )
```

| x1 | <= | x1 | = (and (=> (x1 >= 0) (y1 = x1)) (=> (x1 < 0) (y1 = -x1)) (=> (x2 >= 0) (y2 = x2)) (=> (x2 < 0) (y2 = -x2)) (y1 <= y2))

Parameters

variableLeft	
variableRight	
relation	

Returns

0.14.7.4.44 get_name() [1/2]

```
std::string smtrat::get_name (
    IsSampleOutsideAlgorithm samplingAlgorithm ) [inline]
```

0.14.7.4.45 get_name() [2/2]

```
std::string smtrat::get_name (
    SamplingAlgorithm samplingAlgorithm ) [inline]
```

0.14.7.4.46 handle_basic_options()

```
int smtrat::handle_basic_options (
    const SettingsParser & parser )
```

0.14.7.4.47 is_sat()

```
bool smtrat::is_sat (
    Answer a ) [inline]
```

0.14.7.4.48 isAnyRationalIsZero()

```
bool smtrat::isAnyRationalIsZero (
    RationalCapsule rationalCapsule )
```

0.14.7.4.49 isCondition()

```
bool smtrat::isCondition (
    carl::Condition _condition )
```

0.14.7.4.50 operator<<() [1/10]

```
std::ostream& smtrat::operator<< (
    std::ostream & os,
    Answer a ) [inline]
```

0.14.7.4.51 operator<<() [2/10]

```
std::ostream & smtrat::operator<< (
    std::ostream & os,
    CMakeOptionPrinter cmop )
```

0.14.7.4.52 operator<<() [3/10]

```
std::ostream& smtrat::operator<< (
    std::ostream & os,
    const CoveringStatus & status ) [inline]
```

0.14.7.4.53 operator<<() [4/10]

```
template<typename Settings >
std::ostream& smtrat::operator<< (
    std::ostream & os,
    const LevelWiseInformation< Settings > & levelWiseInformation ) [inline]
```

0.14.7.4.54 operator<<() [5/10]

```
template<typename Module >
std::ostream& smtrat::operator<< (
    std::ostream & os,
    const ModuleFactory< Module > & mf ) [inline]
```

0.14.7.4.55 operator<<() [6/10]

```
std::ostream& smtrat::operator<< (
    std::ostream & os,
    const ModuleInput & mi ) [inline]
```

0.14.7.4.56 operator<<() [7/10]

```
template<typename TT , typename C >
std::ostream& smtrat::operator<< (
    std::ostream & os,
    const PriorityQueue< TT, C > & pq )
```

0.14.7.4.57 operator<<() [8/10]

```
std::ostream& smtrat::operator<< (
    std::ostream & os,
    MaxSMTStrategy ucs ) [inline]
```

0.14.7.4.58 operator<<() [9/10]

```
std::ostream& smtrat::operator<< (
    std::ostream & os,
    Module::LemmaType lt ) [inline]
```

0.14.7.4.59 operator<<() [10/10]

```
std::ostream& smtrat::operator<< (
    std::ostream & os,
    UnsatCoreStrategy ucs ) [inline]
```

0.14.7.4.60 parse_formula()

```
FormulaT smtrat::parse_formula (
    const std::string & filename )
```

Loads the smt2 file specified in filename and returns the formula.
This function ignores most SMT-LIB commands but simply accumulated all asserted formulas.

0.14.7.4.61 parse_smtlib()

```
FormulaT smtrat::parse_smtlib (
    const std::string & )
```

0.14.7.4.62 parseInput()

```
template<typename Executor >
bool smtrat::parseInput (
    const std::string & pathToInputFile,
```

```
Executor & e,
bool & queueInstructions )
```

0.14.7.4.63 parseSMT2File()

```
bool smtrat::parseSMT2File (
    parser::InstructionHandler & handler,
    bool queueInstructions,
    std::istream & input )
```

0.14.7.4.64 preprocess_file()

```
int smtrat::preprocess_file (
    const std::string & filename,
    const std::string & outfile )
```

Loads the smt2 file specified in filename and runs the preprocessing strategy.
The resulting (simplified) problem is written to outfile (or stdout if outfile is empty).

0.14.7.4.65 run_dimacs_file()

```
template<typename Strategy >
int smtrat::run_dimacs_file (
    Strategy & ,
    const std::string &  )
```

0.14.7.4.66 run_opb_file()

```
template<typename Strategy >
int smtrat::run_opb_file (
    Strategy & ,
    const std::string &  )
```

0.14.7.4.67 Settings()

```
const settings::Settings& smtrat::Settings ( ) [inline]
```

0.14.7.4.68 settings_analyzer()

```
const auto& smtrat::settings_analyzer ( ) [inline]
```

0.14.7.4.69 settings_core()

```
const auto& smtrat::settings_core ( ) [inline]
```

0.14.7.4.70 settings_module()

```
const auto& smtrat::settings_module ( ) [inline]
```

0.14.7.4.71 settings_parser()

```
const auto& smtrat::settings_parser ( ) [inline]
```

0.14.7.4.72 settings_solver()

```
const auto& smtrat::settings_solver ( ) [inline]
```

0.14.7.4.73 settings_statistics()

```
const auto& smtrat::settings_statistics ( ) [inline]
```

0.14.7.4.74 settings_validation()

```
const auto& smtrat::settings_validation ( ) [inline]
```

0.14.7.4.75 statistics_get()

```
template<typename T >
auto& smtrat::statistics_get (
    const std::string & name )
```

0.14.7.4.76 testExpression() `void smtrat::testExpression ( )`

0.14.14.1 Function Documentation

0.14.14.1.1 canBeForwarded()

```
bool smtrat::cad::projection::canBeForwarded (
    std::size_t ,
    const UPoly & p ) [inline]
```

Checks whether a polynomial can safely be forwarded to the next level.

0.14.14.1.2 canBeRemoved()

```
bool smtrat::cad::projection::canBeRemoved (
    const UPoly & p ) [inline]
```

Checks whether a polynomial can safely be ignored.

0.14.14.1.3 discriminant()

```
template<typename Poly >
Poly smtrat::cad::projection::discriminant (
    carl::Variable variable,
    const Poly & p )
```

Computes the discriminant of a polynomial.
The polynomial is assumed to be univariate and thus knows is main variable. The given variable instead indicates the main variable of the resulting polynomial.

Parameters

variable	Main variable of the resulting polynomial.
p	Input polynomial.

Returns

Discriminant of p in main variable variable.

0.14.14.1.4 doesNotVanish()

```
template<typename Poly >
bool smtrat::cad::projection::doesNotVanish (
    const Poly & p )
```

Tries to determine whether the given Poly vanishes for some assignment.
Returns true if the Poly is guaranteed not to vanish. Returns false otherwise.

0.14.14.1.5 normalize()

```
template<typename Poly >
Poly smtrat::cad::projection::normalize (
            const Poly & p )
```

Normalizes the given Poly by removing constant and duplicate factors.

0.14.14.1.6 PSC()

```
template<typename Poly >
std::vector<Poly> smtrat::cad::projection::PSC (
            const Poly & p,
            const Poly & q )
```

Computes the Principal Subresultant Coefficients of two polynomials.

0.14.14.1.7 resultant()

```
template<typename Poly >
Poly smtrat::cad::projection::resultant (
            carl::Variable variable,
            const Poly & p,
            const Poly & q )
```

Computes the resultant of two polynomials.
The polynomials are assumed to be univariate polynomials and thus know their respective main variables. The given variable instead indicates the main variable of the resulting polynomial.

Parameters

variable	Main variable of the resulting polynomial.
p	First input polynomial.
q	Second input polynomial.

Returns

Resultant of p and q in main variable variable.

0.14.14.1.8 returnPoly()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::returnPoly (
            const Poly & p,
            Callback && cb )
```

0.14.15 smtrat::cad::projection::brown Namespace Reference

Contains the implementation of Browns projection operator as specified in **?** after Theorem 3.1.

Functions

- template<typename Poly , typename Callback >
  void single (const Poly &p, carl::Variable variable, Callback &&cb)

  Implements the part of Browns projection operator from **?** *that deals with a single polynomial* $p \leftarrow : \{leading_coeff(p), discriminant(p)\}$.
- template<typename Poly , typename Callback >
  void paired (const Poly &p, const UPoly &q, carl::Variable variable, Callback &&cb)

  Implements the part of Browns projection operator from **?** *that deals with two polynomials* p *and* q *which is just the respective part of McCallums projection operator mccallum::paired.*

0.14.15.1 Detailed Description

Contains the implementation of Browns projection operator as specified in **?** after Theorem 3.1.

0.14.15.2 Function Documentation

0.14.15.2.1 paired()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::brown::paired (
            const Poly & p,
            const UPoly & q,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of Browns projection operator from **?** that deals with two polynomials p and q which is just the respective part of McCallums projection operator mccallum::paired.

0.14.15.2.2 single()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::brown::single (
            const Poly & p,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of Browns projection operator from **?** that deals with a single polynomial $\mathrm{p}\hookleftarrow$: $\{leading_c oeff(p), discriminant(p)\}$.

0.14.16 smtrat::cad::projection::collins Namespace Reference

Contains the implementation of Collins projection operator as specified in **?** below Theorem 4.

Functions

- template<typename Poly , typename Callback >
  void single (const Poly &p, carl::Variable variable, Callback &&cb)

  Implements the part of Collins projection operator from **?** *that deals with a single polynomial* $p\hookleftarrow$ *:* $\bigcup_{B\in RED(p)}\{ldcf(B)\}\cup PSC(B,B')$.
- template<typename Poly , typename Callback >
  void paired (const Poly &p, const UPoly &q, carl::Variable variable, Callback &&cb)

  Implements the part of Collins projection operator from **?** *that deals with two polynomials* p *and* $q\hookleftarrow$ *:* $\bigcup_{B_1\in RED(p),B_2\in RED(q)} PSC(B_1,B_2)$.

0.14.16.1 Detailed Description

Contains the implementation of Collins projection operator as specified in **?** below Theorem 4.

0.14.16.2 Function Documentation

0.14.16.2.1 paired()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::collins::paired (
            const Poly & p,
            const UPoly & q,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of Collins projection operator from **?** that deals with two polynomials p and $\mathrm{q}\hookleftarrow$: $\bigcup_{B_1\in RED(p),B_2\in RED(q)} PSC(B_1,B_2)$.

0.14.16.2.2 single()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::collins::single (
            const Poly & p,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of Collins projection operator from **?** that deals with a single polynomial $p \leftarrow : \bigcup_{B \in RED(p)} \{ldcf(B)\} \cup PSC(B, B')$.

0.14.17 smtrat::cad::projection::hong Namespace Reference

Contains the implementation of Hongs projection operator as specified in **?** in Section 2.2.

Functions

- template<typename Poly , typename Callback >
  void single (const Poly &p, carl::Variable variable, Callback &&cb)

  Implements the part of Hongs projection operator from **?** *that deals with a single polynomial p which is just the respective part of Collins' projection operator collins::single.*
- template<typename Poly , typename Callback >
  void paired (const Poly &p, const UPoly &q, carl::Variable variable, Callback &&cb)

  Implements the part of Hongs projection operator from **?** *that deals with two polynomials p and $q \leftarrow : \bigcup_{F \in RED(p)} PSC(F, q)$.*

0.14.17.1 Detailed Description

Contains the implementation of Hongs projection operator as specified in **?** in Section 2.2.

0.14.17.2 Function Documentation

0.14.17.2.1 paired()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::hong::paired (
            const Poly & p,
            const UPoly & q,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of Hongs projection operator from **?** that deals with two polynomials p and $q \leftarrow : \bigcup_{F \in RED(p)} PSC(F, q)$.

0.14.17.2.2 single()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::hong::single (
            const Poly & p,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of Hongs projection operator from **?** that deals with a single polynomial p which is just the respective part of Collins' projection operator collins::single.

0.14.18 smtrat::cad::projection::lazard Namespace Reference

Contains the implementation of Lazards projection operator as specified in **[Lauard1994]**.

Functions

- template<typename Poly , typename Callback >
  void single (const Poly &p, carl::Variable variable, Callback &&cb)

Implements the part of Lazards projection operator from **?** *that deals with a single polynomial* $p \hookleftarrow : \{leading_c oeff(p), trailing_c oeff(p), discriminant(p)\}$.

- template<typename Poly , typename Callback >
  void paired (const Poly &p, const UPoly &q, carl::Variable variable, Callback &&cb)

  Implements the part of Lazard projection operator from **?** *that deals with two polynomials* p *and* q *which is just the respective part of McCallums projection operator mccallum::paired.*

0.14.18.1 Detailed Description

Contains the implementation of Lazards projection operator as specified in **[Lauard1994]**.

0.14.18.2 Function Documentation

0.14.18.2.1 paired()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::lazard::paired (
            const Poly & p,
            const UPoly & q,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of Lazard projection operator from **?** that deals with two polynomials p and q which is just the respective part of McCallums projection operator mccallum::paired.

0.14.18.2.2 single()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::lazard::single (
            const Poly & p,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of Lazards projection operator from **?** that deals with a single polynomial $\mathrm{p} \hookleftarrow : \{leading_c oeff(p), trailing_c oeff(p), discriminant(p)\}$.

0.14.19 smtrat::cad::projection::mccallum Namespace Reference

Contains the implementation of McCallums projection operator as specified in **?**.

Functions

- template<typename Poly , typename Callback >
  void single (const Poly &p, carl::Variable variable, Callback &&cb)

  Implements the part of McCallums projection operator from **?** *that deals with a single polynomial* $p \hookleftarrow : coefficients(p) \cup \{discriminant(p)\}$.
- template<typename Poly , typename Callback >
  void paired (const Poly &p, const UPoly &q, carl::Variable variable, Callback &&cb)

  Implements the part of McCallums projection operator from **?** *that deals with two polynomials* p *and* $q \hookleftarrow : \{resultant(p, q)\}$.

0.14.19.1 Detailed Description

Contains the implementation of McCallums projection operator as specified in **?**.

0.14.19.2 Function Documentation

0.14.19.2.1 paired()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::mccallum::paired (
            const Poly & p,
            const UPoly & q,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of McCallums projection operator from **?** that deals with two polynomials p and q↩ : $\{resultant(p, q)\}$.

0.14.19.2.2 single()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::mccallum::single (
            const Poly & p,
            carl::Variable variable,
            Callback && cb )
```

Implements the part of McCallums projection operator from **?** that deals with a single polynomial p↩ : $coefficients(p) \cup \{discriminant(p)\}$.

0.14.20 smtrat::cad::projection::mccallum_partial Namespace Reference

Contains the implementation of an optimized version McCallums projection operator.

Functions

- template<typename Poly , typename Callback >
  void single (const Poly &p, carl::Variable variable, Callback &&cb)
- template<typename Poly , typename Callback >
  void paired (const Poly &p, const UPoly &q, carl::Variable variable, Callback &&cb)

0.14.20.1 Detailed Description

Contains the implementation of an optimized version McCallums projection operator.
It is based on the observation by Brown that if some coefficient does not vanish only the leading coefficient is required.

0.14.20.2 Function Documentation

0.14.20.2.1 paired()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::mccallum_partial::paired (
            const Poly & p,
            const UPoly & q,
            carl::Variable variable,
            Callback && cb )
```

0.14.20.2.2 single()

```
template<typename Poly , typename Callback >
void smtrat::cad::projection::mccallum_partial::single (
            const Poly & p,
            carl::Variable variable,
            Callback && cb )
```

0.14.21 smtrat::cad::projection_compare Namespace Reference

0.14.24.1 Detailed Description

A framework for sample-based CAD algorithms.
This is a highly modular framework for sample-based CAD algorithms, i.e. single cell construction and coverings. The basic idea is to have properties (of some polynomials or real root functions); each property has a level w.r.t. to a variable ordering (i.e. the index of the main variable of a polynomial) and rules operating on them, each replacing a property by a "simpler" set of properties (eventually reducing the level). At some stage, we delineate properties (that is, ordering the root under a partial sample), determine an ordering and cell boundaries (called representation) to continue proving properties. For more details on the general framework, we refer to the paper.
The structure of this implementation is as follows:

- cadcells::datastructures contains the main datastructures. Read here for more details on the general structure of the framework.
- cadcells::operators defines the properties, the rules and methods to delineate properties. These are used by operators which provide an interface for performing projections on certain steps.
- cadcells::representation provides heuristics for computing the representations for cells, coverings and delineations.
- cadcells::algorithms contains helper methods, building blocks for algorithms as well as algorithms themselves. Go here for usage of the framework and high-level interfaces.

0.14.24.1.1 Quick start

For an introduction, we refer to the code of algorithms::onecell.

0.14.24.2 Typedef Documentation

0.14.24.2.1 Assignment

0.14.25 smtrat::cadcells::algorithms Namespace Reference

Various algorithms as well as helper functions for developing new algorithms.

Functions

- template<cadcells::operators::op op, representation::CellHeuristic cell_heuristic>
  std::optional< std::pair< carl::Variable, datastructures::SymbolicInterval > > get_interval (datastructures::SampledDerivationR typename operators::PropertiesSet< op >::type > &cell_deriv)

  Single cell construction algorithm.
- template<cadcells::operators::op op, representation::CoveringHeuristic covering_heuristic>
  std::optional< datastructures::SampledDerivationRef< typename operators::PropertiesSet< op >::type > > get_level_covering (datastructures::Projections &proj, const std::vector< Atom > &constraints, const Assignment &sample)

  Computes an unsat covering w.r.t.
- template<cadcells::operators::op op>
  std::vector< datastructures::SampledDerivationRef< typename operators::PropertiesSet< op >::type > > get_unsat_intervals (const Constraint &c, datastructures::Projections &proj, const Assignment &sample)

- template<cadcells::operators::op op>
  std::vector< datastructures::SampledDerivationRef< typename operators::PropertiesSet< op >::type > > get_unsat_intervals (const VariableComparison &c, datastructures::Projections &proj, const Assignment &sample)
- template<cadcells::operators::op op>
  std::vector< datastructures::SampledDerivationRef< typename operators::PropertiesSet< op >::type > > get_unsat_intervals (const Atom &c, datastructures::Projections &proj, const Assignment &sample)

  Returns the unsat intervals of the given atom w.r.t.

0.14.25.1 Detailed Description

Various algorithms as well as helper functions for developing new algorithms.

0.14.25.2 Function Documentation

0.14.25.2.1 get_interval()

```
template<cadcells::operators::op op, representation::CellHeuristic cell_heuristic>
std::optional<std::pair<carl::Variable, datastructures::SymbolicInterval> > smtrat::cadcells↩
::algorithms::get_interval (
            datastructures::SampledDerivationRef< typename operators::PropertiesSet< op >↩
::type > & cell_deriv )
```

Single cell construction algorithm.

Template Parameters

op	The operator.
cell_heuristic	The cell heuristic.

Parameters

cell_deriv	A derivation object to construct the cell from.

Returns

A vector of pairs of variables and their symbolic intervals on success or std::nullopt otherwise.

0.14.25.2.2 get_level_covering()

```
template<cadcells::operators::op op, representation::Covering↩
Heuristic covering_heuristic>
std::optional<datastructures::SampledDerivationRef<typename operators::PropertiesSet<op>↩
::type> > smtrat::cadcells::algorithms::get_level_covering (
            datastructures::Projections & proj,
            const std::vector< Atom > & constraints,
            const Assignment & sample )
```

Computes an unsat covering w.r.t.
a set of constraints.
If a constraint is univariate under a sample, for the unassinged variables, the constraint induces intervals in which the constraint will be conflicting. If multiple such intervals from a set of constraints cover the real line, then the partial sample cannot be extended without making a conflict. This conflict is generalized.

Parameters

constraints	Atoms of the same level such that sample cannot be extended for the highest variable without making one atom false. Note that this property is not checked.
sample	A sample such that all but the highest variable in constraints are assigned.

Returns

A sampled derivation which contains the information to reproduce the conflict.

0.14.25.2.3 get_unsat_intervals() [1/3]

```
template<cadcells::operators::op op>
std::vector<datastructures::SampledDerivationRef<typename operators::PropertiesSet<op>↩
::type> > smtrat::cadcells::algorithms::get_unsat_intervals (
            const Atom & c,
            datastructures::Projections & proj,
            const Assignment & sample )
```

Returns the unsat intervals of the given atom w.r.t.
an underlying sample.

Parameters

c	A constraint or a variable comparison.
sample	A sample point such that the highest variable in c w.r.t. the variable odering in proj is the only unassigned variable.

Returns

A list of sampled derivations with the same delineated derivations. The samples for the unassigned variables are sampled from the respective interval.

0.14.25.2.4 get_unsat_intervals() [2/3]

```
template<cadcells::operators::op op>
std::vector<datastructures::SampledDerivationRef<typename operators::PropertiesSet<op>↩
::type> > smtrat::cadcells::algorithms::get_unsat_intervals (
            const Constraint & c,
            datastructures::Projections & proj,
            const Assignment & sample )
```

0.14.25.2.5 get_unsat_intervals() [3/3]

```
template<cadcells::operators::op op>
std::vector<datastructures::SampledDerivationRef<typename operators::PropertiesSet<op>↩
::type> > smtrat::cadcells::algorithms::get_unsat_intervals (
            const VariableComparison & c,
            datastructures::Projections & proj,
            const Assignment & sample )
```

0.14.26 smtrat::cadcells::datastructures Namespace Reference

Main datastructures.

Namespaces

- detail

Data Structures

- struct TaggedIndexedRoot
- class DelineationInterval

  An interval of a delineation.
- class Delineation

  Represents the delineation of a set of polynomials (at a sample), that is.

- class BaseDerivation

  A BaseDerivation has a level and a set of properties of this level, and an underlying derivation representing the lower levels.
- class DelineatedDerivation

  A DelineatedDerivation is a BaseDerivation with a Delineation and an underlying SampledDerivation.
- class SampledDerivation

  A SampledDerivation is a DelineatedDerivation with a sample and an DelineationInterval w.r.t.
- class DerivationRef

  A reference to a derivation, which is either.
- struct PolyRef

  Refers to a polynomial.
- class PolyPool

  A pool for polynomials.
- class Projections

  Encapsulates all computations on polynomials.
- struct property_hash
- struct PropertiesTContent
- struct PropertiesTContent< T, true >
- struct PropertiesTContent< T, false >
- struct PropertiesT

  Set of properties.
- struct PropertiesT< T, Ts... >
- struct CellRepresentation

  Represents a cell.
- struct CoveringRepresentation

  Represents a covering over a cell.
- struct IndexedRoot

  Represents the i-th root of a multivariate polynomial at its main variable (given an appropriate sample).
- struct CompoundMinMax

  Represents the minimum function of the contained indexed root functions.
- struct CompoundMaxMin

  Represents the maximum function of the contained indexed root functions.
- class RootFunction
- class Bound

  Bound type of a SymbolicInterval.
- class SymbolicInterval

  A symbolic interal whose bounds are defined by indexed root expressions.
- class CoveringDescription

  Describes a covering of the real line by SymbolicIntervals (given an appropriate sample).
- struct IndexedRootRelation

  A relation between two roots.
- class IndexedRootOrdering

  Describes an ordering of IndexedRoots.

Typedefs

- using RootMap = std::map< RAN, std::vector< TaggedIndexedRoot > >
- using RootMapPlain = std::map< RAN, std::vector< IndexedRoot > >
- template<typename Properties >
  using BaseDerivationRef = std::shared_ptr< BaseDerivation< Properties > >
- template<typename Properties >

Functions

- std::ostream & operator<< (std::ostream &os, const TaggedIndexedRoot &data)
- bool operator== (const TaggedIndexedRoot &lhs, const TaggedIndexedRoot &rhs)
- bool operator< (const TaggedIndexedRoot &lhs, const TaggedIndexedRoot &rhs)
- std::ostream & operator<< (std::ostream &os, const DelineationInterval &data)
- std::ostream & operator<< (std::ostream &os, const Delineation &data)
- bool lower_lt_lower (const DelineationInterval &del1, const DelineationInterval &del2)

  Compares the lower bounds of two DelineationIntervals.
- bool lower_eq_lower (const DelineationInterval &del1, const DelineationInterval &del2)

  Compares the lower bounds of two DelineationIntervals.
- bool upper_lt_upper (const DelineationInterval &del1, const DelineationInterval &del2)

  Compares the upper bounds of two DelineationIntervals.
- bool upper_lt_lower (const DelineationInterval &del1, const DelineationInterval &del2)

  Compares an upper bound with a lower bound of DelineationIntervals.
- template<typename P >
  bool operator== (const DerivationRef< P > &lhs, const DerivationRef< P > &rhs)
- template<typename P >
  bool operator< (const DerivationRef< P > &lhs, const DerivationRef< P > &rhs)
- template<typename Properties >
  DerivationRef< Properties > make_derivation (Projections &proj, const Assignment &assignment, size_↩t level)

  Initializes a derivation according the the given assignment and level.
- template<typename Properties >
  SampledDerivationRef< Properties > make_sampled_derivation (DelineatedDerivationRef< Properties > delineated, const RAN &main_sample)

  Initializes a sampled derivation w.r.t.
- template<typename Properties >
  void merge_underlying (std::vector< SampledDerivationRef< Properties >> &derivations)

  Merges the underlying derivations of a set of sampled derivations.
- bool operator< (const PolyRef &lhs, const PolyRef &rhs)

- std::ostream & operator<< (std::ostream &os, const IndexedRootOrdering &data)

0.14.26.1 Detailed Description

Main datastructures.

0.14.26.1.1 Polynomials and projection results We assume a fixed variable ordering VariableOrdering. All polynomials are pooled in PolyPool w.r.t. this ordering, that is, they are identified by a PolyRef (a pair of the polynomial's level and an ID on this level). Projection results are cached in Projections. The latter holds a reference to a PolyPool. An instance Projections will be required for all kinds of operations and passed during various function calls. Thus, we initialize these data structures as follows:

```
VariableOrdering vars; // a variable ordering of all variables that will occur.
datastructures::PolyPool pool(vars);
datastructures::Projections proj(pool);
```

Note that PolyPool and Projections do not do reference counting; the cache needs to be cleared explicitly, see Projections::clear_cache and Projections::clear_assignment_cache.

0.14.26.1.2 Basic datastructures The basic datastructures for representing mathematical objects are datastructures::IndexedRoot, datastructures::SymbolicInterval, datastructures::CoveringDescription, and datastructures::IndexedRoot

0.14.26.1.3 Properties datastructures::PropertiesT is the datastructure for storing properties on a single level.
If you work on an algorithm using this framework, you don't need to know this datastructure. If you need to implement a new property, then you find the interfaces a property needs to implement there.

0.14.26.1.4 Delineations datastructures::Delineation is the datastructure for storing the delineation of the indexed roots that stem from properties.
If you work on an algorithm using this framework, you don't need to know this datastructure. If you need to implement a new property or a heuristic for describing a cell (i.e. compute a representation), then you might be interested in this.

0.14.26.1.5 Derivations In the derivation datastructures, all data regarding the derivation is stored - that is the current sample points, the set of properties, the delineation of roots and the possible cell boundaries.
This datastructure is recursive, that is, each derivation object handles only a single level and holds a pointer to a derivation object of the next lower level (the underyling derivation). All operations are forwarded to lower levels whenever neccessary.
Furthermore, there are three types of derivations:

- datastructures::BaseDerivation assumes no sample point or whatever. It simply stores properties.

- datastructures::DelineatedDerivation extends the datastructures::BaseDerivation; it requires that the underlying derivation is a datastructures::SampledDerivation, thus a sample for all lower levels is present under which the properties of the current level can be delineated (i.e. their zeros can be isolated and sorted).
- datastructures::SampledDerivation extends the datastructures::DelineatedDerivation, thus a full sample point is available for which a cell can be isolated. The derivation datastructures are thus two-dimensional recursive. Note that multiple derivation objects can have common underlying cells or even share the same base or delineated derivation.

datastructures::DerivationRef allows to reference a derivation independent of its type.
For initializing derivations properly, use datastructures::make_derivation. To create a sampled derivation from a delineated derivation and a sample, use datastructures::make_sampled_derivation. For merging underlying derivations, use datastructures::merge_underlying.
For more information on memory management read datastructures::DerivationRef.

0.14.26.1.6 Representations The derivation objects do not store heuristic decisions, they just describe the current state. At some point, a representation of this state needs to be determined that is passed to the operator. This heuristic decision is stored in datastructures::CellRepresentation or datastructures::CoveringRepresentation.
The heuristics for computing representations are in representation.

0.14.26.1.7 Operators The operators work on derivations and representations.

0.14.26.2 Typedef Documentation

0.14.26.2.1 BaseDerivationRef

```
template<typename Properties >
using smtrat::cadcells::datastructures::BaseDerivationRef = typedef std::shared_ptr<BaseDerivation<Properties
>
```

0.14.26.2.2 DelineatedDerivationRef

```
template<typename Properties >
using smtrat::cadcells::datastructures::DelineatedDerivationRef = typedef std::shared_ptr<DelineatedDerivatio
>
```

0.14.26.2.3 PropertiesTSet

```
template<typename T >
using smtrat::cadcells::datastructures::PropertiesTSet = typedef boost::container::flat_set<T>
```

0.14.26.2.4 RootMap

```
using smtrat::cadcells::datastructures::RootMap = typedef std::map<RAN,
std::vector<TaggedIndexedRoot> >
```

0.14.26.2.5 RootMapPlain

```
using smtrat::cadcells::datastructures::RootMapPlain = typedef std↩
::map<RAN, std::vector<IndexedRoot> >
```

0.14.26.2.6 SampledDerivationRef

```
template<typename Properties >
using smtrat::cadcells::datastructures::SampledDerivationRef = typedef std::shared_ptr<SampledDerivation<Prop
>
```

0.14.26.3 Function Documentation

0.14.26.3.1 lower_eq_lower()

```
bool smtrat::cadcells::datastructures::lower_eq_lower (
    const DelineationInterval & del1,
    const DelineationInterval & del2 ) [inline]
```

Compares the lower bounds of two DelineationIntervals.
It respects whether the interval is a section or sector.

0.14.26.3.2 lower_lt_lower()

```
bool smtrat::cadcells::datastructures::lower_lt_lower (
    const DelineationInterval & del1,
    const DelineationInterval & del2 ) [inline]
```

Compares the lower bounds of two DelineationIntervals.
It respects whether the interval is a section or sector.

0.14.26.3.3 make_derivation()

```
template<typename Properties >
DerivationRef<Properties> smtrat::cadcells::datastructures::make_derivation (
    Projections & proj,
    const Assignment & assignment,
    size_t level )
```

Initializes a derivation according the the given assignment and level.

0.14.26.3.4 make_sampled_derivation()

```
template<typename Properties >
SampledDerivationRef<Properties> smtrat::cadcells::datastructures::make_sampled_derivation (
    DelineatedDerivationRef< Properties > delineated,
    const RAN & main_sample )
```

Initializes a sampled derivation w.r.t.
the delineated derivation and sample.

0.14.26.3.5 merge()

```
template<class T , class... Ts>
void smtrat::cadcells::datastructures::merge (
    PropertiesT< T, Ts... > & sets_a,
    const PropertiesT< T, Ts... > & sets_b )
```

0.14.26.3.6 merge_underlying()

```
template<typename Properties >
void smtrat::cadcells::datastructures::merge_underlying (
    std::vector< SampledDerivationRef< Properties >> & derivations )
```

Merges the underlying derivations of a set of sampled derivations.
After the operation, all sampled derivations point to the same underlying derivation.

0.14.26.3.7 operator"!=() [1/5]

```
bool smtrat::cadcells::datastructures::operator!= (
    const CompoundMaxMin & lhs,
    const CompoundMaxMin & rhs ) [inline]
```

0.14.26.3.8 operator"!=() [2/5]

```
bool smtrat::cadcells::datastructures::operator!= (
    const CompoundMinMax & lhs,
    const CompoundMinMax & rhs ) [inline]
```

0.14.26.3.9 operator"!=() [3/5]

```
bool smtrat::cadcells::datastructures::operator!= (
    const IndexedRoot & lhs,
    const IndexedRoot & rhs ) [inline]
```

0.14.26.3.10 operator"!=() [4/5]

```
bool smtrat::cadcells::datastructures::operator!= (
    const PolyRef & lhs,
    const PolyRef & rhs ) [inline]
```

0.14.26.3.11 operator"!=() [5/5]

```
bool smtrat::cadcells::datastructures::operator!= (
    const RootFunction & lhs,
    const RootFunction & rhs ) [inline]
```

0.14.26.3.12 operator<() [1/8]

```
bool smtrat::cadcells::datastructures::operator< (
    const CompoundMaxMin & lhs,
    const CompoundMaxMin & rhs ) [inline]
```

0.14.26.3.13 operator<() [2/8]

```
bool smtrat::cadcells::datastructures::operator< (
    const CompoundMinMax & lhs,
    const CompoundMinMax & rhs ) [inline]
```

0.14.26.3.14 operator<() [3/8]

```
template<typename P >
bool smtrat::cadcells::datastructures::operator< (
    const DerivationRef< P > & lhs,
    const DerivationRef< P > & rhs )
```

0.14.26.3.15 operator<() [4/8]

```
bool smtrat::cadcells::datastructures::operator< (
    const IndexedRoot & lhs,
    const IndexedRoot & rhs ) [inline]
```

0.14.26.3.16 operator<() [5/8]

```
bool smtrat::cadcells::datastructures::operator< (
    const IndexedRootRelation & lhs,
    const IndexedRootRelation & rhs ) [inline]
```

0.14.26.3.17 operator<() [6/8]

```
bool smtrat::cadcells::datastructures::operator< (
    const PolyRef & lhs,
    const PolyRef & rhs ) [inline]
```

0.14.26.3.18 operator<() [7/8]

```
bool smtrat::cadcells::datastructures::operator< (
    const RootFunction & lhs,
    const RootFunction & rhs ) [inline]
```

0.14.26.3.19 operator<() [8/8]

```
bool smtrat::cadcells::datastructures::operator< (
    const TaggedIndexedRoot & lhs,
    const TaggedIndexedRoot & rhs ) [inline]
```

0.14.26.3.20 operator<<() [1/14]

```
template<typename P >
std::ostream& smtrat::cadcells::datastructures::operator<< (
    std::ostream & os,
    const CellRepresentation< P > & data ) [inline]
```

0.14.26.3.21 operator<<() [2/14] std::ostream& smtrat::cadcells::datastructures::operator<< (
std::ostream & *os*,
const CompoundMaxMin & *data*) [inline]

0.14.26.3.22 operator<<() [3/14] std::ostream& smtrat::cadcells::datastructures::operator<< (
std::ostream & *os*,
const CompoundMinMax & *data*) [inline]

0.14.26.3.23 operator<<() [4/14] std::ostream& smtrat::cadcells::datastructures::operator<< (
std::ostream & *os*,
const CoveringDescription & *data*) [inline]

0.14.26.3.24 operator<<() [5/14] template<typename P >
std::ostream& smtrat::cadcells::datastructures::operator<< (
std::ostream & *os*,
const CoveringRepresentation< P > & *data*)

0.14.26.3.25 operator<<() [6/14] std::ostream& smtrat::cadcells::datastructures::operator<< (
std::ostream & *os*,
const Delineation & *data*) [inline]

0.14.26.3.26 operator<<() [7/14] std::ostream& smtrat::cadcells::datastructures::operator<< (
std::ostream & *os*,
const DelineationInterval & *data*) [inline]

0.14.26.3.27 operator<<() [8/14] std::ostream& smtrat::cadcells::datastructures::operator<< (
std::ostream & *os*,
const IndexedRoot & *data*) [inline]

0.14.26.3.28 operator<<() [9/14] std::ostream& smtrat::cadcells::datastructures::operator<< (
std::ostream & *os*,
const IndexedRootOrdering & *data*) [inline]

0.14.26.3.29 operator<<() [10/14] std::ostream& smtrat::cadcells::datastructures::operator<< (
std::ostream & *os*,
const IndexedRootRelation & *data*) [inline]

0.14.26.3.30 operator<<() [11/14] std::ostream& smtrat::cadcells::datastructures::operator<< (
std::ostream & *os*,
const PolyRef & *data*) [inline]

0.14.26.3.31 operator<<() [12/14] std::ostream& smtrat::cadcells::datastructures::operator<< (
std::ostream & *os*,
const RootFunction & *data*) [inline]

0.14.26.3.32 operator<<() [13/14]

    std::ostream & os,
    const TaggedIndexedRoot & data ) [inline]
```

0.14.26.3.34 operator==() [1/8]

```
bool smtrat::cadcells::datastructures::operator== (
    const CompoundMaxMin & lhs,
    const CompoundMaxMin & rhs ) [inline]
```

0.14.26.3.35 operator==() [2/8]

```
bool smtrat::cadcells::datastructures::operator== (
    const CompoundMinMax & lhs,
    const CompoundMinMax & rhs ) [inline]
```

0.14.26.3.36 operator==() [3/8]

```
template<typename P >
bool smtrat::cadcells::datastructures::operator== (
    const DerivationRef< P > & lhs,
    const DerivationRef< P > & rhs )
```

0.14.26.3.37 operator==() [4/8]

```
bool smtrat::cadcells::datastructures::operator== (
    const IndexedRoot & lhs,
    const IndexedRoot & rhs ) [inline]
```

0.14.26.3.38 operator==() [5/8]

```
bool smtrat::cadcells::datastructures::operator== (
    const IndexedRootRelation & lhs,
    const IndexedRootRelation & rhs ) [inline]
```

0.14.26.3.39 operator==() [6/8]

```
bool smtrat::cadcells::datastructures::operator== (
    const PolyRef & lhs,
    const PolyRef & rhs ) [inline]
```

0.14.26.3.40 operator==() [7/8]

```
bool smtrat::cadcells::datastructures::operator== (
    const RootFunction & lhs,
    const RootFunction & rhs ) [inline]
```

0.14.26.3.41 operator==() [8/8]

```
bool smtrat::cadcells::datastructures::operator== (
    const TaggedIndexedRoot & lhs,
    const TaggedIndexedRoot & rhs ) [inline]
```

0.14.26.3.42 prop_get() [1/2]

```
template<class T , class... Ts>
const auto& smtrat::cadcells::datastructures::prop_get (
    const PropertiesT< T, Ts... > & sets )
```

0.14.26.3.43 prop_get() [2/2]

```
template<class S , class T , class... Ts, typename std::enable↩
_if<!std::is_same< S, T >::value >::type >
const auto& smtrat::cadcells::datastructures::prop_get (
            const PropertiesT< T, Ts... > & sets )
```

0.14.26.3.44 prop_has() [1/2]

```
template<class S , class T , class... Ts, typename std::enable↩
_if<!std::is_same< S, T >::value >::type >
bool smtrat::cadcells::datastructures::prop_has (
            const PropertiesT< T, Ts... > & sets,
            const S & element )
```

0.14.26.3.45 prop_has() [2/2]

```
template<class T , class... Ts>
bool smtrat::cadcells::datastructures::prop_has (
            const PropertiesT< T, Ts... > & sets,
            const T & element )
```

0.14.26.3.46 prop_insert() [1/2]

```
template<class S , class T , class... Ts, typename std::enable↩
_if<!std::is_same< S, T >::value >::type >
void smtrat::cadcells::datastructures::prop_insert (
            PropertiesT< T, Ts... > & sets,
            const S & element )
```

0.14.26.3.47 prop_insert() [2/2]

```
template<class T , class... Ts>
void smtrat::cadcells::datastructures::prop_insert (
            PropertiesT< T, Ts... > & sets,
            const T & element )
```

0.14.26.3.48 upper_lt_lower()

```
bool smtrat::cadcells::datastructures::upper_lt_lower (
            const DelineationInterval & del1,
            const DelineationInterval & del2 ) [inline]
```

Compares an upper bound with a lower bound of DelineationIntervals.
It respects whether the interval is a section or sector.

0.14.26.3.49 upper_lt_upper()

```
bool smtrat::cadcells::datastructures::upper_lt_upper (
            const DelineationInterval & del1,
            const DelineationInterval & del2 ) [inline]
```

Compares the upper bounds of two DelineationIntervals.
It respects whether the interval is a section or sector.

0.14.27 smtrat::cadcells::datastructures::detail Namespace Reference

Data Structures

- struct PolyProperties
- struct AssignmentProperties

0.14.28 smtrat::cadcells::helper Namespace Reference

Functions

- MultivariateRoot as_multivariate_root (const datastructures::PolyPool &pool, carl::Variable main_var, datastructures::IndexedRoot r)

Converts an datastructures::IndexedRoot to a MultivariateRoot.

- CNF to_formula (const datastructures::PolyPool &pool, carl::Variable main_var, const datastructures::SymbolicInterval &c)

  Converts a datastructures::SymbolicInterval to a CNF.

0.14.28.1 Function Documentation

0.14.28.1.1 as_multivariate_root()

```
MultivariateRoot smtrat::cadcells::helper::as_multivariate_root (
    const datastructures::PolyPool & pool,
    carl::Variable main_var,
    datastructures::IndexedRoot r ) [inline]
```

Converts an datastructures::IndexedRoot to a MultivariateRoot.

0.14.28.1.2 to_formula()

```
CNF smtrat::cadcells::helper::to_formula (
    const datastructures::PolyPool & pool,
    carl::Variable main_var,
    const datastructures::SymbolicInterval & c ) [inline]
```

Converts a datastructures::SymbolicInterval to a CNF.

0.14.29 smtrat::cadcells::operators Namespace Reference

Projection operators.

Namespaces

- mccallum_filtered_impl

0.14.29.1 Detailed Description

Projection operators.
Currently, only the McCallum based operator is implemented.

0.14.29.1.1 Relevant projection functions

We refer to algorithms for usage examples.

0.14.29.1.1.1 Cells

- project_cell_properties
- project_basic_properties
- delineate_properties
- project_delineated_cell_properties

0.14.29.1.1.2 Coverings

- project_cell_properties (on each cell individually)
- project_basic_properties (on each cell individually)
- delineate_properties (on each cell individually)
- project_covering_properties

0.14.29.1.1.3 Delineation

- project_basic_properties
- delineate_properties
- project_delineation_properties

```
bool smtrat::cadcells::operators::project_basic_properties (
            datastructures::DelineatedDerivation< typename PropertiesSet< Op >::type > &
deriv ) [inline]
```

Project basic properties, i.e.
independent from any sample or delineation.

0.14.29.3.13 project_basic_properties< op::mccallum >() template<>

```
bool smtrat::cadcells::operators::project_basic_properties< op::mccallum > (
            datastructures::DelineatedDerivation< PropertiesSet< op::mccallum >::type > &
deriv ) [inline]
```

0.14.29.3.14 project_cell_properties() template<op Op>

```
bool smtrat::cadcells::operators::project_cell_properties (
            datastructures::SampledDerivation< typename PropertiesSet< Op >::type > & deriv
) [inline]
```

Project cell properties.
Returns false iff the given operator is incomplete and cannot cover the given case (i.e. on nullification with Mc↩ Callum).

0.14.29.3.15 project_cell_properties< op::mccallum >() template<>

```
bool smtrat::cadcells::operators::project_cell_properties< op::mccallum > (
            datastructures::SampledDerivation< PropertiesSet< op::mccallum >::type > & deriv
) [inline]
```

0.14.29.3.16 project_covering_properties() template<op Op>

```
bool smtrat::cadcells::operators::project_covering_properties (
            datastructures::CoveringRepresentation< typename PropertiesSet< Op >::type > &
repr ) [inline]
```

Project covering properties.

0.14.29.3.17 project_covering_properties< op::mccallum >() template<>

```
bool smtrat::cadcells::operators::project_covering_properties< op::mccallum > (
            datastructures::CoveringRepresentation< PropertiesSet< op::mccallum >::type > &
repr ) [inline]

0.14.32.1 Detailed Description

Implementation of derivation rules.
Each rule is realized by a function which works on a derivation object. The parameters of the respective properties are passed as function parameter. The function realizing a derivation rule might either call other derivation rules or add properties to the given derivation.

0.14.32.2 Function Documentation

0.14.32.2.1 cell_analytic_submanifold() template<typename P >

```
void smtrat::cadcells::operators::rules::cell_analytic_submanifold (
            [[maybe_unused] ] datastructures::SampledDerivation< P > & deriv,
            const datastructures::SymbolicInterval &  )
```

0.14.32.2.2 cell_connected() template<typename P >

```
void smtrat::cadcells::operators::rules::cell_connected (
            datastructures::SampledDerivation< P > & deriv,
            const datastructures::SymbolicInterval & cell,
            const datastructures::IndexedRootOrdering & ordering )
```

0.14.32.2.3 cell_represents() template<typename P >

```
void smtrat::cadcells::operators::rules::cell_represents (
            datastructures::SampledDerivation< P > & deriv,
            const datastructures::SymbolicInterval & cell )
```

0.14.32.2.4 covering_holds() template<typename P >

```
void smtrat::cadcells::operators::rules::covering_holds (
            datastructures::DelineatedDerivation< P > & ,
            const datastructures::CoveringDescription & covering,
            const datastructures::IndexedRootOrdering & ordering )
```

0.14.32.2.5 delineate() [1/2] template<typename P >

```
void smtrat::cadcells::operators::rules::delineate (
            datastructures::DelineatedDerivation< P > & deriv,
            const properties::poly_irreducible_semi_sgn_inv & prop )
```

0.14.32.2.6 delineate() [2/2] template<typename P >

```
void smtrat::cadcells::operators::rules::delineate (
            datastructures::DelineatedDerivation< P > & deriv,
            const properties::poly_irreducible_sgn_inv & prop )
```

0.14.32.2.7 delineate_all() template<typename P >

```
void smtrat::cadcells::operators::rules::delineate_all (
            datastructures::SampledDerivation< P > & deriv,
            const properties::root_ordering_holds & prop )
```

0.14.32.2.8 delineate_all_compound()

```
template<typename P >
void smtrat::cadcells::operators::rules::delineate_all_compound (
            datastructures::SampledDerivation< P > & deriv,
            const properties::root_ordering_holds & prop )
```

0.14.32.2.9 delineate_all_selective()

```
template<typename P >
void smtrat::cadcells::operators::rules::delineate_all_selective (
            datastructures::SampledDerivation< P > & deriv,
            const properties::root_ordering_holds & prop )
```

0.14.32.2.10 delineate_bounds()

```
template<typename P >
void smtrat::cadcells::operators::rules::delineate_bounds (
            datastructures::SampledDerivation< P > & deriv,
            const properties::root_ordering_holds & prop )
```

0.14.32.2.11 delineate_noop()

```
template<typename P >
void smtrat::cadcells::operators::rules::delineate_noop (
            datastructures::SampledDerivation< P > & deriv,
            const properties::root_ordering_holds & prop )
```

0.14.32.2.12 delineate_samples()

```
template<typename P >
void smtrat::cadcells::operators::rules::delineate_samples (
            datastructures::SampledDerivation< P > & deriv,
            const properties::root_ordering_holds & prop )
```

0.14.32.2.13 is_trivial_root_well_def()

```
template<typename P >
bool smtrat::cadcells::operators::rules::is_trivial_root_well_def (
            datastructures::SampledDerivation< P > & deriv,
            datastructures::IndexedRoot root )
```

0.14.32.2.14 poly_additional_root_outside()

```
template<typename P >
void smtrat::cadcells::operators::rules::poly_additional_root_outside (
            datastructures::SampledDerivation< P > & deriv,
            const datastructures::SymbolicInterval & cell,
            const datastructures::IndexedRootOrdering & ordering,
            datastructures::PolyRef poly )
```

0.14.32.2.15 poly_irreducible_nonzero_semi_sgn_inv()

```
template<typename P >
void smtrat::cadcells::operators::rules::poly_irreducible_nonzero_semi_sgn_inv (
            datastructures::DelineatedDerivation< P > & deriv,
            datastructures::PolyRef poly )
```

0.14.32.2.16 poly_irreducible_nonzero_sgn_inv()

```

0.14.41.1 Typedef Documentation

0.14.41.1.1 Interval

```
template<cadcells::operators::op op>
using smtrat::covering_ng::Interval = typedef cadcells::datastructures::SampledDerivationRef<typename
cadcells::operators::PropertiesSet<op>::type>
```

0.14.41.1.2 IntervalSet

```
template<cadcells::operators::op op>
using smtrat::covering_ng::IntervalSet = typedef std::set<Interval<op>, IntervalCompare<op>
>
```

0.14.41.2 Enumeration Type Documentation

0.14.41.2.1 SamplingAlgorithm

```
enum smtrat::covering_ng::SamplingAlgorithm [strong]
```

Enumerator

LOWER_UPPER_BETWEEN_SAMPLING	First checks lower bound and then upper bound, then checks between the cells if they are covered.

0.14.41.3 Function Documentation

0.14.41.3.1 characterize_covering()

```
template<cadcells::operators::op op, cadcells::representation↩
::CoveringHeuristic covering_heuristic>
std::optional<Interval<op> > smtrat::covering_ng::characterize_covering (
            const IntervalSet< op > & intervals ) [inline]
```

0.14.41.3.2 exists()

```
template<typename FE , cadcells::operators::op op, cadcells::representation↩
::CoveringHeuristic covering_heuristic, smtrat::covering_ng::SamplingAlgorithm sampling_↩
algorithm>
CoveringResult<op> smtrat::covering_ng::exists (
            cadcells::datastructures::Projections & proj,
            FE & f,
            cadcells::Assignment ass )  [inline]
```

0.14.41.3.3 first_unassigned_var()

```
carl::Variable smtrat::covering_ng::first_unassigned_var (
            const cadcells::Assignment & ass,
            const cadcells::VariableOrdering & var_order )  [inline]
```

0.14.41.3.4 get_enclosing_interval()

```
template<cadcells::operators::op op>
std::optional<Interval<op> > smtrat::covering_ng::get_enclosing_interval (
            cadcells::datastructures::Projections & proj,
            const boost::container::flat_set< cadcells::Constraint > & implicant,
            formula::Valuation root_valuation,
            const cadcells::Assignment & ass )  [inline]
```

0.14.41.3.5 get_enclosing_intervals()

```
template<typename FE , cadcells::operators::op op>
std::vector<Interval<op> > smtrat::covering_ng::get_enclosing_intervals (
            cadcells::datastructures::Projections & proj,
            const FE & f,
            const cadcells::Assignment & ass )  [inline]
```

0.14.41.3.6 is_full_sample()

```
bool smtrat::covering_ng::is_full_sample (
            const cadcells::Assignment & ass,
            const cadcells::VariableOrdering & var_order )  [inline]
```

- auto debug_valuation (const Node &f, const cadcells::Assignment &ass)

0.14.45.1 Function Documentation

0.14.45.1.1 debug_valuation()

```
auto smtrat::covering_ng::formula::node_ds::debug_valuation (
    const Node & f,
    const cadcells::Assignment & ass )
```

0.14.45.1.2 extend_valuation()

```
void smtrat::covering_ng::formula::node_ds::extend_valuation (
    Node & f,
    const cadcells::Assignment & ass,
    bool evaluate_all )
```

Updates the valuations.
Assumes that ass is an extension of the previous assignment the formula has been evaluated with.

Parameters

f	
ass	

0.14.45.1.3 revert_valuation()

```
void smtrat::covering_ng::formula::node_ds::revert_valuation (
    Node & f,
    std::size_t level )
```

0.14.45.1.4 to_formula()

```
FormulaT smtrat::covering_ng::formula::node_ds::to_formula (
    const Node & f )
```

0.14.45.1.5 to_node() [1/2]

```

0.14.52.3 Function Documentation

0.14.52.3.1 getNonlinearMonomials()

`std::vector< Poly > smtrat::icp::getNonlinearMonomials ( const Poly & _expr )`

Obtains the non-linear monomials of the given polynomial.

Parameters

_expr	The polynomial to obtain the non-linear monomials for.

Returns

The non-linear monomials.

0.14.52.3.2 getOriginalLraVar()

```
const LRAModule< LRASettings1 >::LRAVariable * smtrat::icp↩
::getOriginalLraVar (
            carl::Variable::Arg _var,
            const LRAModule< LRASettings1 > & _lra )
```

0.14.52.3.3 intervalBoxContainsEmptyInterval()

```
bool smtrat::icp::intervalBoxContainsEmptyInterval
(
            const EvalDoubleIntervalMap & _intervals )
```

Checks mIntervals if it contains an empty interval.

Returns

0.14.52.3.4 intervalToConstraint()

```
std::pair< ConstraintT, ConstraintT > smtrat::icp::interval↩
ToConstraint (
            const Poly & _lhs,
            const smtrat::DoubleInterval _interval )
```

Creates a new constraint from an existing interval.

Parameters

_interval	

Returns

pair <lowerBoundConstraint∗, upperBoundConstraint∗>

0.14.53 smtrat::lra Namespace Reference

Data Structures

- class Variable
- class Bound

  Stores a bound, which could be an upper "<= b" or a lower bound ">= b" for a bound value b.
- class Numeric
- class TableauEntry
- class Tableau
- class Value

Typedefs

- typedef size_t EntryID

Functions

- Numeric abs (const Numeric &_value)

  Calculates the absolute value of the given Numeric.
- Numeric mod (const Numeric &_valueA, const Numeric &_valueB)

  Calculates the result of the first argument modulo the second argument.
- Numeric lcm (const Numeric &_valueA, const Numeric &_valueB)

  Calculates the least common multiple of the two arguments.
- Numeric gcd (const Numeric &_valueA, const Numeric &_valueB)

  Calculates the greatest common divisor of the two arguments.
- Numeric operator+ (const Numeric &_valueA, const Numeric &_valueB)

  Calculates the sum of the two given Numerics.
- Numeric operator- (const Numeric &_valueA, const Numeric &_valueB)

  Calculates the difference between the two given Numerics.
- Numeric operator∗ (const Numeric &_valueA, const Numeric &_valueB)

  Calculates the product of the two given Numerics.
- Numeric operator/ (const Numeric &_valueA, const Numeric &_valueB)

  Calculates the division of the two given Numerics.
- Numeric & operator+= (Numeric &_valueA, const Numeric &_valueB)

  Adds the value of the second given Numeric to the second given Numeric.
- Numeric & operator-= (Numeric &_valueA, const Numeric &_valueB)

  Subtracts the second given Numeric to the first given Numeric.
- Numeric & operator∗= (Numeric &_valueA, const Numeric &_valueB)

  Multiplies the second given Numeric to the first given Numeric.
- Numeric & operator/= (Numeric &_valueA, const Numeric &_valueB)

  Divides the first given Numeric by the second given Numeric.
- Numeric operator- (const Numeric &_value)

  Calculates the additive inverse of the given Numeric.
- Numeric & operator++ (Numeric &_value)

  Increments the given Numeric by one.
- Numeric & operator-- (Numeric &_value)

  Decrements the given Numeric by one.
- std::ostream & operator<< (std::ostream &_out, const Numeric &_value)

  Prints the given Numerics representation on the given output stream.
- template<typename T1 >
  std::ostream & operator<< (std::ostream &_out, const Value< T1 > &_value)

Variables

- static EntryID LAST_ENTRY_ID = 0

0.14.53.1 Typedef Documentation

0.14.53.1.1 EntryID `typedef size_t smtrat::lra::EntryID`

0.14.53.2 Function Documentation

0.14.53.2.1 abs() `Numeric smtrat::lra::abs ( const Numeric & _value )`

Calculates the absolute value of the given Numeric.

Parameters

_value	The Numeric to calculate the Numeric for.

Returns

The absolute value of the given Numeric.

0.14.53.2.2 gcd()

```
Numeric smtrat::lra::gcd (
    const Numeric & _valueA,
    const Numeric & _valueB )
```

Calculates the greatest common divisor of the two arguments.
Note, that this method can only be applied to integers.

Parameters

_valueA	An integer.
_valueB	An integer.

Returns

The least common divisor of the two arguments.

0.14.53.2.3 lcm()

```
Numeric smtrat::lra::lcm (
    const Numeric & _valueA,
    const Numeric & _valueB )
```

Calculates the least common multiple of the two arguments.
Note, that this method can only be applied to integers.

Parameters

_valueA	An integer.
_valueB	An integer.

Returns

The least common multiple of the two arguments.

0.14.53.2.4 mod()

```
Numeric smtrat::lra::mod (
    const Numeric & _valueA,
    const Numeric & _valueB )
```

Calculates the result of the first argument modulo the second argument.
Note, that this method can only be applied to integers.

Parameters

_valueA	An integer.
_valueB	An integer != 0.

Returns

The first argument modulo the second argument.

0.14.53.2.5 operator∗()

```
Numeric smtrat::lra::operator* (
    const Numeric & _valueA,
    const Numeric & _valueB )
```

Calculates the product of the two given Numerics.

Parameters

_valueA	The first factor.
_valueB	The second factor.

Returns

The product of the two given Numerics.

0.14.53.2.6 operator∗=()

```
Numeric & smtrat::lra::operator*= (
    Numeric & _valueA,
    const Numeric & _valueB )
```

Multiplies the second given Numeric to the first given Numeric.

Parameters

_valueA	The Numeric to multiply.
_valueB	The Numeric to multiply by.

Returns

The first given Numeric multiplied by the second given Numeric.

0.14.53.2.7 operator+()

```
Numeric smtrat::lra::operator+ (
    const Numeric & _valueA,
    const Numeric & _valueB )
```

Calculates the sum of the two given Numerics.

Parameters

_valueA	The first summand.
_valueB	The second summand.

Returns

The sum of the two given Numerics.

0.14.53.2.8 operator++()

```
Numeric & smtrat::lra::operator++ (
    Numeric & _value )
```

Increments the given Numeric by one.

Parameters

_value	The Numeric to increment.

Returns

The given Numeric incremented by one.

0.14.53.2.9 operator+=()

```
Numeric & smtrat::lra::operator+= (
    Numeric & _valueA,
    const Numeric & _valueB )
```

Adds the value of the second given Numeric to the second given Numeric.

Parameters

_valueA	The Numeric to add to.
_valueB	The Numeric to add.

Returns

The first given Numeric increased by the second given Numeric.

0.14.53.2.10 operator-() [1/2]

```
Numeric smtrat::lra::operator- (
    const Numeric & _value )
```

Calculates the additive inverse of the given Numeric.

Parameters

_value	The Numeric to calculate the additive inverse for.

Returns

The additive inverse of the given Numeric.

0.14.53.2.11 operator-() [2/2]

```
Numeric smtrat::lra::operator- (
    const Numeric & _valueA,
    const Numeric & _valueB )
```

Calculates the difference between the two given Numerics.

Parameters

_valueA	The minuend.
_valueB	The subtrahend.

Returns

The difference between the two given Numerics.

0.14.53.2.12 operator--()

```
Numeric & smtrat::lra::operator-- (
    Numeric & _value )
```

Decrements the given Numeric by one.

Parameters

_value	The Numeric to decrement.

Returns

The given Numeric decremented by one.

0.14.53.2.13 operator-=()

```
Numeric & smtrat::lra::operator-= (
    Numeric & _valueA,
    const Numeric & _valueB )
```

Subtracts the second given Numeric to the first given Numeric.

Parameters

_valueA	The Numeric to subtract from.
_valueB	The Numeric to subtract.

Returns

The first given Numeric subtracted by the second given Numeric.

0.14.53.2.14 operator/()

```
Numeric smtrat::lra::operator/ (
    const Numeric & _valueA,
    const Numeric & _valueB )
```

Calculates the division of the two given Numerics.

Parameters

_valueA	The dividend.
_valueB	The divisor.

Returns

The difference of the two given Numerics.

0.14.53.2.15 operator/=()

```
Numeric & smtrat::lra::operator/= (
    Numeric & _valueA,
    const Numeric & _valueB )
```

Divides the first given Numeric by the second given Numeric.

Parameters

_valueA	The Numeric to divide.
_valueB	The Numeric to divide by.

Returns

The first given Numeric divided by the second given Numeric.

0.14.53.2.16 operator<<() [1/2]

```
std::ostream & smtrat::lra::operator<< (
    std::ostream & _out,
    const Numeric & _value )
```

Prints the given Numerics representation on the given output stream.

Parameters

_out	The output stream to print on.
_value	The Numeric to print.

Returns

The output stream after printing the given Numerics representation on it.

0.14.53.2.17 operator<<() [2/2]

```
template<typename T1 >
std::ostream& smtrat::lra::operator<< (
    std::ostream & _out,
    const Value< T1 > & _value )
```

0.14.58 smtrat::mcsat::constraint_type Namespace Reference

Functions

- template<typename T >
  ConstraintType categorize (const T &t, const Model &model, carl::Variable next)
- template<typename T >
  bool is_constant (const T &t)

  Checks whether the constraint is constant, i.e.
- template<typename T >
  bool isAssigned (const T &t, const Model &model)

  Checks whether all variables contained in the constraint are assigned in the model.
- template<typename T >
  bool is_univariate (const T &t, const Model &model, carl::Variable next)

  Checks whether the constraint contains only a single unassigned variable, and this is the next one.
- template<typename T >
  bool isUnassigned (const T &t, const Model &model, carl::Variable next)

  Checks whether the constraint contains an unassigned variable that is not the next one.

0.14.58.1 Function Documentation

0.14.58.1.1 categorize() template<typename T >

```
ConstraintType smtrat::mcsat::constraint_type::categorize (
            const T & t,
            const Model & model,
            carl::Variable next )
```

0.14.58.1.2 is_constant() template<typename T >

```
bool smtrat::mcsat::constraint_type::is_constant (
            const T & t )
```

Checks whether the constraint is constant, i.e.
whether it contains no variables.

0.14.58.1.3 is_univariate() template<typename T >

```
bool smtrat::mcsat::constraint_type::is_univariate (
            const T & t,
            const Model & model,
            carl::Variable next )
```

Checks whether the constraint contains only a single unassigned variable, and this is the next one.

0.14.58.1.4 isAssigned() template<typename T >

```
bool smtrat::mcsat::constraint_type::isAssigned (
            const T & t,
            const Model & model )
```

Checks whether all variables contained in the constraint are assigned in the model.
In particular, a `Constant` constraint is also `Assigned`.

0.14.58.1.5 isUnassigned() template<typename T >

```
bool smtrat::mcsat::constraint_type::isUnassigned (
            const T & t,
            const Model & model,
            carl::Variable next )
```

Checks whether the constraint contains an unassigned variable that is not the next one.

Functions

- bool isSubset (const carl::Variables &subset, const carl::Variables &superset)
- std::ostream & operator<< (std::ostream &os, const Bound &b)

0.14.59.1 Detailed Description

A Fourier-Motzkin based backend.
Preprocessing of constraints:
The input is a constraint c: p∗x∼q which can be used as a bound on x with p,q multivariate polynomials. If x only occurs linearly in c, this decomposition is possible. If p is zero, then c is conflicting iff !(0∼q). If this is the case, we can return (c && p=0) -> 0∼q as explanation. Otherwise, we evaluate c over the partial model and obtain x∼r, where r is a rational. To properly perform the elimination step detailed below, we additionally store whether p is negative over the current assignment as a Boolean.
We store (c,p,q,r,n) for each bound.
FM elimination:
Given a lower bound l and an upper bound u, the elimination is as follows: Conflict if l.r >= u.r (or strict, if both relations from c are weak) l.q ∗ u.p < u.q ∗ l.p
If exactly one of u.p and l.p was found to be negative, the relation has to be inverted. If u.p or l.p are not constants, we additionally have to add a literal stating that their sign does not change.
For all bounds involved, we add b.p < 0 resp. b.p > 0 as side condition to the explanation.
Handling of "not equal":
For linear arithmetic, a bound i belonging to a constraint with relation != can be in conflict with

- a bound e for a constraint with = iff i.r == e.r, then we return i.c && e.c -> i.q ∗ e.p != e.q ∗ i.p
- two bounds l, u with >= resp. <= as relation and i.r == l.r == u.r, then we return i.c && l.c && u.c && (l.q ∗ u.p = u.q ∗ l.p) -> l.q ∗ i.p != i.q ∗ l.p

For all bounds b involved, we add b.p != 0 as side condition to the explanation.

0.14.59.2 Function Documentation

0.14.59.2.1 isSubset()

```
bool smtrat::mcsat::fm::isSubset (
    const carl::Variables & subset,
    const carl::Variables & superset ) [inline]
```

0.14.59.2.2 operator<<()

```
std::ostream& smtrat::mcsat::fm::operator<< (
    std::ostream & os,
    const Bound & b ) [inline]
```

Functions

- FormulaT buildFormulaFromVC (VariableComparisonT &&vc)

  Construct a formula representing a variable comparison.
- template<typename MVRootParams >
  FormulaT buildEquality (carl::Variable var, const MVRootParams &mvp)

  Construct an atomic formula representing a variable being equal to the given multivariate root.
- template<typename MVRootParams >
  FormulaT buildBelow (carl::Variable var, const MVRootParams &mvp)

  Construct an atomic formula representing a variable being less than the given multivariate root.
- template<typename MVRootParams >
  FormulaT buildAbove (carl::Variable var, const MVRootParams &mvp)

  Construct an atomic formula representing a variable being greater than the given multivariate root.
- std::set< ConstraintT > convertToConstraints (std::vector< FormulaT > constraintAtoms)

  Transform constraints represented as atomic formualas into the easier to use objects of the Constraint class.

0.14.62.1 Function Documentation

0.14.62.1.1 buildAbove()

```
template<typename MVRootParams >
FormulaT smtrat::mcsat::nlsat::helper::buildAbove (
            carl::Variable var,
            const MVRootParams & mvp )
```

Construct an atomic formula representing a variable being greater than the given multivariate root.
"v > root(..)"

0.14.62.1.2 buildBelow()

```
template<typename MVRootParams >
FormulaT smtrat::mcsat::nlsat::helper::buildBelow (
            carl::Variable var,
            const MVRootParams & mvp )
```

Construct an atomic formula representing a variable being less than the given multivariate root.
"v < root(..)"

0.14.62.1.3 buildEquality()

```
template<typename MVRootParams >
FormulaT smtrat::mcsat::nlsat::helper::buildEquality (
            carl::Variable var,
            const MVRootParams & mvp )
```

Construct an atomic formula representing a variable being equal to the given multivariate root.
"v = root(..)"

0.14.62.1.4 buildFormulaFromVC()

```
FormulaT smtrat::mcsat::nlsat::helper::buildFormulaFromVC (
            VariableComparisonT && vc )  [inline]
```

Construct a formula representing a variable comparison.
Simplify to a regular constraint if possible.

0.14.62.1.5 convertToConstraints()

```
std::set<ConstraintT> smtrat::mcsat::nlsat::helper::convert↩
ToConstraints (
            std::vector< FormulaT > constraintAtoms )  [inline]
```

Transform constraints represented as atomic formualas into the easier to use objects of the Constraint class.

Functions

- template<typename Settings >
  std::optional< cadcells::CNF > onecell (const std::vector< cadcells::Atom > &constraints, const cadcells↩ ::Polynomial::ContextType &context, const cadcells::Assignment &sample)

  An MCSAT-style single cell explanation function.

Variables

- bool clause_chain_with_equivalences = false

0.14.63.1 Typedef Documentation

0.14.63.1.1 Settings `using smtrat::mcsat::onecell::Settings = typedef BCApproximationSettings`

0.14.63.2 Function Documentation

0.14.63.2.1 onecell()

```
template<typename Settings >
std::optional<cadcells::CNF> smtrat::mcsat::onecell::onecell (
            const std::vector< cadcells::Atom > & constraints,
            const cadcells::Polynomial::ContextType & context,
            const cadcells::Assignment & sample )
```

An MCSAT-style single cell explanation function.
A set of constraints is called infeasible w.r.t. an assignment if the defining polynomials are univariate under the sample and there does not exists a value for the unassigned variable that satisfies all constraints.
This method eliminates the unassigned variable using get_level_covering or get_delineation and then constructs a single cell in the assigned variables level by level.

Parameters

constraints	Atoms of the same level such that sample cannot be extended for the highest variable without making one atom false. Note that this property is not checked.
sample	A sample such that all but the highest variable in constraints are assigned.

Returns

A set of constraints whose conjunction describes an unsatisfying cell that can be concluded from the input constraints.

0.14.64.1 Typedef Documentation

0.14.64.1.1 CADCell `using smtrat::mcsat::onecellcad::CADCell = typedef std::vector<std::variant<Sector, Section> >`

Represent a single cell [brown15].

A cell is a collection of boundary objects along each axis, called cell-components based on math. vectors and their components.

0.14.64.1.2 RANMap

`using smtrat::mcsat::onecellcad::RANMap = typedef std::map<carl::Variable, RAN>`

0.14.64.2 Enumeration Type Documentation

0.14.64.2.1 InvarianceType

`enum smtrat::mcsat::onecellcad::InvarianceType [strong]`

Invariance Types.

Enumerator

ORD_INV	
SIGN_INV	

0.14.64.3 Function Documentation

0.14.64.3.1 addResultants()

```
void smtrat::mcsat::onecellcad::addResultants (
    std::vector< std::pair< Poly, Poly >> & resultants,
    std::vector< std::vector< TagPoly >> & polys,
    carl::Variable mainVar,
    const std::vector< carl::Variable > & variableOrder ) [inline]
```

0.14.64.3.2 appendOnCorrectLevel()

```
void smtrat::mcsat::onecellcad::appendOnCorrectLevel (
    const Poly & poly,
    InvarianceType tag,
    std::vector< std::vector< TagPoly >> & polys,
    std::vector< carl::Variable > variableOrder ) [inline]
```

0.14.64.3.3 asMultiPolys()

```
std::vector<Poly> smtrat::mcsat::onecellcad::asMultiPolys (
    const std::vector< TagPoly > polys ) [inline]
```

0.14.64.3.4 asRANPoint()

```
RealAlgebraicPoint<smtrat::Rational> smtrat::mcsat::onecellcad::asRANPoint (
    const mcsat::Bookkeeping & data ) [inline]
```

0.14.64.3.5 asRootExpr()

```
MultivariateRootT smtrat::mcsat::onecellcad::asRootExpr (
    carl::Variable rootVariable,
    Poly poly,
    std::size_t rootIdx ) [inline]
```

Parameters

rootVariable	The variable with respect to which the roots are computed in the end. It will be replaced by the special unique root-variable "_z" common in root-expressions.

0.14.64.3.6 asVector()

`template<typename T >`

```
std::vector<T> smtrat::mcsat::onecellcad::asVector (
            const std::set< T > s )
```

0.14.64.3.7 cellDimension()

```
std::size_t smtrat::mcsat::onecellcad::cellDimension (
            const CADCell & cell,
            const std::size_t uptoLevel )  [inline]
```

Returns

Dimension of a hybercube to which the given cell is homeomorphic, i.e., count the number of sectors of the given Cell restricted to its first components (with index 0 to 'uptoLevel').

0.14.64.3.8 contains() [1/2]

```
template<typename T >
bool smtrat::mcsat::onecellcad::contains (
            const std::vector< T > & list,
            const T & elem )
```

0.14.64.3.9 contains() [2/2]

```
bool smtrat::mcsat::onecellcad::contains (
            const std::vector< TagPoly > & polys,
            const Poly & poly )  [inline]
```

0.14.64.3.10 discriminant()

```
Poly smtrat::mcsat::onecellcad::discriminant (
            const carl::Variable & mainVariable,
            const Poly & p )  [inline]
```

Projection related utilities for onecellcad.

0.14.64.3.11 duplicateElimination() [1/2]

```
void smtrat::mcsat::onecellcad::duplicateElimination (
            std::vector< Poly > & vec )  [inline]
```

0.14.64.3.12 duplicateElimination() [2/2]

```
std::vector<std::pair<Poly, Poly> > smtrat::mcsat↩
::onecellcad::duplicateElimination (
            std::vector< std::pair< Poly, Poly >> vec )  [inline]
```

0.14.64.3.13 fullSpaceCell()

```
CADCell smtrat::mcsat::onecellcad::fullSpaceCell (
            std::size_t cellComponentCount )  [inline]
```

0.14.64.3.14 getDegree()

```
std::size_t smtrat::mcsat::onecellcad::getDegree (
            TagPoly p,
            carl::Variable v )  [inline]
```

Parameters

p	Polynomial to get degree from
v	Rootvariable for degree calc

Returns

0.14.64.3.15 hasOnlyNonConstIrreducibles()

```
template<typename PolyType >
bool smtrat::mcsat::onecellcad::hasOnlyNonConstIrreducibles (
            const std::vector< PolyType > & polys )
```

0.14.64.3.16 hasUniqElems()

```
template<typename T >
bool smtrat::mcsat::onecellcad::hasUniqElems (
            const std::vector< T > & container )
```

0.14.64.3.17 isNonConstIrreducible()

```
template<typename PolyType >
bool smtrat::mcsat::onecellcad::isNonConstIrreducible (
            const PolyType & poly )
```

0.14.64.3.18 isSubset()

```
template<typename T >
bool smtrat::mcsat::onecellcad::isSubset (
            const std::vector< T > & c1,
            const std::vector< T > & c2 )
```

0.14.64.3.19 leadcoefficient()

```
Poly smtrat::mcsat::onecellcad::leadcoefficient (
            const carl::Variable & mainVariable,
            const Poly & p )  [inline]
```

0.14.64.3.20 levelOf()

```
std::optional<std::size_t> smtrat::mcsat::onecellcad::levelOf (
            const std::vector< carl::Variable > & variableOrder,
            const Poly & poly )  [inline]
```

Find the index of the highest variable (wrt.
the ordering in 'variableOrder') that occurs with positive degree in 'poly'. Although 'level' is a math concept that starts counting at 1 we start counting at 0 and represent "no level/variable" as std::nullopt because it simplifies using the level directly as an index into arrays or vectors. Examples:

- polyLevel(2) == nullopt wrt. any variable order
- polyLevel(0∗x+2) == nullopt wrt. any variable order
- polyLevel(x+2) == 0 wrt. [x < y < z]
- polyLevel(x+2) == 1 wrt. [y < x < z]
- polyLevel(x+2) == 2 wrt. [y < z < x]
- polyLevel(x∗y+2) == 1 wrt. [x < y < z] because of y
- polyLevel(x∗y+2) == 1 wrt. [y < x < z] because of x
- polyLevel(x∗y+2) == 2 wrt. [x < z < y] because of y Preconditions:
- 'variables(poly)' must be a subset of 'variableOrder'.

0.14.64.3.21 nonConstIrreducibleFactors()

```
std::vector<TagPoly> smtrat::mcsat::onecellcad::nonConstIrreducibleFactors (
    std::vector< carl::Variable > variableOrder,
    Poly poly,
    InvarianceType tag ) [inline]
```

0.14.64.3.22 operator<()

```
bool smtrat::mcsat::onecellcad::operator< (
    const InvarianceType & l,
    const InvarianceType & r ) [inline]
```

0.14.64.3.23 operator<<() [1/8]

```
std::ostream& smtrat::mcsat::onecellcad::operator<< (
    std::ostream & os,
    const CADCell & cell ) [inline]
```

0.14.64.3.24 operator<<() [2/8]

```
std::ostream& smtrat::mcsat::onecellcad::operator<< (
    std::ostream & os,
    const InvarianceType & inv ) [inline]
```

0.14.64.3.25 operator<<() [3/8]

```
template<typename Number >
std::ostream& smtrat::mcsat::onecellcad::operator<< (
    std::ostream & os,
    const RealAlgebraicPoint< Number > & r )
```

Streaming operator for a RealAlgebraicPoint.

0.14.64.3.26 operator<<() [4/8]

```
std::ostream& smtrat::mcsat::onecellcad::operator<< (
    std::ostream & os,
    const Section & s ) [inline]
```

0.14.64.3.27 operator<<() [5/8]

```
std::ostream& smtrat::mcsat::onecellcad::operator<< (
    std::ostream & os,
    const Sector & s ) [inline]
```

0.14.64.3.28 operator<<() [6/8]

```
std::ostream& smtrat::mcsat::onecellcad::operator<< (
    std::ostream & os,
    const std::vector< std::vector< TagPoly >> & lvls ) [inline]
```

0.14.64.3.29 operator<<() [7/8]

```
std::ostream& smtrat::mcsat::onecellcad::operator<< (
    std::ostream & os,
    const std::vector< TagPoly > & polys ) [inline]
```

0.14.64.3.30 operator<<() [8/8]

```
std::ostream& smtrat::mcsat::onecellcad::operator<< (
    std::ostream & os,
    const TagPoly & p ) [inline]
```

0.14.64.3.31 operator==() [1/2]

```
bool smtrat::mcsat::onecellcad::operator== (
            const TagPoly & lhs,
            const TagPoly & rhs ) [inline]
```

0.14.64.3.32 operator==() [2/2]

```
template<typename Number >
bool smtrat::mcsat::onecellcad::operator== (
            RealAlgebraicPoint< Number > & lhs,
            RealAlgebraicPoint< Number > & rhs )
```

Check if two RealAlgebraicPoints are equal.

0.14.64.3.33 optimized_singleLevelFullProjection()

```
bool smtrat::mcsat::onecellcad::optimized_↩
singleLevelFullProjection (
            carl::Variable mainVar,
            size_t currentLevel,
            std::vector< std::vector< TagPoly >> & projectionLevels,
            OneCellCAD & cad ) [inline]
```

0.14.64.3.34 polyVarsAreAllInList()

```
template<typename PolyType >
bool smtrat::mcsat::onecellcad::polyVarsAreAllInList (
            const std::vector< PolyType > & polys,
            const std::vector< carl::Variable > & variables )
```

0.14.64.3.35 prefix()

```
template<typename T >
std::vector<T> smtrat::mcsat::onecellcad::prefix (
            const std::vector< T > vars,
            std::size_t prefixSize )
```

0.14.64.3.36 resultant()

```
Poly smtrat::mcsat::onecellcad::resultant (
            const carl::Variable & mainVariable,
            const Poly & p1,
            const Poly & p2 ) [inline]
```

0.14.64.3.37 singleLevelFullProjection()

```
void smtrat::mcsat::onecellcad::singleLevelFullProjection
(
            std::vector< carl::Variable > & variableOrder,
            carl::Variable mainVar,
            size_t currentLevel,
            std::vector< std::vector< TagPoly >> & projectionLevels ) [inline]
```

0.14.66.1 Detailed Description

OneCell Explanation.

0.14.66.1.1 Rationale To better understand the CAD implementation this document concisely explains important CAD terminology from the literature and high-level implementation design decisions. Low-level design decisions for structs and classes are found in the implementation files themselves.

0.14.66.1.2 Universe The n-dimensional space in which a CADCell exists. The universe has n axes (=std basis vectors), numbered 0 to n-1, and each axis is associated with one variable.

0.14.66.1.3 Variables order A variable order like x,y,z tell us that the universe is 3-dimensional, gives a name to the each coordinate axis (thus also defines an axis ordering), tells us how to interpret a point like (5,2,1), and allows us to define properties like "level" for points and polynomials and "cylindrical" for CADCells.

0.14.66.1.4 Level of a point Number of components that a point has but interpreted with respect to the first variables in a variable ordering. E.g., if the universe has 3 axes/variables like x,y,z in that (increasing) order, then a point of level 2 has exactly 2 components representing the coordinates for the first two variables, x and y.

0.14.66.1.5 Level of a polynomial The number/index of the highest variable, with respect to a variable ordering, that appears with a positive degree in a polynomial. E.g., if the universe has 3 axes/variables like x,y,z in that (increasing) order, then a polynomial of level 2 at most mentions the first 2 variables, x and y, and definitely mentions second variable y but no "higher" variable like z .

0.14.66.1.6 CADCell A "cylindric algebraic cell" exists in an n-dimensional vector space called a "universe". A cell is a subspace of that universe with a possibly lower dimension and is "cylindric" only with respect to a specific variable ordering, numbered 0 to n-1. A cell is "algebraic", because its boundaries are represented by polynomials. Along each axis a cell is bound by either an non-empty open interval, called a "sector" and represented by two polynomials, or by a closed point-interval, called a "section" and represented by one polynomial. E.g. a section along axis k, said to be of "level k", requires a polynomial instead of a fixed number, because the fixed number can vary depending on the position along the (lower dimensional) axes 0 to k-1. This is why a section of level k is represented by a multivariate polynomial of "level k" (uses only the first k variables in the variable ordering). If we replace the first k-1 variables in that polynomial by specific numbers, we are left with a univariate polynomial whose root is then the fixed boundary number along axis k (if that polynomial has multiple roots, we also need to specify precisely which one of those represents the fixed boundary number). A different position, i.e., a different variable replacement, yields a possibly different univariate polynomial with a different root.

0.14.66.1.7 Level of a sector/section The number of the axis (with respect to some variable ordering that defines the same axis ordering) for which a sector/section defines the bounds. This number is also the level of the polynomial(s) inside the sector/section.

0.14.66.1.8 Open CADCell A cell is "open" if it only consists of sectors, i.e., it is open along all axes and is therefore a subspace with the same dimension as its universe.

0.14.71 smtrat::mcsat::vs::helper Namespace Reference

Data Structures

- struct TestCandidate

Functions

- void getFormulaAtoms (const FormulaT &f, FormulaSetT &result)
- FormulaT to_formula (const carl::vs::CaseDistinction< Poly > &docc)

  Converts a DisjunctionOfConstraintConjunctions to a regular Formula.
- static bool generateZeros (const FormulaT &formula, const carl::Variable &eliminationVar, std::function< void(SqrtEx &&sqrtExpression, ConstraintsT &&sideConditions)> yield_result)

  Get zeros with side conditions of the given constraint.
- static bool addOrMergeTestCandidate (std::vector< TestCandidate > &results, const TestCandidate &new↩ Substitution)

  Adds a new substitution to the given list of substitutions or merges it to an existing one.
- static bool generateTestCandidates (std::vector< TestCandidate > &results, const carl::Variable &eliminationVar, const FormulaSetT &constraints)

  Generate all test candidates according to "vanilla" virtual substitution.
- bool substitute (const FormulaT &constr, const carl::Variable var, const carl::vs::Term< Poly > &term, FormulaT &result)

0.14.71.1 Function Documentation

0.14.71.1.1 addOrMergeTestCandidate()

```
static bool smtrat::mcsat::vs::helper::addOrMergeTest↩
Candidate (
    std::vector< TestCandidate > & results,
    const TestCandidate & newSubstitution ) [static]
```

Adds a new substitution to the given list of substitutions or merges it to an existing one.
Returns true if a new substitution was created.

0.14.71.1.2 generateTestCandidates()

```
static bool smtrat::mcsat::vs::helper::generateTest↩
Candidates (
            std::vector< TestCandidate > & results,
            const carl::Variable & eliminationVar,
            const FormulaSetT & constraints )  [static]
```

Generate all test candidates according to "vanilla" virtual substitution.
Returns false iff VS is not applicable.

0.14.71.1.3 generateZeros()

```
static bool smtrat::mcsat::vs::helper::generateZeros (
            const FormulaT & formula,
            const carl::Variable & eliminationVar,
            std::function< void(SqrtEx &&sqrtExpression, ConstraintsT &&sideConditions)>
yield_result )  [static]
```

Get zeros with side conditions of the given constraint.
Kind of a generator function. Passes generated zeros to a callback function to avoid copying.

0.14.71.1.4 getFormulaAtoms()

```
void smtrat::mcsat::vs::helper::getFormulaAtoms (
            const FormulaT & f,
            FormulaSetT & result )  [inline]
```

0.14.71.1.5 substitute()

```
bool smtrat::mcsat::vs::helper::substitute (
            const FormulaT & constr,
            const carl::Variable var,
            const carl::vs::Term< Poly > & term,
            FormulaT & result )  [inline]
```

0.14.71.1.6 to_formula()

```
FormulaT smtrat::mcsat::vs::helper::to_formula (
            const carl::vs::CaseDistinction< Poly > & docc )  [inline]
```

Converts a DisjunctionOfConstraintConjunctions to a regular Formula.

Namespaces

- recursive

0.14.73 smtrat::onecellcad::recursive Namespace Reference

Data Structures

- struct Section

  Represent a cell's closed-interval-boundary object along one single axis by an irreducible, multivariate polynomial of level k.
- struct Sector

  Represent a cell's open-interval boundary object along one single axis by two irreducible, multivariate polynomials of level k.

Typedefs

- using UniPoly = carl::UnivariatePolynomial< smtrat::Rational >
- using MultiPoly = carl::MultivariatePolynomial< smtrat::Rational >
- using MultiCoeffUniPoly = carl::UnivariatePolynomial< MultiPoly >
- using RANPoint = RealAlgebraicPoint< smtrat::Rational >
- using RANMap = std::map< carl::Variable, RAN >
- using OpenCADCell = std::vector< Sector >

  Represent a single open cell [1].

Functions

- std::ostream & operator<< (std::ostream &o, const Section &s)
- std::ostream & operator<< (std::ostream &o, const Sector &s)
- std::ostream & operator<< (std::ostream &o, const OpenCADCell &c)
- OpenCADCell createFullspaceCoveringCell (size_t level)
- size_t levelOf (const MultiPoly &poly, const std::vector< carl::Variable > &variableOrder)

  Find the index of the highest variable (wrt.
- std::map< carl::Variable, RAN > toStdMap (const RANPoint &point, size_t count, const std::vector< carl::↩ Variable > &variableOrder)

  Create a mapping from the first 'count'-many variables in the given 'variableOrder' to the first 'count'-many components of the given 'point'.
- std::optional< OpenCADCell > mergeCellWithPoly (OpenCADCell &cell, const RANPoint &point, const std↩ ::vector< carl::Variable > &variableOrder, const MultiPoly poly)

  Merge the given open OpenCADCell 'cell' that contains the given 'point' (called "alpha" in [1]) with a polynomial 'poly'.
- std::optional< OpenCADCell > createOpenCADCell (const std::vector< MultiPoly > polySet, const RANPoint &point, const std::vector< carl::Variable > &variableOrder)

  Construct a OpenCADCell for the given set of polynomials 'polySet' that contains the given 'point'.

0.14.73.1 Typedef Documentation

0.14.73.1.1 MultiCoeffUniPoly

`using smtrat::onecellcad::recursive::MultiCoeffUniPoly = typedef carl::UnivariatePolynomial<MultiPoly>`

0.14.73.1.2 MultiPoly

`using smtrat::onecellcad::recursive::MultiPoly = typedef carl::Multivariate↩ Polynomial<smtrat::Rational>`

0.14.73.1.3 OpenCADCell

`using smtrat::onecellcad::recursive::OpenCADCell = typedef std↩ ::vector<Sector>`

Represent a single open cell [1].
A cell is a collection of boundary objects along each axis. In case of an open cell, the boundary objects are all sectors.

0.14.73.1.4 RANMap

`using smtrat::onecellcad::recursive::RANMap = typedef std::map<carl::↩ Variable, RAN>`

0.14.73.1.5 RANPoint

`using smtrat::onecellcad::recursive::RANPoint = typedef RealAlgebraic↩ Point<smtrat::Rational>`

0.14.73.1.6 UniPoly

`using smtrat::onecellcad::recursive::UniPoly = typedef carl::Univariate↩ Polynomial<smtrat::Rational>`

0.14.73.2 Function Documentation

0.14.73.2.1 createFullspaceCoveringCell()

```
OpenCADCell smtrat::onecellcad::recursive::create↩ FullspaceCoveringCell (
            size_t level )
```

0.14.73.2.2 createOpenCADCell()

```
std::optional<OpenCADCell> smtrat::onecellcad::recursive↩
::createOpenCADCell (
            const std::vector< MultiPoly > polySet,
            const RANPoint & point,
            const std::vector< carl::Variable > & variableOrder )
```

Construct a OpenCADCell for the given set of polynomials 'polySet' that contains the given 'point'.
The returned cell represents the largest region that is sign-invariant on all polynomials in the 'polySet' and is cylindrical with respect to the variables ordering given in 'variableOrder'. Note that this construction is only correct if plugging in the 'point' into any polynomial of the 'polySet' yields a non-zero value, i.e. 'point' is not a root of any polynomial in 'polySet', otherwise no OpenCADCell is returned. Note that the dimension (number of components) of the 'point' == the number of variables in 'variableOrder' and that any polynomial of the 'polySet' must be irreducible and mention only variables from 'variableOrder'.

0.14.73.2.3 levelOf()

```
size_t smtrat::onecellcad::recursive::levelOf (
            const MultiPoly & poly,
            const std::vector< carl::Variable > & variableOrder )
```

Find the index of the highest variable (wrt.
the ordering in 'variableOrder') that occurs with positive degree in 'poly'. Since levelOf is a math concept it starts counting at 1! Examples:

- levelOf(2) == 0 wrt. any variable order
- levelOf(0∗x+2) == 0 wrt. any variable order
- levelOf(x+2) == 1 wrt. [x < y < z]
- levelOf(x+2) == 2 wrt. [y < x < z]
- levelOf(x+2) == 3 wrt. [y < z < x]
- levelOf(x∗y+2) == 2 wrt. [x < y < z] because of y
- levelOf(x∗y+2) == 2 wrt. [y < x < z] because of x
- levelOf(x∗y+2) == 3 wrt. [x < z < y] because of y Preconditions:
- 'variables(poly)' must be a subset of 'variableOrder'.

0.14.73.2.4 mergeCellWithPoly()

```
std::optional<OpenCADCell> smtrat::onecellcad::recursive↩
::mergeCellWithPoly (
            OpenCADCell & cell,
            const RANPoint & point,
            const std::vector< carl::Variable > & variableOrder,
            const MultiPoly poly )
```

Merge the given open OpenCADCell 'cell' that contains the given 'point' (called "alpha" in [1]) with a polynomial 'poly'.
Before the merge 'cell' represents a region that is sign-invariant on other (previously merged) polynomials (all signs are non-zero). The returned cell represents a region that is additionally sign-invariant on 'poly' (also with non-zero sign).

Returns

either an OpenCADCell or nothing (representing a failed construction)

0.14.73.2.5 operator<<() [1/3]

```
std::ostream& smtrat::onecellcad::recursive::operator<< (
            std::ostream & o,
            const OpenCADCell & c )
```

0.14.73.2.6 operator<<() [2/3]

```
std::ostream& smtrat::onecellcad::recursive::operator<< (
    std::ostream & o,
    const Section & s )
```

0.14.73.2.7 operator<<() [3/3]

```
std::ostream& smtrat::onecellcad::recursive::operator<< (
    std::ostream & o,
    const Sector & s )
```

0.14.73.2.8 toStdMap()

```
std::map<carl::Variable, RAN> smtrat::onecellcad::recursive::toStdMap (
    const RANPoint & point,
    size_t count,
    const std::vector< carl::Variable > & variableOrder )
```

Create a mapping from the first 'count'-many variables in the given 'variableOrder' to the first 'count'-many components of the given 'point'.

```

0.14.90 smtrat::subtropical Namespace Reference

Implements data structures and encodings for the subtropical method.

Data Structures

- struct Moment

  Represents the normal vector component and the sign variable assigned to a variable in an original constraint.
- struct Vertex

  Represents a term of an original constraint and assigns him a rating variable if a weak separator is searched.
- struct Separator

  Represents the class of all original constraints with the same left hand side after a normalization.
- class Encoding

Enumerations

- enum class SeparatorType { STRICT = 0 , WEAK = 1 , SEMIWEAK = 2 }
- enum class Direction { BOTH = 0 , NEGATIVE = 1 , POSITIVE = 2 }

  Subdivides the relations into classes with the same linearization result.

Functions

- carl::BasicConstraint< Poly > normalize (const carl::BasicConstraint< Poly > &c)
- std::optional< Direction > direction (carl::Relation r)
- std::optional< Direction > direction_for_equality (const Separator &s)
- FormulaT transform_to_equation (const FormulaT &formula)

  Requires a quantifier-free real arithmetic formula with no negations.
- FormulaT encode_as_formula (const FormulaT &formula, Encoding &encoding, SeparatorType separator_type)

  Requires a quantifier-free real arithmetic formula with no negations.

- FormulaT encode_as_formula_alt (const FormulaT &formula, Encoding &encoding, SeparatorType separator_type)

  Requires a quantifier-free real arithmetic formula with no negations.

0.14.90.1 Detailed Description

Implements data structures and encodings for the subtropical method.

0.14.90.2 Enumeration Type Documentation

0.14.90.2.1 Direction `enum smtrat::subtropical::Direction [strong]`

Subdivides the relations into classes with the same linearization result.

Enumerator

BOTH	
NEGATIVE	
POSITIVE	

0.14.90.2.2 SeparatorType `enum smtrat::subtropical::SeparatorType [strong]`

Enumerator

STRICT	
WEAK	
SEMIWEAK	

0.14.90.3 Function Documentation

0.14.90.3.1 direction()

```
std::optional<Direction> smtrat::subtropical::direction (
    carl::Relation r ) [inline]
```

0.14.90.3.2 direction_for_equality()

```
std::optional<Direction> smtrat::subtropical::direction_↩
for_equality (
    const Separator & s ) [inline]
```

0.14.90.3.3 encode_as_formula()

```
FormulaT smtrat::subtropical::encode_as_formula (
    const FormulaT & formula,
    Encoding & encoding,
    SeparatorType separator_type ) [inline]
```

Requires a quantifier-free real arithmetic formula with no negations.

Parameters

formula	The formula to translate

Returns

linear formula

0.14.90.3.4 encode_as_formula_alt()

```
FormulaT smtrat::subtropical::encode_as_formula_alt (
    const FormulaT & formula,
    Encoding & encoding,
    SeparatorType separator_type ) [inline]
```

Requires a quantifier-free real arithmetic formula with no negations.

Parameters

formula	The formula to translate

Returns

linear formula

0.14.90.3.5 normalize()

```
carl::BasicConstraint<Poly> smtrat::subtropical::normalize (
    const carl::BasicConstraint< Poly > & c ) [inline]
```

0.14.90.3.6 transform_to_equation()

```
FormulaT smtrat::subtropical::transform_to_equation (
    const FormulaT & formula ) [inline]
```

Requires a quantifier-free real arithmetic formula with no negations.

Parameters

formula	The formula to transform

Returns

an equisatisfiable equation

0.14.91 smtrat::unsatcore Namespace Reference

Contains strategy implementations for unsat core computations.

Data Structures

- class UnsatCoreBackend
- class UnsatCoreBackend< Solver, UnsatCoreStrategy::ModelExclusion >

  Implements an easy strategy to obtain an unsatisfiable core.

0.14.91.1 Detailed Description

Contains strategy implementations for unsat core computations.

```

0.14.93 smtrat::vb Namespace Reference

Data Structures

- class Variable

  Class for a variable.
- class Bound

  Class for the bound of a variable.
- class VariableBounds

  Class to manage the bounds of a variable.

Functions

- template<typename Type >
  std::ostream & operator<< (std::ostream &_os, const VariableBounds< Type > &_vs)

  Prints the contents of the given variable bounds manager to the given stream.

0.14.93.1 Function Documentation

0.14.93.1.1 operator<<()

```
template<typename Type >
std::ostream& smtrat::vb::operator<< (
            std::ostream & _os,
            const VariableBounds< Type > & _vs ) [inline]
```

Prints the contents of the given variable bounds manager to the given stream.

Parameters

_os	The stream to print on.
_vs	The variable bounds manager to print.

Returns

The stream after printing on it.

0.14.94 smtrat::vs Namespace Reference

Data Structures

- class Condition
- struct unsignedTripleCmp
- class State
- class Substitution
- struct substitutionPointerEqual
- struct substitutionPointerHash

Typedefs

- typedef std::set< carl::PointerSet< Condition > > ConditionSetSet
- typedef std::set< ConditionSetSet > ConditionSetSetSet
- typedef std::list< const Condition * > ConditionList
- typedef std::vector< ConditionList > DisjunctionOfConditionConjunctions

- typedef std::pair< size_t, std::pair< size_t, size_t > > UnsignedTriple
- typedef std::pair< UnsignedTriple, vs::State * > ValStatePair
- typedef std::map< UnsignedTriple, vs::State *, unsignedTripleCmp > ValuationMap
- typedef std::vector< smtrat::ConstraintT > ConstraintVector

  a vector of constraints
- typedef std::vector< ConstraintVector > DisjunctionOfConstraintConjunctions

  a vector of vectors of constraints
- template<typename T >
  using SubstitutionFastPointerMap = std::unordered_map< const smtrat::Poly *, T, substitutionPointerHash, substitutionPointerEqual >

Functions

- std::ostream & operator<< (std::ostream &_out, const Condition &_condition)
- void simplify (DisjunctionOfConstraintConjunctions &)

  Simplifies a disjunction of conjunctions of constraints by deleting consistent constraint and inconsistent conjunctions of constraints.
- void simplify (DisjunctionOfConstraintConjunctions &_toSimplify, Variables &_conflictingVars, const smtrat::EvalDoubleIntervalMap &_solutionSpace)
- bool splitProducts (DisjunctionOfConstraintConjunctions &, bool=false)

  Splits all constraints in the given disjunction of conjunctions of constraints having a non-trivial factorization into a set of constraints which compare the factors instead.
- bool splitProducts (const ConstraintVector &, DisjunctionOfConstraintConjunctions &, bool=false)

  Splits all constraints in the given conjunction of constraints having a non-trivial factorization into a set of constraints which compare the factors instead.
- DisjunctionOfConstraintConjunctions splitProducts (const smtrat::ConstraintT &, bool=false)

  Splits the given constraint into a set of constraints which compare the factors of the factorization of the constraints considered polynomial.
- void splitSosDecompositions (DisjunctionOfConstraintConjunctions &_toSimplify)
- DisjunctionOfConstraintConjunctions getSignCombinations (const smtrat::ConstraintT &)

  For a given constraint f_1...*f_n ~ 0 this method computes all combinations of constraints f_1 ~_1 0 ...*
- void getOddBitStrings (std::size_t _length, std::vector< std::bitset< MAX_PRODUCT_SPLIT_NUMBER > > &_strings)
- void getEvenBitStrings (std::size_t _length, std::vector< std::bitset< MAX_PRODUCT_SPLIT_NUMBER > > &_strings)
- void print (DisjunctionOfConstraintConjunctions &_substitutionResults)

  Prints the given disjunction of conjunction of constraints.
- bool substitute (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper, Variables &_conflictingVariables, const smtrat::EvalDoubleIntervalMap &↩ _solutionSpace)
- bool substituteNormal (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper, Variables &_conflictingVariables, const smtrat::EvalDoubleIntervalMap &↩ _solutionSpace)
- bool substituteNormalSqrtEq (const smtrat::Poly &_radicand, const smtrat::Poly &_q, const smtrat::Poly &_r, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper)

  Sub-method of substituteNormalSqrt, where applying the substitution led to a term containing a square root.
- bool substituteNormalSqrtNeq (const smtrat::Poly &_radicand, const smtrat::Poly &_q, const smtrat::Poly &↩ _r, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper)

  Sub-method of substituteNormalSqrt, where applying the substitution led to a term containing a square root.
- bool substituteNormalSqrtLess (const smtrat::Poly &_radicand, const smtrat::Poly &_q, const smtrat::Poly &_r, const smtrat::Poly &_s, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper)

  Sub-method of substituteNormalSqrt, where applying the substitution led to a term containing a square root.
- bool substituteNormalSqrtLeq (const smtrat::Poly &_radicand, const smtrat::Poly &_q, const smtrat::Poly &↩ _r, const smtrat::Poly &_s, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper)

Sub-method of substituteNormalSqrt, where applying the substitution led to a term containing a square root.

- bool substitutePlusEps (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper, Variables &_conflictingVariables, const smtrat::EvalDoubleIntervalMap &↩ _solutionSpace)
- bool substituteEpsGradients (const smtrat::ConstraintT &_cons, const Substitution &_subs, const Relation _relation, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper, Variables &_conflicting↩ Variables, const smtrat::EvalDoubleIntervalMap &_solutionSpace)
- void substituteInf (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunctions &_result, Variables &_conflictingVariables, const smtrat::EvalDoubleIntervalMap &_solutionSpace)
- void substituteInfLessGreater (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunctio &_result)

  Applies the given substitution to the given constraint, where the substitution is of the form [x -> +/-infinity] with x as the variable and c and b polynomials in the real theory excluding x.
- void substituteTrivialCase (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunctions &_result)

  Deals with the case, that the left hand side of the constraint to substitute is a trivial polynomial in the variable to substitute.
- void substituteNotTrivialCase (const smtrat::ConstraintT &, const Substitution &, DisjunctionOfConstraintConjunctions &)

  Deals with the case, that the left hand side of the constraint to substitute is not a trivial polynomial in the variable to substitute.
- template<class combineType >
  bool combine (const std::vector< std::vector< std::vector< combineType > > > &_toCombine, std::vector< std::vector< combineType > > &_combination)

  Combines vectors.
- void simplify (DisjunctionOfConstraintConjunctions &, carl::Variables &, const smtrat::EvalDoubleIntervalMap &)

  Simplifies a disjunction of conjunctions of constraints by deleting consistent constraint and inconsistent conjunctions of constraints.
- void getOddBitStrings (size_t _length, std::vector< std::bitset< MAX_PRODUCT_SPLIT_NUMBER > > &↩ _strings)
- void getEvenBitStrings (size_t _length, std::vector< std::bitset< MAX_PRODUCT_SPLIT_NUMBER > > &_strings)
- bool substitute (const smtrat::ConstraintT &, const Substitution &, DisjunctionOfConstraintConjunctions &, bool _accordingPaper, carl::Variables &, const smtrat::EvalDoubleIntervalMap &)

  Applies a substitution to a constraint and stores the results in the given vector.
- bool substituteNormal (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper, carl::Variables &_conflictingVariables, const smtrat::EvalDoubleIntervalMap &_solutionSpace)

  Applies a substitution of a variable to a term, which is not minus infinity nor a to an square root expression plus an infinitesimal.
- bool substitutePlusEps (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunctions &_result, bool _accordingPaper, carl::Variables &_conflictingVariables, const smtrat::EvalDoubleIntervalMap &_solutionSpace)

  Applies the given substitution to the given constraint, where the substitution is of the form [x -> t+epsilon] with x as the variable and c and b polynomials in the real theory excluding x.
- bool substituteEpsGradients (const smtrat::ConstraintT &_cons, const Substitution &_subs, const carl↩ ::Relation _relation, DisjunctionOfConstraintConjunctions &, bool _accordingPaper, carl::Variables &_↩ conflictingVariables, const smtrat::EvalDoubleIntervalMap &_solutionSpace)

  Sub-method of substituteEps, where one of the gradients in the point represented by the substitution must be negative if the given relation is less or positive if the given relation is greater.
- void substituteInf (const smtrat::ConstraintT &_cons, const Substitution &_subs, DisjunctionOfConstraintConjunctions &_result, carl::Variables &_conflictingVariables, const smtrat::EvalDoubleIntervalMap &_solutionSpace)

  Applies the given substitution to the given constraint, where the substitution is of the form [x -> -infinity] with x as the variable and c and b polynomials in the real theory excluding x.
- std::ostream & operator<< (std::ostream &os, const Substitution &s)

  Prints the given substitution on the given output stream.

0.14.94.1 Typedef Documentation

0.14.94.1.1 ConditionList

```
typedef std::list< const Condition* > smtrat::vs::ConditionList
```

0.14.94.1.2 ConditionSetSet

```
typedef std::set< carl::PointerSet<Condition> > smtrat::vs::ConditionSetSet
```

0.14.94.1.3 ConditionSetSetSet

```
typedef std::set< ConditionSetSet > smtrat::vs::ConditionSetSetSet
```

0.14.94.1.4 ConstraintVector

```
typedef std::vector<smtrat::ConstraintT> smtrat::vs::ConstraintVector
```

a vector of constraints

0.14.94.1.5 DisjunctionOfConditionConjunctions

```
typedef std::vector< ConditionList > smtrat::vs::DisjunctionOfC
```

0.14.94.1.6 DisjunctionOfConstraintConjunctions

```
typedef std::vector<ConstraintVector> smtrat::vs::DisjunctionO
```

a vector of vectors of constraints

0.14.94.1.7 SubstitutionFastPointerMap

```
template<typename T >
using smtrat::vs::SubstitutionFastPointerMap = typedef std::unordered_map<const smtrat::Poly*,
T, substitutionPointerHash, substitutionPointerEqual>
```

0.14.94.1.8 UnsignedTriple

```
typedef std::pair<size_t, std::pair<size_t, size_t> > smtrat::vs::UnsignedTriple
```

0.14.94.1.9 ValStatePair

```
typedef std::pair<UnsignedTriple, vs::State*> smtrat::vs::ValStatePair
```

0.14.94.1.10 ValuationMap

```
typedef std::map<UnsignedTriple, vs::State*, unsignedTripleCmp>
smtrat::vs::ValuationMap
```

0.14.94.2 Function Documentation

0.14.94.2.1 combine()

```
template<class combineType >
bool smtrat::vs::combine (
            const std::vector< std::vector< std::vector< combineType > > > & _toCombine,
            std::vector< std::vector< combineType > > & _combination )
```

Combines vectors.

Parameters

_toCombine	The vectors to combine.
_combination	The resulting combination.

Returns

false, if the upper limit in the number of combinations resulting by this method is exceeded. Note, that this hinders a combinatorial blow up. true, otherwise.

0.14.94.2.2 getEvenBitStrings() [1/2]

```
void smtrat::vs::getEvenBitStrings (
    size_t _length,
    std::vector< std::bitset< MAX_PRODUCT_SPLIT_NUMBER > > & _strings )
```

Parameters

_length	The maximal length of the bit strings with even parity to compute.
_strings	All bit strings of length less or equal the given length with even parity.

0.14.94.2.3 getEvenBitStrings() [2/2]

```
void smtrat::vs::getEvenBitStrings (
    std::size_t _length,
    std::vector< std::bitset< MAX_PRODUCT_SPLIT_NUMBER > > & _strings )
```

0.14.94.2.4 getOddBitStrings() [1/2]

```
void smtrat::vs::getOddBitStrings (
    size_t _length,
    std::vector< std::bitset< MAX_PRODUCT_SPLIT_NUMBER > > & _strings )
```

Parameters

_length	The maximal length of the bit strings with odd parity to compute.
_strings	All bit strings of length less or equal the given length with odd parity.

0.14.94.2.5 getOddBitStrings() [2/2]

```
void smtrat::vs::getOddBitStrings (
    std::size_t _length,
    std::vector< std::bitset< MAX_PRODUCT_SPLIT_NUMBER > > & _strings )
```

0.14.94.2.6 getSignCombinations()

```
DisjunctionOfConstraintConjunctions smtrat::vs::getSign↩
Combinations (
    const smtrat::ConstraintT & )
```

For a given constraint f_1∗...∗f_n ∼ 0 this method computes all combinations of constraints f_1 ∼_1 0 ... f_n ∼_n 0 such that

```
f_1 ~_1 0 and ... and f_n ~_n 0   iff   f_1*...*f_n ~ 0
```

holds.

Parameters

_constraint	A pointer to the constraint to split this way.

Returns

The resulting combinations.

0.14.94.2.7 operator<<() [1/2]

```
std::ostream& smtrat::vs::operator<< (
    std::ostream & _out,
    const Condition & _condition )
```

0.14.94.2.8 operator<<() [2/2]

```
std::ostream & smtrat::vs::operator<< (
    std::ostream & os,
    const Substitution & s )
```

Prints the given substitution on the given output stream.

Parameters

_out	The output stream, on which to write.
_substitution	The substitution to print.

Returns

The output stream after printing the substitution on it.

0.14.94.2.9 print()

```
void smtrat::vs::print (
    DisjunctionOfConstraintConjunctions & _substitutionResults )
```

Prints the given disjunction of conjunction of constraints.

Parameters

_substitutionResults	The disjunction of conjunction of constraints to print.

0.14.94.2.10 simplify() [1/3]

```
void smtrat::vs::simplify (
    DisjunctionOfConstraintConjunctions & )
```

Simplifies a disjunction of conjunctions of constraints by deleting consistent constraint and inconsistent conjunctions of constraints.
If a conjunction of only consistent constraints exists, the simplified disjunction contains one empty conjunction.

Parameters

_toSimplify	The disjunction of conjunctions to simplify.

0.14.94.2.11 simplify() [2/3]

```
void smtrat::vs::simplify (
    DisjunctionOfConstraintConjunctions & ,
    carl::Variables & ,
    const smtrat::EvalDoubleIntervalMap & )
```

Simplifies a disjunction of conjunctions of constraints by deleting consistent constraint and inconsistent conjunctions of constraints.
If a conjunction of only consistent constraints exists, the simplified disjunction contains one empty conjunction.

Parameters

_toSimplify	The disjunction of conjunctions to simplify.
_conflictingVars	
_solutionSpace	

0.14.94.2.12 simplify() [3/3]

```
void smtrat::vs::simplify (
    DisjunctionOfConstraintConjunctions & _toSimplify,
    Variables & _conflictingVars,
    const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

0.14.94.2.13 splitProducts() [1/3]

```
bool smtrat::vs::splitProducts (
    const ConstraintVector & ,
    DisjunctionOfConstraintConjunctions & ,
    bool  = false )
```

Splits all constraints in the given conjunction of constraints having a non-trivial factorization into a set of constraints which compare the factors instead.

Parameters

_toSimplify	The conjunction of the constraints to split.
_result	The result, being a disjunction of conjunctions of constraints.
_onlyNeq	A flag indicating that only constraints with the relation symbol != are split.

Returns

false, if the upper limit in the number of combinations resulting by this method is exceeded. Note, that this hinders a combinatorial blow up. true, otherwise.

0.14.94.2.14 splitProducts() [2/3]

```
DisjunctionOfConstraintConjunctions smtrat::vs::splitProducts (
    const smtrat::ConstraintT & ,
    bool  = false )
```

Splits the given constraint into a set of constraints which compare the factors of the factorization of the constraints considered polynomial.

Parameters

_constraint	A pointer to the constraint to split.
_onlyNeq	A flag indicating that only constraints with the relation symbol != are split.

Returns

The resulting disjunction of conjunctions of constraints, which is semantically equivalent to the given constraint.

0.14.94.2.15 splitProducts() [3/3]

```
bool smtrat::vs::splitProducts (
    DisjunctionOfConstraintConjunctions & ,
    bool  = false )
```

Splits all constraints in the given disjunction of conjunctions of constraints having a non-trivial factorization into a set of constraints which compare the factors instead.

Parameters

_toSimplify	The disjunction of conjunctions of the constraints to split.
_onlyNeq	A flag indicating that only constraints with the relation symbol != are split.

Returns

false, if the upper limit in the number of combinations resulting by this method is exceeded. Note, that this hinders a combinatorial blow up. true, otherwise.

0.14.94.2.16 splitSosDecompositions()

```
void smtrat::vs::splitSosDecompositions (
DisjunctionOfConstraintConjunctions & _toSimplify )
```

0.14.94.2.17 substitute() [1/2]

```
bool smtrat::vs::substitute (
const smtrat::ConstraintT & ,
const Substitution & ,
DisjunctionOfConstraintConjunctions & ,
bool _accordingPaper,
carl::Variables & ,
const smtrat::EvalDoubleIntervalMap &  )
```

Applies a substitution to a constraint and stores the results in the given vector.

Parameters

_cons	The constraint to substitute in.
_subs	The substitution to apply.
_result	The vector, in which to store the results of this substitution.

Returns

false, if the upper limit in the number of combinations in the result of the substitution is exceeded. Note, that this hinders a combinatorial blow up. true, otherwise.

0.14.94.2.18 substitute() [2/2]

```
bool smtrat::vs::substitute (
const smtrat::ConstraintT & _cons,
const Substitution & _subs,
DisjunctionOfConstraintConjunctions & _result,
bool _accordingPaper,
Variables & _conflictingVariables,
const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

0.14.94.2.19 substituteEpsGradients() [1/2]

```
bool smtrat::vs::substituteEpsGradients (
const smtrat::ConstraintT & _cons,
const Substitution & _subs,
const carl::Relation _relation,
DisjunctionOfConstraintConjunctions & ,
bool _accordingPaper,
carl::Variables & _conflictingVariables,
const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

Sub-method of substituteEps, where one of the gradients in the point represented by the substitution must be negative if the given relation is less or positive if the given relation is greater.

Parameters

_cons	The constraint to substitute in.
_subs	The substitution to apply.

Parameters

_relation	The relation symbol, deciding whether the substitution result must be negative or positive.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.
_accordingPaper	A flag that indicates whether to apply the virtual substitution rules according to the paper "Quantifier elimination for real algebra - the quadratic case and beyond." by Volker Weispfenning (true) or in an adapted way which omits a higher degree in the result by splitting the result in more cases (false).
_conflictingVariables	If a conflict with the given solution space occurs, the variables being part of this conflict are stored in this container.
_solutionSpace	The solution space in form of double intervals of the variables occurring in the given constraint.

0.14.94.2.20 substituteEpsGradients() [2/2]

```
bool smtrat::vs::substituteEpsGradients (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    const Relation _relation,
    DisjunctionOfConstraintConjunctions & _result,
    bool _accordingPaper,
    Variables & _conflictingVariables,
    const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

0.14.94.2.21 substituteInf() [1/2]

```
void smtrat::vs::substituteInf (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    DisjunctionOfConstraintConjunctions & _result,
    carl::Variables & _conflictingVariables,
    const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

Applies the given substitution to the given constraint, where the substitution is of the form [x -> -infinity] with x as the variable and c and b polynomials in the real theory excluding x.
The constraint is of the form "f(x) \rho 0" with \rho element of {=,!=,<,>,<=,>=} and k as the maximum degree of x in f.

Parameters

_cons	The constraint to substitute in.
_subs	The substitution to apply.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.
_conflictingVariables	If a conflict with the given solution space occurs, the variables being part of this conflict are stored in this container.
_solutionSpace	The solution space in form of double intervals of the variables occurring in the given constraint.

0.14.94.2.22 substituteInf() [2/2]

```
void smtrat::vs::substituteInf (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    DisjunctionOfConstraintConjunctions & _result,
    Variables & _conflictingVariables,
```

```
const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

0.14.94.2.23 substituteInfLessGreater()

```
void smtrat::vs::substituteInfLessGreater (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    DisjunctionOfConstraintConjunctions & _result )
```

Applies the given substitution to the given constraint, where the substitution is of the form [x -> +/-infinity] with x as the variable and c and b polynomials in the real theory excluding x.
The constraint is of the form "a∗x^2+bx+c \rho 0", where \rho is less or greater.

Parameters

_cons	The constraint to substitute in.
_subs	The substitution to apply.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.

0.14.94.2.24 substituteNormal() [1/2]

```
bool smtrat::vs::substituteNormal (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    DisjunctionOfConstraintConjunctions & _result,
    bool _accordingPaper,
    carl::Variables & _conflictingVariables,
    const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

Applies a substitution of a variable to a term, which is not minus infinity nor a to an square root expression plus an infinitesimal.

Parameters

_cons	The constraint to substitute in.
_subs	The substitution to apply.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.
_accordingPaper	A flag that indicates whether to apply the virtual substitution rules according to the paper "Quantifier elimination for real algebra - the quadratic case and beyond." by Volker Weispfenning (true) or in an adapted way which omits a higher degree in the result by splitting the result in more cases (false).
_conflictingVariables	If a conflict with the given solution space occurs, the variables being part of this conflict are stored in this container.
_solutionSpace	The solution space in form of double intervals of the variables occurring in the given constraint.

0.14.94.2.25 substituteNormal() [2/2]

```
bool smtrat::vs::substituteNormal (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    DisjunctionOfConstraintConjunctions & _result,
    bool _accordingPaper,
    Variables & _conflictingVariables,
    const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

0.14.94.2.26 substituteNormalSqrtEq()

```
bool smtrat::vs::substituteNormalSqrtEq (
    const smtrat::Poly & _radicand,
    const smtrat::Poly & _q,
    const smtrat::Poly & _r,
    DisjunctionOfConstraintConjunctions & _result,
    bool _accordingPaper )
```

Sub-method of substituteNormalSqrt, where applying the substitution led to a term containing a square root. The relation symbol of the constraint to substitute is "=".

```
(_q+_r*sqrt(_radicand))
```

The term then looks like: ----------— _s

Parameters

_radicand	The radicand of the square root.
_q	The summand not containing the square root.
_r	The coefficient of the radicand.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.
_accordingPaper	A flag that indicates whether to apply the virtual substitution rules according to the paper "Quantifier elimination for real algebra - the quadratic case and beyond." by Volker Weispfenning (true) or in an adapted way which omits a higher degree in the result by splitting the result in more cases (false).

0.14.94.2.27 substituteNormalSqrtLeq()

```
bool smtrat::vs::substituteNormalSqrtLeq (
    const smtrat::Poly & _radicand,
    const smtrat::Poly & _q,
    const smtrat::Poly & _r,
    const smtrat::Poly & _s,
    DisjunctionOfConstraintConjunctions & _result,
    bool _accordingPaper )
```

Sub-method of substituteNormalSqrt, where applying the substitution led to a term containing a square root. The relation symbol of the constraint to substitute is less or equal.

```
(_q+_r*sqrt(_radicand))
```

The term then looks like: ----------— _s

Parameters

_radicand	The radicand of the square root.
_q	The summand not containing the square root.
_r	The coefficient of the radicand.
_s	The denominator of the expression containing the square root.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.
_accordingPaper	A flag that indicates whether to apply the virtual substitution rules according to the paper "Quantifier elimination for real algebra - the quadratic case and beyond." by Volker Weispfenning (true) or in an adapted way which omits a higher degree in the result by splitting the result in more cases (false).

0.14.94.2.28 substituteNormalSqrtLess()

```
bool smtrat::vs::substituteNormalSqrtLess (
    const smtrat::Poly & _radicand,
```

```
const smtrat::Poly & _q,
const smtrat::Poly & _r,
const smtrat::Poly & _s,
DisjunctionOfConstraintConjunctions & _result,
bool _accordingPaper )
```

Sub-method of substituteNormalSqrt, where applying the substitution led to a term containing a square root. The relation symbol of the constraint to substitute is less.

```
(_q+_r*sqrt(_radicand))
```

The term then looks like: ----------— _s

Parameters

_radicand	The radicand of the square root.
_q	The summand not containing the square root.
_r	The coefficient of the radicand.
_s	The denominator of the expression containing the square root.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.
_accordingPaper	A flag that indicates whether to apply the virtual substitution rules according to the paper "Quantifier elimination for real algebra - the quadratic case and beyond." by Volker Weispfenning (true) or in an adapted way which omits a higher degree in the result by splitting the result in more cases (false).

0.14.94.2.29 substituteNormalSqrtNeq()

```
bool smtrat::vs::substituteNormalSqrtNeq (
const smtrat::Poly & _radicand,
const smtrat::Poly & _q,
const smtrat::Poly & _r,
DisjunctionOfConstraintConjunctions & _result,
bool _accordingPaper )
```

Sub-method of substituteNormalSqrt, where applying the substitution led to a term containing a square root. The relation symbol of the constraint to substitute is "!=".

```
(_q+_r*sqrt(_radicand))
```

The term then looks like: ----------— _s

Parameters

_radicand	The radicand of the square root.
_q	The summand not containing the square root.
_r	The coefficient of the radicand.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.
_accordingPaper	A flag that indicates whether to apply the virtual substitution rules according to the paper "Quantifier elimination for real algebra - the quadratic case and beyond." by Volker Weispfenning (true) or in an adapted way which omits a higher degree in the result by splitting the result in more cases (false).

0.14.94.2.30 substituteNotTrivialCase()

```
void smtrat::vs::substituteNotTrivialCase (
const smtrat::ConstraintT & ,
const Substitution & ,
DisjunctionOfConstraintConjunctions & )
```

Deals with the case, that the left hand side of the constraint to substitute is not a trivial polynomial in the variable to substitute.
The constraints left hand side then should looks like: ax^2+bx+c

Parameters

_cons	The constraint to substitute in.
_subs	The substitution to apply.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.

0.14.94.2.31 substitutePlusEps() [1/2]

```
bool smtrat::vs::substitutePlusEps (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    DisjunctionOfConstraintConjunctions & _result,
    bool _accordingPaper,
    carl::Variables & _conflictingVariables,
    const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

Applies the given substitution to the given constraint, where the substitution is of the form [x -> t+epsilon] with x as the variable and c and b polynomials in the real theory excluding x.
The constraint is of the form "f(x) \rho 0" with \rho element of {=,!=,<,>,<=,>=} and k as the maximum degree of x in f.

Parameters

_cons	The constraint to substitute in.
_subs	The substitution to apply.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.
_accordingPaper	A flag that indicates whether to apply the virtual substitution rules according to the paper "Quantifier elimination for real algebra - the quadratic case and beyond." by Volker Weispfenning (true) or in an adapted way which omits a higher degree in the result by splitting the result in more cases (false).
_conflictingVariables	If a conflict with the given solution space occurs, the variables being part of this conflict are stored in this container.
_solutionSpace	The solution space in form of double intervals of the variables occurring in the given constraint.

0.14.94.2.32 substitutePlusEps() [2/2]

```
bool smtrat::vs::substitutePlusEps (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    DisjunctionOfConstraintConjunctions & _result,
    bool _accordingPaper,
    Variables & _conflictingVariables,
    const smtrat::EvalDoubleIntervalMap & _solutionSpace )
```

0.14.94.2.33 substituteTrivialCase()

```
void smtrat::vs::substituteTrivialCase (
    const smtrat::ConstraintT & _cons,
    const Substitution & _subs,
    DisjunctionOfConstraintConjunctions & _result )
```

Deals with the case, that the left hand side of the constraint to substitute is a trivial polynomial in the variable to substitute.
The constraints left hand side then should look like: ax^2+bx+c

Parameters

_cons	The constraint to substitute in.
_subs	The substitution to apply.
_result	The vector, in which to store the results of this substitution. It is semantically a disjunction of conjunctions of constraints.

  Initialize the global symbol table for constants.

Data Fields

- ParserState * state

0.15.2.1 Detailed Description

Base class for all theories.
A theory represents one or multiple SMT-LIB theories and takes care of converting smtlib constructs into our datastructures.
A theory has two kinds of functions:

- Initializer are static functions that initialize global datastructures. These are for example the set of constants.
- Handlers are member functions that implement a certain SMT-LIB functionality. Handlers always return a boolean that indicates if the theory could complete the request. Oftentimes, a theory will return false because the request should be handled by another theory. Handlers are used, whenever the parser can not easily decide which theory to use and thus tries to call every theory. The result of a handler is always a term that is returned through a reference argument.

  A theory may override any of the following methods.

0.15.2.2 Constructor & Destructor Documentation

0.15.2.2.1 AbstractTheory() `smtrat::parser::AbstractTheory::AbstractTheory ( ParserState * state ) [inline]`

0.15.2.2.2 ~AbstractTheory() `virtual smtrat::parser::AbstractTheory::~AbstractTheory ( ) [inline], [virtual]`

0.15.2.3 Member Function Documentation

0.15.2.3.1 addConstants()

```
static void smtrat::parser::AbstractTheory::addConstants (
    qi::symbols< char, types::ConstType > & ) [inline], [static]
```

Initialize the global symbol table for constants.

0.15.2.3.2 addSimpleSorts()

```
static void smtrat::parser::AbstractTheory::addSimpleSorts (
    qi::symbols< char, carl::Sort > & ) [inline], [static]
```

Initialize the global symbol table for simple sorts.

0.15.2.3.3 declareVariable()

```
virtual bool smtrat::parser::AbstractTheory::declareVariable (
    const std::string & ,
    const carl::Sort & ,
    types::VariableType & ,
    TheoryError & errors ) [inline], [virtual]
```

Declare a new variable with the given name and the given sort.
Reimplemented in smtrat::parser::UninterpretedTheory, smtrat::parser::CoreTheory, smtrat::parser::BitvectorTheory, and smtrat::parser::ArithmeticTheory.

0.15.2.3.4 expandDistinct()

```
template<typename T , typename Builder >
FormulaT smtrat::parser::AbstractTheory::expandDistinct (
    const std::vector< T > & values,
    const Builder & neqBuilder ) [inline]
```

0.15.2.3.5 functionCall()

```
virtual bool smtrat::parser::AbstractTheory::functionCall (
    const Identifier & ,
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors ) [inline], [virtual]
```

Resolve another unknown function call.
Reimplemented in smtrat::parser::UninterpretedTheory, smtrat::parser::CoreTheory, smtrat::parser::BitvectorTheory, and smtrat::parser::ArithmeticTheory.

0.15.2.3.6 handleDistinct()

```
virtual bool smtrat::parser::AbstractTheory::handleDistinct (
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors ) [inline], [virtual]
```

Resolve a distinct operator.
Reimplemented in smtrat::parser::CoreTheory, smtrat::parser::BitvectorTheory, smtrat::parser::ArithmeticTheory, and smtrat::parser::UninterpretedTheory.

0.15.2.3.7 handleITE()

```
virtual bool smtrat::parser::AbstractTheory::handleITE (
    const FormulaT & ,
    const types::TermType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors ) [inline], [virtual]
```

Resolve an if-then-else operator.

Reimplemented in smtrat::parser::UninterpretedTheory, smtrat::parser::CoreTheory, smtrat::parser::BitvectorTheory, and smtrat::parser::ArithmeticTheory.

0.15.2.3.8 instantiate()

```
virtual bool smtrat::parser::AbstractTheory::instantiate (
    const types::VariableType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors ) [inline], [virtual]
```

Instantiate a variable within a term.
Reimplemented in smtrat::parser::BitvectorTheory, and smtrat::parser::ArithmeticTheory.

0.15.2.3.9 refreshVariable()

```
virtual bool smtrat::parser::AbstractTheory::refreshVariable (
    const types::VariableType & ,
    types::VariableType & ,
    TheoryError & errors ) [inline], [virtual]
```

Reimplemented in smtrat::parser::BitvectorTheory.

0.15.2.3.10 resolveSymbol()

```
virtual bool smtrat::parser::AbstractTheory::resolveSymbol (
    const Identifier & ,
    types::TermType & ,
    TheoryError & errors ) [inline], [virtual]
```

Resolve a symbol that was not declared within the ParserState.
This might be a symbol that actually uses indices, for example bitvector constants.
Reimplemented in smtrat::parser::BitvectorTheory.

0.15.10 benchmax::slurm::ArchiveProperties Struct Reference

All properties needed to archive log files.

`#include <SlurmUtilities.h>`

Data Fields

- std::string filename_archive

  Filename of the archive.
- std::string tmp_dir

  Temporary directory to look for output files.

0.15.10.1 Detailed Description

All properties needed to archive log files.

0.15.10.2 Field Documentation

0.15.10.2.1 filename_archive `std::string benchmax::slurm::ArchiveProperties::filename_archive`
Filename of the archive.

0.15.10.2.2 tmp_dir `std::string benchmax::slurm::ArchiveProperties::tmp_dir`
Temporary directory to look for output files.

0.15.11 smtrat::parser::ArithmeticTheory Struct Reference

Implements the theory of arithmetic, including LRA, LIA, NRA and NIA.
`#include <Arithmetic.h>`

Public Member Functions

- ArithmeticTheory (ParserState *state)
- bool declareVariable (const std::string &name, const carl::Sort &sort, types::VariableType &result, TheoryError &errors)

  Declare a new variable with the given name and the given sort.
- bool handleITE (const FormulaT &ifterm, const types::TermType &thenterm, const types::TermType &elseterm, types::TermType &result, TheoryError &errors)

  Resolve an if-then-else operator.
- bool handleDistinct (const std::vector< types::TermType > &arguments, types::TermType &result, TheoryError &errors)

  Resolve a distinct operator.
- bool instantiate (const types::VariableType &var, const types::TermType &replacement, types::TermType &result, TheoryError &errors)

  Instantiate a variable within a term.
- bool functionCall (const Identifier &identifier, const std::vector< types::TermType > &arguments, types::TermType &result, TheoryError &errors)

  Resolve another unknown function call.
- virtual bool resolveSymbol (const Identifier &, types::TermType &, TheoryError &errors)

  Resolve a symbol that was not declared within the ParserState.
- template<typename T , typename Builder >
  FormulaT expandDistinct (const std::vector< T > &values, const Builder &neqBuilder)
- virtual bool refreshVariable (const types::VariableType &, types::VariableType &, TheoryError &errors)

Static Public Member Functions

- static void addSimpleSorts (qi::symbols< char, carl::Sort > &sorts)
- static void addConstants (qi::symbols< char, types::ConstType > &)

  Initialize the global symbol table for constants.

Data Fields

- std::map< std::string, arithmetic::OperatorType > ops
- std::map< carl::Variable, std::tuple< FormulaT, Poly, Poly > > mITEs
- ParserState * state

0.15.11.1 Detailed Description

Implements the theory of arithmetic, including LRA, LIA, NRA and NIA.

0.15.11.2 Constructor & Destructor Documentation

0.15.11.2.1 ArithmeticTheory()

```
smtrat::parser::ArithmeticTheory::ArithmeticTheory (
    ParserState * state )
```

0.15.11.3 Member Function Documentation

0.15.11.3.1 addConstants()

```
static void smtrat::parser::AbstractTheory::addConstants (
    qi::symbols< char, types::ConstType > & ) [inline], [static], [inherited]
```

Initialize the global symbol table for constants.

0.15.11.3.2 addSimpleSorts()

```
void smtrat::parser::ArithmeticTheory::addSimpleSorts (
    qi::symbols< char, carl::Sort > & sorts ) [static]
```

0.15.11.3.3 declareVariable()

```
bool smtrat::parser::ArithmeticTheory::declareVariable (
    const std::string & ,
    const carl::Sort & ,
    types::VariableType & ,
    TheoryError & errors ) [virtual]
```

Declare a new variable with the given name and the given sort.
Reimplemented from smtrat::parser::AbstractTheory.

0.15.11.3.4 expandDistinct()

```
template<typename T , typename Builder >
FormulaT smtrat::parser::AbstractTheory::expandDistinct (
    const std::vector< T > & values,
    const Builder & neqBuilder ) [inline], [inherited]
```

0.15.11.3.5 functionCall()

```
bool smtrat::parser::ArithmeticTheory::functionCall (
    const Identifier & ,
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors ) [virtual]
```

Resolve another unknown function call.
Reimplemented from smtrat::parser::AbstractTheory.

0.15.11.3.6 handleDistinct()

```
bool smtrat::parser::ArithmeticTheory::handleDistinct (
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors )  [virtual]
```

Resolve a distinct operator.
Reimplemented from smtrat::parser::AbstractTheory.

0.15.11.3.7 handleITE()

```
bool smtrat::parser::ArithmeticTheory::handleITE (
    const FormulaT & ,
    const types::TermType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors )  [virtual]
```

Resolve an if-then-else operator.
Reimplemented from smtrat::parser::AbstractTheory.

0.15.11.3.8 instantiate()

```
bool smtrat::parser::ArithmeticTheory::instantiate (
    const types::VariableType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors )  [virtual]
```

Instantiate a variable within a term.
Reimplemented from smtrat::parser::AbstractTheory.

0.15.11.3.9 refreshVariable()

```
virtual bool smtrat::parser::AbstractTheory::refreshVariable (
    const types::VariableType & ,
    types::VariableType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Reimplemented in smtrat::parser::BitvectorTheory.

0.15.11.3.10 resolveSymbol()

```
virtual bool smtrat::parser::AbstractTheory::resolveSymbol (
    const Identifier & ,
    types::TermType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Resolve a symbol that was not declared within the ParserState.
This might be a symbol that actually uses indices, for example bitvector constants.
Reimplemented in smtrat::parser::BitvectorTheory.

0.15.11.4 Field Documentation

0.15.11.4.1 mITEs

```
std::map<carl::Variable, std::tuple<FormulaT, Poly, Poly> > smtrat::parser↩
::ArithmeticTheory::mITEs
```

0.15.11.4.2 ops

```
std::map<std::string, arithmetic::OperatorType> smtrat::parser::Arithmetic↩
Theory::ops
```

0.15.11.4.3 state

```
ParserState* smtrat::parser::AbstractTheory::state  [inherited]
```

0.15.12 smtrat::parser::types::ArithmeticTheory Struct Reference

Types of the arithmetic theory.
`#include <TheoryTypes.h>`

Public Types

0.15.25 benchmax::Backend Class Reference

Base class for all backends.
`#include <Backend.h>`

Public Member Functions

- bool suspendable () const
- void process_results (const Jobs &jobs, bool check_finished)
- void addResult (const Tool *tool, const fs::path &file, BenchmarkResult &&result)

  Add a result.
- void run (const Jobs &jobs, bool wait_for_termination)

  Run the list of tools against the list of benchmarks.

Protected Member Functions

- Backend ()
- virtual void startTool (const Tool *)

  Hook for every tool at the beginning.
- virtual void finalize ()

  Hook to allow for asynchronous backends to wait for jobs to terminate.
- virtual void execute (const Tool *, const fs::path &)

  Execute a single pair of tool and benchmark.
- void madeProgress (std::size_t files=1)

  Can be called to give information about the current progress, if available.
- virtual bool collect_results (const Jobs &, bool)
- void sanitize_results (const Jobs &jobs) const
- void write_results (const Jobs &jobs) const

Protected Attributes

- std::size_t mExpectedJobs

  Number of jobs that should be run.
- std::atomic< std::size_t > mFinishedJobs

  Number of jobs that are finished.
- std::atomic< std::size_t > mLastPercent

  Percentage of finished jobs when madeProgress() was last called.

0.15.25.1 Detailed Description

Base class for all backends.
Offers appropriate hooks to model the whole workflow for backends where each job is executed individually. The run() method is called from ourside which first calls startTool() for every tool and then runs execute() for every pair of tool and benchmark. It also offers addResult() to store results and madeProgress() to provide a progress indication to the user. If a benchmark requires a completely different workflow, for example for a batch job, it should override the run() method.

0.15.25.2 Constructor & Destructor Documentation

0.15.25.2.1 Backend() `benchmax::Backend::Backend ( ) [inline], [protected]`

0.15.25.3 Member Function Documentation

0.15.25.3.1 addResult()

```
void benchmax::Backend::addResult (
    const Tool * tool,
    const fs::path & file,
    BenchmarkResult && result ) [inline]
```

Add a result.

0.15.25.3.2 collect_results()

```
virtual bool benchmax::Backend::collect_results (
    const Jobs & ,
    bool ) [inline], [protected], [virtual]
```

0.15.25.3.3 execute()

```
virtual void benchmax::Backend::execute (
    const Tool * ,
    const fs::path & ) [inline], [protected], [virtual]
```

Execute a single pair of tool and benchmark.
Reimplemented in benchmax::LocalBackend, and benchmax::CondorBackend.

0.15.25.3.4 finalize()

```
virtual void benchmax::Backend::finalize ( ) [inline], [protected], [virtual]
```

Hook to allow for asynchronous backends to wait for jobs to terminate.

0.15.25.3.5 madeProgress()

```
void benchmax::Backend::madeProgress (
    std::size_t files = 1 ) [inline], [protected]
```

Can be called to give information about the current progress, if available.

0.15.25.3.6 process_results()

```
void benchmax::Backend::process_results (
    const Jobs & jobs,
    bool check_finished ) [inline]
```

0.15.25.3.7 run()

```
void benchmax::Backend::run (
    const Jobs & jobs,
    bool wait_for_termination ) [inline]
```

Run the list of tools against the list of benchmarks.

0.15.25.3.8 sanitize_results()

```
void benchmax::Backend::sanitize_results (
    const Jobs & jobs ) const [inline], [protected]
```

0.15.25.3.9 startTool()

```
virtual void benchmax::Backend::startTool (
    const Tool * ) [inline], [protected], [virtual]
```

Hook for every tool at the beginning.
Can be used to upload the tool to some remote system.

0.15.25.3.10 suspendable()

```
bool benchmax::Backend::suspendable ( ) const [inline]
```

0.15.25.3.11 write_results()

```
void benchmax::Backend::write_results (
    const Jobs & jobs ) const [inline], [protected]
```

0.15.25.4 Field Documentation

0.15.25.4.1 mExpectedJobs `std::size_t benchmax::Backend::mExpectedJobs [protected]`

Number of jobs that should be run.

0.15.25.4.2 mFinishedJobs `std::atomic<std::size_t> benchmax::Backend::mFinishedJobs [protected]`

Number of jobs that are finished.

0.15.25.4.3 mLastPercent `std::atomic<std::size_t> benchmax::Backend::mLastPercent [protected]`

Percentage of finished jobs when madeProgress() was last called.

0.15.32 smtrat::cad::BaseProjection< Settings > Class Template Reference

```
#include <BaseProjection.h>
```

Public Member Functions

- std::size_t dim () const

  Returns the dimension of the projection.
- const auto & vars () const

  Returns the variables used for projection.
- void reset ()

  Resets all datastructures, use the given variables from now on.
- template<typename F >
  void setRemoveCallback (F &&f)

  Sets a callback that is called whenever polynomials are removed.
- carl::Bitset addPolynomial (const Poly &p, std::size_t cid, bool isBound)

  Adds the given polynomial to the projection. Converts to a UPoly and calls the appropriate overload.
- virtual carl::Bitset addPolynomial (const UPoly &p, std::size_t cid, bool isBound)=0

  Adds the given polynomial to the projection.
- carl::Bitset addEqConstraint (const Poly &p, std::size_t cid, bool isBound)

  Adds the given polynomial of an equational constraint to the projection. Converts to a UPoly and calls the appropriate overload.
- virtual carl::Bitset addEqConstraint (const UPoly &p, std::size_t cid, bool isBound)

  Adds the given polynomial of an equational constraint to the projection.
- void removePolynomial (const Poly &p, std::size_t cid, bool isBound)

  Removes the given polynomial from the projection. Converts to a UPoly and calls the appropriate overload.
- virtual void removePolynomial (const UPoly &p, std::size_t cid, bool isBound)=0

  Removes the given polynomial from the projection.
- virtual std::size_t size (std::size_t level) const =0
- std::size_t size () const
- virtual bool empty (std::size_t level) const =0
- virtual bool empty ()
- OptionalID getPolyForLifting (std::size_t level, SampleLiftedWith &slw)

  Get a polynomial from this level suited for lifting.
- virtual bool hasPolynomialById (std::size_t level, std::size_t id) const =0
- virtual const UPoly & getPolynomialById (std::size_t level, std::size_t id) const =0

  Retrieves a polynomial from its id.
- virtual void exportAsDot (std::ostream &) const
- virtual Origin getOrigin (std::size_t level, std::size_t id) const

Protected Types

- using Constraints = CADConstraints< Settings::backtracking >

Protected Member Functions

- BaseProjection (const Constraints &c)
- void callRemoveCallback (std::size_t level, const SampleLiftedWith &slw) const
- std::size_t getID (std::size_t level)

  Returns a fresh polynomial id for the given level.
- void freeID (std::size_t level, std::size_t id)

  Frees a currently used polynomial id for the given level.
- carl::Variable var (std::size_t level) const

  Returns the variable that corresponds to the given level, that is the variable eliminated in this level.
- bool canBePurgedByBounds (const UPoly &p) const

  Checks whether a polynomial can safely be ignored due to the bounds.
- bool isPurged (std::size_t level, std::size_t id)

Protected Attributes

- const Constraints & mConstraints
- std::vector< PolynomialLiftingQueue< BaseProjection > > mLiftingQueues

  List of lifting queues that can be used for incremental projection.
- ProjectionInformation mInfo

  Additional info on projection, projection levels and projection polynomials.
- ProjectionOperator mOperator

  The projection operator.
- std::function< void(std::size_t, const SampleLiftedWith &)> mRemoveCallback

  Callback to be called when polynomials are removed. The arguments are the projection level and a bitset that indicate which polynomials were removed in this level.

```
template<typename Settings >
smtrat::cad::BaseProjection< Settings >::BaseProjection (
            const Constraints & c )  [inline], [protected]
```

0.15.32.3 Member Function Documentation

0.15.32.3.1 addEqConstraint() [1/2] template<typename Settings >

```
carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const Poly & p,
            std::size_t cid,
            bool isBound ) [inline]
```

Adds the given polynomial of an equational constraint to the projection. Converts to a UPoly and calls the appropriate overload.

0.15.32.3.2 addEqConstraint() [2/2] template<typename Settings >

```
virtual carl::Bitset smtrat::cad::BaseProjection< Settings >::addEqConstraint (
            const UPoly & p,
            std::size_t cid,
            bool isBound ) [inline], [virtual]
```

Adds the given polynomial of an equational constraint to the projection.
Reimplemented in smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >.

0.15.32.3.3 addPolynomial() [1/2] template<typename Settings >

```
carl::Bitset smtrat::cad::BaseProjection< Settings >::addPolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound ) [inline]
```

Adds the given polynomial to the projection. Converts to a UPoly and calls the appropriate overload.

0.15.32.3.4 addPolynomial() [2/2] template<typename Settings >

```
virtual carl::Bitset smtrat::cad::BaseProjection< Settings >::addPolynomial (
            const UPoly & p,
            std::size_t cid,
            bool isBound ) [pure virtual]
```

Adds the given polynomial to the projection.
Implemented in smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED, Settings >, smtrat::cad::Projection< In
smtrat::cad::ModelBasedProjection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::Projection< Increme
smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, Settings >, and smtrat::cad::Projection< Incrementality::SIMPLE

0.15.32.3.5 callRemoveCallback() template<typename Settings >

```
void smtrat::cad::BaseProjection< Settings >::callRemoveCallback (
            std::size_t level,
            const SampleLiftedWith & slw ) const [inline], [protected]
```

0.15.32.3.6 canBePurgedByBounds() template<typename Settings >

```
bool smtrat::cad::BaseProjection< Settings >::canBePurgedByBounds (
            const UPoly & p ) const [inline], [protected]
```

Checks whether a polynomial can safely be ignored due to the bounds.

0.15.32.3.7 dim() template<typename Settings >

```
std::size_t smtrat::cad::BaseProjection< Settings >::dim ( ) const [inline]
```

Returns the dimension of the projection.

0.15.32.3.8 empty() [1/2] template<typename Settings >

```
virtual bool smtrat::cad::BaseProjection< Settings >::empty ( ) [inline], [virtual]
```

0.15.32.3.9 empty() [2/2] template<typename Settings >

```
virtual bool smtrat::cad::BaseProjection< Settings >::empty (
            std::size_t level ) const [pure virtual]
```

Implemented in smtrat::qe::cad::Projection< Settings >, smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED
smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::ModelBasedProjection< Increme
smtrat::cad::Projection< Incrementality::FULL, BT, Settings >, and smtrat::cad::Projection< Incrementality::FULL, Backtracking::HID

0.15.32.3.10 exportAsDot() template<typename Settings >

```
virtual void smtrat::cad::BaseProjection< Settings >::exportAsDot (
            std::ostream & ) const [inline], [virtual]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, BT, Settings >, and smtrat::cad::Projection< Incrementality::FULL,

0.15.32.3.11 freeID() template<typename Settings >

```
void smtrat::cad::BaseProjection< Settings >::freeID (
            std::size_t level,
            std::size_t id ) [inline], [protected]
```

Frees a currently used polynomial id for the given level.

0.15.32.3.12 getID() template<typename Settings >

```
std::size_t smtrat::cad::BaseProjection< Settings >::getID (
            std::size_t level ) [inline], [protected]
```

Returns a fresh polynomial id for the given level.

0.15.32.3.13 getOrigin() template<typename Settings >

```
virtual Origin smtrat::cad::BaseProjection< Settings >::getOrigin (
            std::size_t level,
            std::size_t id ) const [inline], [virtual]
```

Reimplemented in smtrat::cad::Projection< Incrementality::FULL, BT, Settings >.

0.15.32.3.14 getPolyForLifting() template<typename Settings >

```
OptionalID smtrat::cad::BaseProjection< Settings >::getPolyForLifting (
            std::size_t level,
            SampleLiftedWith & slw ) [inline]
```

Get a polynomial from this level suited for lifting.

0.15.32.3.15 getPolynomialById() template<typename Settings >

```
virtual const UPoly& smtrat::cad::BaseProjection< Settings >::getPolynomialById (
            std::size_t level,
            std::size_t id ) const [pure virtual]
```

Retrieves a polynomial from its id.
Implemented in smtrat::qe::cad::Projection< Settings >, smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED
smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::ModelBasedProjection< Increme
smtrat::cad::Projection< Incrementality::FULL, BT, Settings >, and smtrat::cad::Projection< Incrementality::FULL, Backtracking::HID

0.15.32.3.16 hasPolynomialById() template<typename Settings >

```
virtual bool smtrat::cad::BaseProjection< Settings >::hasPolynomialById (
            std::size_t level,
            std::size_t id ) const [pure virtual]
```

Implemented in smtrat::qe::cad::Projection< Settings >, smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED
smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::ModelBasedProjection< Increme
smtrat::cad::Projection< Incrementality::FULL, BT, Settings >, and smtrat::cad::Projection< Incrementality::FULL, Backtracking::HID

0.15.32.3.17 isPurged()

```
template<typename Settings >
bool smtrat::cad::BaseProjection< Settings >::isPurged (
            std::size_t level,
            std::size_t id )  [inline], [protected]
```

0.15.32.3.18 removePolynomial() [1/2]

```
template<typename Settings >
void smtrat::cad::BaseProjection< Settings >::removePolynomial (
            const Poly & p,
            std::size_t cid,
            bool isBound )  [inline]
```

Removes the given polynomial from the projection. Converts to a UPoly and calls the appropriate overload.

0.15.32.3.19 removePolynomial() [2/2]

```
template<typename Settings >
virtual void smtrat::cad::BaseProjection< Settings >::removePolynomial (
            const UPoly & p,
            std::size_t cid,
            bool isBound )  [pure virtual]
```

Removes the given polynomial from the projection.
Implemented in smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::ModelBasedProje
smtrat::cad::Projection< Incrementality::FULL, BT, Settings >, smtrat::cad::Projection< Incrementality::FULL, Backtracking::HIDE, S
smtrat::cad::Projection< Incrementality::SIMPLE, BT, Settings >, and smtrat::cad::Projection< Incrementality::NONE, Backtracking::

0.15.32.3.20 reset()

```
template<typename Settings >
void smtrat::cad::BaseProjection< Settings >::reset ( )  [inline]
```

Resets all datastructures, use the given variables from now on.

0.15.32.3.21 setRemoveCallback()

```
template<typename Settings >
template<typename F >
void smtrat::cad::BaseProjection< Settings >::setRemoveCallback (
            F && f )  [inline]
```

Sets a callback that is called whenever polynomials are removed.

0.15.32.3.22 size() [1/2]

```
template<typename Settings >
std::size_t smtrat::cad::BaseProjection< Settings >::size ( ) const  [inline]
```

0.15.32.3.23 size() [2/2]

```
template<typename Settings >
virtual std::size_t smtrat::cad::BaseProjection< Settings >::size (
            std::size_t level ) const  [pure virtual]
```

Implemented in smtrat::qe::cad::Projection< Settings >, smtrat::cad::Projection< Incrementality::NONE, Backtracking::UNORDERED
smtrat::cad::Projection< Incrementality::NONE, Backtracking::ORDERED, Settings >, smtrat::cad::ModelBasedProjection< Increme
smtrat::cad::Projection< Incrementality::FULL, BT, Settings >, and smtrat::cad::Projection< Incrementality::FULL, Backtracking::HID

0.15.32.3.24 var() template<typename Settings >

```
carl::Variable smtrat::cad::BaseProjection< Settings >::var (
            std::size_t level ) const [inline], [protected]
```

Returns the variable that corresponds to the given level, that is the variable eliminated in this level.

0.15.32.3.25 vars() template<typename Settings >

```
const auto& smtrat::cad::BaseProjection< Settings >::vars ( ) const [inline]
```

Returns the variables used for projection.

0.15.32.4 Field Documentation

0.15.32.4.1 mConstraints template<typename Settings >

```
const Constraints& smtrat::cad::BaseProjection< Settings >::mConstraints [protected]
```

0.15.32.4.2 mInfo template<typename Settings >

```
ProjectionInformation smtrat::cad::BaseProjection< Settings >::mInfo [protected]
```

Additional info on projection, projection levels and projection polynomials.

0.15.32.4.3 mLiftingQueues template<typename Settings >

```
std::vector<PolynomialLiftingQueue<BaseProjection> > smtrat::cad::BaseProjection< Settings
>::mLiftingQueues [protected]
```

List of lifting queues that can be used for incremental projection.

0.15.32.4.4 mOperator template<typename Settings >

```
ProjectionOperator smtrat::cad::BaseProjection< Settings >::mOperator [protected]
```

The projection operator.

0.15.32.4.5 mRemoveCallback template<typename Settings >

```
std::function<void(std::size_t, const SampleLiftedWith&)> smtrat::cad::BaseProjection< Settings
>::mRemoveCallback [protected]
```

Callback to be called when polynomials are removed. The arguments are the projection level and a bitset that indicate which polynomials were removed in this level.

0.15.33 smtrat::cad::BaseSettings Struct Reference

```
#include <Settings.h>
```

0.15.43 smtrat::BEModule< Settings > Class Template Reference

`#include <BEModule.h>`

Public Types

- typedef Settings SettingsType
- enum class LemmaType : unsigned { NORMAL = 0 , PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- BEModule (const ModuleInput ∗_formula, Conditionals &_conditionals, Manager ∗_manager=NULL)
- ∼BEModule ()
- Answer checkCore ()

  Checks the received formula for consistency.
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void updateModel () const

  Updates the current assignment into the model.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput ∗ pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput ∗ pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module ∗ > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore ([[maybe_unused]] const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore ([[maybe_unused]] const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

Stores the assignment of the current satisfiable result, if existent.

- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

0.15.43.4 Member Function Documentation

0.15.43.4.1 add()

```
bool smtrat::PModule::add (
            ModuleInput::const_iterator _subformula )  [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.43.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
            const FormulaT & _constraint )  [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

0.15.43.4.3 addCore()

```
virtual bool smtrat::Module::addCore (
            [[maybe_unused] ] ModuleInput::const_iterator formula )  [inline], [protected],
[virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.43.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

0.15.43.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

0.15.43.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

0.15.43.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.
Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

0.15.43.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.
Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.43.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.43.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.43.4.11 allModels()

`const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns

All satisfying assignments, if existent.

0.15.43.4.12 anAnswerFound()

`bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns

True, if one of them has determined a result.

0.15.43.4.13 answerFound()

`const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns

A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.43.4.14 appliedPreprocessing()

`bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]`

Returns

true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

0.15.43.4.15 backendsModel()

`const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

0.15.43.4.16 branchAt() [1/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.43.4.17 branchAt() [2/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

0.15.43.4.18 branchAt() [3/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

0.15.43.4.19 branchAt() [4/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

0.15.43.4.20 check()

```
Answer smtrat::PModule::check (
    bool _final = false,
    bool _full = true,
    carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.43.4.21 checkCore()

`template<typename Settings >`
`Answer smtrat::BEModule< Settings >::checkCore ( ) [virtual]`

Checks the received formula for consistency.

Returns

SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.43.4.22 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
std::vector< FormulaSetT >::const_iterator _infsubset,
const std::string & _filename = "smaller_muses",
unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

0.15.43.4.23 checkModel()

`unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns

false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

0.15.43.4.24 cleanModel()

`void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

0.15.43.4.25 clearLemmas()

`void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

0.15.43.4.26 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

0.15.43.4.27 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

0.15.43.4.28 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

0.15.43.4.29 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

0.15.43.4.30 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.
If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

0.15.43.4.31 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

0.15.43.4.32 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns

The constraints which the backends must be informed about.

0.15.43.4.33 currentlySatisfied() `virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

0.15.43.4.34 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

0.15.43.4.35 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.43.4.36 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual],
[inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.43.4.37 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns

The index of the smallest (regarding the size of the sets) element of origins

0.15.43.4.38 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module. Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.

Parameters

_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

0.15.43.4.39 excludeNotReceivedVariablesFromModel()

`void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]`

Excludes all variables from the current model, which do not occur in the received formula.

0.15.43.4.40 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

0.15.43.4.41 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns

The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.43.4.42 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns

The position of the first (by this module) unchecked sub-formula of the received formula.

0.15.43.4.43 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

0.15.43.4.44 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

0.15.43.4.45 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

0.15.43.4.46 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

0.15.43.4.47 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

0.15.43.4.48 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasible↩
Subsets (
            const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.
Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns

The infeasible subsets the given backend provides.

0.15.43.4.49 getInformationRelevantFormulas()

```
const std::set< FormulaT > & smtrat::Module↩
::getInformationRelevantFormulas ( ) [protected], [inherited]
```

Gets all InformationRelevantFormulas.

Returns

Set of all formulas

0.15.43.4.50 getModelEqualities()

```
std::list< std::vector< carl::Variable > > smtrat::Module↩
::getModelEqualities ( ) const [virtual], [inherited]
```

Partition the variables from the current model into equivalence classes according to their assigned value.
The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns

Equivalence classes.

0.15.43.4.51 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
            const FormulaT & _formula,
            FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

0.15.43.4.52 getOrigins() [2/3] void smtrat::Module::getOrigins (const FormulaT & _formula, FormulasT & _origins) const [inline], [protected], [inherited]

Parameters

_formula	
_origins	

0.15.43.4.53 getOrigins() [3/3] const FormulaT& smtrat::Module::getOrigins (ModuleInput::const_iterator _formula) const [inline], [protected], [inherited]

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns

The origins of the passed formula at the given position.

0.15.43.4.54 getReceivedFormulaSimplified() std::pair< bool, FormulaT > smtrat::PModule::get↩ ReceivedFormulaSimplified ( ) [virtual], [inherited]

Returns

A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

0.15.43.4.55 hasLemmas() bool smtrat::Module::hasLemmas ( ) [inline], [inherited]

Checks whether this module or any of its backends provides any lemmas.

0.15.43.4.56 hasValidInfeasibleSubset() bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]

Returns

true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

0.15.43.4.57 id() std::size_t smtrat::Module::id ( ) const [inline], [inherited]

Returns

A unique ID to identify this module instance.

0.15.43.4.58 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns

The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

0.15.43.4.59 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.43.4.60 informBackends() `void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

0.15.43.4.61 informCore() `virtual bool smtrat::Module::informCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.43.4.62 informedConstraints() `const carl::FastSet<FormulaT>& smtrat::Module::informed↩ Constraints ( ) const [inline], [inherited]`

Returns

The position of the first constraint of which no backend has been informed about.

0.15.43.4.63 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.
This method must not be called twice and only before the first runBackends call.
Reimplemented in smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntBlastModule< Settings >, smtrat::FPPModule< Settings >, smtrat::CurryModule< Settings >, and smtrat::BVModule< Settings >.

0.15.43.4.64 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

0.15.43.4.65 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

0.15.43.4.66 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns

true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

0.15.43.4.67 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns

A constant reference to the lemmas being valid formulas this module or its backends made.

0.15.43.4.68 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.
({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns

The vector being the two given vectors merged.

0.15.43.4.69 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns

The assignment of the current satisfiable result, if existent.

0.15.43.4.70 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns

true, if there is no variable assigned by both models; false, otherwise.

0.15.43.4.71 moduleName()

```
template<typename Settings >
std::string smtrat::BEModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns

The name of the given module type as name.

Reimplemented from smtrat::Module.

0.15.43.4.72 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

0.15.43.4.73 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

0.15.43.4.74 passedFormulaBegin()

```
ModuleInput::iterator smtrat::Module::passedFormulaBegin ( )
[inline], [protected], [inherited]
```

Returns

An iterator to the end of the passed formula. TODO: disable this method

0.15.43.4.75 passedFormulaEnd()

```
ModuleInput::iterator smtrat::Module::passedFormulaEnd ( )
[inline], [protected], [inherited]
```

Returns

An iterator to the end of the passed formula.

0.15.43.4.76 pPassedFormula()

```
const ModuleInput* smtrat::Module::pPassedFormula ( ) const
[inline], [inherited]
```

Returns

A pointer to the formula passed to the backends of this module.

0.15.43.4.77 pReceivedFormula() `const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to this module.

0.15.43.4.78 print() `void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

0.15.43.4.79 printAllModels() `void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.43.4.80 printInfeasibleSubsets() `void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

0.15.43.4.81 printModel() `void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.43.4.82 printPassedFormula() `void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

0.15.43.4.83 printReceivedFormula()

`void smtrat::Module::printReceivedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

0.15.43.4.84 probablyLooping()

`bool smtrat::Module::probablyLooping ( const typename Poly::PolyType & _branchingPolynomial, const Rational & _branchingValue ) const [protected], [inherited]`

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns

true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

0.15.43.4.85 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

0.15.43.4.86 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

0.15.43.4.87 receivedVariable()

`bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

0.15.43.4.88 remove()

`void smtrat::PModule::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

0.15.43.4.89 removeCore()

```
virtual void smtrat::Module::removeCore (
    [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected],
[virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

0.15.43.4.90 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

0.15.43.4.91 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

0.15.43.4.92 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const
[inline], [inherited]
```

Returns

A reference to the formula passed to the backends of this module.

0.15.43.4.93 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns

A reference to the formula passed to this module.

0.15.43.4.94 runBackends() [1/2]

```
virtual Answer smtrat::PModule::runBackends ( ) [inline],
[virtual], [inherited]
```

Reimplemented from smtrat::Module.

0.15.43.4.95 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.43.4.96 setId()

`void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]`

Sets this modules unique ID to identify itself.

Parameters

↩ _↩ *id*	The id to set this module's id to.

0.15.43.4.97 setThreadPriority()

`void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]`

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

0.15.43.4.98 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns

True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

0.15.43.4.99 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

0.15.43.4.100 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns

The priority of this module to get a thread for running its check procedure.

0.15.43.4.101 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::SATModule< Settings >.

0.15.43.4.102 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

0.15.43.4.103 updateModel() `void smtrat::PModule::updateModel ( ) const [virtual], [inherited]`

Updates the current assignment into the model.
Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.
Reimplemented from smtrat::Module.

0.15.43.4.104 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.43.5 Field Documentation

0.15.43.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

0.15.43.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

0.15.43.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

0.15.43.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

0.15.43.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

0.15.43.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

0.15.43.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaToPass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.43.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

0.15.43.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.43.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

0.15.43.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

0.15.43.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

0.15.43.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

0.15.43.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

0.15.43.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

0.15.43.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

0.15.43.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

0.15.43.5.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

0.15.43.5.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

0.15.43.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

0.15.43.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

0.15.43.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

0.15.43.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

0.15.43.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.43.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

0.15.44 benchmax::BenchmarkResult Struct Reference

Results for a single benchmark run.

`#include <BenchmarkResult.h>`

Public Member Functions

- template<typename TimeLimit >
  void cleanup (const TimeLimit &limit)

  Properly detect timeouts.
- auto get_path () const
- void store (size_t id) const
- void store () const
- void restore () const
- void forget () const

Data Fields

- int exitCode

  Shell exit code.
- std::chrono::milliseconds time

  Runtime in milliseconds.
- std::string answer

  Answer string.
- std::size_t peak_memory_kbytes

  Peak memory usage.
- std::string stdout

  Standard output (mostly for parsing the answer and additional information).
- std::string stderr

  Error output (mostly for parsing the answer and additional information).
- std::map< std::string, std::string > additional

  Arbitrary additional information that can be provided by the tool class.
- size_t stored_id = 0

  Identifier for temporary file.

0.15.44.1 Detailed Description

Results for a single benchmark run.

0.15.44.2 Member Function Documentation

0.15.44.2.1 cleanup() `template<typename TimeLimit >`

```
void benchmax::BenchmarkResult::cleanup (
            const TimeLimit & limit )  [inline]
```

Properly detect timeouts.
Most backends give processes a bit more time to avoid having race-condition-like situations.

0.15.44.2.2 forget() `void benchmax::BenchmarkResult::forget ( ) const  [inline]`

0.15.44.2.3 get_path() `auto benchmax::BenchmarkResult::get_path ( ) const  [inline]`

0.15.44.2.4 restore() `void benchmax::BenchmarkResult::restore ( ) const  [inline]`

0.15.44.2.5 store() [1/2] `void benchmax::BenchmarkResult::store ( ) const  [inline]`

0.15.44.2.6 store() [2/2]

```
void benchmax::BenchmarkResult::store (
            size_t id ) const  [inline]
```

0.15.44.3 Field Documentation

0.15.44.3.1 additional `std::map<std::string, std::string> benchmax::BenchmarkResult::additional [mutable]`

Arbitrary additional information that can be provided by the tool class.

0.15.44.3.2 answer `std::string benchmax::BenchmarkResult::answer`

Answer string.

0.15.44.3.3 exitCode `int benchmax::BenchmarkResult::exitCode`

Shell exit code.

0.15.44.3.4 peak_memory_kbytes `std::size_t benchmax::BenchmarkResult::peak_memory_kbytes`

Peak memory usage.

0.15.44.3.5 stderr `std::string benchmax::BenchmarkResult::stderr`

Error output (mostly for parsing the answer and additional information).

0.15.44.3.6 stdout `std::string benchmax::BenchmarkResult::stdout`

Standard output (mostly for parsing the answer and additional information).

0.15.44.3.7 stored_id `size_t benchmax::BenchmarkResult::stored_id = 0 [mutable]`

Identifier for temporary file.

0.15.44.3.8 time `std::chrono::milliseconds benchmax::BenchmarkResult::time`

Runtime in milliseconds.

0.15.45 benchmax::BenchmarkSet Class Reference

A set of benchmarks from some common base directory.

`#include <BenchmarkSet.h>`

Public Member Functions

- void add_directory (const std::filesystem::path &dir)

  Recursively find all benchmarks from this directory.
- std::size_t size () const

  Number of files.
- auto begin () const

  Begin iterator.
- auto end () const

  End iterator.

0.15.45.1 Detailed Description

A set of benchmarks from some common base directory.

0.15.45.2 Member Function Documentation

0.15.45.2.1 add_directory() `void benchmax::BenchmarkSet::add_directory ( const std::filesystem::path & dir )`

Recursively find all benchmarks from this directory.

0.15.45.2.2 begin() `auto benchmax::BenchmarkSet::begin ( ) const [inline]`

Begin iterator.

0.15.45.2.3 end() `auto benchmax::BenchmarkSet::end ( ) const [inline]`

End iterator.

0.15.45.2.4 size() `std::size_t benchmax::BenchmarkSet::size ( ) const [inline]`

Number of files.

0.15.46 benchmax::settings::BenchmarkSettings Struct Reference

Settings for benchmarks.

`#include <benchmarks.h>`

Data Fields

- carl::settings::binary_quantity limit_memory

  Memory limit in megabytes.
- carl::settings::duration limit_time

  Time limit in seconds.
- carl::settings::duration grace_time

  Grace time in seconds.
- std::vector< std::filesystem::path > input_directories

  Lift of input directories.
- std::filesystem::path input_directories_common_prefix

  Common prefix of input directories (to shorten filenames in output).
- std::filesystem::path output_dir

  Output directory.
- std::filesystem::path output_file_xml

  Filename of xml file.

0.15.46.1 Detailed Description

Settings for benchmarks.

0.15.46.2 Field Documentation

0.15.46.2.1 grace_time `carl::settings::duration benchmax::settings::BenchmarkSettings::grace_time`

Grace time in seconds.

0.15.46.2.2 input_directories `std::vector<std::filesystem::path> benchmax::settings::BenchmarkSettings::input_directories`

Lift of input directories.

0.15.46.2.3 input_directories_common_prefix `std::filesystem::path benchmax::settings::BenchmarkSettings::input_directories_common_prefix`

Common prefix of input directories (to shorten filenames in output).

0.15.46.2.4 limit_memory `carl::settings::binary_quantity benchmax::settings::BenchmarkSettings::limit_memory`

Memory limit in megabytes.

0.15.46.2.5 limit_time `carl::settings::duration benchmax::settings::BenchmarkSettings::limit_time`

Time limit in seconds.

0.15.46.2.6 output_dir `std::filesystem::path benchmax::settings::BenchmarkSettings::output_dir`

Output directory.

0.15.46.2.7 output_file_xml `std::filesystem::path benchmax::settings::BenchmarkSettings::output_file_xml`

Filename of xml file.

0.15.47 smtrat::Bimap< Class, FirstKeyType, FirstKeyName, SecondKeyType, SecondKeyName > Class Template Reference

Container that stores expensive to construct objects and allows the fast lookup with respect to two independent keys within the objects.

`#include <Bimap.h>`

Public Types

- typedef std::forward_list< Class > Data
- typedef Data::iterator Iterator
- typedef Data::const_iterator ConstIterator

Public Member Functions

- Iterator begin () noexcept
- ConstIterator begin () const noexcept
- Iterator end () noexcept
- ConstIterator end () const noexcept
- Class & firstAt (const FirstKeyType &firstKey)
- Class & secondAt (const SecondKeyType &secondKey)
- Iterator firstFind (const FirstKeyType &firstKey)
- Iterator secondFind (const SecondKeyType &secondKey)
- template<typename... Args>
  Iterator emplace (Args &&... args)

0.15.47.1 Detailed Description

template<class Class, typename FirstKeyType, FirstKeyType Class::* FirstKeyName, typename SecondKeyType, SecondKeyType Class::* SecondKeyName>
class smtrat::Bimap< Class, FirstKeyType, FirstKeyName, SecondKeyType, SecondKeyName >

Container that stores expensive to construct objects and allows the fast lookup with respect to two independent keys within the objects.

0.15.49.5.3 number `qi::uint_parser<Integer,2,1,-1> smtrat::parser::BinaryParser::number`

0.15.50 smtrat::parser::BitvectorTheory Struct Reference

Implements the theory of bitvectors.
`#include <Bitvector.h>`

Public Types

- using OperatorType = carl::BVTermType

Public Member Functions

- BitvectorTheory (ParserState *state)
- bool declareVariable (const std::string &name, const carl::Sort &sort, types::VariableType &result, TheoryError &errors)

  Declare a new variable with the given name and the given sort.
- bool resolveSymbol (const Identifier &identifier, types::TermType &result, TheoryError &errors)

  Resolve a symbol that was not declared within the ParserState.
- bool handleITE (const FormulaT &ifterm, const types::TermType &thenterm, const types::TermType &elseterm, types::TermType &result, TheoryError &errors)

  Resolve an if-then-else operator.
- bool handleDistinct (const std::vector< types::TermType > &arguments, types::TermType &result, TheoryError &errors)

  Resolve a distinct operator.
- bool instantiate (const types::VariableType &var, const types::TermType &replacement, types::TermType &subject, TheoryError &errors)

  Instantiate a variable within a term.
- bool refreshVariable (const types::VariableType &var, types::VariableType &subject, TheoryError &errors)
- bool functionCall (const Identifier &identifier, const std::vector< types::TermType > &arguments, types::TermType &result, TheoryError &errors)

  Resolve another unknown function call.
- template<typename T , typename Builder >
  FormulaT expandDistinct (const std::vector< T > &values, const Builder &neqBuilder)

Static Public Member Functions

- static void addSimpleSorts (qi::symbols< char, carl::Sort > &sorts)
- static void addConstants (qi::symbols< char, types::ConstType > &)

  Initialize the global symbol table for constants.

Data Fields

- carl::Sort bvSort
- conversion::VectorVariantConverter< types::BVTerm > vectorConverter
- conversion::VariantConverter< types::BVTerm > termConverter
- ParserState * state

0.15.50.1 Detailed Description

Implements the theory of bitvectors.

0.15.50.2 Member Typedef Documentation

0.15.50.2.1 OperatorType

```
using smtrat::parser::BitvectorTheory::OperatorType = carl::BVTerm↩
Type
```

0.15.50.3 Constructor & Destructor Documentation

0.15.50.3.1 BitvectorTheory()

```
smtrat::parser::BitvectorTheory::BitvectorTheory (
    ParserState * state )
```

0.15.50.4 Member Function Documentation

0.15.50.4.1 addConstants()

```
static void smtrat::parser::AbstractTheory::addConstants (
    qi::symbols< char, types::ConstType > & ) [inline], [static], [inherited]
```

Initialize the global symbol table for constants.

0.15.50.4.2 addSimpleSorts()

```
void smtrat::parser::BitvectorTheory::addSimpleSorts (
    qi::symbols< char, carl::Sort > & sorts ) [static]
```

0.15.50.4.3 declareVariable()

```
bool smtrat::parser::BitvectorTheory::declareVariable (
    const std::string & ,
    const carl::Sort & ,
    types::VariableType & ,
    TheoryError & errors ) [virtual]
```

Declare a new variable with the given name and the given sort.
Reimplemented from smtrat::parser::AbstractTheory.

0.15.50.4.4 expandDistinct()

```
template<typename T , typename Builder >
FormulaT smtrat::parser::AbstractTheory::expandDistinct (
    const std::vector< T > & values,
    const Builder & neqBuilder ) [inline], [inherited]
```

0.15.50.4.5 functionCall()

```
bool smtrat::parser::BitvectorTheory::functionCall (
    const Identifier & ,
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors ) [virtual]
```

Resolve another unknown function call.
Reimplemented from smtrat::parser::AbstractTheory.

0.15.50.4.6 handleDistinct()

```
bool smtrat::parser::BitvectorTheory::handleDistinct (
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors ) [virtual]
```

Resolve a distinct operator.
Reimplemented from smtrat::parser::AbstractTheory.

0.15.50.4.7 handleITE()

```
bool smtrat::parser::BitvectorTheory::handleITE (
    const FormulaT & ,
    const types::TermType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors ) [virtual]
```

Resolve an if-then-else operator.
Reimplemented from smtrat::parser::AbstractTheory.

0.15.50.4.8 instantiate()

```
bool smtrat::parser::BitvectorTheory::instantiate (
    const types::VariableType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors ) [virtual]
```

Instantiate a variable within a term.
Reimplemented from smtrat::parser::AbstractTheory.

0.15.50.4.9 refreshVariable()

```
bool smtrat::parser::BitvectorTheory::refreshVariable (
    const types::VariableType & var,
    types::VariableType & subject,
    TheoryError & errors ) [virtual]
```

Reimplemented from smtrat::parser::AbstractTheory.

0.15.50.4.10 resolveSymbol()

```
bool smtrat::parser::BitvectorTheory::resolveSymbol (
    const Identifier & ,
    types::TermType & ,
    TheoryError & errors ) [virtual]
```

Resolve a symbol that was not declared within the ParserState.
This might be a symbol that actually uses indices, for example bitvector constants.
Reimplemented from smtrat::parser::AbstractTheory.

0.15.54 smtrat::mcsat::Bookkeeping Class Reference

Represent the trail, i.e.

```
#include <Bookkeeping.h>
```

Public Member Functions

- const auto & model () const
- const auto & assignedVariables () const
- const auto & assignments () const
- const auto & constraints () const
- const auto & mvBounds () const
- const auto & variables () const
- void updateVariables (const carl::Variables &variables)
- void pushConstraint (const FormulaT &f)

  Assert a constraint/literal.
- void popConstraint (const FormulaT &f)
- void pushAssignment (carl::Variable v, const ModelValue &mv, const FormulaT &f)
- void popAssignment (carl::Variable v)

0.15.54.1 Detailed Description

Represent the trail, i.e.
the assignment/model state, of a MCSAT run in different representations (kept in sync) for a fast access. Most notably, we store literals, i.e. a polynomial (in)equality-atom or its negation, which we assert to be true. Since the negation can be represented by an atom by flipping the (in)equality, it suffices to store only atoms. Here we call atomic formulas over the theory of real arithmetic "constraints".

0.15.54.2 Member Function Documentation

0.15.54.2.1 assignedVariables() `const auto& smtrat::mcsat::Bookkeeping::assignedVariables ( ) const [inline]`

Public Member Functions

- BooleanEncodingTheory (ParserState *state)
- virtual bool declareVariable (const std::string &, const carl::Sort &, types::VariableType &, TheoryError &errors)

  Declare a new variable with the given name and the given sort.
- virtual bool resolveSymbol (const Identifier &, types::TermType &, TheoryError &errors)

  Resolve a symbol that was not declared within the ParserState.
- virtual bool handleITE (const FormulaT &, const types::TermType &, const types::TermType &, types::TermType &, TheoryError &errors)

  Resolve an if-then-else operator.
- virtual bool handleDistinct (const std::vector< types::TermType > &, types::TermType &, TheoryError &errors)

  Resolve a distinct operator.
- template<typename T , typename Builder >
  FormulaT expandDistinct (const std::vector< T > &values, const Builder &neqBuilder)
- virtual bool instantiate (const types::VariableType &, const types::TermType &, types::TermType &, TheoryError &errors)

  Instantiate a variable within a term.
- virtual bool refreshVariable (const types::VariableType &, types::VariableType &, TheoryError &errors)
- virtual bool functionCall (const Identifier &, const std::vector< types::TermType > &, types::TermType &, TheoryError &errors)

  Resolve another unknown function call.

Static Public Member Functions

- static void addSimpleSorts (qi::symbols< char, carl::Sort > &)

  Initialize the global symbol table for simple sorts.
- static void addConstants (qi::symbols< char, types::ConstType > &)

  Initialize the global symbol table for constants.

Data Fields

- ParserState * state

0.15.56.1 Detailed Description

Implements the theory of bitvectors.

0.15.56.2 Constructor & Destructor Documentation

0.15.56.2.1 BooleanEncodingTheory()

```
smtrat::parser::BooleanEncodingTheory::BooleanEncoding↩
Theory (
            ParserState * state )
```

0.15.56.3 Member Function Documentation

0.15.56.3.1 addConstants()

```
static void smtrat::parser::AbstractTheory::addConstants (
            qi::symbols< char, types::ConstType > & ) [inline], [static], [inherited]
```

Initialize the global symbol table for constants.

0.15.56.3.2 addSimpleSorts()

```
static void smtrat::parser::AbstractTheory::addSimpleSorts (
            qi::symbols< char, carl::Sort > & ) [inline], [static], [inherited]
```

Initialize the global symbol table for simple sorts.

0.15.56.3.3 declareVariable()

```
virtual bool smtrat::parser::AbstractTheory::declareVariable (
            const std::string & ,
            const carl::Sort & ,
            types::VariableType & ,
            TheoryError & errors ) [inline], [virtual], [inherited]
```

Declare a new variable with the given name and the given sort.
Reimplemented in smtrat::parser::UninterpretedTheory, smtrat::parser::CoreTheory, smtrat::parser::BitvectorTheory, and smtrat::parser::ArithmeticTheory.

0.15.56.3.4 expandDistinct()

```
template<typename T , typename Builder >
FormulaT smtrat::parser::AbstractTheory::expandDistinct (
            const std::vector< T > & values,
            const Builder & neqBuilder ) [inline], [inherited]
```

0.15.56.3.5 functionCall()

```
virtual bool smtrat::parser::AbstractTheory::functionCall (
    const Identifier & ,
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Resolve another unknown function call.
Reimplemented in smtrat::parser::UninterpretedTheory, smtrat::parser::CoreTheory, smtrat::parser::BitvectorTheory, and smtrat::parser::ArithmeticTheory.

0.15.56.3.6 handleDistinct()

```
virtual bool smtrat::parser::AbstractTheory::handleDistinct (
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Resolve a distinct operator.
Reimplemented in smtrat::parser::CoreTheory, smtrat::parser::BitvectorTheory, smtrat::parser::ArithmeticTheory, and smtrat::parser::UninterpretedTheory.

0.15.56.3.7 handleITE()

```
virtual bool smtrat::parser::AbstractTheory::handleITE (
    const FormulaT & ,
    const types::TermType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Resolve an if-then-else operator.
Reimplemented in smtrat::parser::UninterpretedTheory, smtrat::parser::CoreTheory, smtrat::parser::BitvectorTheory, and smtrat::parser::ArithmeticTheory.

0.15.56.3.8 instantiate()

```
virtual bool smtrat::parser::AbstractTheory::instantiate (
    const types::VariableType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Instantiate a variable within a term.
Reimplemented in smtrat::parser::BitvectorTheory, and smtrat::parser::ArithmeticTheory.

0.15.56.3.9 refreshVariable()

```
virtual bool smtrat::parser::AbstractTheory::refreshVariable (
    const types::VariableType & ,
    types::VariableType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Reimplemented in smtrat::parser::BitvectorTheory.

0.15.56.3.10 resolveSymbol()

```
virtual bool smtrat::parser::AbstractTheory::resolveSymbol (
    const Identifier & ,
    types::TermType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Resolve a symbol that was not declared within the ParserState.
This might be a symbol that actually uses indices, for example bitvector constants.
Reimplemented in smtrat::parser::BitvectorTheory.

0.15.59.1 Detailed Description

template<typename T1, typename T2>
class smtrat::lra::Bound< T1, T2 >

Stores a bound, which could be an upper "<= b" or a lower bound ">= b" for a bound value b.
In the case that "<= b" and ">= b" hold this bound is a so called equal bound represented by "==b".

0.15.59.2 Member Typedef Documentation

0.15.59.2.1 BoundSet template<typename T1 , typename T2 >

```
typedef carl::PointerSet<Bound<T1, T2> > smtrat::lra::Bound< T1, T2 >::BoundSet
```

A set of pointer to bounds.

0.15.59.3 Member Enumeration Documentation

0.15.59.3.1 Type template<typename T1 , typename T2 >

```
enum smtrat::lra::Bound::Type
```

The type of the bound: LOWER = ">=", UPPER = "<=", EQUAL "==".

Enumerator

LOWER	
UPPER	
EQUAL	

0.15.59.4 Constructor & Destructor Documentation

```
template<typename T1 , typename T2 >
const std::shared_ptr<std::vector<FormulaT> >& smtrat::lra::Bound< T1, T2 >::pOrigins ( )
const  [inline]
```

Returns

0.15.59.5.34 print()

```
template<typename T1 , typename T2 >
void smtrat::lra::Bound< T1, T2 >::print (
            bool _withOrigins = false,
            std::ostream & _out = std::cout,
            bool _printTypebool = false ) const
```

Parameters

_withOrigins	
_out	
_printTypebool	

0.15.59.5.35 pVariable()

```
template<typename T1 , typename T2 >
Variable<T1, T2>* smtrat::lra::Bound< T1, T2 >::pVariable ( ) const  [inline]
```

Returns

0.15.59.5.36 resetNeqRepresentation()

```
template<typename T1 , typename T2 >
void smtrat::lra::Bound< T1, T2 >::resetNeqRepresentation ( ) const  [inline]
```

0.15.59.5.37 setComplement()

```
template<typename T1 , typename T2 >
void smtrat::lra::Bound< T1, T2 >::setComplement (
            const Bound< T1, T2 > * _complement ) const  [inline]
```

0.15.59.5.38 setNeqRepresentation()

```
template<typename T1 , typename T2 >
void smtrat::lra::Bound< T1, T2 >::setNeqRepresentation (
            const FormulaT & _constraint ) const  [inline]
```

Parameters

_constraint	

0.15.59.5.39 toString()

```
template<typename T1 , typename T2 >
const std::string smtrat::lra::Bound< T1, T2 >::toString ( ) const
```

Returns

0.15.59.5.40 type()

```
template<typename T1 , typename T2 >
Type smtrat::lra::Bound< T1, T2 >::type ( ) const  [inline]
```

Returns

0.15.59.5.41 unmarkAsDeleted()

```
template<typename T1 , typename T2 >
void smtrat::lra::Bound< T1, T2 >::unmarkAsDeleted ( ) const  [inline]
```

Returns

0.15.59.5.42 variable()

```
template<typename T1 , typename T2 >
const Variable<T1, T2>& smtrat::lra::Bound< T1, T2 >::variable ( ) const  [inline]
```

Returns

0.15.59.6 Friends And Related Function Documentation

0.15.59.6.1 operator<<

```
template<typename T1 , typename T2 >
template<typename T3 , typename T4 >
std::ostream& operator<< (
            std::ostream & _ostream,
            const Bound< T3, T4 > & _bound )  [friend]
```

Parameters

_withOrigins	
_out	
_printTypebool	

0.15.60 smtrat::mcsat::fm::Bound Struct Reference

```
#include <ConflictGenerator.h>
```

0.15.61.1 Detailed Description

template<typename T>
class smtrat::vb::Bound< T >

Class for the bound of a variable.

0.15.61.2 Member Enumeration Documentation

Enumerator

0.15.61.2.1 Type `template<typename T >`

`enum smtrat::vb::Bound::Type`

The type of a bounds.

Enumerator

STRICT_LOWER_BOUND	
WEAK_LOWER_BOUND	
EQUAL_BOUND	
WEAK_UPPER_BOUND	
STRICT_UPPER_BOUND	

0.15.61.3 Constructor & Destructor Documentation

0.15.61.3.1 Bound() `template<typename T >`

```
smtrat::vb::Bound< T >::Bound (
            Rational *const _limit,
            Variable< T > *const _variable,
            Type _type )
```

Constructs this bound.

Parameters

_limit	A pointer to the limit (rational) of the bound. It is NULL, if the limit is not finite.
_variable	The variable to which this bound belongs.
_type	The type of the bound (either it is an equal bound or it is weak resp. strict and upper resp. lower)

0.15.61.3.2 ~Bound() `template<typename T >`

`smtrat::vb::Bound< T >::~Bound ( )`

Destructs this bound.

0.15.61.4 Member Function Documentation

0.15.61.4.1 activate() `template<typename T >`

```
bool smtrat::vb::Bound< T >::activate (
            const T & _origin ) const  [inline]
```

Adds an origin to this bound.

Parameters

_origin	The origin to add.

Returns

true, if this has activated this bound; false, if the bound was already active before.

0.15.61.4.2 deactivate() template<typename T >

```
bool smtrat::vb::Bound< T >::deactivate (
            const T & _origin ) const [inline]
```

Removes an origin from this bound.

Parameters

_origin	The origin to add.

Returns

true, if this has deactivated this bound; false, if the bound was already inactive before.

0.15.61.4.3 isActive() template<typename T >

```
bool smtrat::vb::Bound< T >::isActive ( ) const [inline]
```

Returns

true, if this bound is active, which means that there is at least one origin for it left. Note, that origins can be removed belatedly. false, otherwise.

0.15.61.4.4 isInfinite() template<typename T >

```
bool smtrat::vb::Bound< T >::isInfinite ( ) const [inline]
```

Returns

true, if the bound infinite; false, otherwise.

0.15.61.4.5 isLowerBound() template<typename T >

```
bool smtrat::vb::Bound< T >::isLowerBound ( ) const [inline]
```

Returns

true, if the bound is a lower bound; false, otherwise.

0.15.61.4.6 isUpperBound() template<typename T >

```
bool smtrat::vb::Bound< T >::isUpperBound ( ) const [inline]
```

Returns

true, if the bound is an upper bound; false, otherwise.

0.15.61.4.7 limit() template<typename T >

```
const Rational& smtrat::vb::Bound< T >::limit ( ) const [inline]
```

Returns

A constant reference to the value of the limit. Note, that it must be ensured that the bound is finite before calling this method.

0.15.61.4.8 operator<() template<typename T >

```
bool smtrat::vb::Bound< T >::operator< (
            const Bound< T > & _bound ) const
```

Checks whether the this bound is smaller than the given one.

Parameters

_bound	The bound to compare with.

Returns

true, if for this bound (A) and the given bound (B) it holds that: A is not inf and B is inf, A smaller than B, where A and B are rationals, A equals B, where A and B are rationals, but A is an equal bound but B is not; false, otherwise.

0.15.61.4.9 origins() `template<typename T >`

`const std::set<T,carl::less<T,false> >& smtrat::vb::Bound< T >::origins ( ) const [inline]`

Returns

A constant reference to the set of origins of this bound.

0.15.61.4.10 pLimit() `template<typename T >`

`const Rational* smtrat::vb::Bound< T >::pLimit ( ) const [inline]`

Returns

A pointer to the limit of this bound.

0.15.61.4.11 print() `template<typename T >`

```
void smtrat::vb::Bound< T >::print (
            std::ostream & _out,
            bool _withRelation = false ) const
```

Prints this bound on the given stream.

Parameters

_out	The stream to print on.
_withRelation	A flag indicating whether to print also a relation symbol in front of the bound value.

0.15.61.4.12 pVariable() `template<typename T >`

`Variable<T>* smtrat::vb::Bound< T >::pVariable ( ) const [inline]`

Returns

A pointer to the variable wrapper considered by this bound.

0.15.61.4.13 type() `template<typename T >`

`Type smtrat::vb::Bound< T >::type ( ) const [inline]`

Returns

The type of this bound.

0.15.61.4.14 variable() template<typename T >

```
const Variable<T>& smtrat::vb::Bound< T >::variable ( ) const [inline]
```

Returns

A constant reference to the variable wrapper considered by this bound.

0.15.61.5 Friends And Related Function Documentation

0.15.61.5.1 operator<< template<typename T >

```
template<typename T1 >
std::ostream& operator<< (
            std::ostream & _out,
            const Bound< T1 > & _bound ) [friend]
```

Prints the bound on the given output stream.

Parameters

_out	The output stream to print on.
_bound	The bound to print.

Returns

The output stream after printing the bound on it.

0.15.62 smtrat::Branching Struct Reference

Stores all necessary information of an branch, which can be used to detect probable infinite loop of branchings.

```
#include <Module.h>
```

Public Member Functions

- Branching (const typename Poly::PolyType &_polynomial, const Rational &_value)

  Constructor.

Data Fields

- Poly::PolyType mPolynomial

  The polynomial to branch at.
- Rational mValue

  The value to branch the polynomial at.
- size_t mRepetitions

  The number of repetitions of the branching.
- int mIncreasing

  Stores whether this the branching of the polynomial has been on an increasing sequence of values (>0), or on a decreasing sequence of values (<0).

0.15.62.1 Detailed Description

Stores all necessary information of an branch, which can be used to detect probable infinite loop of branchings.

0.15.62.2 Constructor & Destructor Documentation

0.15.62.2.1 Branching()

```
smtrat::Branching::Branching (
    const typename Poly::PolyType & _polynomial,
    const Rational & _value ) [inline]
```

Constructor.

Parameters

_polynomial	The polynomial to branch at.
_value	The value to branch the polynomial at.

0.15.62.3 Field Documentation

0.15.62.3.1 mIncreasing

```
int smtrat::Branching::mIncreasing
```

Stores whether this the branching of the polynomial has been on an increasing sequence of values (>0), or on a decreasing sequence of values (<0).
It is initially zero.

0.15.62.3.2 mPolynomial

```
Poly::PolyType smtrat::Branching::mPolynomial
```

The polynomial to branch at.

0.15.62.3.3 mRepetitions

```
size_t smtrat::Branching::mRepetitions
```

The number of repetitions of the branching.

0.15.62.3.4 mValue

```
Rational smtrat::Branching::mValue
```

The value to branch the polynomial at.

`#include <BVModule.h>`

Public Types

- typedef Settings SettingsType
- enum class LemmaType : unsigned { NORMAL = 0 , PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- BVModule (const ModuleInput ∗_formula, Conditionals &_conditionals, Manager ∗_manager=NULL)
- ∼BVModule ()
- bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_↩ VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput ∗ pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput ∗ pPassedFormula () const
- const ModuleInput & rPassedFormula () const

- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- size_t evaluateBVFormula (const FormulaT &formula)
- void transferBackendModel () const
- virtual bool informCore ([[maybe_unused]] const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore ([[maybe_unused]] const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

Adds a formula to the InformationRelevantFormula.

- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

0.15.65.4.1 add() `bool smtrat::Module::add (`

```
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.65.4.2 addConstraintToInform() `void smtrat::Module::addConstraintToInform (`

```
            const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

0.15.65.4.3 addCore() [1/2]

```
virtual bool smtrat::Module::addCore (
    [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected],
[virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.65.4.4 addCore() [2/2]

```
template<typename Settings >
bool smtrat::BVModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula )
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.65.4.5 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula
(
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

0.15.65.4.6 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

0.15.65.4.7 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

0.15.65.4.8 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.
Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

0.15.65.4.9 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.
Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.65.4.10 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.65.4.11 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.65.4.12 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns

All satisfying assignments, if existent.

0.15.65.4.13 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns

True, if one of them has determined a result.

0.15.65.4.14 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const
[inline], [inherited]
```

Returns

A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.65.4.15 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

0.15.65.4.16 branchAt() [1/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.65.4.17 branchAt() [2/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

0.15.65.4.18 branchAt() [3/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.65.4.19 branchAt() [4/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.

Parameters

_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

0.15.65.4.20 check()

```
Answer smtrat::Module::check (
    bool _final = false,
    bool _full = true,
    carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.65.4.21 checkCore()

```
template<typename Settings >
Answer smtrat::BVModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns

SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.65.4.22 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

0.15.65.4.23 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns

false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

0.15.65.4.24 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

0.15.65.4.25 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

0.15.65.4.26 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

0.15.65.4.27 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

0.15.65.4.28 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

0.15.65.4.29 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

0.15.65.4.30 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.
If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

0.15.65.4.31 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

0.15.65.4.32 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns

The constraints which the backends must be informed about.

0.15.65.4.33 currentlySatisfied() `virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

0.15.65.4.34 currentlySatisfiedByBackend() `unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

0.15.65.4.35 deinform() `void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.65.4.36 deinformCore() `virtual void smtrat::Module::deinformCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.65.4.37 determine_smallest_origin() `size_t smtrat::Module::determine_smallest_origin ( const std::vector< FormulaT > & origins ) const [protected], [inherited]`

Parameters

origins	A vector of sets of origins.

Returns

The index of the smallest (regarding the size of the sets) element of origins

0.15.65.4.38 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
            ModuleInput::iterator _subformula,
            bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module. Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

0.15.65.4.39 evaluateBVFormula()

```
template<typename Settings >
size_t smtrat::BVModule< Settings >::evaluateBVFormula (
            const FormulaT & formula ) [protected]
```

0.15.65.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

0.15.65.4.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
            const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

0.15.65.4.42 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns

The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.65.4.43 firstUncheckedReceivedSubformula() `ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns

The position of the first (by this module) unchecked sub-formula of the received formula.

0.15.65.4.44 freeSplittingVariable() `static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

0.15.65.4.45 generateTrivialInfeasibleSubset() `void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

0.15.65.4.46 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

0.15.65.4.47 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

0.15.65.4.48 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

0.15.65.4.49 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.
Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns

The infeasible subsets the given backend provides.

0.15.65.4.50 getInformationRelevantFormulas() `const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns

Set of all formulas

0.15.65.4.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.
The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns

Equivalence classes.

0.15.65.4.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

0.15.65.4.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

0.15.65.4.54 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns

The origins of the passed formula at the given position.

0.15.65.4.55 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns

A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

0.15.65.4.56 hasLemmas() `bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

0.15.65.4.57 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns

true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

0.15.65.4.58 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns

A unique ID to identify this module instance.

0.15.65.4.59 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns

The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

0.15.65.4.60 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.65.4.61 informBackends() `void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

0.15.65.4.62 informCore() [1/2]

`virtual bool smtrat::Module::informCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.65.4.63 informCore() [2/2]

`template<typename Settings > bool smtrat::BVModule< Settings >::informCore ( const FormulaT & _constraint )`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.65.4.64 informedConstraints()

`const carl::FastSet<FormulaT>& smtrat::Module::informedConstraints ( ) const [inline], [inherited]`

Returns

The position of the first constraint of which no backend has been informed about.

0.15.65.4.65 init()

`template<typename Settings > void smtrat::BVModule< Settings >::init ( ) [virtual]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.
This method must not and will not be called more than once and only before the first runBackends call.
Reimplemented from smtrat::Module.

0.15.65.4.66 is_minimizing()

`bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

0.15.65.4.67 isLemmaLevel()

`bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

0.15.65.4.68 isPreprocessor()

`bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns

true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

0.15.65.4.69 lemmas()

`const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns

A constant reference to the lemmas being valid formulas this module or its backends made.

0.15.65.4.70 merge()

`std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.
({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns

The vector being the two given vectors merged.

0.15.65.4.71 model()

`const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns

The assignment of the current satisfiable result, if existent.

0.15.65.4.72 modelsDisjoint()

`bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns

true, if there is no variable assigned by both models; false, otherwise.

0.15.65.4.73 moduleName()

`template<typename Settings > std::string smtrat::BVModule< Settings >::moduleName ( ) const [inline], [virtual]`

Returns

The name of the given module type as name.

Reimplemented from smtrat::Module.

0.15.65.4.74 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

0.15.65.4.75 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

0.15.65.4.76 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula. TODO: disable this method

0.15.65.4.77 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula.

0.15.65.4.78 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to the backends of this module.

0.15.65.4.79 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to this module.

0.15.65.4.80 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

0.15.65.4.81 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.65.4.82 printInfeasibleSubsets()

`void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

0.15.65.4.83 printModel()

`void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.65.4.84 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

0.15.65.4.85 printReceivedFormula()

`void smtrat::Module::printReceivedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

0.15.65.4.86 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns

true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

0.15.65.4.87 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

0.15.65.4.88 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

0.15.65.4.89 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

0.15.65.4.90 remove()

```
void smtrat::Module::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

0.15.65.4.91 removeCore() [1/2]

```
virtual void smtrat::Module::removeCore (
    [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

0.15.65.4.92 removeCore() [2/2]

```
template<typename Settings >
void smtrat::BVModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula )
```

Removes the subformula of the received formula at the given position to the considered ones of this module. Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

0.15.65.4.93 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
            ModuleInput::iterator _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

0.15.65.4.94 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

0.15.65.4.95 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const
[inline], [inherited]
```

Returns

A reference to the formula passed to the backends of this module.

0.15.65.4.96 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns

A reference to the formula passed to this module.

0.15.65.4.97 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( )  [inline],
[protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

0.15.65.4.98 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
            bool _final,
            bool _full,
            carl::Variable _objective )  [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.65.4.99 setId()

`void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]`

Sets this modules unique ID to identify itself.

Parameters

↩ _↩ *id*	The id to set this module's id to.

0.15.65.4.100 setThreadPriority()

`void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]`

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

0.15.65.4.101 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns

True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

0.15.65.4.102 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

0.15.65.4.103 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns

The priority of this module to get a thread for running its check procedure.

0.15.65.4.104 transferBackendModel() `template<typename Settings > void smtrat::BVModule< Settings >::transferBackendModel ( ) const [protected]`

0.15.65.4.105 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::SATModule< Settings >.

0.15.65.4.106 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

0.15.65.4.107 updateModel() `template<typename Settings > void smtrat::BVModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.
Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.
Reimplemented from smtrat::Module.

0.15.65.4.108 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.65.5 Field Documentation

0.15.65.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

0.15.65.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

0.15.65.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

0.15.65.5.4 mConstraintsToInform

`carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

0.15.65.5.5 mFinalCheck

`bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

0.15.65.5.6 mFirstPosInLastBranches

`std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

0.15.65.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.65.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::m↩FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

0.15.65.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.65.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

0.15.65.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

0.15.65.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

0.15.65.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

0.15.65.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

0.15.65.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

0.15.65.5.16 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

0.15.65.5.17 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

0.15.65.5.18 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

0.15.65.5.19 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

0.15.65.5.20 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

0.15.65.5.21 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

0.15.65.5.22 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

0.15.65.5.23 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.65.5.24 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

0.15.94 smtrat::mcsat::ClauseChain Class Reference

An explanation is either a single clause or a chain of clauses, satisfying the following properties:

`#include <ClauseChain.h>`

Data Structures

- struct Link

Public Types

- using const_iterator = typename std::vector< Link >::const_iterator

Public Member Functions

- ClauseChain ()
- FormulaT createTseitinVar (const FormulaT &formula)

  Create a Tseitin variable for the given formula.
- void appendPropagating (const FormulaT &&clause, const FormulaT &&impliedTseitinLiteral)

  Append a clause that implies impliedTseitinLiteral under the current assignment.
- void appendConflicting (const FormulaT &&clause)

  Append a conflicting clause (regarding the current assignment).
- void appendOptional (const FormulaT &&clause)

  Append an additional clause which is neither propagating nor conflicting.
- const std::vector< Link > & chain () const
- const_iterator begin () const
- const_iterator end () const
- FormulaT resolve () const

  Performs resolution on the chain.
- FormulaT to_formula () const

  Transforms the clause chain into a formula (containing Tseitin variables).

Static Public Member Functions

- static ClauseChain from_formula (const FormulaT &f, const Model &model, bool with_equivalence)

  Transforms a given Boolean conjunction over AND and OR to CNF via Tseitin-Transformation so that, if the input formula is conflicting under the current assignment, after all clauses in "implications" have been propagated in the given order, the returned formula evaluates to false.

Friends

- std::ostream & operator<< (std::ostream &stream, const ClauseChain &chain)

0.15.94.1 Detailed Description

An explanation is either a single clause or a chain of clauses, satisfying the following properties:

- If the clauses are inserted and propagated in the chain's order, at least the last clause should be conflicting.
- Each conflicting clause is already conflicting after preceding clauses have been inserted and propagated.
- Tseitin vars should be used so that a Tseitin variable C is equivalent to its corresponding subformula F (or at least C -> F).

0.15.94.2 Member Typedef Documentation

0.15.94.2.1 const_iterator

```
using smtrat::mcsat::ClauseChain::const_iterator = typename std↩
::vector<Link>::const_iterator
```

0.15.94.3 Constructor & Destructor Documentation

0.15.94.3.1 ClauseChain()

```
smtrat::mcsat::ClauseChain::ClauseChain ( ) [inline]
```

0.15.94.4 Member Function Documentation

0.15.94.4.1 appendConflicting()

```
void smtrat::mcsat::ClauseChain::appendConflicting (
    const FormulaT && clause ) [inline]
```

Append a conflicting clause (regarding the current assignment).

0.15.94.4.2 appendOptional()

```
void smtrat::mcsat::ClauseChain::appendOptional (
    const FormulaT && clause ) [inline]
```

Append an additional clause which is neither propagating nor conflicting.
Can be used to pass additional knowledge.

0.15.94.4.3 appendPropagating()

```
void smtrat::mcsat::ClauseChain::appendPropagating (
    const FormulaT && clause,
    const FormulaT && impliedTseitinLiteral ) [inline]
```

Append a clause that implies impliedTseitinLiteral under the current assignment.
Note that impliedTseitinLiteral = ∼v for a Tseitin variable v obtained via createTseitinVar.

0.15.94.4.4 begin()

```
const_iterator smtrat::mcsat::ClauseChain::begin ( ) const [inline]
```

Returns

A constant iterator to the beginning of this chain.

0.15.94.4.5 chain()

```
const std::vector<Link>& smtrat::mcsat::ClauseChain::chain ( ) const [inline]
```

Returns

A vector representing this chain.

0.15.94.4.6 createTseitinVar()

```
FormulaT smtrat::mcsat::ClauseChain::createTseitinVar (
    const FormulaT & formula ) [inline]
```

Create a Tseitin variable for the given formula.
The returned variable C should be used so that C <-> formula or at least ~formula -> ~C

0.15.94.4.7 end()

```
const_iterator smtrat::mcsat::ClauseChain::end ( ) const [inline]
```

Returns

A constant iterator to the end of this chain.

0.15.94.4.8 from_formula()

```
ClauseChain smtrat::mcsat::ClauseChain::from_formula (
    const FormulaT & f,
    const Model & model,
    bool with_equivalence ) [static]
```

Transforms a given Boolean conjunction over AND and OR to CNF via Tseitin-Transformation so that, if the input formula is conflicting under the current assignment, after all clauses in "implications" have been propagated in the given order, the returned formula evaluates to false.

0.15.94.4.9 resolve()

```
FormulaT smtrat::mcsat::ClauseChain::resolve ( ) const
```

Performs resolution on the chain.
Uses the last clause for resolution.

Returns

A single clause conflicting under the current assignment.

0.15.94.4.10 to_formula()

```
FormulaT smtrat::mcsat::ClauseChain::to_formula ( ) const
```

Transforms the clause chain into a formula (containing Tseitin variables).

Data Structures

- struct SettingsType

Public Types

- enum class LemmaType : unsigned { NORMAL = 0 , PERMANENT = 1 }

Public Member Functions

- CNFerModule (const ModuleInput ∗, Conditionals &, Manager ∗const =NULL)

  Constructs a CNFerModule.
- ∼CNFerModule ()

  Destructs a CNFerModule.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void updateModel () const

  Updates the current assignment into the model.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput ∗ pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput ∗ pPassedFormula () const

- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore ([[maybe_unused]] const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore ([[maybe_unused]] const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

0.15.98.1 Member Enumeration Documentation

0.15.98.1.1 LemmaType `enum smtrat::Module::LemmaType : unsigned [strong], [inherited]`

Enumerator

NORMAL	
PERMANENT	

0.15.98.2 Constructor & Destructor Documentation

0.15.98.2.1 CNFerModule()

```
smtrat::CNFerModule::CNFerModule (
    const ModuleInput * ,
    Conditionals & ,
    Manager * const  = NULL )
```

Constructs a CNFerModule.

0.15.98.2.2 ~CNFerModule()

```
smtrat::CNFerModule::~CNFerModule ( )
```

Destructs a CNFerModule.

0.15.98.3 Member Function Documentation

0.15.98.3.1 add()

```
bool smtrat::PModule::add (
    ModuleInput::const_iterator _subformula )  [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.98.3.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint )  [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

0.15.98.3.3 addCore()

```
virtual bool smtrat::Module::addCore (
    [[maybe_unused] ] ModuleInput::const_iterator formula )  [inline], [protected],
[virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.98.3.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

0.15.98.3.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

0.15.98.3.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

0.15.98.3.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.
Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

0.15.98.3.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.
Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.98.3.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.98.3.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.98.3.11 allModels()

`const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns

All satisfying assignments, if existent.

0.15.98.3.12 anAnswerFound()

`bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns

True, if one of them has determined a result.

0.15.98.3.13 answerFound()

`const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns

A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.98.3.14 appliedPreprocessing()

`bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]`

Returns

true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

0.15.98.3.15 backendsModel()

`const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

0.15.98.3.16 branchAt() [1/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.98.3.17 branchAt() [2/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

0.15.98.3.18 branchAt() [3/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

0.15.98.3.19 branchAt() [4/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

0.15.98.3.20 check()

```
Answer smtrat::PModule::check (
    bool _final = false,
    bool _full = true,
    carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.98.3.21 checkCore()

`Answer smtrat::CNFerModule::checkCore ( ) [virtual]`

Checks the received formula for consistency.

Returns

SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.98.3.22 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
std::vector< FormulaSetT >::const_iterator _infsubset,
const std::string & _filename = "smaller_muses",
unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

0.15.98.3.23 checkModel()

`unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns

false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

0.15.98.3.24 cleanModel()

`void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

0.15.98.3.25 clearLemmas()

`void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

0.15.98.3.26 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

0.15.98.3.27 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

0.15.98.3.28 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

0.15.98.3.29 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

0.15.98.3.30 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.
If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

0.15.98.3.31 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

0.15.98.3.32 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns

The constraints which the backends must be informed about.

0.15.98.3.33 currentlySatisfied() `virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

0.15.98.3.34 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

0.15.98.3.35 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.98.3.36 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual],
[inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.98.3.37 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns

The index of the smallest (regarding the size of the sets) element of origins

0.15.98.3.38 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module. Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.

Parameters

_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

0.15.98.3.39 excludeNotReceivedVariablesFromModel()

`void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]`

Excludes all variables from the current model, which do not occur in the received formula.

0.15.98.3.40 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
            const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

0.15.98.3.41 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns

The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.98.3.42 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns

The position of the first (by this module) unchecked sub-formula of the received formula.

0.15.98.3.43 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
            const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

0.15.98.3.44 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

0.15.98.3.45 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

0.15.98.3.46 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

0.15.98.3.47 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

0.15.98.3.48 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::getInfeasible↩ Subsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.
Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns

The infeasible subsets the given backend provides.

0.15.98.3.49 getInformationRelevantFormulas() `const std::set< FormulaT > & smtrat::Module↩ ::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns

Set of all formulas

0.15.98.3.50 getModelEqualities() `std::list< std::vector< carl::Variable > > smtrat::Module↩ ::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.
The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns

Equivalence classes.

0.15.98.3.51 getOrigins() [1/3] `void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

0.15.98.3.52 getOrigins() [2/3]

`void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

0.15.98.3.53 getOrigins() [3/3]

`const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns

The origins of the passed formula at the given position.

0.15.98.3.54 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns

A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

0.15.98.3.55 hasLemmas()

`bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

0.15.98.3.56 hasValidInfeasibleSubset()

`bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns

true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

0.15.98.3.57 id()

`std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns

A unique ID to identify this module instance.

0.15.98.3.58 infeasibleSubsets()

`const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns

The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

0.15.98.3.59 inform()

`bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.98.3.60 informBackends()

`void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

0.15.98.3.61 informCore()

`virtual bool smtrat::Module::informCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.98.3.62 informedConstraints()

`const carl::FastSet<FormulaT>& smtrat::Module::informed↩ Constraints ( ) const [inline], [inherited]`

Returns

The position of the first constraint of which no backend has been informed about.

0.15.98.3.63 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.
This method must not be called twice and only before the first runBackends call.
Reimplemented in smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntBlastModule< Settings >, smtrat::FPPModule< Settings >, smtrat::CurryModule< Settings >, and smtrat::BVModule< Settings >.

0.15.98.3.64 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

0.15.98.3.65 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

0.15.98.3.66 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns

true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

0.15.98.3.67 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns

A constant reference to the lemmas being valid formulas this module or its backends made.

0.15.98.3.68 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.
({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns

The vector being the two given vectors merged.

0.15.98.3.69 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns

The assignment of the current satisfiable result, if existent.

0.15.98.3.70 modelsDisjoint()

`bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns

true, if there is no variable assigned by both models; false, otherwise.

0.15.98.3.71 moduleName()

`virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns

The name of the given module type as name.

Reimplemented in smtrat::VSModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::STropModule< Settings >, smtrat::SplitSOSModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntEqModule< Settings >, smtrat::IntBlastModule< Settings >, smtrat::IncWidthModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::GBModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::CurryModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::BVModule< Settings >, and smtrat::BEModule< Settings >.

0.15.98.3.72 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

0.15.98.3.73 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

0.15.98.3.74 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula. TODO: disable this method

0.15.98.3.75 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula.

0.15.98.3.76 pPassedFormula() `const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to the backends of this module.

0.15.98.3.77 pReceivedFormula() `const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to this module.

0.15.98.3.78 print() `void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

0.15.98.3.79 printAllModels() `void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.98.3.80 printInfeasibleSubsets() `void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

0.15.98.3.81 printModel() `void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.98.3.82 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

0.15.98.3.83 printReceivedFormula()

`void smtrat::Module::printReceivedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

0.15.98.3.84 probablyLooping()

`bool smtrat::Module::probablyLooping ( const typename Poly::PolyType & _branchingPolynomial, const Rational & _branchingValue ) const [protected], [inherited]`

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns

true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

0.15.98.3.85 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

0.15.98.3.86 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

0.15.98.3.87 receivedVariable()

`bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

0.15.98.3.88 remove()

`void smtrat::PModule::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

0.15.98.3.89 removeCore()

```
virtual void smtrat::Module::removeCore (
    [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected],
[virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

0.15.98.3.90 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

0.15.98.3.91 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

0.15.98.3.92 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const
[inline], [inherited]
```

Returns

A reference to the formula passed to the backends of this module.

0.15.98.3.93 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns

A reference to the formula passed to this module.

0.15.98.3.94 runBackends() [1/2]

```
virtual Answer smtrat::PModule::runBackends ( ) [inline],
[virtual], [inherited]
```

Reimplemented from smtrat::Module.

0.15.98.3.95 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.98.3.96 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ _↩ *id*	The id to set this module's id to.

0.15.98.3.97 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

0.15.98.3.98 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns

True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

0.15.98.3.99 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint (
    const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

0.15.98.3.100 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns

The priority of this module to get a thread for running its check procedure.

0.15.98.3.101 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::SATModule< Settings >.

0.15.98.3.102 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

0.15.98.3.103 updateModel() `void smtrat::PModule::updateModel ( ) const [virtual], [inherited]`

Updates the current assignment into the model.
Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.
Reimplemented from smtrat::Module.

0.15.98.3.104 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.98.4 Field Documentation

0.15.98.4.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

0.15.98.4.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

0.15.98.4.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

0.15.98.4.4 mConstraintsToInform

`carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

0.15.98.4.5 mFinalCheck

`bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

0.15.98.4.6 mFirstPosInLastBranches

`std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

0.15.98.4.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.98.4.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::m↩FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

0.15.98.4.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.98.4.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

0.15.98.4.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

0.15.98.4.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

0.15.98.4.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

0.15.98.4.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

0.15.98.4.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

0.15.98.4.16 mModelComputed `bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

0.15.98.4.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

0.15.98.4.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

0.15.98.4.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

0.15.98.4.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

0.15.98.4.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

0.15.98.4.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

0.15.98.4.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

0.15.98.4.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.98.4.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

0.15.99 smtrat::CoCoAGBModule< Settings > Class Template Reference

`#include <CoCoAGBModule.h>`

Public Types

- enum class LemmaType : unsigned { NORMAL = 0 , PERMANENT = 1 }

Public Member Functions

- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_↩ VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateModel () const

  Updates the model, if the solver has detected the consistency of the received formula, beforehand.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.

- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore ([[maybe_unused]] const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore ([[maybe_unused]] const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer checkCore ()

  Checks the received formula for consistency.
- virtual void removeCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.

- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

0.15.99.1 Member Enumeration Documentation

0.15.99.1.1 LemmaType `enum smtrat::Module::LemmaType : unsigned [strong], [inherited]`

Enumerator

NORMAL	
PERMANENT	

0.15.99.2 Member Function Documentation

0.15.99.2.1 add()

`bool smtrat::Module::add ( ModuleInput::const_iterator _subformula ) [inherited]`

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.99.2.2 addConstraintToInform()

`void smtrat::Module::addConstraintToInform ( const FormulaT & _constraint ) [protected], [virtual], [inherited]`

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

0.15.99.2.3 addCore()

`virtual bool smtrat::Module::addCore ( [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]`

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.99.2.4 addInformationRelevantFormula()

`void smtrat::Module::addInformationRelevantFormula ( const FormulaT & formula ) [protected], [inherited]`

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

0.15.99.2.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline], [inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

0.15.99.2.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

0.15.99.2.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.
Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

0.15.99.2.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.
Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.99.2.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.99.2.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.99.2.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const  [inline],
[inherited]
```

Returns

All satisfying assignments, if existent.

0.15.99.2.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns

True, if one of them has determined a result.

0.15.99.2.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns

A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.99.2.14 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

0.15.99.2.15 branchAt() [1/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.99.2.16 branchAt() [2/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

0.15.99.2.17 branchAt() [3/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.99.2.18 branchAt() [4/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
```

```
std::vector< FormulaT > && _premise,
bool _leftCaseWeak = true,
bool _preferLeftCase = true,
bool _useReceivedFormulaAsPremise = false )  [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

0.15.99.2.19 check()

```
Answer smtrat::Module::check (
bool _final = false,
bool _full = true,
carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.99.2.20 checkCore()

```
Answer smtrat::Module::checkCore ( )  [protected], [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::VSModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::SymmetryModule< Settings >, smtrat::STropModule< Settings >, smtrat::SplitSOSModule< Settings >, smtrat::SATModule< Settings >, smtrat::PFEModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Se smtrat::NRAILModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::MCBModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASetti smtrat::LRAModule< LRASettings1 >, smtrat::IntEqModule< Settings >, smtrat::IntBlastModule< Settings >, smtrat::IncWidthModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::ICEModule< Settings >, smtrat::GBPPModule< Settings >, smtrat::GBModule< Settings >, smtrat::FPPModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::ESModule< Settings smtrat::EMModule< Settings >, smtrat::CurryModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::CoveringNGModule< Settings >, smtrat::CNFerModule, smtrat::BVModule< Settings >, and smtrat::BEModule< Settings >.

0.15.99.2.21 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

0.15.99.2.22 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns

false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

0.15.99.2.23 cleanModel()

```
void smtrat::Module::cleanModel ( ) const [inline], [protected],
[inherited]
```

Substitutes variable occurrences by its model value in the model values of other variables.

0.15.99.2.24 clearLemmas()

```
void smtrat::Module::clearLemmas ( ) [inline], [inherited]
```

Deletes all yet found lemmas.

0.15.99.2.25 clearModel()

```
void smtrat::Module::clearModel ( ) const [inline], [protected],
[inherited]
```

Clears the assignment, if any was found.

0.15.99.2.26 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

0.15.99.2.27 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

0.15.99.2.28 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

0.15.99.2.29 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.
If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

0.15.99.2.30 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

0.15.99.2.31 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns

The constraints which the backends must be informed about.

0.15.99.2.32 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

0.15.99.2.33 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend
(
    const FormulaT & _formula ) const [inherited]
```

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

0.15.99.2.34 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.99.2.35 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual],
[inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.99.2.36 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns

The index of the smallest (regarding the size of the sets) element of origins

0.15.99.2.37 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module. Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

0.15.99.2.38 excludeNotReceivedVariablesFromModel()

`void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]`

Excludes all variables from the current model, which do not occur in the received formula.

0.15.99.2.39 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

0.15.99.2.40 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns

The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.99.2.41 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns

The position of the first (by this module) unchecked sub-formula of the received formula.

0.15.99.2.42 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
    const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

0.15.99.2.43 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

0.15.99.2.44 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

0.15.99.2.45 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

0.15.99.2.46 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

0.15.99.2.47 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::getInfeasible↩ Subsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.
Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns

The infeasible subsets the given backend provides.

0.15.99.2.48 getInformationRelevantFormulas() `const std::set< FormulaT > & smtrat::Module↩ ::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns

Set of all formulas

0.15.99.2.49 getModelEqualities() `std::list< std::vector< carl::Variable > > smtrat::Module↩ ::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.
The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns

Equivalence classes.

0.15.99.2.50 getOrigins() [1/3] `void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

0.15.99.2.51 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

0.15.99.2.52 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns

The origins of the passed formula at the given position.

0.15.99.2.53 getReceivedFormulaSimplified()

```
std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]
```

Returns

A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

0.15.99.2.54 hasLemmas()

```
bool smtrat::Module::hasLemmas ( ) [inline], [inherited]
```

Checks whether this module or any of its backends provides any lemmas.

0.15.99.2.55 hasValidInfeasibleSubset()

```
bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]
```

Returns

true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

0.15.99.2.56 id()

```
std::size_t smtrat::Module::id ( ) const [inline], [inherited]
```

Returns

A unique ID to identify this module instance.

0.15.99.2.57 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns

The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

0.15.99.2.58 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.99.2.59 informBackends() `void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

0.15.99.2.60 informCore() `virtual bool smtrat::Module::informCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.99.2.61 informedConstraints() `const carl::FastSet<FormulaT>& smtrat::Module::informed↩ Constraints ( ) const [inline], [inherited]`

Returns

The position of the first constraint of which no backend has been informed about.

0.15.99.2.62 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.
This method must not be called twice and only before the first runBackends call.
Reimplemented in smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntBlastModule< Settings >, smtrat::FPPModule< Settings >, smtrat::CurryModule< Settings >, and smtrat::BVModule< Settings >.

0.15.99.2.63 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

0.15.99.2.64 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

0.15.99.2.65 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns

true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

0.15.99.2.66 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns

A constant reference to the lemmas being valid formulas this module or its backends made.

0.15.99.2.67 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.
({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns

The vector being the two given vectors merged.

0.15.99.2.68 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns

The assignment of the current satisfiable result, if existent.

0.15.99.2.69 modelsDisjoint()

`bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns

true, if there is no variable assigned by both models; false, otherwise.

0.15.99.2.70 moduleName()

`virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns

The name of the given module type as name.

Reimplemented in smtrat::VSModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::STropModule< Settings >, smtrat::SplitSOSModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntEqModule< Settings >, smtrat::IntBlastModule< Settings >, smtrat::IncWidthModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::GBModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::CurryModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::BVModule< Settings >, and smtrat::BEModule< Settings >.

0.15.99.2.71 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

0.15.99.2.72 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

0.15.99.2.73 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula. TODO: disable this method

0.15.99.2.74 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula.

0.15.99.2.75 pPassedFormula() `const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to the backends of this module.

0.15.99.2.76 pReceivedFormula() `const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to this module.

0.15.99.2.77 print() `void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

0.15.99.2.78 printAllModels() `void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.99.2.79 printInfeasibleSubsets() `void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

0.15.99.2.80 printModel() `void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.99.2.81 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

0.15.99.2.82 printReceivedFormula()

`void smtrat::Module::printReceivedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

0.15.99.2.83 probablyLooping()

`bool smtrat::Module::probablyLooping ( const typename Poly::PolyType & _branchingPolynomial, const Rational & _branchingValue ) const [protected], [inherited]`

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns

true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

0.15.99.2.84 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

0.15.99.2.85 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

0.15.99.2.86 receivedVariable()

`bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

0.15.99.2.87 remove()

`void smtrat::Module::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

0.15.99.2.88 removeCore()

```
virtual void smtrat::Module::removeCore (
    [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected],
[virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

0.15.99.2.89 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin
(
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

0.15.99.2.90 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

0.15.99.2.91 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const
[inline], [inherited]
```

Returns

A reference to the formula passed to the backends of this module.

0.15.99.2.92 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns

A reference to the formula passed to this module.

0.15.99.2.93 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( ) [inline],
[protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

0.15.99.2.94 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.99.2.95 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ _↩ *id*	The id to set this module's id to.

0.15.99.2.96 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

0.15.99.2.97 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns

True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

0.15.99.2.98 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint (
    const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

0.15.99.2.99 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns

The priority of this module to get a thread for running its check procedure.

0.15.99.2.100 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::SATModule< Settings >.

0.15.99.2.101 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

0.15.99.2.102 updateModel() `void smtrat::Module::updateModel ( ) const [virtual], [inherited]`

Updates the model, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::PModule, smtrat::VSModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::STropModule< Settings >, smtrat::SATModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::MCBModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntEqModule< Settings >, smtrat::IntBlastModule< Settings >, smtrat::IncWidthModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::GBPPModule< Settings >, smtrat::FPPModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::ESModule< Settings >, smtrat::CurryModule< Settings >, smtrat::CubeLIAModule< Se
smtrat::CSplitModule< Settings >, smtrat::CoveringNGModule< Settings >, and smtrat::BVModule< Settings >.

0.15.99.2.103 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.99.3 Field Documentation

0.15.99.3.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

0.15.99.3.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

0.15.99.3.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

0.15.99.3.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

0.15.99.3.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

0.15.99.3.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

0.15.99.3.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩ Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.99.3.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module::m↩ FirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

0.15.99.3.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.99.3.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

0.15.99.3.11 mInfeasibleSubsets `std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

0.15.99.3.12 mInformedConstraints `carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

0.15.99.3.13 mLastBranches `std::vector< Branching > smtrat::Module::mLastBranches = std↩ ::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

0.15.99.3.14 mLemmas `std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

0.15.99.3.15 mModel `Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

0.15.99.3.16 mModelComputed `bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

0.15.99.3.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

0.15.99.3.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

0.15.99.3.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

0.15.99.3.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

0.15.99.3.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

0.15.99.3.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

0.15.99.3.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

0.15.99.3.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.99.3.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

0.15.104.2.3 id()

```
size_t smtrat::vs::Condition::id ( ) const [inline]
```

0.15.104.2.4 operator<()

```
bool smtrat::vs::Condition::operator< (
    const Condition & _condition ) const
```

Checks if the given condition (right hand side) is greater than this condition (left hand side).

Parameters

_condition	The condition to compare with (rhs).

Returns

true ,if the given substitution is greater than this substitution; false ,otherwise.

0.15.104.2.5 operator==()

```
bool smtrat::vs::Condition::operator== (
    const Condition & _condition ) const
```

Checks the equality of a given condition (right hand side) with this condition (left hand side).

Parameters

_condition	The condition to compare with (rhs).

Returns

true ,if the given condition is equal to this condition; false ,otherwise.

0.15.104.2.6 originalConditions()

```
const carl::PointerSet<Condition>& smtrat::vs::Condition↩

```
double smtrat::vs::Condition::valuate (
    const carl::Variable & _consideredVariable,
    size_t _maxNumberOfVars,
    bool _preferEquation ) const
```

Valuates the constraint according to a variable (it possibly not contains).

Parameters

_consideredVariable	The variable which is considered in this valuation.
_maxNumberOfVars	

Returns

A valuation of the constraint according to an heuristic.

0.15.104.2.14 valuation()

`size_t smtrat::vs::Condition::valuation ( ) const [inline]`

0.15.104.3 Friends And Related Function Documentation

0.15.105 benchmax::CondorBackend Class Reference

Backend for the HTCondor batch system.

`#include <CondorBackend.h>`

Public Member Functions

- void run (const Jobs &, bool)

  Run all tools on all benchmarks.
- bool suspendable () const
- void process_results (const Jobs &jobs, bool check_finished)
- void addResult (const Tool *tool, const fs::path &file, BenchmarkResult &&result)

  Add a result.

Protected Member Functions

- virtual void execute (const Tool *, const fs::path &)

  No-op version of execute.
- virtual void startTool (const Tool *)

  Hook for every tool at the beginning.
- virtual void finalize ()

  Hook to allow for asynchronous backends to wait for jobs to terminate.
- void madeProgress (std::size_t files=1)

  Can be called to give information about the current progress, if available.
- virtual bool collect_results (const Jobs &, bool)
- void sanitize_results (const Jobs &jobs) const
- void write_results (const Jobs &jobs) const

Protected Attributes

- std::size_t mExpectedJobs

  Number of jobs that should be run.
- std::atomic< std::size_t > mFinishedJobs

  Number of jobs that are finished.
- std::atomic< std::size_t > mLastPercent

  Percentage of finished jobs when madeProgress() was last called.

0.15.105.1 Detailed Description

Backend for the HTCondor batch system.
Currently submits all jobs individually and asynchronously waits for them to finish.

0.15.105.2 Member Function Documentation

0.15.105.2.1 addResult()

```
void benchmax::Backend::addResult (
    const Tool * tool,
    const fs::path & file,
    BenchmarkResult && result ) [inline], [inherited]
```

Add a result.

0.15.105.2.2 collect_results()

```
virtual bool benchmax::Backend::collect_results (
    const Jobs & ,
    bool ) [inline], [protected], [virtual], [inherited]
```

0.15.105.2.3 execute()

```
virtual void benchmax::CondorBackend::execute (
    const Tool * ,
    const fs::path & ) [inline], [protected], [virtual]
```

No-op version of execute.
Reimplemented from benchmax::Backend.

0.15.105.2.4 finalize()

```
virtual void benchmax::Backend::finalize ( ) [inline], [protected], [virtual], [inherited]
```

Hook to allow for asynchronous backends to wait for jobs to terminate.

0.15.105.2.5 madeProgress()

```
void benchmax::Backend::madeProgress (
    std::size_t files = 1 ) [inline], [protected], [inherited]
```

Can be called to give information about the current progress, if available.

0.15.105.2.6 process_results()

```
void benchmax::Backend::process_results (
    const Jobs & jobs,
    bool check_finished ) [inline], [inherited]
```

0.15.105.2.7 run()

```
void benchmax::CondorBackend::run (
    const Jobs & ,
    bool ) [inline]
```

Run all tools on all benchmarks.

0.15.105.2.8 sanitize_results()

```
void benchmax::Backend::sanitize_results (
    const Jobs & jobs ) const [inline], [protected], [inherited]
```

0.15.105.2.9 startTool()

```
virtual void benchmax::Backend::startTool (
    const Tool * ) [inline], [protected], [virtual], [inherited]
```

Hook for every tool at the beginning.
Can be used to upload the tool to some remote system.

0.15.105.2.10 suspendable()

```
bool benchmax::Backend::suspendable ( ) const [inline], [inherited]
```

0.15.105.2.11 write_results()

```
void benchmax::Backend::write_results (
    const Jobs & jobs ) const [inline], [protected], [inherited]
```

0.15.105.3 Field Documentation

0.15.105.3.1 mExpectedJobs

```
std::size_t benchmax::Backend::mExpectedJobs [protected], [inherited]
```

Number of jobs that should be run.

0.15.105.3.2 mFinishedJobs

```
std::atomic<std::size_t> benchmax::Backend::mFinishedJobs [protected], [inherited]
```

Number of jobs that are finished.

0.15.105.3.3 mLastPercent `std::atomic<std::size_t> benchmax::Backend::mLastPercent [protected], [inherited]`

Percentage of finished jobs when madeProgress() was last called.

0.15.106 smtrat::mcsat::fm::ConflictGenerator< Comparator > Struct Template Reference

`#include <LRAModule.h>`

Public Member Functions

- Context (const FormulaT &_origin, ModuleInput::iterator _pos)

Data Fields

- FormulaT origin

  The formula in the received formula.
- ModuleInput::iterator position

  The position of this formula in the passed formula.

0.15.113.1 Detailed Description

template<class Settings>
struct smtrat::LRAModule< Settings >::Context

Stores a formula, being part of the received formula of this module, and the position of this formula in the passed formula.
TODO: Maybe it is enough to store a mapping of the formula to the position.

0.15.113.2 Constructor & Destructor Documentation

0.15.113.2.1 Context() `template<class Settings >`

```
smtrat::LRAModule< Settings >::Context::Context (
            const FormulaT & _origin,
            ModuleInput::iterator _pos ) [inline]
```

0.15.113.3 Field Documentation

0.15.113.3.1 origin `template<class Settings >`

`FormulaT smtrat::LRAModule< Settings >::Context::origin`

The formula in the received formula.

0.15.113.3.2 position `template<class Settings >`

`ModuleInput::iterator smtrat::LRAModule< Settings >::Context::position`

The position of this formula in the passed formula.

0.15.116.2 Member Function Documentation

0.15.116.2.1 candidates()

```
const std::vector<ContractionCandidate*>& smtrat::icp::ContractionCandidateManager::candidates ( ) [inline]
```

0.15.116.2.2 closure()

```
void smtrat::icp::ContractionCandidateManager::closure (
    const ContractionCandidate *const _candidate,
    std::set< const ContractionCandidate * > & _candidates ) const
```

Calculates the closure of a certain candidate according to the variables contained.

Parameters

_candidate	

Returns

the set of candidates in the closure of _candidate

0.15.116.2.3 createCandidate()

```
ContractionCandidate * smtrat::icp::ContractionCandidateManager::createCandidate (
    carl::Variable _lhs,
    const Poly _rhs,
    const ConstraintT & _constraint,
    carl::Variable _derivationVar,
    Contractor< carl::SimpleNewton > & _contractor,
    bool _usePropagation )
```

Constructor & Functions.
Creates a new candidate with an unique id.

Parameters

_lhs	The slack/nonlinear variable which represents the constraint
_constraint	The constraint which is to be replaced
_derivationVar	The variable from which the derivative is created when performing contraction
_origin	The pointer to the original formula, needed for assertions and removals of subformulas

Returns

a pointer to the created contraction candidate

0.15.116.2.4 getCandidate()

```
ContractionCandidate * smtrat::icp::ContractionCandidateManager::getCandidate (
    unsigned _id ) const
```

Returns the contraction candidate for the given id.

Parameters

_id	

Returns

the pointer to the contraction candidate

0.15.116.2.5 getId()

```
unsigned smtrat::icp::ContractionCandidateManager::getId (
            const ContractionCandidate *const _candidate ) const
```

Returns the id of the given contraction candidate.

Parameters

_candidate	

Returns

id of the candidate

0.15.123.1 Detailed Description

Implements the core theory of the booleans.

0.15.123.2 Member Typedef Documentation

0.15.123.2.1 OperatorType

```
using smtrat::parser::CoreTheory::OperatorType = boost::variant<carl↩
::FormulaType>
```

0.15.123.3 Constructor & Destructor Documentation

0.15.123.3.1 CoreTheory()

```
smtrat::parser::CoreTheory::CoreTheory (
    ParserState * state )
```

0.15.123.4 Member Function Documentation

0.15.123.4.1 addConstants()

```
void smtrat::parser::CoreTheory::addConstants (
    qi::symbols< char, types::ConstType > & constants )  [static]
```

0.15.123.4.2 addSimpleSorts()

```
void smtrat::parser::CoreTheory::addSimpleSorts (
    qi::symbols< char, carl::Sort > & sorts )  [static]
```

0.15.123.4.3 declareVariable()

```
bool smtrat::parser::CoreTheory::declareVariable (
    const std::string & ,
    const carl::Sort & ,
    types::VariableType & ,
    TheoryError & errors )  [virtual]
```

Declare a new variable with the given name and the given sort.
Reimplemented from smtrat::parser::AbstractTheory.

0.15.123.4.4 expandDistinct()

```
template<typename T , typename Builder >
FormulaT smtrat::parser::AbstractTheory::expandDistinct (
    const std::vector< T > & values,
    const Builder & neqBuilder )  [inline], [inherited]
```

0.15.123.4.5 functionCall()

```
bool smtrat::parser::CoreTheory::functionCall (
    const Identifier & ,
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors )  [virtual]
```

Resolve another unknown function call.
Reimplemented from smtrat::parser::AbstractTheory.

0.15.123.4.6 handleDistinct()

```
bool smtrat::parser::CoreTheory::handleDistinct (
    const std::vector< types::TermType > & ,
    types::TermType & ,
    TheoryError & errors )  [virtual]
```

Resolve a distinct operator.
Reimplemented from smtrat::parser::AbstractTheory.

0.15.123.4.7 handleITE()

```
bool smtrat::parser::CoreTheory::handleITE (
    const FormulaT & ,
    const types::TermType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors )  [virtual]
```

Resolve an if-then-else operator.
Reimplemented from smtrat::parser::AbstractTheory.

0.15.123.4.8 instantiate()

```
virtual bool smtrat::parser::AbstractTheory::instantiate (
    const types::VariableType & ,
    const types::TermType & ,
    types::TermType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Instantiate a variable within a term.
Reimplemented in smtrat::parser::BitvectorTheory, and smtrat::parser::ArithmeticTheory.

0.15.123.4.9 refreshVariable()

```
virtual bool smtrat::parser::AbstractTheory::refreshVariable (
    const types::VariableType & ,
    types::VariableType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Reimplemented in smtrat::parser::BitvectorTheory.

0.15.123.4.10 resolveSymbol()

```
virtual bool smtrat::parser::AbstractTheory::resolveSymbol (
    const Identifier & ,
    types::TermType & ,
    TheoryError & errors )  [inline], [virtual], [inherited]
```

Resolve a symbol that was not declared within the ParserState.
This might be a symbol that actually uses indices, for example bitvector constants.
Reimplemented in smtrat::parser::BitvectorTheory.

0.15.131 smtrat::cadcells::datastructures::CoveringDescription Class Reference

Describes a covering of the real line by SymbolicIntervals (given an appropriate sample).

```
#include <roots.h>
```

Public Member Functions

- void add (const SymbolicInterval &c)

  Add a SymbolicInterval to the covering.
- const auto & cells () const

0.15.131.1 Detailed Description

Describes a covering of the real line by SymbolicIntervals (given an appropriate sample).

0.15.131.2 Member Function Documentation

0.15.131.2.1 add()

```
void smtrat::cadcells::datastructures::CoveringDescription::add (
            const SymbolicInterval & c )  [inline]
```

Add a SymbolicInterval to the covering.
The added cell needs to be the rightmost cell of the already added cells and not be contained in any of these cells (or vice versa).

- The first cell needs to have -oo as left bound.
- The last cell needs to have oo as right bound.
- All cells need to cover the real line under an appropriate sample.
- Evaluated under an appropriate sample, the left bound of the added cell c is strictly greater than the left bounds of already added cells (considering also "strictness" of the bounds).

- The right bound of the added cell c needs to be greater than all right bounds of already added cells (considering also "strictness" of the bounds).

0.15.131.2.2 cells() `const auto& smtrat::cadcells::datastructures::CoveringDescription::cells ( ) const [inline]`

0.15.132 smtrat::CoveringNGModule< Settings > Class Template Reference

`#include <CoveringNGModule.h>`

Public Types

- using SettingsType = Settings
- enum class LemmaType : unsigned { NORMAL = 0 , PERMANENT = 1 }

Public Member Functions

- CoveringNGModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- ~CoveringNGModule ()
- bool informCore (const FormulaT &_constraint)
- bool addCore (ModuleInput::const_iterator _subformula)
- void removeCore (ModuleInput::const_iterator _subformula)
- void updateModel () const

  Updates the model, if the solver has detected the consistency of the received formula, beforehand.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_↩VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

Sets the priority of this module to get a thread for running its check procedure.

- const ModuleInput ∗ pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput ∗ pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const

- const std::vector< Module ∗ > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="∗∗∗") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="∗∗∗") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="∗∗∗") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="∗∗∗") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore ([[maybe_unused]] const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore ([[maybe_unused]] const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.

- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const

- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.

- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

smtrat::CoveringNGModule< Settings >::~CoveringNGModule ( )
```

0.15.132.4 Member Function Documentation

0.15.132.4.1 add()

```
bool smtrat::Module::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.132.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

0.15.132.4.3 addCore() [1/2]

```
virtual bool smtrat::Module::addCore (
    [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected],
[virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.132.4.4 addCore() [2/2]

```
template<typename Settings >
bool smtrat::CoveringNGModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula )
```

0.15.132.4.5 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula
(
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

0.15.132.4.6 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

0.15.132.4.7 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

0.15.132.4.8 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.
Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

0.15.132.4.9 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.
Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.132.4.10 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.132.4.11 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.132.4.12 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns

All satisfying assignments, if existent.

0.15.132.4.13 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns

True, if one of them has determined a result.

0.15.132.4.14 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const
[inline], [inherited]
```

Returns

A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.132.4.15 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected],
[inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

0.15.132.4.16 branchAt() [1/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.132.4.17 branchAt() [2/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

0.15.132.4.18 branchAt() [3/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.132.4.19 branchAt() [4/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

0.15.132.4.20 check()

```
Answer smtrat::Module::check (
    bool _final = false,
    bool _full = true,
    carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.132.4.21 checkCore()

```
template<typename Settings >
Answer smtrat::CoveringNGModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.132.4.22 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

0.15.132.4.23 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns

false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

0.15.132.4.24 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

0.15.132.4.25 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

0.15.132.4.26 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

0.15.132.4.27 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

0.15.132.4.28 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

0.15.132.4.29 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

0.15.132.4.30 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.
If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

0.15.132.4.31 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

0.15.132.4.32 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns

The constraints which the backends must be informed about.

0.15.132.4.33 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

0.15.132.4.34 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

0.15.132.4.35 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.132.4.36 deinformCore()

`virtual void smtrat::Module::deinformCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.132.4.37 determine_smallest_origin()

`size_t smtrat::Module::determine_smallest_origin ( const std::vector< FormulaT > & origins ) const [protected], [inherited]`

Parameters

origins	A vector of sets of origins.

Returns

The index of the smallest (regarding the size of the sets) element of origins

0.15.132.4.38 eraseSubformulaFromPassedFormula()

`ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula ( ModuleInput::iterator _subformula, bool _ignoreOrigins = false ) [protected], [virtual], [inherited]`

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module. Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

0.15.132.4.39 excludeNotReceivedVariablesFromModel()

`void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]`

Excludes all variables from the current model, which do not occur in the received formula.

0.15.132.4.40 findBestOrigin()

`std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin ( const std::vector< FormulaT > & _origins ) const [protected], [inherited]`

Parameters

_origins	

Returns

0.15.132.4.41 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns

The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.132.4.42 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns

The position of the first (by this module) unchecked sub-formula of the received formula.

0.15.132.4.43 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

0.15.132.4.44 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasible↩Subset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

0.15.132.4.45 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

0.15.132.4.46 getBackendsModel()

`void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

0.15.132.4.47 getInfeasibleSubsets() [1/2]

`void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

0.15.132.4.48 getInfeasibleSubsets() [2/2]

`std::vector< FormulaSetT > smtrat::Module::get↩InfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.
Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns

The infeasible subsets the given backend provides.

0.15.132.4.49 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module↩::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns

Set of all formulas

0.15.132.4.50 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module↩::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.
The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns

Equivalence classes.

0.15.132.4.51 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
const FormulaT & _formula,
FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

0.15.132.4.52 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
const FormulaT & _formula,
FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

0.15.132.4.53 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns

The origins of the passed formula at the given position.

0.15.132.4.54 getReceivedFormulaSimplified()

```
std::pair< bool, FormulaT > smtrat::Module::get↩
ReceivedFormulaSimplified ( ) [virtual], [inherited]
```

Returns

A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

0.15.132.4.55 hasLemmas()

```
bool smtrat::Module::hasLemmas ( ) [inline], [inherited]
```

Checks whether this module or any of its backends provides any lemmas.

0.15.132.4.56 hasValidInfeasibleSubset()

```
bool smtrat::Module::hasValidInfeasibleSubset ( ) const
[inherited]
```

Returns

true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

0.15.132.4.57 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns

A unique ID to identify this module instance.

0.15.132.4.58 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns

The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

0.15.132.4.59 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.132.4.60 informBackends() `void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

0.15.132.4.61 informCore() [1/2] `virtual bool smtrat::Module::informCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.132.4.62 informCore() [2/2]

```
template<typename Settings >
bool smtrat::CoveringNGModule< Settings >::informCore (
            const FormulaT & _constraint )
```

0.15.132.4.63 informedConstraints()

```
const carl::FastSet<FormulaT>& smtrat::Module::informed↩
Constraints ( ) const [inline], [inherited]
```

Returns

The position of the first constraint of which no backend has been informed about.

0.15.132.4.64 init()

```
void smtrat::Module::init ( ) [virtual], [inherited]
```

Informs all backends about the so far encountered constraints, which have not yet been communicated.
This method must not be called twice and only before the first runBackends call.
Reimplemented in smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntBlastModule< Settings >, smtrat::FPPModule< Settings >, smtrat::CurryModule< Settings >, and smtrat::BVModule< Settings >.

0.15.132.4.65 is_minimizing()

```
bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]
```

0.15.132.4.66 isLemmaLevel()

```
bool smtrat::Module::isLemmaLevel (
            LemmaLevel level ) [protected], [inherited]
```

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

0.15.132.4.67 isPreprocessor()

```
bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]
```

Returns

true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

0.15.132.4.68 lemmas()

```
const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline],
[inherited]
```

Returns

A constant reference to the lemmas being valid formulas this module or its backends made.

0.15.132.4.69 merge()

```
std::vector< FormulaT > smtrat::Module::merge (
            const std::vector< FormulaT > & _vecSetA,
            const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]
```

Merges the two vectors of sets into the first one.
({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns

The vector being the two given vectors merged.

0.15.132.4.70 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns

The assignment of the current satisfiable result, if existent.

0.15.132.4.71 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns

true, if there is no variable assigned by both models; false, otherwise.

0.15.132.4.72 moduleName() `virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns

The name of the given module type as name.

Reimplemented in smtrat::VSModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::STropModule< Settings >, smtrat::SplitSOSModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntEqModule< Settings >, smtrat::IntBlastModule< Settings >, smtrat::IncWidthModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::GBModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::CurryModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::BVModule< Settings >, and smtrat::BEModule< Settings >.

0.15.132.4.73 objective() `carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

0.15.132.4.74 originInReceivedFormula() `bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

0.15.132.4.75 passedFormulaBegin() `ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula. TODO: disable this method

0.15.132.4.76 passedFormulaEnd() `ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula.

0.15.132.4.77 pPassedFormula() `const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to the backends of this module.

0.15.132.4.78 pReceivedFormula() `const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to this module.

0.15.132.4.79 print() `void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

0.15.132.4.80 printAllModels() `void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.132.4.81 printInfeasibleSubsets() `void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

0.15.132.4.82 printModel()

`void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.132.4.83 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

0.15.132.4.84 printReceivedFormula()

`void smtrat::Module::printReceivedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

0.15.132.4.85 probablyLooping()

`bool smtrat::Module::probablyLooping ( const typename Poly::PolyType & _branchingPolynomial, const Rational & _branchingValue ) const [protected], [inherited]`

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns

true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

0.15.132.4.86 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

0.15.132.4.87 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩
InfeasibleSubset (
            ModuleInput::const_iterator _subformula )  [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

0.15.132.4.88 receivedVariable()

```
bool smtrat::Module::receivedVariable (
            carl::Variable::Arg _var ) const  [inline], [inherited]
```

0.15.132.4.89 remove()

```
void smtrat::Module::remove (
            ModuleInput::const_iterator _subformula )  [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

0.15.132.4.90 removeCore() [1/2]

```
virtual void smtrat::Module::removeCore (
            [[maybe_unused] ] ModuleInput::const_iterator formula )  [inline], [protected],
[virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

0.15.132.4.91 removeCore() [2/2]

```
template<typename Settings >
void smtrat::CoveringNGModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula )
```

0.15.132.4.92 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origin (
            ModuleInput::iterator _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

0.15.132.4.93 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

0.15.132.4.94 rPassedFormula() `const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]`

Returns

A reference to the formula passed to the backends of this module.

0.15.132.4.95 rReceivedFormula() `const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]`

Returns

A reference to the formula passed to this module.

0.15.132.4.96 runBackends() [1/2] `virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]`

Reimplemented in smtrat::PModule.

0.15.132.4.97 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.132.4.98 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ *_id*	The id to set this module's id to.

0.15.132.4.99 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

0.15.132.4.100 solverState() `Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns

True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

0.15.132.4.101 splitUnequalConstraint() `void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

0.15.132.4.102 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns

The priority of this module to get a thread for running its check procedure.

0.15.132.4.103 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::SATModule< Settings >.

0.15.132.4.104 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

0.15.132.4.105 updateModel() `template<typename Settings > void smtrat::CoveringNGModule< Settings >::updateModel ( ) const [virtual]`

Updates the model, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented from smtrat::Module.

0.15.132.4.106 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.132.5 Field Documentation

0.15.132.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`
The backends of this module which have been used.

0.15.132.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`
Stores all satisfying assignments.

0.15.132.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`
This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

0.15.132.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`
Stores the constraints which the backends must be informed about.

0.15.132.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`
true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

0.15.132.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`
The beginning of the cyclic buffer storing the last branches.

0.15.132.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`
Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.132.5.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module↩::mFirstUncheckedReceivedSubformula [protected], [inherited]`
Stores the position of the first (by this module) unchecked sub-formula of the received formula.

0.15.132.5.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`
Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.132.5.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`
false, if this module should avoid too expensive procedures and rather return unknown instead.

0.15.132.5.11 mInfeasibleSubsets `std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`
Stores the infeasible subsets.

0.15.132.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

0.15.132.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

0.15.132.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

0.15.132.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

0.15.132.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

0.15.132.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

0.15.132.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

0.15.132.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplitting↩Variables [static], [inherited]`

Reusable splitting variables.

0.15.132.5.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

0.15.132.5.21 mSmallerMusesCheckCounter

`unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

0.15.132.5.22 mSolverState

`std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

0.15.132.5.23 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheory↩Propagations [protected], [inherited]`

0.15.132.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.132.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

0.15.133 smtrat::cadcells::datastructures::CoveringRepresentation< P > Struct Template Reference

Represents a covering over a cell.

`#include <representation.h>`

Public Member Functions

- CoveringDescription get_covering () const

  Returns a descriptions of the covering.
- std::vector< SampledDerivationRef< P > > sampled_derivations ()

  Returns the derivations.
- bool is_valid () const

  Checks whether this represents a proper non-redundant covering.

Data Fields

- std::vector< CellRepresentation< P > > cells

  Cells of the covering in increasing order and no cell is contained in another cell.
- IndexedRootOrdering ordering

  An ordering on the roots for the cell boundaries mainting the covering.

0.15.133.1 Detailed Description

template<typename P>
struct smtrat::cadcells::datastructures::CoveringRepresentation< P >

Represents a covering over a cell.
The cells forming the covering are in increasing order (ordered by lower bound) and no cell is contained in another cell.

0.15.133.2 Member Function Documentation

0.15.133.2.1 get_covering() `template<typename P > CoveringDescription smtrat::cadcells::datastructures::CoveringRepresentation< P >::get_covering ( ) const [inline]`

Returns a descriptions of the covering.

0.15.133.2.2 is_valid() `template<typename P > bool smtrat::cadcells::datastructures::CoveringRepresentation< P >::is_valid ( ) const [inline]`

Checks whether this represents a proper non-redundant covering.

0.15.133.2.3 sampled_derivations() `template<typename P >` `std::vector<SampledDerivationRef<P> > smtrat::cadcells::datastructures::CoveringRepresentation< P >::sampled_derivations ( ) [inline]`

Returns the derivations.

0.15.133.3 Field Documentation

0.15.133.3.1 cells `template<typename P >` `std::vector<CellRepresentation<P> > smtrat::cadcells::datastructures::CoveringRepresentation< P >::cells`

Cells of the covering in increasing order and no cell is contained in another cell.

0.15.133.3.2 ordering `template<typename P >` `IndexedRootOrdering smtrat::cadcells::datastructures::CoveringRepresentation< P >::ordering`

An ordering on the roots for the cell boundaries mainting the covering.

Public Member Functions

- std::string moduleName () const
- CSplitModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.

- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_↩ VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const

- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const

- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore ([[maybe_unused]] const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore ([[maybe_unused]] const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

Merges the two vectors of sets into the first one.

- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

```

0.15.136.4 Member Function Documentation

0.15.136.4.1 add() `bool smtrat::Module::add ( ModuleInput::const_iterator _subformula ) [inherited]`

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.136.4.2 addConstraintToInform() `void smtrat::Module::addConstraintToInform ( const FormulaT & _constraint ) [protected], [virtual], [inherited]`

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

0.15.136.4.3 addCore() [1/2] `virtual bool smtrat::Module::addCore ( [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]`

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.136.4.4 addCore() [2/2] `template<typename Settings > bool smtrat::CSplitModule< Settings >::addCore ( ModuleInput::const_iterator _subformula )`

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

False, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; True, otherwise.

0.15.136.4.5 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

0.15.136.4.6 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

0.15.136.4.7 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

0.15.136.4.8 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.
Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

0.15.136.4.9 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.
Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.136.4.10 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.136.4.11 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.136.4.12 allModels()

`const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns

All satisfying assignments, if existent.

0.15.136.4.13 anAnswerFound()

`bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns

True, if one of them has determined a result.

0.15.136.4.14 answerFound()

`const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns

A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.136.4.15 backendsModel()

`const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

0.15.136.4.16 branchAt() [1/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.136.4.17 branchAt() [2/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

0.15.136.4.18 branchAt() [3/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
```

```
bool _preferLeftCase = true,
bool _useReceivedFormulaAsPremise = false,
const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

0.15.136.4.19 branchAt() [4/4]

```
bool smtrat::Module::branchAt (
const Poly & _polynomial,
bool _integral,
const Rational & _value,
std::vector< FormulaT > && _premise,
bool _leftCaseWeak = true,
bool _preferLeftCase = true,
bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

0.15.136.4.20 check()

```
Answer smtrat::Module::check (
bool _final = false,
bool _full = true,
carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.136.4.21 checkCore() `template<typename Settings > Answer smtrat::CSplitModule< Settings >::checkCore ( ) [virtual]`

Checks the received formula for consistency.

Returns

SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; UNKNOWN, otherwise.

Reimplemented from smtrat::Module.

0.15.136.4.22 checkInfSubsetForMinimality() `void smtrat::Module::checkInfSubsetForMinimality ( std::vector< FormulaSetT >::const_iterator _infsubset, const std::string & _filename = "smaller_muses", unsigned _maxSizeDifference = 1 ) const [inherited]`

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

0.15.136.4.23 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns

false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

0.15.136.4.24 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

0.15.136.4.25 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

0.15.136.4.26 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

0.15.136.4.27 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

0.15.136.4.28 clearPassedFormula()

`void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

0.15.136.4.29 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

0.15.136.4.30 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.
If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

0.15.136.4.31 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

0.15.136.4.32 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns

The constraints which the backends must be informed about.

0.15.136.4.33 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

0.15.136.4.34 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

0.15.136.4.35 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.136.4.36 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual],
[inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.136.4.37 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns

The index of the smallest (regarding the size of the sets) element of origins

0.15.136.4.38 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module. Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

0.15.136.4.39 excludeNotReceivedVariablesFromModel() `void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]`

Excludes all variables from the current model, which do not occur in the received formula.

0.15.136.4.40 findBestOrigin() `std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin ( const std::vector< FormulaT > & _origins ) const [protected], [inherited]`

Parameters

_origins	

Returns

0.15.136.4.41 firstSubformulaToPass() `ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns

The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.136.4.42 firstUncheckedReceivedSubformula() `ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns

The position of the first (by this module) unchecked sub-formula of the received formula.

0.15.136.4.43 freeSplittingVariable() `static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

0.15.136.4.44 generateTrivialInfeasibleSubset() `void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

0.15.136.4.45 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

0.15.136.4.46 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

0.15.136.4.47 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

0.15.136.4.48 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets (
    const Module & _backend ) const [protected], [inherited]
```

Get the infeasible subsets the given backend provides.
Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns

The infeasible subsets the given backend provides.

0.15.136.4.49 getInformationRelevantFormulas()

```
const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]
```

Gets all InformationRelevantFormulas.

Returns

Set of all formulas

0.15.136.4.50 getModelEqualities()

```
std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]
```

Partition the variables from the current model into equivalence classes according to their assigned value.
The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns

Equivalence classes.

0.15.136.4.51 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

0.15.136.4.52 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

0.15.136.4.53 getOrigins() [3/3] const FormulaT& smtrat::Module::getOrigins (ModuleInput::const_iterator _formula) const [inline], [protected], [inherited]

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns

The origins of the passed formula at the given position.

0.15.136.4.54 getReceivedFormulaSimplified() std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]

Returns

A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

0.15.136.4.55 hasLemmas() bool smtrat::Module::hasLemmas ( ) [inline], [inherited]

Checks whether this module or any of its backends provides any lemmas.

0.15.136.4.56 hasValidInfeasibleSubset() bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]

Returns

true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

0.15.136.4.57 id() std::size_t smtrat::Module::id ( ) const [inline], [inherited]

Returns

A unique ID to identify this module instance.

0.15.136.4.58 infeasibleSubsets() const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]

Returns

The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

0.15.136.4.59 inform() bool smtrat::Module::inform (const FormulaT & _constraint) [inherited]

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.136.4.60 informBackends()

`void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

0.15.136.4.61 informCore()

`virtual bool smtrat::Module::informCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.136.4.62 informedConstraints()

`const carl::FastSet<FormulaT>& smtrat::Module::informedConstraints ( ) const [inline], [inherited]`

Returns

The position of the first constraint of which no backend has been informed about.

0.15.136.4.63 init()

`void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.
This method must not be called twice and only before the first runBackends call.
Reimplemented in smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntBlastModule< Settings >, smtrat::FPPModule< Settings >, smtrat::CurryModule< Settings >, and smtrat::BVModule< Settings >.

0.15.136.4.64 is_minimizing()

`bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

0.15.136.4.65 isLemmaLevel()

`bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

0.15.136.4.66 isPreprocessor()

`bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns

true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

0.15.136.4.67 lemmas()

`const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns

A constant reference to the lemmas being valid formulas this module or its backends made.

0.15.136.4.68 merge()

`std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.
({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns

The vector being the two given vectors merged.

0.15.136.4.69 model()

`const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns

The assignment of the current satisfiable result, if existent.

0.15.136.4.70 modelsDisjoint()

`bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns

true, if there is no variable assigned by both models; false, otherwise.

0.15.136.4.71 moduleName()

`template<typename Settings > std::string smtrat::CSplitModule< Settings >::moduleName ( ) const [inline], [virtual]`

Returns

The name of the given module type as name.

Reimplemented from smtrat::Module.

0.15.136.4.72 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

0.15.136.4.73 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

0.15.136.4.74 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula. TODO: disable this method

0.15.136.4.75 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula.

0.15.136.4.76 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to the backends of this module.

0.15.136.4.77 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to this module.

0.15.136.4.78 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

0.15.136.4.79 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.136.4.80 printInfeasibleSubsets()

`void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

0.15.136.4.81 printModel()

`void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.136.4.82 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

0.15.136.4.83 printReceivedFormula()

`void smtrat::Module::printReceivedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

0.15.136.4.84 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns

true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

0.15.136.4.85 receivedFormulaChecked()

```
void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]
```

Notifies that the received formulas has been checked.

0.15.136.4.86 receivedFormulasAsInfeasibleSubset()

```
void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

0.15.136.4.87 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

0.15.136.4.88 remove()

```
void smtrat::Module::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

0.15.136.4.89 removeCore() [1/2]

```
virtual void smtrat::Module::removeCore (
    [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

0.15.136.4.90 removeCore() [2/2]

```
template<typename Settings >
void smtrat::CSplitModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula )
```

Removes the subformula of the received formula at the given position to the considered ones of this module. Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

0.15.136.4.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origin (
            ModuleInput::iterator _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

0.15.136.4.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

0.15.136.4.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const
[inline], [inherited]
```

Returns

A reference to the formula passed to the backends of this module.

0.15.136.4.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns

A reference to the formula passed to this module.

0.15.136.4.95 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( )  [inline],
[protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

0.15.136.4.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
            bool _final,
            bool _full,
            carl::Variable _objective )  [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.136.4.97 setId()

`void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]`

Sets this modules unique ID to identify itself.

Parameters

↩ _↩ *id*	The id to set this module's id to.

0.15.136.4.98 setThreadPriority()

`void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]`

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

0.15.136.4.99 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns

True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

0.15.136.4.100 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

0.15.136.4.101 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns

The priority of this module to get a thread for running its check procedure.

0.15.136.4.102 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::SATModule< Settings >.

0.15.136.4.103 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

0.15.136.4.104 updateModel() `template<typename Settings > void smtrat::CSplitModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.
Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.
Reimplemented from smtrat::Module.

0.15.136.4.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.136.5 Field Documentation

0.15.136.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

0.15.136.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

0.15.136.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

0.15.136.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

0.15.136.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

0.15.136.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

0.15.136.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩ Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.136.5.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module↩ ::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

0.15.136.5.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.136.5.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

0.15.136.5.11 mInfeasibleSubsets `std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

0.15.136.5.12 mInformedConstraints `carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

0.15.136.5.13 mLastBranches `std::vector< Branching > smtrat::Module::mLastBranches = std↩ ::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

0.15.136.5.14 mLemmas `std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

0.15.136.5.15 mModel `Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

0.15.136.5.16 mModelComputed `bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

0.15.136.5.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

0.15.136.5.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

0.15.136.5.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

0.15.136.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

0.15.136.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

0.15.136.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

0.15.136.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

0.15.136.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.136.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

0.15.137 smtrat::CubeLIAModule< Settings > Class Template Reference

`#include <CubeLIAModule.h>`

Public Types

- typedef Settings SettingsType
- enum class LemmaType : unsigned { NORMAL = 0 , PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- CubeLIAModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- ~CubeLIAModule ()
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_↩VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

The beginning of the cyclic buffer storing the last branches.

- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore ([[maybe_unused]] const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore ([[maybe_unused]] const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.

- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

0.15.137.4 Member Function Documentation

0.15.137.4.1 add() `bool smtrat::Module::add (`

```
            ModuleInput::const_iterator _subformula )  [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.137.4.2 addConstraintToInform() `void smtrat::Module::addConstraintToInform (`

```
            const FormulaT & _constraint )  [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

0.15.137.4.3 addCore() [1/2] `virtual bool smtrat::Module::addCore (`

```
[[maybe_unused] ] ModuleInput::const_iterator formula )  [inline], [protected],
[virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.137.4.4 addCore() [2/2]

```
template<typename Settings >
bool smtrat::CubeLIAModule< Settings >::addCore (
            ModuleInput::const_iterator _subformula )
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.137.4.5 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula
(
            const FormulaT & formula )  [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

0.15.137.4.6 addLemma()

```
void smtrat::Module::addLemma (
            const FormulaT & _lemma,
            const LemmaType & _lt = LemmaType::NORMAL,
            const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) )  [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

0.15.137.4.7 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

0.15.137.4.8 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.
Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

0.15.137.4.9 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.
Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.137.4.10 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.137.4.11 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.137.4.12 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns

All satisfying assignments, if existent.

0.15.137.4.13 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns

True, if one of them has determined a result.

0.15.137.4.14 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const
[inline], [inherited]
```

Returns

A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.137.4.15 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected],
[inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

0.15.137.4.16 branchAt() [1/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.137.4.17 branchAt() [2/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

0.15.137.4.18 branchAt() [3/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.137.4.19 branchAt() [4/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

0.15.137.4.20 check()

```
Answer smtrat::Module::check (
    bool _final = false,
    bool _full = true,
    carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.137.4.21 checkCore()

```
template<typename Settings >
Answer smtrat::CubeLIAModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns

SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.137.4.22 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

0.15.137.4.23 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns

false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

0.15.137.4.24 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

0.15.137.4.25 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

0.15.137.4.26 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

0.15.137.4.27 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

0.15.137.4.28 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

0.15.137.4.29 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

0.15.137.4.30 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.
If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

0.15.137.4.31 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

0.15.137.4.32 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns

The constraints which the backends must be informed about.

0.15.137.4.33 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

0.15.137.4.34 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

0.15.137.4.35 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.137.4.36 deinformCore()

`virtual void smtrat::Module::deinformCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.137.4.37 determine_smallest_origin()

`size_t smtrat::Module::determine_smallest_origin ( const std::vector< FormulaT > & origins ) const [protected], [inherited]`

Parameters

origins	A vector of sets of origins.

Returns

The index of the smallest (regarding the size of the sets) element of origins

0.15.137.4.38 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
            ModuleInput::iterator _subformula,
            bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module. Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

0.15.137.4.39 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

0.15.137.4.40 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
            const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

0.15.137.4.41 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns

The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.137.4.42 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns

The position of the first (by this module) unchecked sub-formula of the received formula.

0.15.137.4.43 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

0.15.137.4.44 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasible↩ Subset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

0.15.137.4.45 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

0.15.137.4.46 getBackendsModel()

`void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

0.15.137.4.47 getInfeasibleSubsets() [1/2]

`void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

0.15.137.4.48 getInfeasibleSubsets() [2/2]

`std::vector< FormulaSetT > smtrat::Module::get↩ InfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.
Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns

The infeasible subsets the given backend provides.

0.15.137.4.49 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module↩ ::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns

Set of all formulas

0.15.137.4.50 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module↩ ::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.
The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns

Equivalence classes.

0.15.137.4.51 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
const FormulaT & _formula,
FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

0.15.137.4.52 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
const FormulaT & _formula,
FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

0.15.137.4.53 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns

The origins of the passed formula at the given position.

0.15.137.4.54 getReceivedFormulaSimplified()

```
std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]
```

Returns

A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

0.15.137.4.55 hasLemmas()

```
bool smtrat::Module::hasLemmas ( ) [inline], [inherited]
```

Checks whether this module or any of its backends provides any lemmas.

0.15.137.4.56 hasValidInfeasibleSubset()

```
bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]
```

Returns

true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

0.15.137.4.57 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns

A unique ID to identify this module instance.

0.15.137.4.58 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns

The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

0.15.137.4.59 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.137.4.60 informBackends() `void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

0.15.137.4.61 informCore() `virtual bool smtrat::Module::informCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.137.4.62 informedConstraints() `const carl::FastSet<FormulaT>& smtrat::Module::informedConstraints ( ) const [inline], [inherited]`

Returns

The position of the first constraint of which no backend has been informed about.

0.15.137.4.63 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.
This method must not be called twice and only before the first runBackends call.
Reimplemented in smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntBlastModule< Settings >, smtrat::FPPModule< Settings >, smtrat::CurryModule< Settings >, and smtrat::BVModule< Settings >.

0.15.137.4.64 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

0.15.137.4.65 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

0.15.137.4.66 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns

true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

0.15.137.4.67 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns

A constant reference to the lemmas being valid formulas this module or its backends made.

0.15.137.4.68 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.
({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns

The vector being the two given vectors merged.

0.15.137.4.69 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns

The assignment of the current satisfiable result, if existent.

0.15.137.4.70 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns

true, if there is no variable assigned by both models; false, otherwise.

0.15.137.4.71 moduleName() `template<typename Settings > std::string smtrat::CubeLIAModule< Settings >::moduleName ( ) const [inline], [virtual]`

Returns

The name of the given module type as name.

Reimplemented from smtrat::Module.

0.15.137.4.72 objective() `carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

0.15.137.4.73 originInReceivedFormula() `bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

0.15.137.4.74 passedFormulaBegin() `ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula. TODO: disable this method

0.15.137.4.75 passedFormulaEnd() `ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula.

0.15.137.4.76 pPassedFormula() `const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to the backends of this module.

0.15.137.4.77 pReceivedFormula() `const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to this module.

0.15.137.4.78 print() `void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

0.15.137.4.79 printAllModels() `void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.137.4.80 printInfeasibleSubsets() `void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

0.15.137.4.81 printModel() `void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.137.4.82 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

0.15.137.4.83 printReceivedFormula()

`void smtrat::Module::printReceivedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

0.15.137.4.84 probablyLooping()

`bool smtrat::Module::probablyLooping ( const typename Poly::PolyType & _branchingPolynomial, const Rational & _branchingValue ) const [protected], [inherited]`

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns

true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

0.15.137.4.85 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

0.15.137.4.86 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

0.15.137.4.87 receivedVariable()

`bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

0.15.137.4.88 remove()

`void smtrat::Module::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

0.15.137.4.89 removeCore() [1/2]

```
virtual void smtrat::Module::removeCore (
            [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected],
[virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

0.15.137.4.90 removeCore() [2/2]

```
template<typename Settings >
void smtrat::CubeLIAModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula )
```

Removes the subformula of the received formula at the given position to the considered ones of this module.
Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

0.15.137.4.91 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origin (
            ModuleInput::iterator _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

0.15.137.4.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

0.15.137.4.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const
[inline], [inherited]
```

Returns

A reference to the formula passed to the backends of this module.

0.15.137.4.94 rReceivedFormula() `const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]`

Returns

A reference to the formula passed to this module.

0.15.137.4.95 runBackends() [1/2] `virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]`

Reimplemented in smtrat::PModule.

0.15.137.4.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.137.4.97 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

_id	The id to set this module's id to.

0.15.137.4.98 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

0.15.137.4.99 solverState() `Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns

True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

0.15.137.4.100 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

0.15.137.4.101 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns

The priority of this module to get a thread for running its check procedure.

0.15.137.4.102 updateAllModels()

`void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::SATModule< Settings >.

0.15.137.4.103 updateLemmas()

`void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

0.15.137.4.104 updateModel()

`template<typename Settings > void smtrat::CubeLIAModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.
Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.
Reimplemented from smtrat::Module.

0.15.137.4.105 usedBackends()

`const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.137.5 Field Documentation

0.15.137.5.1 mAllBackends

`std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

0.15.137.5.2 mAllModels

`std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

0.15.137.5.3 mBackendsFoundAnswer

`std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

0.15.137.5.4 mConstraintsToInform

`carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

0.15.137.5.5 mFinalCheck

`bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

0.15.137.5.6 mFirstPosInLastBranches

`std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

0.15.137.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaToPass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.137.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

0.15.137.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.137.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

0.15.137.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

0.15.137.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

0.15.137.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

0.15.137.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

0.15.137.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

0.15.137.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

0.15.137.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

0.15.137.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

0.15.137.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

0.15.137.5.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

0.15.137.5.21 mSmallerMusesCheckCounter

`unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

0.15.137.5.22 mSolverState

`std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

0.15.137.5.23 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheoryPropagations [protected], [inherited]`

0.15.137.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.137.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

0.15.138 smtrat::CurryModule< Settings > Class Template Reference

`#include <CurryModule.h>`

Public Types

- typedef Settings SettingsType
- enum class LemmaType : unsigned { NORMAL = 0 , PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- CurryModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- ~CurryModule ()
- bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_↩VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const

- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput ∗ pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput ∗ pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const

- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module ∗ > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="∗∗∗") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="∗∗∗") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="∗∗∗") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore ([[maybe_unused]] const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore ([[maybe_unused]] const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_↩ ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_↩ branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAs↩ Premise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩ Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩ ::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

0.15.138.4.1 add()

```
bool smtrat::Module::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.138.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

0.15.138.4.3 addCore() [1/2]

```
virtual bool smtrat::Module::addCore (
    [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected],
[virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.138.4.4 addCore() [2/2]

```
template<typename Settings >
bool smtrat::CurryModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula )
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.138.4.5 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula
(
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

0.15.138.4.6 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline], [inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

0.15.138.4.7 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

0.15.138.4.8 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.
Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

0.15.138.4.9 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.
Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.138.4.10 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.138.4.11 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.138.4.12 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns

All satisfying assignments, if existent.

0.15.138.4.13 anAnswerFound()

`bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns

True, if one of them has determined a result.

0.15.138.4.14 answerFound()

`const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns

A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.138.4.15 backendsModel()

`const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

0.15.138.4.16 branchAt() [1/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.138.4.17 branchAt() [2/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

0.15.138.4.18 branchAt() [3/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.138.4.19 branchAt() [4/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
```

```
std::vector< FormulaT > && _premise,
bool _leftCaseWeak = true,
bool _preferLeftCase = true,
bool _useReceivedFormulaAsPremise = false )  [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

0.15.138.4.20 check()

```
Answer smtrat::Module::check (
bool _final = false,
bool _full = true,
carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.138.4.21 checkCore()

```
template<typename Settings >
Answer smtrat::CurryModule< Settings >::checkCore ( )  [virtual]
```

Checks the received formula for consistency.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.138.4.22 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
std::vector< FormulaSetT >::const_iterator _infsubset,
const std::string & _filename = "smaller_muses",
unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

0.15.138.4.23 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns

false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

0.15.138.4.24 cleanModel()

```
void smtrat::Module::cleanModel ( ) const [inline], [protected],
[inherited]
```

Substitutes variable occurrences by its model value in the model values of other variables.

0.15.138.4.25 clearLemmas()

```
void smtrat::Module::clearLemmas ( ) [inline], [inherited]
```

Deletes all yet found lemmas.

0.15.138.4.26 clearModel()

```
void smtrat::Module::clearModel ( ) const [inline], [protected],
[inherited]
```

Clears the assignment, if any was found.

0.15.138.4.27 clearModels()

```
void smtrat::Module::clearModels ( ) const [inline], [protected],
[inherited]
```

Clears all assignments, if any was found.

0.15.138.4.28 clearPassedFormula()

```
void smtrat::Module::clearPassedFormula ( ) [protected],
[inherited]
```

0.15.138.4.29 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
const FormulaT & _formula,
FormulaSetT & _origins ) const [inherited]
```

0.15.138.4.30 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.
If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

0.15.138.4.31 collectTheoryPropagations()

```
void smtrat::Module::collectTheoryPropagations ( ) [inherited]
```

0.15.138.4.32 constraintsToInform()

```
const carl::FastSet<FormulaT>& smtrat::Module::constraints↩
ToInform ( ) const [inline], [inherited]
```

Returns

The constraints which the backends must be informed about.

0.15.138.4.33 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

0.15.138.4.34 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

0.15.138.4.35 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.138.4.36 deinformCore()

`virtual void smtrat::Module::deinformCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.138.4.37 determine_smallest_origin()

`size_t smtrat::Module::determine_smallest_origin ( const std::vector< FormulaT > & origins ) const [protected], [inherited]`

Parameters

origins	A vector of sets of origins.

Returns

The index of the smallest (regarding the size of the sets) element of origins

0.15.138.4.38 eraseSubformulaFromPassedFormula()

`ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula ( ModuleInput::iterator _subformula, bool _ignoreOrigins = false ) [protected], [virtual], [inherited]`

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module. Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

0.15.138.4.39 excludeNotReceivedVariablesFromModel()

`void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]`

Excludes all variables from the current model, which do not occur in the received formula.

0.15.138.4.40 findBestOrigin()

`std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin ( const std::vector< FormulaT > & _origins ) const [protected], [inherited]`

Parameters

_origins	

Returns

0.15.138.4.41 firstSubformulaToPass() `ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns

The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.138.4.42 firstUncheckedReceivedSubformula() `ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns

The position of the first (by this module) unchecked sub-formula of the received formula.

0.15.138.4.43 freeSplittingVariable() `static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

0.15.138.4.44 generateTrivialInfeasibleSubset() `void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

0.15.138.4.45 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

0.15.138.4.46 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

0.15.138.4.47 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

0.15.138.4.48 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.
Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns

The infeasible subsets the given backend provides.

0.15.138.4.49 getInformationRelevantFormulas() `const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns

Set of all formulas

0.15.138.4.50 getModelEqualities() `std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.
The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns

Equivalence classes.

0.15.138.4.51 getOrigins() [1/3] `void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

0.15.138.4.52 getOrigins() [2/3] `void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

0.15.138.4.53 getOrigins() [3/3] `const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns

The origins of the passed formula at the given position.

0.15.138.4.54 getReceivedFormulaSimplified() `std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns

A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

0.15.138.4.55 hasLemmas() `bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

0.15.138.4.56 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns

true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

0.15.138.4.57 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns

A unique ID to identify this module instance.

0.15.138.4.58 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns

The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

0.15.138.4.59 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.138.4.60 informBackends()

`void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

0.15.138.4.61 informCore() [1/2]

`virtual bool smtrat::Module::informCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.138.4.62 informCore() [2/2]

`template<typename Settings > bool smtrat::CurryModule< Settings >::informCore ( const FormulaT & _constraint )`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.138.4.63 informedConstraints()

`const carl::FastSet<FormulaT>& smtrat::Module::informed↩ Constraints ( ) const [inline], [inherited]`

Returns

The position of the first constraint of which no backend has been informed about.

0.15.138.4.64 init() template<typename Settings > void smtrat::CurryModule< Settings >::init ( ) [virtual]

Informs all backends about the so far encountered constraints, which have not yet been communicated.
This method must not and will not be called more than once and only before the first runBackends call.
Reimplemented from smtrat::Module.

0.15.138.4.65 is_minimizing() bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]

0.15.138.4.66 isLemmaLevel() bool smtrat::Module::isLemmaLevel (LemmaLevel *level*) [protected], [inherited]

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

0.15.138.4.67 isPreprocessor() bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]

Returns

true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

0.15.138.4.68 lemmas() const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]

Returns

A constant reference to the lemmas being valid formulas this module or its backends made.

0.15.138.4.69 merge() std::vector< FormulaT > smtrat::Module::merge (const std::vector< FormulaT > & *_vecSetA*, const std::vector< FormulaT > & *_vecSetB*) const [protected], [inherited]

Merges the two vectors of sets into the first one.
({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns

The vector being the two given vectors merged.

0.15.138.4.70 model() const Model& smtrat::Module::model ( ) const [inline], [inherited]

Returns

The assignment of the current satisfiable result, if existent.

0.15.138.4.71 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns

true, if there is no variable assigned by both models; false, otherwise.

0.15.138.4.72 moduleName()

```
template<typename Settings >
std::string smtrat::CurryModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns

The name of the given module type as name.

Reimplemented from smtrat::Module.

0.15.138.4.73 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

0.15.138.4.74 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

0.15.138.4.75 passedFormulaBegin()

```
ModuleInput::iterator smtrat::Module::passedFormulaBegin (
) [inline], [protected], [inherited]
```

Returns

An iterator to the end of the passed formula. TODO: disable this method

0.15.138.4.76 passedFormulaEnd()

```
ModuleInput::iterator smtrat::Module::passedFormulaEnd ( )
[inline], [protected], [inherited]
```

Returns

An iterator to the end of the passed formula.

0.15.138.4.77 pPassedFormula()

```
const ModuleInput* smtrat::Module::pPassedFormula ( ) const
[inline], [inherited]
```

Returns

A pointer to the formula passed to the backends of this module.

0.15.138.4.78 pReceivedFormula() `const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to this module.

0.15.138.4.79 print() `void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

0.15.138.4.80 printAllModels() `void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.138.4.81 printInfeasibleSubsets() `void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

0.15.138.4.82 printModel() `void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.138.4.83 printPassedFormula() `void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

0.15.138.4.84 printReceivedFormula()

`void smtrat::Module::printReceivedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

0.15.138.4.85 probablyLooping()

`bool smtrat::Module::probablyLooping ( const typename Poly::PolyType & _branchingPolynomial, const Rational & _branchingValue ) const [protected], [inherited]`

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns

true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

0.15.138.4.86 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

0.15.138.4.87 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

0.15.138.4.88 receivedVariable()

`bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

0.15.138.4.89 remove()

`void smtrat::Module::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

0.15.138.4.90 removeCore() [1/2]

`virtual void smtrat::Module::removeCore ( [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

0.15.138.4.91 removeCore() [2/2]

`template<typename Settings > void smtrat::CurryModule< Settings >::removeCore ( ModuleInput::const_iterator _subformula )`

Removes the subformula of the received formula at the given position to the considered ones of this module.
Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

0.15.138.4.92 removeOrigin()

`std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin ( ModuleInput::iterator _formula, const FormulaT & _origin ) [inline], [protected], [inherited]`

0.15.138.4.93 removeOrigins()

`std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins ( ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected], [inherited]`

0.15.138.4.94 rPassedFormula()

`const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]`

Returns

A reference to the formula passed to the backends of this module.

0.15.138.4.95 rReceivedFormula()

`const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]`

Returns

A reference to the formula passed to this module.

0.15.138.4.96 runBackends() [1/2]

`virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]`

Reimplemented in smtrat::PModule.

0.15.138.4.97 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.138.4.98 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ _↩ *id*	The id to set this module's id to.

0.15.138.4.99 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

0.15.138.4.100 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns

True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

0.15.138.4.101 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint (
    const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

0.15.138.4.102 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns

The priority of this module to get a thread for running its check procedure.

0.15.138.4.103 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::SATModule< Settings >.

0.15.138.4.104 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

0.15.138.4.105 updateModel() `template<typename Settings > void smtrat::CurryModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.
Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.
Reimplemented from smtrat::Module.

0.15.138.4.106 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.138.5 Field Documentation

0.15.138.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

0.15.138.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

0.15.138.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

0.15.138.5.4 mConstraintsToInform

`carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

0.15.138.5.5 mFinalCheck

`bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

0.15.138.5.6 mFirstPosInLastBranches

`std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

0.15.138.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩ Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.138.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module↩ ::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

0.15.138.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.138.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

0.15.138.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

0.15.138.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

0.15.138.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩ ::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

0.15.138.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

0.15.138.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

0.15.138.5.16 mModelComputed `bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

0.15.138.5.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

0.15.138.5.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

0.15.138.5.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

0.15.138.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

0.15.138.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

0.15.138.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

0.15.138.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

0.15.138.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.138.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

0.15.139 smtrat::CycleEnumerator< FHG, Collector > Struct Template Reference

This class encapsulates an algorithm for enumerating all cycles.

`#include <ForwardHyperGraph.h>`

Public Member Functions

- CycleEnumerator (const FHG &fhg, Collector &c)

  Constructor from a graph and a collector object.
- bool findAll ()

  Start the search for all cycles. Returns whether the search was finished (true) or aborted (false).

0.15.139.1 Detailed Description

template<typename FHG, typename Collector>
struct smtrat::CycleEnumerator< FHG, Collector >

This class encapsulates an algorithm for enumerating all cycles.
This class implements an adaption of the algorithm described in **[Johnson75]**. Unlike the algorithm described there, this version works on forward hypergraphs as implemented by ForwardHyperGraph.
Although the algorithm works recursively, this implementation can be used somewhat iteratively. The cycles are given to the caller using an collector functor. If this functor returns true, the search for more cycles is aborted immediately. Due to this pattern, there is no need to store the cycles within this class and thus the memory usage is minimized.

0.15.139.2 Constructor & Destructor Documentation

0.15.139.2.1 CycleEnumerator()

```
template<typename FHG , typename Collector >
smtrat::CycleEnumerator< FHG, Collector >::CycleEnumerator (
            const FHG & fhg,
            Collector & c )  [inline]
```

Constructor from a graph and a collector object.

0.15.139.3 Member Function Documentation

0.15.139.3.1 findAll()

```
template<typename FHG , typename Collector >
bool smtrat::CycleEnumerator< FHG, Collector >::findAll ( )
```

Start the search for all cycles. Returns whether the search was finished (true) or aborted (false).

0.15.140 benchmax::Database Class Reference

Dummy database that effectively disables storing to database. Set BENCHMAX_DATABASE to actually use a database.

```

    const std::string & a2,
    const Index & a3 ) [inline]
```

Execute a statement with two strings and an index.

0.15.141.2.7 execute() [5/6]

```
Results benchmax::DBAL::execute (
    Statement & stmt,
    const std::string & a1,
    std::size_t a2 ) [inline]
```

Execute a statement with a string and a number.

0.15.141.2.8 execute() [6/6]

```
Results benchmax::DBAL::execute (
    Statement & stmt,
    int a1,
    std::size_t a2,
    std::size_t a3,
    const Index & a4,
    const Index & a5,
    const Index & a6 ) [inline]
```

Execute a statement with an int, two numbers and three indices.

0.15.141.2.9 getIndex() [1/2]

```
Index benchmax::DBAL::getIndex (
    const Results & res,
    const std::string & name ) [inline]
```

Get the index of some name within the results.

0.15.141.2.10 getIndex() [2/2]

```
Index benchmax::DBAL::getIndex (
    const Results & res,
    const std::string & name ) [inline]
```

0.15.141.2.11 insert() [1/2] template<typename... Args>

```
Index benchmax::DBAL::insert (
            const std::string & query,
            const Args &... args ) [inline]
```

Insert some data and return the new index.

0.15.141.2.12 insert() [2/2] template<typename... Args>

```
Index benchmax::DBAL::insert (
            const std::string & query,
            const Args &... args ) [inline]
```

0.15.141.2.13 prepare() [1/2]

```
Statement benchmax::DBAL::prepare (
            const std::string & query ) [inline]
```

Prepare a statement.

0.15.141.2.14 prepare() [2/2]

```
Statement benchmax::DBAL::prepare (
            const std::string & query ) [inline]
```

0.15.141.2.15 select() [1/2] template<typename... Args>

```
Results benchmax::DBAL::select (
            const std::string & query,
            const Args &... args ) [inline]
```

Select some data.

0.15.141.2.16 select() [2/2] template<typename... Args>

```
Results benchmax::DBAL::select (
            const std::string & query,
            const Args &... args ) [inline]
```

0.15.141.2.17 size() [1/2]

```
std::size_t benchmax::DBAL::size (
            const Results & res ) [inline]
```

Return the size of the results.

0.15.141.2.18 size() [2/2]

```
std::size_t benchmax::DBAL::size (
            const Results & res ) [inline]
```

- template<typename P >
  bool operator< (const DerivationRef< P > &lhs, const DerivationRef< P > &rhs)

0.15.157.1 Detailed Description

template<typename Properties>
class smtrat::cadcells::datastructures::DerivationRef< Properties >

A reference to a derivation, which is either.

- a BaseDerivation (a set of properties for each level)
- a DelineatedDerivation (a BaseDerivation with an underlying SampledDerivation on which the properties can be delineated)
- a SampledDerivation (a DelineatedDerivation with an underlying SampledDerivation plus a sample on the current level such that a delineated interval can be computed)

0.15.157.1.1 Memory management Memory management is based on std::shared_ptr. A SampledDerivation holds a shared pointer to a DelineatedDerivation, which in turn holds a shared pointer to BaseDerivation. The BaseDerivation holds a DerivationRef to the underlying derivation. Note that not all combinations are legal; i.e. the underlying derivation of a delineated derivation must be a sampled derivation.

0.15.157.2 Constructor & Destructor Documentation

0.15.165 smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::Edge Struct Reference

Internal type of an edge.
`#include <ForwardHyperGraph.h>`

Public Member Functions

- Edge (const EdgeProperty &ep)

  Constructor from a property.
- void addOut (Vertex v)

  Add v to the outgoing vertices of this edge.
- const EdgeProperty & operator∗ () const

  Access the property.
- EdgeProperty & operator∗ ()

  Access the property.
- const EdgeProperty ∗ operator-> () const

  Access the property.
- EdgeProperty ∗ operator-> ()

  Access the property.
- const std::vector< Vertex > & out () const

  Retrieve the list of outgoing vertices.

Data Fields

- friend ForwardHyperGraph

0.15.165.1 Detailed Description

template<typename VertexProperty, typename EdgeProperty, bool UniqueVertices = true>
struct smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::Edge

Internal type of an edge.

0.15.165.2 Constructor & Destructor Documentation

0.15.165.2.1 Edge()

```
template<typename VertexProperty , typename EdgeProperty , bool Unique↩
Vertices = true>
smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::Edge::Edge (
            const EdgeProperty & ep )  [inline]
```

Constructor from a property.

0.15.165.3 Member Function Documentation

0.15.165.3.1 addOut()

```
template<typename VertexProperty , typename EdgeProperty , bool Unique↩
Vertices = true>
void smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::Edge::addOut (
            Vertex v )  [inline]
```

Add v to the outgoing vertices of this edge.

0.15.165.3.2 operator*() [1/2]

```
template<typename VertexProperty , typename EdgeProperty , bool UniqueVertices = true>
EdgeProperty& smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >↩
::Edge::operator* ( ) [inline]
```

Access the property.

0.15.165.3.3 operator*() [2/2]

```
template<typename VertexProperty , typename EdgeProperty , bool UniqueVertices = true>
const EdgeProperty& smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices
>::Edge::operator* ( ) const [inline]
```

Access the property.

0.15.165.3.4 operator->() [1/2]

```
template<typename VertexProperty , typename EdgeProperty , bool UniqueVertices = true>
EdgeProperty* smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >↩
::Edge::operator-> ( ) [inline]
```

Access the property.

0.15.165.3.5 operator->() [2/2]

```
template<typename VertexProperty , typename EdgeProperty , bool UniqueVertices = true>
const EdgeProperty* smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices
>::Edge::operator-> ( ) const [inline]
```

Access the property.

0.15.165.3.6 out()

```
template<typename VertexProperty , typename EdgeProperty , bool Unique↩
Vertices = true>
const std::vector<Vertex>& smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, Unique↩
Vertices >::Edge::out ( ) const [inline]
```

Retrieve the list of outgoing vertices.

0.15.165.4 Field Documentation

0.15.165.4.1 ForwardHyperGraph

```
#include <EMModule.h>
```

Public Types

- typedef Settings SettingsType
- enum class LemmaType : unsigned { NORMAL = 0 , PERMANENT = 1 }

Public Member Functions

- EMModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=NULL)
- ~EMModule ()
- Answer checkCore ()

  Checks the received formula for consistency.
- bool isPreprocessor () const
- bool appliedPreprocessing () const

- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void updateModel () const

  Updates the current assignment into the model.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const

- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore ([[maybe_unused]] const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore ([[maybe_unused]] const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

Stores the assignment of the current satisfiable result, if existent.

- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

0.15.167.4 Member Function Documentation

0.15.167.4.1 add() `bool smtrat::PModule::add (`

```
            ModuleInput::const_iterator _subformula )  [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.167.4.2 addConstraintToInform() `void smtrat::Module::addConstraintToInform (`

```
            const FormulaT & _constraint )  [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

0.15.167.4.3 addCore() `virtual bool smtrat::Module::addCore (`

```
            [[maybe_unused] ] ModuleInput::const_iterator formula )  [inline], [protected],
[virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.167.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

0.15.167.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

0.15.167.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

0.15.167.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.
Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

0.15.167.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.
Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.167.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.167.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.167.4.11 allModels() `const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns

All satisfying assignments, if existent.

0.15.167.4.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns

True, if one of them has determined a result.

0.15.167.4.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns

A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.167.4.14 appliedPreprocessing() `bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]`

Returns

true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

0.15.167.4.15 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

0.15.167.4.16 branchAt() [1/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.167.4.17 branchAt() [2/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

0.15.167.4.18 branchAt() [3/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

0.15.167.4.19 branchAt() [4/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

0.15.167.4.20 check()

```
Answer smtrat::PModule::check (
    bool _final = false,
    bool _full = true,
    carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.167.4.21 checkCore()

`template<typename Settings >`
`Answer smtrat::EMModule< Settings >::checkCore ( ) [virtual]`

Checks the received formula for consistency.

Returns

SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.167.4.22 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
std::vector< FormulaSetT >::const_iterator _infsubset,
const std::string & _filename = "smaller_muses",
unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

0.15.167.4.23 checkModel()

`unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns

false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

0.15.167.4.24 cleanModel()

`void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

0.15.167.4.25 clearLemmas()

`void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

0.15.167.4.26 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

0.15.167.4.27 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

0.15.167.4.28 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

0.15.167.4.29 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

0.15.167.4.30 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.
If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

0.15.167.4.31 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

0.15.167.4.32 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns

The constraints which the backends must be informed about.

0.15.167.4.33 currentlySatisfied() `virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

0.15.167.4.34 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

0.15.167.4.35 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.167.4.36 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual],
[inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.167.4.37 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns

The index of the smallest (regarding the size of the sets) element of origins

0.15.167.4.38 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module. Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.

Parameters

_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

0.15.167.4.39 excludeNotReceivedVariablesFromModel()

`void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]`

Excludes all variables from the current model, which do not occur in the received formula.

0.15.167.4.40 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
            const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

0.15.167.4.41 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns

The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.167.4.42 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns

The position of the first (by this module) unchecked sub-formula of the received formula.

0.15.167.4.43 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
            const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

0.15.167.4.44 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

0.15.167.4.45 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

0.15.167.4.46 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

0.15.167.4.47 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

0.15.167.4.48 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.
Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns

The infeasible subsets the given backend provides.

0.15.167.4.49 getInformationRelevantFormulas() `const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns

Set of all formulas

0.15.167.4.50 getModelEqualities() `std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.
The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns

Equivalence classes.

0.15.167.4.51 getOrigins() [1/3] `void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

0.15.167.4.52 getOrigins() [2/3]

`void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

0.15.167.4.53 getOrigins() [3/3]

`const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns

The origins of the passed formula at the given position.

0.15.167.4.54 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns

A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

0.15.167.4.55 hasLemmas()

`bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

0.15.167.4.56 hasValidInfeasibleSubset()

`bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns

true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

0.15.167.4.57 id()

`std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns

A unique ID to identify this module instance.

0.15.167.4.58 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns

The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

0.15.167.4.59 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.167.4.60 informBackends() `void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

0.15.167.4.61 informCore() `virtual bool smtrat::Module::informCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.167.4.62 informedConstraints() `const carl::FastSet<FormulaT>& smtrat::Module::informed↩ Constraints ( ) const [inline], [inherited]`

Returns

The position of the first constraint of which no backend has been informed about.

0.15.167.4.63 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.
This method must not be called twice and only before the first runBackends call.
Reimplemented in smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntBlastModule< Settings >, smtrat::FPPModule< Settings >, smtrat::CurryModule< Settings >, and smtrat::BVModule< Settings >.

0.15.167.4.64 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

0.15.167.4.65 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

0.15.167.4.66 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns

true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

0.15.167.4.67 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns

A constant reference to the lemmas being valid formulas this module or its backends made.

0.15.167.4.68 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.
({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns

The vector being the two given vectors merged.

0.15.167.4.69 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns

The assignment of the current satisfiable result, if existent.

0.15.167.4.70 modelsDisjoint()

`bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns

true, if there is no variable assigned by both models; false, otherwise.

0.15.167.4.71 moduleName()

`virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns

The name of the given module type as name.

Reimplemented in smtrat::VSModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::STropModule< Settings >, smtrat::SplitSOSModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntEqModule< Settings >, smtrat::IntBlastModule< Settings >, smtrat::IncWidthModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::GBModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::CurryModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::BVModule< Settings >, and smtrat::BEModule< Settings >.

0.15.167.4.72 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

0.15.167.4.73 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

0.15.167.4.74 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula. TODO: disable this method

0.15.167.4.75 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula.

0.15.167.4.76 pPassedFormula() `const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to the backends of this module.

0.15.167.4.77 pReceivedFormula() `const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to this module.

0.15.167.4.78 print() `void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

0.15.167.4.79 printAllModels() `void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.167.4.80 printInfeasibleSubsets() `void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

0.15.167.4.81 printModel() `void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.167.4.82 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

0.15.167.4.83 printReceivedFormula()

`void smtrat::Module::printReceivedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

0.15.167.4.84 probablyLooping()

`bool smtrat::Module::probablyLooping ( const typename Poly::PolyType & _branchingPolynomial, const Rational & _branchingValue ) const [protected], [inherited]`

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns

true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

0.15.167.4.85 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

0.15.167.4.86 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

0.15.167.4.87 receivedVariable()

`bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

0.15.167.4.88 remove()

`void smtrat::PModule::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

0.15.167.4.89 removeCore()

```
virtual void smtrat::Module::removeCore (
    [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected],
[virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

0.15.167.4.90 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

0.15.167.4.91 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

0.15.167.4.92 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const
[inline], [inherited]
```

Returns

A reference to the formula passed to the backends of this module.

0.15.167.4.93 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns

A reference to the formula passed to this module.

0.15.167.4.94 runBackends() [1/2]

```
virtual Answer smtrat::PModule::runBackends ( ) [inline],
[virtual], [inherited]
```

Reimplemented from smtrat::Module.

0.15.167.4.95 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.167.4.96 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ _↩ *id*	The id to set this module's id to.

0.15.167.4.97 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

0.15.167.4.98 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns

True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

0.15.167.4.99 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint (
    const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

0.15.167.4.100 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns

The priority of this module to get a thread for running its check procedure.

0.15.167.4.101 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::SATModule< Settings >.

0.15.167.4.102 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

0.15.167.4.103 updateModel() `void smtrat::PModule::updateModel ( ) const [virtual], [inherited]`

Updates the current assignment into the model.
Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.
Reimplemented from smtrat::Module.

0.15.167.4.104 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.167.5 Field Documentation

0.15.167.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

0.15.167.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

0.15.167.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

0.15.167.5.4 mConstraintsToInform

`carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

0.15.167.5.5 mFinalCheck

`bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

0.15.167.5.6 mFirstPosInLastBranches

`std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

0.15.167.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩ Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.167.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module↩ ::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

0.15.167.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.167.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

0.15.167.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

0.15.167.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

0.15.167.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩ ::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

0.15.167.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

0.15.167.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

0.15.167.5.16 mModelComputed `bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

0.15.167.5.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

0.15.167.5.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

0.15.167.5.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

0.15.167.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

0.15.167.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

0.15.167.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

0.15.167.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

0.15.167.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.167.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

0.15.168 smtrat::subtropical::Encoding Class Reference

`#include <Subtropical.h>`

Public Member Functions

- FormulaT encode_separator (const Separator &separator, const Direction direction, const SeparatorType separator_type)

  Creates the formula for the hyperplane that linearly separates at least one variant positive frame vertex from all variant negative frame vertices.
- FormulaT encode_integer (carl::Variable var)
- Model construct_assignment (const Model &lra_model, const FormulaT &f) const

0.15.168.1 Member Function Documentation

0.15.168.1.1 construct_assignment()

```
Model smtrat::subtropical::Encoding::construct_assignment (
    const Model & lra_model,
    const FormulaT & f ) const  [inline]
```

Stores all informations retrieved from the LRA solver to construct the model

0.15.168.1.2 encode_integer()

```
FormulaT smtrat::subtropical::Encoding::encode_integer (
    carl::Variable var )  [inline]
```

0.15.168.1.3 encode_separator()

```
FormulaT smtrat::subtropical::Encoding::encode_separator (
    const Separator & separator,
    const Direction direction,
    const SeparatorType separator_type )  [inline]
```

Creates the formula for the hyperplane that linearly separates at least one variant positive frame vertex from all variant negative frame vertices.
If a weak separator is searched, the corresponding rating is included.

Parameters

separator	The separator object that stores the construction information.
negated	True, if the formula for the negated polynomial shall be constructed. False, if the formula for the original polynomial shall be constructed.

Returns

Formula that is satisfiable iff such a separating hyperplane exists.

Create the hyperplane and sign change formula
Create the rating case distinction formula
Create the strict/weak linear separating hyperplane

0.15.169 smtrat::EQGraph< VertexName > Struct Template Reference

- enum class LemmaType : unsigned { NORMAL = 0 , PERMANENT = 1 }

Public Member Functions

- ESModule (const ModuleInput ∗_formula, Conditionals &_conditionals, Manager ∗_manager=NULL)
- ∼ESModule ()
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput ∗ pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput ∗ pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const

- const std::vector< Module ∗ > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.

- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore ([[maybe_unused]] const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore ([[maybe_unused]] const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

Stores the assignment of the current satisfiable result, if existent.

- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

0.15.172.4.1 add() `bool smtrat::PModule::add (`

```
            ModuleInput::const_iterator _subformula )  [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.172.4.2 addConstraintToInform() `void smtrat::Module::addConstraintToInform (`

```
            const FormulaT & _constraint )  [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

0.15.172.4.3 addCore() `virtual bool smtrat::Module::addCore (`

```
            [[maybe_unused] ] ModuleInput::const_iterator formula )  [inline], [protected],
[virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.172.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

0.15.172.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

0.15.172.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

0.15.172.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.
Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

0.15.172.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.
Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.172.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.172.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.172.4.11 allModels() `const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns

All satisfying assignments, if existent.

0.15.172.4.12 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns

True, if one of them has determined a result.

0.15.172.4.13 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns

A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.172.4.14 appliedPreprocessing() `bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]`

Returns

true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

0.15.172.4.15 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

0.15.172.4.16 branchAt() [1/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.172.4.17 branchAt() [2/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

0.15.172.4.18 branchAt() [3/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

0.15.172.4.19 branchAt() [4/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

0.15.172.4.20 check()

```
Answer smtrat::PModule::check (
    bool _final = false,
    bool _full = true,
    carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.172.4.21 checkCore()

`template<typename Settings >`
`Answer smtrat::ESModule< Settings >::checkCore ( ) [virtual]`

Checks the received formula for consistency.

Returns

SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.172.4.22 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
std::vector< FormulaSetT >::const_iterator _infsubset,
const std::string & _filename = "smaller_muses",
unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

0.15.172.4.23 checkModel()

`unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns

false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

0.15.172.4.24 cleanModel()

`void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

0.15.172.4.25 clearLemmas()

`void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

0.15.172.4.26 clearModel()

`void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

0.15.172.4.27 clearModels()

`void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

0.15.172.4.28 clearPassedFormula()

`void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

0.15.172.4.29 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

0.15.172.4.30 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.
If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

0.15.172.4.31 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

0.15.172.4.32 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns

The constraints which the backends must be informed about.

0.15.172.4.33 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

0.15.172.4.34 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

0.15.172.4.35 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.172.4.36 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual],
[inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.172.4.37 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns

The index of the smallest (regarding the size of the sets) element of origins

0.15.172.4.38 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module. Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.

Parameters

_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

0.15.172.4.39 excludeNotReceivedVariablesFromModel()

`void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]`

Excludes all variables from the current model, which do not occur in the received formula.

0.15.172.4.40 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
            const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

0.15.172.4.41 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns

The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.172.4.42 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns

The position of the first (by this module) unchecked sub-formula of the received formula.

0.15.172.4.43 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
            const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

0.15.172.4.44 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

0.15.172.4.45 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

0.15.172.4.46 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

0.15.172.4.47 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

0.15.172.4.48 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.
Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns

The infeasible subsets the given backend provides.

0.15.172.4.49 getInformationRelevantFormulas() `const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns

Set of all formulas

0.15.172.4.50 getModelEqualities() `std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.
The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns

Equivalence classes.

0.15.172.4.51 getOrigins() [1/3] `void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

0.15.172.4.52 getOrigins() [2/3]

`void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

0.15.172.4.53 getOrigins() [3/3]

`const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns

The origins of the passed formula at the given position.

0.15.172.4.54 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns

A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

0.15.172.4.55 hasLemmas()

`bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

0.15.172.4.56 hasValidInfeasibleSubset()

`bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns

true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

0.15.172.4.57 id()

`std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns

A unique ID to identify this module instance.

0.15.172.4.58 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns

The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

0.15.172.4.59 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.172.4.60 informBackends() `void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

0.15.172.4.61 informCore() `virtual bool smtrat::Module::informCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.172.4.62 informedConstraints() `const carl::FastSet<FormulaT>& smtrat::Module::informed↩ Constraints ( ) const [inline], [inherited]`

Returns

The position of the first constraint of which no backend has been informed about.

0.15.172.4.63 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.
This method must not be called twice and only before the first runBackends call.
Reimplemented in smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntBlastModule< Settings >, smtrat::FPPModule< Settings >, smtrat::CurryModule< Settings >, and smtrat::BVModule< Settings >.

0.15.172.4.64 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

0.15.172.4.65 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

0.15.172.4.66 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns

true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

0.15.172.4.67 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns

A constant reference to the lemmas being valid formulas this module or its backends made.

0.15.172.4.68 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.
({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns

The vector being the two given vectors merged.

0.15.172.4.69 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns

The assignment of the current satisfiable result, if existent.

0.15.172.4.70 modelsDisjoint()

`bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns

true, if there is no variable assigned by both models; false, otherwise.

0.15.172.4.71 moduleName()

`virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns

The name of the given module type as name.

Reimplemented in smtrat::VSModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::STropModule< Settings >, smtrat::SplitSOSModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntEqModule< Settings >, smtrat::IntBlastModule< Settings >, smtrat::IncWidthModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::GBModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::CurryModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::BVModule< Settings >, and smtrat::BEModule< Settings >.

0.15.172.4.72 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

0.15.172.4.73 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

0.15.172.4.74 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula. TODO: disable this method

0.15.172.4.75 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula.

0.15.172.4.76 pPassedFormula() `const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to the backends of this module.

0.15.172.4.77 pReceivedFormula() `const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to this module.

0.15.172.4.78 print() `void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

0.15.172.4.79 printAllModels() `void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.172.4.80 printInfeasibleSubsets() `void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

0.15.172.4.81 printModel() `void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.172.4.82 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

0.15.172.4.83 printReceivedFormula()

`void smtrat::Module::printReceivedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

0.15.172.4.84 probablyLooping()

`bool smtrat::Module::probablyLooping ( const typename Poly::PolyType & _branchingPolynomial, const Rational & _branchingValue ) const [protected], [inherited]`

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns

true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

0.15.172.4.85 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

0.15.172.4.86 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

0.15.172.4.87 receivedVariable()

`bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

0.15.172.4.88 remove()

`void smtrat::PModule::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

0.15.172.4.89 removeCore()

```
virtual void smtrat::Module::removeCore (
    [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected],
[virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

0.15.172.4.90 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

0.15.172.4.91 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

0.15.172.4.92 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const
[inline], [inherited]
```

Returns

A reference to the formula passed to the backends of this module.

0.15.172.4.93 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const
[inline], [inherited]
```

Returns

A reference to the formula passed to this module.

0.15.172.4.94 runBackends() [1/2]

```
virtual Answer smtrat::PModule::runBackends ( ) [inline],
[virtual], [inherited]
```

Reimplemented from smtrat::Module.

0.15.172.4.95 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.172.4.96 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ _↩ *id*	The id to set this module's id to.

0.15.172.4.97 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

0.15.172.4.98 solverState()

```
Answer smtrat::Module::solverState ( ) const [inline], [inherited]
```

Returns

True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

0.15.172.4.99 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint (
    const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

0.15.172.4.100 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns

The priority of this module to get a thread for running its check procedure.

0.15.172.4.101 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::SATModule< Settings >.

0.15.172.4.102 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

0.15.172.4.103 updateModel() `template<typename Settings > void smtrat::ESModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.
Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.
Reimplemented from smtrat::Module.

0.15.172.4.104 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.172.5 Field Documentation

0.15.172.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

0.15.172.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

0.15.172.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

0.15.172.5.4 mConstraintsToInform

`carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

0.15.172.5.5 mFinalCheck

`bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

0.15.172.5.6 mFirstPosInLastBranches

`std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

0.15.172.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩ Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.172.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module↩ ::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

0.15.172.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.172.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

0.15.172.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

0.15.172.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

0.15.172.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩ ::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

0.15.172.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

0.15.172.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

0.15.172.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

0.15.172.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

0.15.172.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

0.15.172.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

0.15.172.5.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

0.15.172.5.21 mSmallerMusesCheckCounter

`unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

0.15.172.5.22 mSolverState

`std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

0.15.172.5.23 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

0.15.172.5.24 mUsedBackends

`std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.172.5.25 mVariableCounters

`std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

0.15.173 smtrat::ExactlyOneCommanderEncoder Class Reference

`#include <ExactlyOneCommanderEncoder.h>`

Public Member Functions

- ExactlyOneCommanderEncoder ()
- Rational encodingSize (const ConstraintT &constraint)
- bool canEncode (const ConstraintT &constraint)
- std::string name ()
- std::optional< FormulaT > encode (const ConstraintT &constraint)

  Encodes an arbitrary constraint.

Data Fields

- std::size_t problem_size

Protected Member Functions

- std::optional< FormulaT > doEncode (const ConstraintT &constraint)
- FormulaT generateVarChain (const std::set< carl::Variable > &vars, carl::FormulaType type)

Public Member Functions

- std::optional< mcsat::Explanation > operator() (const mcsat::Bookkeeping &data, carl::Variable var, const FormulasT &reason, bool) const

  We construct a formula 'E -> I', i.e.

0.15.179.1 Member Function Documentation

0.15.179.1.1 operator()()

```
std::optional< mcsat::Explanation > smtrat::mcsat::nlsat::Explanation↩
::operator() (
            const mcsat::Bookkeeping & data,
            carl::Variable var,
            const FormulasT & reason,
            bool ) const
```

We construct a formula 'E -> I', i.e.
'e1 & e2 ... en -> i', called "Explanation", in its clausal form '-e1 v -e2 ... en v i', where e1, e2.. are `reason` Atoms and CAD cell bound atoms, and i is the `implication`. It "explains" why the assignment point in `data` is inconsistent with the `reason` atoms/constraints and the implication in that it constructs a whole region of assignments points, which the assignment point in `data` is a part of.

Parameters

variableOrdering	Determine the order of variables, e.g. x1, x2, .. x10
data	Represent the assigned variables and their assigned values in different representations. These are a prefix of the `variableOrdering`, e.g. x1, x2, .. x5
var	The smallest/first variable in the `variableOrdering` that is not assigned by `data`, e.g. x6
reason	A collection of atoms that are inconsistent together or imply the `implication`. These atoms mention only variables x1, x2.. x6 (some atom definitely mentions x6) and possibly x7..x10 if they are irrelevant and "vanish" under the assignment in `data`, e.g. x1∗x7+x6=0 (for x1 := 0) or x6∗(x7^2+1)>0 (equiv to x6>0, since x7^2+1 > 0)

void smtrat::mcsat::nlsat::ExplanationGenerator::generate↩
Explanation (
            const FormulaT & impliedAtom,
            std::vector< FormulasT > & explainAtomsinLvls ) const  [inline]
```

Construct explanation in non-clausal form (without the impliedAtom/implication).
It consists of atomic formulas as expressions for cell component bounds and the constraintAtoms for which a CAD was constructed. Each cell component creates zero, one or two explanation atoms. The impliedAtom is not added to facilitate conversion into a clausal form afterwards.

0.15.184.2.2 getExplanation()

- using Valuation = std::vector< double >

Public Member Functions

- void addFeature (Extractor &&e, std::size_t level, double weight)
- Valuation valuateVariable (const Objects &o, carl::Variable v) const
- std::vector< carl::Variable > sortVariables (const Objects &o, std::vector< carl::Variable > vars) const

Data Fields

- std::vector< std::tuple< Extractor, std::size_t, double > > mFeatures

0.15.196.1 Detailed Description

template<typename Objects>
struct smtrat::mcsat::variableordering::detail::FeatureCollector< Objects >

This class manages features that are used to valuate variables on objects.
Each feature consists of a valuation function, a level and a weight. All feature valuations of a certain level are combined linearly using the respective weights. Valuations are then compared lexicographically.

0.15.196.2 Member Typedef Documentation

0.15.200.1 Detailed Description

Stores a formula along with its origins.

0.15.200.2 Constructor & Destructor Documentation

0.15.200.2.1 FormulaWithOrigins() [1/4] smtrat::FormulaWithOrigins::FormulaWithOrigins ( )

0.15.200.2.2 FormulaWithOrigins() [2/4]

```
smtrat::FormulaWithOrigins::FormulaWithOrigins (
            const FormulaT & _formula )  [inline]
```

Constructs a formula with empty origins.

Parameters

_formula	The formula of the formula with origins to construct.

0.15.200.2.3 FormulaWithOrigins() [3/4]

```
smtrat::FormulaWithOrigins::FormulaWithOrigins (
            const FormulaT & _formula,
            const std::shared_ptr< FormulasT > & _origins )  [inline]
```

Constructs a formula with the given origins.

Parameters

_formula	The formula of the formula with origins to construct.
_origins	The origins of the formula with origins to construct.

0.15.200.2.4 FormulaWithOrigins() [4/4] `smtrat::FormulaWithOrigins::FormulaWithOrigins ( const FormulaWithOrigins & )`

0.15.200.3 Member Function Documentation

0.15.200.3.1 deducted() `bool smtrat::FormulaWithOrigins::deducted ( ) const [inline]`

Returns

The deduction flag, which indicates, that this formula g is a direct sub-formula of a conjunction of formulas (and g f_1 .. f_n), and, that (implies (and f_1 .. f_n) g) holds.

0.15.200.3.2 formula() `const FormulaT& smtrat::FormulaWithOrigins::formula ( ) const [inline]`

Returns

A constant reference to the formula.

0.15.200.3.3 hasOrigins() `bool smtrat::FormulaWithOrigins::hasOrigins ( ) const [inline]`

Returns

true, if this sub-formula of the module input has origins.

0.15.200.3.4 origins() `const FormulasT& smtrat::FormulaWithOrigins::origins ( ) const [inline]`

Returns

A constant reference to the origins.

0.15.200.3.5 setDeducted() `void smtrat::FormulaWithOrigins::setDeducted ( bool _deducted ) const [inline]`

Sets the deduction flag to the given value.

Parameters

_deducted	The value to set the deduction flag to.

0.15.200.4 Friends And Related Function Documentation

0.15.200.4.1 ModuleInput `friend class ModuleInput [friend]`

0.15.200.4.2 operator< `bool operator< ( const FormulaWithOrigins & _fwoA, const FormulaWithOrigins & _fwoB ) [friend]`

Parameters

_fwoA	The first formula with origins to compare.
_fwoB	The second formula with origins to compare.

Returns

true, if the formula of the first formula with origins is less than the formula of the second formula with origins; false, otherwise.

0.15.200.4.3 operator== `bool operator== ( const FormulaWithOrigins & _fwoA, const FormulaWithOrigins & _fwoB ) [friend]`

Parameters

_fwoA	The first formula with origins to compare.
_fwoB	The second formula with origins to compare.

Returns

true, if the formula of the first formula with origins and the formula of the second formula with origins are equal; false, otherwise.

0.15.201 smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices > Class Template Reference

This class implements a forward hypergraph.
`#include <ForwardHyperGraph.h>`

Data Structures

- struct Edge

  Internal type of an edge.

Public Types

- using Vertex = std::size_t

  Internal type of a vertex.

Public Member Functions

- Vertex newVertex (const VertexProperty &vp)

  Returns a new vertex that is labeled with the given vertex property.
- Edge & newEdge (Vertex source, const EdgeProperty &ep)

  Creates a new edge where the given vertex is the incoming vertex that is labeled with the given edge property.
- Edge & newEdge (const VertexProperty &source, const EdgeProperty &ep)

Creates a new edge where the given vertex is the incoming vertex that is labeled with the given edge property.

- const VertexProperty & operator[] (Vertex v) const

  Retrieves the vertex property for the given vertex.
- VertexProperty & operator[] (Vertex v)

  Retrieves the vertex property for the given vertex.
- const std::vector< Edge > & out (Vertex v) const

  Retrieves all outgoing edges for the given vertex.
- const std::vector< Edge > & out (const VertexProperty &v) const

  Retrieves all outgoing edges for the given vertex.
- Vertex begin () const

  Returns the first vertex.
- Vertex end () const

  Returns the past-the-last vertex.
- std::size_t size () const

  Returns the number of vertices.
- void toDot (const std::string &filename) const

  Writes a representation of this graph to the given file.

Friends

- template<typename VP , typename EP >
  std::ostream & operator<< (std::ostream &os, const ForwardHyperGraph< VP, EP > &fhg)

  Writes a textual representation of this graph to the given stream.

template<typename VertexProperty, typename EdgeProperty, bool UniqueVertices = true>
class smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >

This class implements a forward hypergraph.
We define a hypergraph to be a graph structure (V,E) where V is a set of vertices and $E \subseteq 2^V$ a set of hyperedges. A hyperedge can connect an arbitrary number of vertices.
If a hypergraph is directed if every edge $e \in E$ is partitioned into $I(e)$ and $O(e)$ that are sets of incoming vertices and outgoing vertices, respectively. A forward hypergraph is directed and every edge has only a single incoming vertices, that is $|I(e)| = 1$. Note that we store edges as a mapping from the incoming vertex to a set of outgoing vertices and thus do not have an explicit incoming vertex in our edge representation.
This implementation of a forward hypergraph accepts arbitrary labels (called properties) for both vertices and edges. It relies on a dense list of vertices that are internally labeled starting from zero. Therefore, removal of vertices is not supported.
If the third template parameter UniqueVertices is set to true (being the default), we make sure that every vertex is unique with respect to its property. To make this possible, a vertex property may not be changed in this case which is enforced using a static assertion. No requirements are imposed on the edge properties.
This class supports both printing a simple text representation and writing a description to a dot file.

0.15.201.2 Member Typedef Documentation

0.15.201.2.1 Vertex

```
template<typename VertexProperty , typename EdgeProperty , bool Unique↩
Vertices = true>
using smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::Vertex =
std::size_t
```

Internal type of a vertex.

0.15.201.3 Member Function Documentation

0.15.201.3.1 begin()

```
template<typename VertexProperty , typename EdgeProperty , bool Unique↩
Vertices = true>
Vertex smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::begin ( )
const [inline]
```

Returns the first vertex.

0.15.201.3.2 end()

```
template<typename VertexProperty , typename EdgeProperty , bool Unique↩
Vertices = true>
Vertex smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::end ( )
const [inline]
```

Returns the past-the-last vertex.

0.15.201.3.3 newEdge() [1/2]

```
template<typename VertexProperty , typename EdgeProperty , bool
UniqueVertices = true>
Edge& smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::newEdge (
            const VertexProperty & source,
            const EdgeProperty & ep ) [inline]
```

Creates a new edge where the given vertex is the incoming vertex that is labeled with the given edge property.

0.15.201.3.4 newEdge() [2/2]

```
template<typename VertexProperty , typename EdgeProperty , bool
UniqueVertices = true>
Edge& smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::newEdge (
            Vertex source,
            const EdgeProperty & ep ) [inline]
```

Creates a new edge where the given vertex is the incoming vertex that is labeled with the given edge property.

0.15.201.3.5 newVertex()

```
template<typename VertexProperty , typename EdgeProperty , bool Unique↩
Vertices = true>
Vertex smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::newVertex (
            const VertexProperty & vp ) [inline]
```

Returns a new vertex that is labeled with the given vertex property.
If UniqueVertices is set to true and a vector with the given property already exists, this vector is returned.

0.15.201.3.6 operator[]() [1/2]

```
template<typename VertexProperty , typename EdgeProperty , bool
UniqueVertices = true>
VertexProperty& smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >↩
::operator[] (
            Vertex v ) [inline]
```

Retrieves the vertex property for the given vertex.
This method is disabled if UniqueVertices is set to true.

0.15.201.3.7 operator[]() [2/2]

```
template<typename VertexProperty , typename EdgeProperty , bool
UniqueVertices = true>
const VertexProperty& smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices
>::operator[] (
            Vertex v ) const [inline]
```

Retrieves the vertex property for the given vertex.

0.15.201.3.8 out() [1/2]

```
template<typename VertexProperty , typename EdgeProperty , bool Unique↩
Vertices = true>
```

```
const std::vector<Edge>& smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, Unique↩
Vertices >::out (
            const VertexProperty & v ) const  [inline]
```

Retrieves all outgoing edges for the given vertex.

0.15.201.3.9 out() [2/2]

```
template<typename VertexProperty , typename EdgeProperty , bool Unique↩
Vertices = true>
const std::vector<Edge>& smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, Unique↩
Vertices >::out (
            Vertex v ) const  [inline]
```

Retrieves all outgoing edges for the given vertex.

0.15.201.3.10 size()

```
template<typename VertexProperty , typename EdgeProperty , bool Unique↩
Vertices = true>
std::size_t smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::size (
) const  [inline]
```

Returns the number of vertices.

0.15.201.3.11 toDot()

```
template<typename VertexProperty , typename EdgeProperty , bool Unique↩
Vertices = true>
void smtrat::ForwardHyperGraph< VertexProperty, EdgeProperty, UniqueVertices >::toDot (
            const std::string & filename ) const
```

Writes a representation of this graph to the given file.

0.15.201.4 Friends And Related Function Documentation

0.15.201.4.1 operator<<

```
template<typename VertexProperty , typename EdgeProperty , bool Unique↩
Vertices = true>
template<typename VP , typename EP >
std::ostream& operator<< (
            std::ostream & os,
            const ForwardHyperGraph< VP, EP > & fhg )  [friend]
```

Writes a textual representation of this graph to the given stream.

0.15.202 smtrat::FouMoModule< Settings > Class Template Reference

A module which applies the Fourier-Motzkin algorithm.

```
#include <FouMoModule.h>
```

Public Types

- typedef Settings SettingsType
- enum class LemmaType : unsigned { NORMAL = 0 , PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- FouMoModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=NULL)
- ~FouMoModule ()
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

Removes the subformula of the received formula at the given position to the considered ones of this module.

- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_↩ VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const

- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore ([[maybe_unused]] const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore ([[maybe_unused]] const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

Copies the infeasible subsets of the passed formula.

- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

0.15.202.1 Detailed Description

template<typename Settings>
class smtrat::FouMoModule< Settings >

A module which applies the Fourier-Motzkin algorithm.

0.15.202.2 Member Typedef Documentation

0.15.202.2.1 SettingsType `template<typename Settings >`

`typedef Settings smtrat::FouMoModule< Settings >::SettingsType`

0.15.202.3 Member Enumeration Documentation

0.15.202.3.1 LemmaType `enum smtrat::Module::LemmaType : unsigned [strong], [inherited]`

Enumerator

NORMAL	
PERMANENT	

0.15.202.4 Constructor & Destructor Documentation

0.15.202.4.1 FouMoModule() `template<typename Settings >`

```
smtrat::FouMoModule< Settings >::FouMoModule (
            const ModuleInput * _formula,
            Conditionals & _conditionals,
            Manager * _manager = NULL )
```

0.15.202.4.2 ~FouMoModule() `template<typename Settings >`

`smtrat::FouMoModule< Settings >::~FouMoModule ( ) [inline]`

0.15.202.5 Member Function Documentation

0.15.202.5.1 add() `bool smtrat::Module::add (`

`ModuleInput::const_iterator _subformula ) [inherited]`

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.202.5.2 addConstraintToInform() `void smtrat::Module::addConstraintToInform (`

`const FormulaT & _constraint ) [protected], [virtual], [inherited]`

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

0.15.202.5.3 addCore() [1/2]

```
virtual bool smtrat::Module::addCore (
    [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected],
[virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.202.5.4 addCore() [2/2]

```
template<typename Settings >
bool smtrat::FouMoModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula )
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.202.5.5 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula
(
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

0.15.202.5.6 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

0.15.202.5.7 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

0.15.202.5.8 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.
Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

0.15.202.5.9 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.
Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.202.5.10 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.202.5.11 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.202.5.12 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns

All satisfying assignments, if existent.

0.15.202.5.13 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns

True, if one of them has determined a result.

0.15.202.5.14 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const
[inline], [inherited]
```

Returns

A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.202.5.15 backendsModel()

```
const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]
```

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

0.15.202.5.16 branchAt() [1/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.202.5.17 branchAt() [2/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

0.15.202.5.18 branchAt() [3/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.202.5.19 branchAt() [4/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.

Parameters

_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

0.15.202.5.20 check()

```
Answer smtrat::Module::check (
    bool _final = false,
    bool _full = true,
    carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.202.5.21 checkCore()

```
template<typename Settings >
Answer smtrat::FouMoModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns

SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.202.5.22 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

0.15.202.5.23 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns

false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

0.15.202.5.24 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

0.15.202.5.25 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

0.15.202.5.26 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

0.15.202.5.27 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

0.15.202.5.28 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

0.15.202.5.29 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

0.15.202.5.30 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.
If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

0.15.202.5.31 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

0.15.202.5.32 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns

The constraints which the backends must be informed about.

0.15.202.5.33 currentlySatisfied() `virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

0.15.202.5.34 currentlySatisfiedByBackend() `unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

0.15.202.5.35 deinform() `void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.202.5.36 deinformCore() `virtual void smtrat::Module::deinformCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.202.5.37 determine_smallest_origin() `size_t smtrat::Module::determine_smallest_origin ( const std::vector< FormulaT > & origins ) const [protected], [inherited]`

Parameters

origins	A vector of sets of origins.

Returns

The index of the smallest (regarding the size of the sets) element of origins

0.15.202.5.38 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
            ModuleInput::iterator _subformula,
            bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module. Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

0.15.202.5.39 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

0.15.202.5.40 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
            const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

0.15.202.5.41 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns

The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.202.5.42 firstUncheckedReceivedSubformula() `ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns

The position of the first (by this module) unchecked sub-formula of the received formula.

0.15.202.5.43 freeSplittingVariable() `static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

0.15.202.5.44 generateTrivialInfeasibleSubset() `void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

0.15.202.5.45 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

0.15.202.5.46 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

0.15.202.5.47 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

0.15.202.5.48 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.
Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns

The infeasible subsets the given backend provides.

0.15.202.5.49 getInformationRelevantFormulas() `const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns

Set of all formulas

0.15.202.5.50 getModelEqualities() `std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.
The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns

Equivalence classes.

0.15.202.5.51 getOrigins() [1/3] `void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

0.15.202.5.52 getOrigins() [2/3] `void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

0.15.202.5.53 getOrigins() [3/3] `const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns

The origins of the passed formula at the given position.

0.15.202.5.54 getReceivedFormulaSimplified() `std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns

A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

0.15.202.5.55 hasLemmas() `bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

0.15.202.5.56 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns

true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

0.15.202.5.57 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns

A unique ID to identify this module instance.

0.15.202.5.58 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns

The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

0.15.202.5.59 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.202.5.60 informBackends() `void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

0.15.202.5.61 informCore() `virtual bool smtrat::Module::informCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual],`

[inherited]
Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.202.5.62 informedConstraints() `const carl::FastSet<FormulaT>& smtrat::Module::informedConstraints ( ) const [inline], [inherited]`

Returns

The position of the first constraint of which no backend has been informed about.

0.15.202.5.63 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.
This method must not be called twice and only before the first runBackends call.
Reimplemented in smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntBlastModule< Settings >, smtrat::FPPModule< Settings >, smtrat::CurryModule< Settings >, and smtrat::BVModule< Settings >.

0.15.202.5.64 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

0.15.202.5.65 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

0.15.202.5.66 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns

true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

0.15.202.5.67 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns

A constant reference to the lemmas being valid formulas this module or its backends made.

0.15.202.5.68 merge()

```
std::vector< FormulaT > smtrat::Module::merge (
    const std::vector< FormulaT > & _vecSetA,
    const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]
```

Merges the two vectors of sets into the first one.
({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns

The vector being the two given vectors merged.

0.15.202.5.69 model()

```
const Model& smtrat::Module::model ( ) const [inline], [inherited]
```

Returns

The assignment of the current satisfiable result, if existent.

0.15.202.5.70 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns

true, if there is no variable assigned by both models; false, otherwise.

0.15.202.5.71 moduleName()

```
template<typename Settings >
std::string smtrat::FouMoModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns

The name of the given module type as name.

Reimplemented from smtrat::Module.

0.15.202.5.72 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

0.15.202.5.73 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

0.15.202.5.74 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula. TODO: disable this method

0.15.202.5.75 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula.

0.15.202.5.76 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to the backends of this module.

0.15.202.5.77 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to this module.

0.15.202.5.78 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

0.15.202.5.79 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.202.5.80 printInfeasibleSubsets()

`void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

0.15.202.5.81 printModel()

`void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.202.5.82 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

0.15.202.5.83 printReceivedFormula()

`void smtrat::Module::printReceivedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

0.15.202.5.84 probablyLooping()

`bool smtrat::Module::probablyLooping ( const typename Poly::PolyType & _branchingPolynomial, const Rational & _branchingValue ) const [protected], [inherited]`

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns

true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

0.15.202.5.85 receivedFormulaChecked() `void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

0.15.202.5.86 receivedFormulasAsInfeasibleSubset() `void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

0.15.202.5.87 receivedVariable() `bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

0.15.202.5.88 remove() `void smtrat::Module::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

0.15.202.5.89 removeCore() [1/2] `virtual void smtrat::Module::removeCore ( [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

0.15.202.5.90 removeCore() [2/2] `template<typename Settings > void smtrat::FouMoModule< Settings >::removeCore ( ModuleInput::const_iterator _subformula )`

Removes the subformula of the received formula at the given position to the considered ones of this module.
Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

0.15.202.5.91 removeOrigin() `std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩Origin (`

```
ModuleInput::iterator _formula,
const FormulaT & _origin )  [inline], [protected], [inherited]
```

0.15.202.5.92 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins (
ModuleInput::iterator _formula,
const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected], [inherited]
```

0.15.202.5.93 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]
```

Returns

A reference to the formula passed to the backends of this module.

0.15.202.5.94 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]
```

Returns

A reference to the formula passed to this module.

0.15.202.5.95 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( )  [inline], [protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

0.15.202.5.96 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
bool _final,
bool _full,
carl::Variable _objective )  [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.202.5.97 setId()

```
void smtrat::Module::setId (
std::size_t _id )  [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ _↩ *id*	The id to set this module's id to.

0.15.202.5.98 setThreadPriority()

`void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]`

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

0.15.202.5.99 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns

True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

0.15.202.5.100 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

0.15.202.5.101 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns

The priority of this module to get a thread for running its check procedure.

0.15.202.5.102 updateAllModels()

`void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::SATModule< Settings >.

0.15.202.5.103 updateLemmas()

`void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

0.15.202.5.104 updateModel() `template<typename Settings > void smtrat::FouMoModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.
Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.
Reimplemented from smtrat::Module.

0.15.202.5.105 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.202.6 Field Documentation

0.15.202.6.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

0.15.202.6.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

0.15.202.6.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

0.15.202.6.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

0.15.202.6.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

0.15.202.6.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

0.15.202.6.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩ Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.202.6.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module↩ ::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

0.15.202.6.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.202.6.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

0.15.202.6.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

0.15.202.6.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

0.15.202.6.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

0.15.202.6.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

0.15.202.6.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

0.15.202.6.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

0.15.202.6.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

0.15.202.6.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

0.15.202.6.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplitting↩Variables [static], [inherited]`

Reusable splitting variables.

0.15.202.6.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

0.15.202.6.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

0.15.202.6.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

0.15.202.6.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

0.15.202.6.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.202.6.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

0.15.203 smtrat::qe::fm::FourierMotzkinQE Class Reference

Provides a simple implementation for Fourier Motzkin variable elimination for linear, existentially quantified constraints.

`#include <FourierMotzkinQE.h>`

Public Types

- using FormulaPartition = std::vector< std::vector< FormulaT > >

Public Member Functions

- FourierMotzkinQE (const FormulaT &qfree, const QEQuery &quantifiers)
- FormulaT eliminateQuantifiers ()

0.15.203.1 Detailed Description

Provides a simple implementation for Fourier Motzkin variable elimination for linear, existentially quantified constraints.

0.15.203.2 Member Typedef Documentation

0.15.203.2.1 FormulaPartition `using smtrat::qe::fm::FourierMotzkinQE::FormulaPartition = std↩ ::vector<std::vector<FormulaT> >`

0.15.204 smtrat::FPPModule< Settings > Class Template Reference

`#include <FPPModule.h>`

Public Types

- typedef Settings SettingsType
- enum class LemmaType : unsigned { NORMAL = 0 , PERMANENT = 1 }

Public Member Functions

- FPPModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=NULL)
- ~FPPModule ()
- bool informCore (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const

- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.

- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore ([[maybe_unused]] const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore ([[maybe_unused]] const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_↩ ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_↩ branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAs↩ Premise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

```

0.15.204.4 Member Function Documentation

0.15.204.4.1 add()

```
bool smtrat::PModule::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.204.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

0.15.204.4.3 addCore() [1/2]

```
virtual bool smtrat::Module::addCore (
    [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected],
[virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.204.4.4 addCore() [2/2]

```
template<typename Settings >
bool smtrat::FPPModule< Settings >::addCore (
    ModuleInput::const_iterator _subformula )
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.204.4.5 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula
(
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

0.15.204.4.6 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline], [inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

0.15.204.4.7 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

0.15.204.4.8 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.
Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

0.15.204.4.9 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.
Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.204.4.10 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.204.4.11 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.204.4.12 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const  [inline],
[inherited]
```

Returns

All satisfying assignments, if existent.

0.15.204.4.13 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns

True, if one of them has determined a result.

0.15.204.4.14 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns

A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.204.4.15 appliedPreprocessing() `bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]`

Returns

true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

0.15.204.4.16 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

0.15.204.4.17 branchAt() [1/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.204.4.18 branchAt() [2/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

0.15.204.4.19 branchAt() [3/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
```

```
const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

0.15.204.4.20 branchAt() [4/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

0.15.204.4.21 check()

```
Answer smtrat::PModule::check (
    bool _final = false,
    bool _full = true,
    carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.204.4.22 checkCore()

```
template<typename Settings >
Answer smtrat::FPPModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns

SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.204.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality ( std::vector< FormulaSetT >::const_iterator _infsubset, const std::string & _filename = "smaller_muses", unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

0.15.204.4.24 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns

false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

0.15.204.4.25 cleanModel()

```
void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]
```

Substitutes variable occurrences by its model value in the model values of other variables.

0.15.204.4.26 clearLemmas()

```
void smtrat::Module::clearLemmas ( ) [inline], [inherited]
```

Deletes all yet found lemmas.

0.15.204.4.27 clearModel()

```
void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]
```

Clears the assignment, if any was found.

0.15.204.4.28 clearModels()

```
void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]
```

Clears all assignments, if any was found.

0.15.204.4.29 clearPassedFormula()

```
void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]
```

0.15.204.4.30 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

0.15.204.4.31 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.
If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

0.15.204.4.32 collectTheoryPropagations()

```
void smtrat::Module::collectTheoryPropagations ( ) [inherited]
```

0.15.204.4.33 constraintsToInform()

```
const carl::FastSet<FormulaT>& smtrat::Module::constraints↩
ToInform ( ) const [inline], [inherited]
```

Returns

The constraints which the backends must be informed about.

0.15.204.4.34 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

0.15.204.4.35 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

0.15.204.4.36 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.204.4.37 deinformCore()

`virtual void smtrat::Module::deinformCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.204.4.38 determine_smallest_origin()

`size_t smtrat::Module::determine_smallest_origin ( const std::vector< FormulaT > & origins ) const [protected], [inherited]`

Parameters

origins	A vector of sets of origins.

Returns

The index of the smallest (regarding the size of the sets) element of origins

0.15.204.4.39 eraseSubformulaFromPassedFormula()

`ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula ( ModuleInput::iterator _subformula, bool _ignoreOrigins = false ) [protected], [virtual], [inherited]`

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module. Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

0.15.204.4.40 excludeNotReceivedVariablesFromModel()

`void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]`

Excludes all variables from the current model, which do not occur in the received formula.

0.15.204.4.41 findBestOrigin()

`std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin ( const std::vector< FormulaT > & _origins ) const [protected], [inherited]`

Parameters

_origins	

Returns

0.15.204.4.42 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns

The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.204.4.43 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns

The position of the first (by this module) unchecked sub-formula of the received formula.

0.15.204.4.44 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

0.15.204.4.45 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

0.15.204.4.46 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

0.15.204.4.47 getBackendsModel()

`void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

0.15.204.4.48 getInfeasibleSubsets() [1/2]

`void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

0.15.204.4.49 getInfeasibleSubsets() [2/2]

```
std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets (
            const Module & _backend ) const  [protected], [inherited]
```

Get the infeasible subsets the given backend provides.

Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns

The infeasible subsets the given backend provides.

0.15.204.4.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns

Set of all formulas

0.15.204.4.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.
The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns

Equivalence classes.

0.15.204.4.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

0.15.204.4.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

0.15.204.4.54 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns

The origins of the passed formula at the given position.

0.15.204.4.55 getReceivedFormulaSimplified() `std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns

A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

0.15.204.4.56 hasLemmas() `bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

0.15.204.4.57 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns

true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

0.15.204.4.58 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns

A unique ID to identify this module instance.

0.15.204.4.59 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns

The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

0.15.204.4.60 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.204.4.61 informBackends()

`void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

0.15.204.4.62 informCore() [1/2]

`virtual bool smtrat::Module::informCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.204.4.63 informCore() [2/2]

`template<typename Settings > bool smtrat::FPPModule< Settings >::informCore ( const FormulaT & _constraint )`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.204.4.64 informedConstraints()

`const carl::FastSet<FormulaT>& smtrat::Module::informedConstraints ( ) const [inline], [inherited]`

Returns

The position of the first constraint of which no backend has been informed about.

0.15.204.4.65 init() `template<typename Settings >`
`void smtrat::FPPModule< Settings >::init ( ) [virtual]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.
This method must not and will not be called more than once and only before the first runBackends call.
Reimplemented from smtrat::Module.

0.15.204.4.66 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

0.15.204.4.67 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

0.15.204.4.68 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns

true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

0.15.204.4.69 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns

A constant reference to the lemmas being valid formulas this module or its backends made.

0.15.204.4.70 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.
({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns

The vector being the two given vectors merged.

0.15.204.4.71 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns

The assignment of the current satisfiable result, if existent.

0.15.204.4.72 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns

true, if there is no variable assigned by both models; false, otherwise.

0.15.204.4.73 moduleName()

```
virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]
```

Returns

The name of the given module type as name.

Reimplemented in smtrat::VSModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::STropModule< Settings >, smtrat::SplitSOSModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntEqModule< Settings >, smtrat::IntBlastModule< Settings >, smtrat::IncWidthModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::GBModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::CurryModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::BVModule< Settings >, and smtrat::BEModule< Settings >.

0.15.204.4.74 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

0.15.204.4.75 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

0.15.204.4.76 passedFormulaBegin()

```
ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]
```

Returns

An iterator to the end of the passed formula. TODO: disable this method

0.15.204.4.77 passedFormulaEnd()

```
ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]
```

Returns

An iterator to the end of the passed formula.

0.15.204.4.78 pPassedFormula() `const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to the backends of this module.

0.15.204.4.79 pReceivedFormula() `const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to this module.

0.15.204.4.80 print() `void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

0.15.204.4.81 printAllModels() `void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.204.4.82 printInfeasibleSubsets() `void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

0.15.204.4.83 printModel() `void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.204.4.84 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

0.15.204.4.85 printReceivedFormula()

`void smtrat::Module::printReceivedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

0.15.204.4.86 probablyLooping()

`bool smtrat::Module::probablyLooping ( const typename Poly::PolyType & _branchingPolynomial, const Rational & _branchingValue ) const [protected], [inherited]`

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns

true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

0.15.204.4.87 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

0.15.204.4.88 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

0.15.204.4.89 receivedVariable()

`bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

0.15.204.4.90 remove()

`void smtrat::PModule::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

0.15.204.4.91 removeCore() [1/2]

```
virtual void smtrat::Module::removeCore (
            [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected],
[virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

0.15.204.4.92 removeCore() [2/2]

```
template<typename Settings >
void smtrat::FPPModule< Settings >::removeCore (
            ModuleInput::const_iterator _subformula )
```

Removes the subformula of the received formula at the given position to the considered ones of this module.
Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

0.15.204.4.93 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origin (
            ModuleInput::iterator _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

0.15.204.4.94 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

0.15.204.4.95 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const
[inline], [inherited]
```

Returns

A reference to the formula passed to the backends of this module.

0.15.204.4.96 rReceivedFormula() `const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]`

Returns

A reference to the formula passed to this module.

0.15.204.4.97 runBackends() [1/2] `virtual Answer smtrat::PModule::runBackends ( ) [inline], [virtual], [inherited]`

Reimplemented from smtrat::Module.

0.15.204.4.98 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.204.4.99 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

_id	The id to set this module's id to.

0.15.204.4.100 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

0.15.204.4.101 solverState() `Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns

True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

0.15.204.4.102 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

0.15.204.4.103 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns

The priority of this module to get a thread for running its check procedure.

0.15.204.4.104 updateAllModels()

`void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::SATModule< Settings >.

0.15.204.4.105 updateLemmas()

`void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

0.15.204.4.106 updateModel()

`template<typename Settings > void smtrat::FPPModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.
Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.
Reimplemented from smtrat::Module.

0.15.204.4.107 usedBackends()

`const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.204.5 Field Documentation

0.15.204.5.1 mAllBackends

`std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

0.15.204.5.2 mAllModels

`std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

0.15.204.5.3 mBackendsFoundAnswer

`std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

0.15.204.5.4 mConstraintsToInform

`carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

0.15.204.5.5 mFinalCheck

`bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

0.15.204.5.6 mFirstPosInLastBranches

`std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

0.15.204.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaToPass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.204.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

0.15.204.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.204.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

0.15.204.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

0.15.204.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

0.15.204.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

0.15.204.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

0.15.204.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

0.15.204.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

0.15.204.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

0.15.204.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

0.15.204.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

0.15.204.5.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

0.15.204.5.21 mSmallerMusesCheckCounter

`unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

0.15.204.5.22 mSolverState

`std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

0.15.204.5.23 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheoryPropagations [protected], [inherited]`

0.15.204.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.204.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

0.15.205 smtrat::mcsat::FullParallelExplanation< Backends > Struct Template Reference

This explanation executes all given explanation parallel in multiple threads and waits until every single one has finished, returning the result of the first listed explanation.

`#include <FullParallelExplanation.h>`

0.15.205.1 Detailed Description

template<typename... Backends>
struct smtrat::mcsat::FullParallelExplanation< Backends >

This explanation executes all given explanation parallel in multiple threads and waits until every single one has finished, returning the result of the first listed explanation.

0.15.206 smtrat::cad::FullSampleComparator< Iterator, Strategy > Struct Template Reference

`#include <SampleComparator.h>`

```

0.15.211 smtrat::GBModule< Settings > Class Template Reference

A solver module based on Groebner basis.

```
#include <GBModule.h>
```

Public Types

- typedef Settings SettingsType
- typedef Settings::Order Order
- typedef Settings::PolynomialWithReasons GBPolynomial
- typedef Settings::MultivariateIdeal Ideal
- enum class LemmaType : unsigned { NORMAL = 0 , PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- GBModule (const ModuleInput *const, Conditionals &, Manager *const =NULL)
- virtual ~GBModule ()
- bool addCore (ModuleInput::const_iterator _formula)
- virtual Answer checkCore ()

  Checks the received formula for consistency.
- void removeCore (ModuleInput::const_iterator _formula)
- void printStateHistory ()
- void printRewriteRules ()
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

The inverse of informing about a constraint.

- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_↩VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateModel () const

  Updates the model, if the solver has detected the consistency of the received formula, beforehand.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

Excludes all variables from the current model, which do not occur in the received formula.

- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- GBPolynomial rewriteVariable (const GBPolynomial &, const carl::Variable &, const TermT &, const BitVector &)
- bool validityCheck ()
- virtual bool informCore ([[maybe_unused]] const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore ([[maybe_unused]] const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

Adds the given formula to the passed formula with no origin.

- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.

- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- Settings::Groebner mBasis

  The current Groebner basis.
- InequalitiesTable< Settings > mInequalities

  The inequalities table for handling inequalities.
- std::vector< ModuleInput::const_iterator > mBacktrackPoints

  The vector of backtrack points, which has pointers to received constraints.
- std::list< GBModuleState< Settings > > mStateHistory

  Saves the relevant history to support backtracking.
- bool mRecalculateGB

  After popping in the history, it might be necessary to recalculate. This flag indicates this.
- std::list< typename InequalitiesTable< Settings >::Rows::iterator > mNewInequalities

  A list of inequalities which were added after the last consistency check.
- groebner::RewriteRules mRewriteRules

  The rewrite rules for the variables.
- std::map< ConstraintT, carl::Variable > mAdditionalVarMap
- FormulasT mGbEqualities

  A workaround to associate equalities in the passed formula originating from the gb (in contrast to those which originate from simplified formulae)
- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

Friends

- class InequalitiesTable< Settings >

0.15.211.1 Detailed Description

template<class Settings>
class smtrat::GBModule< Settings >

A solver module based on Groebner basis.
Details can be found in my Bachelor Thesis "On Groebner Bases in SMT-Compliant Decision Procedures"

Author

Sebastian Junges

0.15.211.2 Member Typedef Documentation

0.15.211.5 Member Function Documentation

0.15.211.5.1 add() `bool smtrat::Module::add (`

```
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.211.5.2 addConstraintToInform() `void smtrat::Module::addConstraintToInform (`

```
            const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

0.15.211.5.3 addCore() [1/2] `virtual bool smtrat::Module::addCore (`

```
[[maybe_unused] ] ModuleInput::const_iterator formula )  [inline], [protected],
[virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.211.5.4 addCore() [2/2]

```
template<class Settings >
bool smtrat::GBModule< Settings >::addCore (
            ModuleInput::const_iterator _formula )
```

0.15.211.5.5 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula
(
            const FormulaT & formula )  [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

0.15.211.5.6 addLemma()

```
void smtrat::Module::addLemma (
            const FormulaT & _lemma,
            const LemmaType & _lt = LemmaType::NORMAL,
            const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) )  [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

0.15.211.5.7 addOrigin()

```
void smtrat::Module::addOrigin (
            ModuleInput::iterator _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

0.15.211.5.8 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
            ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.
Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

0.15.211.5.9 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.
Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.211.5.10 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.211.5.11 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
```

```
const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.211.5.12 allModels() `const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns

All satisfying assignments, if existent.

0.15.211.5.13 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns

True, if one of them has determined a result.

0.15.211.5.14 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns

A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.211.5.15 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

0.15.211.5.16 branchAt() [1/4] `bool smtrat::Module::branchAt (`

```
carl::Variable::Arg _var,
const Rational & _value,
bool _leftCaseWeak = true,
bool _preferLeftCase = true,
bool _useReceivedFormulaAsPremise = false,
const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

0.15.211.5.17 branchAt() [2/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

0.15.211.5.18 branchAt() [3/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

0.15.211.5.19 branchAt() [4/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

0.15.211.5.20 callGroebnerToSDP()

```
template<class Settings >
GBPolynomial smtrat::GBModule< Settings >::callGroebnerToSDP (
    const Ideal & gb ) [protected]
```

0.15.211.5.21 check()

```
Answer smtrat::Module::check (
    bool _final = false,
```

```
bool _full = true,
carl::Variable _objective = carl::Variable::NO_VARIABLE )  [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.211.5.22 checkCore()

```
template<class Settings >
virtual Answer smtrat::GBModule< Settings >::checkCore ( )  [virtual]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.211.5.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
std::vector< FormulaSetT >::const_iterator _infsubset,
const std::string & _filename = "smaller_muses",
unsigned _maxSizeDifference = 1 ) const  [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

0.15.211.5.24 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const  [protected], [inherited]
```

Returns

false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

0.15.211.5.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

0.15.211.5.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

0.15.211.5.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

0.15.211.5.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

0.15.211.5.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

0.15.211.5.30 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

0.15.211.5.31 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.
If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

0.15.211.5.32 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

0.15.211.5.33 constraintByGB()

```
template<class Settings >
bool smtrat::GBModule< Settings >::constraintByGB (
    carl::Relation cr ) [protected]
```

0.15.211.5.34 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraints↩`

`ToInform ( ) const [inline], [inherited]`

Returns

The constraints which the backends must be informed about.

0.15.211.5.35 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

0.15.211.5.36 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

0.15.211.5.37 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.211.5.38 deinformCore()

`virtual void smtrat::Module::deinformCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.211.5.39 determine_smallest_origin()

`size_t smtrat::Module::determine_smallest_origin ( const std::vector< FormulaT > & origins ) const [protected], [inherited]`

Parameters

origins	A vector of sets of origins.

Returns

The index of the smallest (regarding the size of the sets) element of origins

0.15.211.5.40 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
            ModuleInput::iterator _subformula,
            bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module. Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

0.15.211.5.41 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

0.15.211.5.42 factorisedConstraintDeduction()

```
template<class Settings >
void smtrat::GBModule< Settings >::factorisedConstraintDeduction (
            const std::list< GBPolynomial > & factorisation,
            const carl::BitVector & reasons ) [protected]
```

0.15.211.5.43 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
            const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

0.15.211.5.44 findTrivialFactorisations()

```
template<class Settings >
bool smtrat::GBModule< Settings >::findTrivialFactorisations ( ) [protected]
```

0.15.211.5.45 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns

The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.211.5.46 firstUncheckedReceivedSubformula() `ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns

The position of the first (by this module) unchecked sub-formula of the received formula.

0.15.211.5.47 freeSplittingVariable() `static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

0.15.211.5.48 generateReasons() `template<class Settings > FormulasT smtrat::GBModule< Settings >::generateReasons ( const carl::BitVector & reasons ) [protected]`

0.15.211.5.49 generateReasonSet() `template<class Settings > FormulaSetT smtrat::GBModule< Settings >::generateReasonSet ( const carl::BitVector & reasons ) [protected]`

0.15.211.5.50 generateTrivialInfeasibleSubset() `void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

0.15.211.5.51 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

0.15.211.5.52 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

0.15.211.5.53 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

0.15.211.5.54 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.
Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns

The infeasible subsets the given backend provides.

0.15.211.5.55 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns

Set of all formulas

0.15.211.5.56 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.
The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns

Equivalence classes.

0.15.211.5.57 getOrigins() [1/3]

`void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

0.15.211.5.58 getOrigins() [2/3]

`void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

0.15.211.5.59 getOrigins() [3/3]

`const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns

The origins of the passed formula at the given position.

0.15.211.5.60 getReceivedFormulaSimplified() `std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns

A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

0.15.211.5.61 handleConstraintNotToGB() `template<class Settings > void smtrat::GBModule< Settings >::handleConstraintNotToGB ( ModuleInput::const_iterator _formula ) [protected]`

0.15.211.5.62 handleConstraintToGBQueue() `template<class Settings > void smtrat::GBModule< Settings >::handleConstraintToGBQueue ( ModuleInput::const_iterator _formula ) [protected]`

0.15.211.5.63 hasLemmas() `bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

0.15.211.5.64 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns

true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

0.15.211.5.65 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns

A unique ID to identify this module instance.

0.15.211.5.66 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns

The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

0.15.211.5.67 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.211.5.68 informBackends()

`void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

0.15.211.5.69 informCore()

`virtual bool smtrat::Module::informCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.211.5.70 informedConstraints()

`const carl::FastSet<FormulaT>& smtrat::Module::informedConstraints ( ) const [inline], [inherited]`

Returns

The position of the first constraint of which no backend has been informed about.

0.15.211.5.71 init()

`void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.
This method must not be called twice and only before the first runBackends call.
Reimplemented in smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntBlastModule< Settings >, smtrat::FPPModule< Settings >, smtrat::CurryModule< Settings >, and smtrat::BVModule< Settings >.

0.15.211.5.72 is_minimizing()

`bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

0.15.211.5.73 isLemmaLevel()

`bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

0.15.211.5.74 isPreprocessor()

`bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns

true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

0.15.211.5.75 iterativeVariableRewriting()

`template<class Settings > bool smtrat::GBModule< Settings >::iterativeVariableRewriting ( ) [protected]`

0.15.211.5.76 knownConstraintDeduction()

`template<class Settings > void smtrat::GBModule< Settings >::knownConstraintDeduction ( const std::list< std::pair< carl::BitVector, carl::BitVector > > & deductions ) [protected]`

0.15.211.5.77 lemmas()

`const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns

A constant reference to the lemmas being valid formulas this module or its backends made.

0.15.211.5.78 merge()

`std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.
({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns

The vector being the two given vectors merged.

0.15.211.5.79 model()

`const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns

The assignment of the current satisfiable result, if existent.

0.15.211.5.80 modelsDisjoint()

```
bool smtrat::Module::modelsDisjoint (
    const Model & _modelA,
    const Model & _modelB ) [static], [protected], [inherited]
```

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns

true, if there is no variable assigned by both models; false, otherwise.

0.15.211.5.81 moduleName()

```
template<class Settings >
std::string smtrat::GBModule< Settings >::moduleName ( ) const [inline], [virtual]
```

Returns

The name of the given module type as name.

Reimplemented from smtrat::Module.

0.15.211.5.82 newConstraintDeduction()

```
template<class Settings >
void smtrat::GBModule< Settings >::newConstraintDeduction ( ) [protected]
```

0.15.211.5.83 objective()

```
carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]
```

0.15.211.5.84 originInReceivedFormula()

```
bool smtrat::Module::originInReceivedFormula (
    const FormulaT & _origin ) const [protected], [inherited]
```

0.15.211.5.85 passedFormulaBegin()

```
ModuleInput::iterator smtrat::Module::passedFormulaBegin (
) [inline], [protected], [inherited]
```

Returns

An iterator to the end of the passed formula. TODO: disable this method

0.15.211.5.86 passedFormulaEnd()

```
ModuleInput::iterator smtrat::Module::passedFormulaEnd ( )
[inline], [protected], [inherited]
```

Returns

An iterator to the end of the passed formula.

0.15.211.5.87 passGB() template<class Settings >

void smtrat::GBModule< Settings >::passGB ( ) [protected]

0.15.211.5.88 popBacktrackPoint() template<class Settings >

void smtrat::GBModule< Settings >::popBacktrackPoint (ModuleInput::const_iterator *btpoint*) [protected]

0.15.211.5.89 pPassedFormula() const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]

Returns

A pointer to the formula passed to the backends of this module.

0.15.211.5.90 pReceivedFormula() const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]

Returns

A pointer to the formula passed to this module.

0.15.211.5.91 print() void smtrat::Module::print (const std::string & *_initiation* = "***") const [inherited]

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

0.15.211.5.92 printAllModels() void smtrat::Module::printAllModels (std::ostream & *_out* = *std::cout*) [inherited]

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.211.5.93 printInfeasibleSubsets() void smtrat::Module::printInfeasibleSubsets (const std::string & *_initiation* = "***") const [inherited]

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

0.15.211.5.94 printModel()

```
void smtrat::Module::printModel (
    std::ostream & _out = std::cout ) const [inherited]
```

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.211.5.95 printPassedFormula()

```
void smtrat::Module::printPassedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

0.15.211.5.96 printReceivedFormula()

```
void smtrat::Module::printReceivedFormula (
    const std::string & _initiation = "***" ) const [inherited]
```

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

0.15.211.5.97 printRewriteRules()

```
template<class Settings >
void smtrat::GBModule< Settings >::printRewriteRules ( )
```

0.15.211.5.98 printStateHistory()

```
template<class Settings >
void smtrat::GBModule< Settings >::printStateHistory ( )
```

0.15.211.5.99 probablyLooping()

```
bool smtrat::Module::probablyLooping (
    const typename Poly::PolyType & _branchingPolynomial,
    const Rational & _branchingValue ) const [protected], [inherited]
```

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns

true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

0.15.211.5.100 processNewConstraint() template<class Settings >

```
void smtrat::GBModule< Settings >::processNewConstraint (
            ModuleInput::const_iterator _formula ) [protected]
```

0.15.211.5.101 pushBacktrackPoint() template<class Settings >

```
void smtrat::GBModule< Settings >::pushBacktrackPoint (
            ModuleInput::const_iterator btpoint ) [protected]
```

0.15.211.5.102 receivedFormulaChecked() void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]

Notifies that the received formulas has been checked.

0.15.211.5.103 receivedFormulasAsInfeasibleSubset() void smtrat::Module::receivedFormulasAs↩InfeasibleSubset (

```
            ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Stores an infeasible subset consisting only of the given received formula.

0.15.211.5.104 receivedVariable() bool smtrat::Module::receivedVariable (

```
            carl::Variable::Arg _var ) const [inline], [inherited]
```

0.15.211.5.105 remove() void smtrat::Module::remove (

```
            ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

0.15.211.5.106 removeCore() [1/2] virtual void smtrat::Module::removeCore (

```
            [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected],
[virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

0.15.211.5.107 removeCore() [2/2] template<class Settings >

```
void smtrat::GBModule< Settings >::removeCore (
            ModuleInput::const_iterator _formula )
```

0.15.211.5.108 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
            ModuleInput::iterator _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

0.15.211.5.109 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected], [inherited]
```

0.15.211.5.110 removeReceivedFormulaFromNewInequalities()

```
template<class Settings >
void smtrat::GBModule< Settings >::removeReceivedFormulaFromNewInequalities (
            ModuleInput::const_iterator _formula )  [protected]
```

0.15.211.5.111 removeSubformulaFromPassedFormula()

```
template<class Settings >
void smtrat::GBModule< Settings >::removeSubformulaFromPassedFormula (
            ModuleInput::iterator _formula )  [protected]
```

0.15.211.5.112 rewriteVariable()

```
template<class Settings >
GBPolynomial smtrat::GBModule< Settings >::rewriteVariable (
            const GBPolynomial & ,
            const carl::Variable & ,
            const TermT & ,
            const BitVector &  )  [inline], [protected]
```

0.15.211.5.113 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const  [inline], [inherited]
```

Returns

A reference to the formula passed to the backends of this module.

0.15.211.5.114 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const  [inline], [inherited]
```

Returns

A reference to the formula passed to this module.

0.15.211.5.115 runBackends() [1/2]

```
virtual Answer smtrat::Module::runBackends ( )  [inline], [protected], [virtual], [inherited]
```

Reimplemented in smtrat::PModule.

0.15.211.5.116 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
            bool _final,
            bool _full,
            carl::Variable _objective )  [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.211.5.117 saveState()

`template<class Settings >`
`bool smtrat::GBModule< Settings >::saveState ( ) [protected]`

0.15.211.5.118 setId()

`void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]`

Sets this modules unique ID to identify itself.

Parameters

↩ _↩ *id*	The id to set this module's id to.

0.15.211.5.119 setThreadPriority()

`void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]`

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

0.15.211.5.120 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns

True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

0.15.211.5.121 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

0.15.211.5.122 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns

The priority of this module to get a thread for running its check procedure.

0.15.211.5.123 transformIntoEquality() `template<class Settings > GBPolynomial smtrat::GBModule< Settings >::transformIntoEquality ( ModuleInput::const_iterator constraint ) [protected]`

0.15.211.5.124 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::SATModule< Settings >.

0.15.211.5.125 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

0.15.211.5.126 updateModel() `void smtrat::Module::updateModel ( ) const [virtual], [inherited]`

Updates the model, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::PModule, smtrat::VSModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::STropModule< Settings >, smtrat::SATModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::MCBModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntEqModule< Settings >, smtrat::IntBlastModule< Settings >, smtrat::IncWidthModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::GBPPModule< Settings >, smtrat::FPPModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::ESModule< Settings >, smtrat::CurryModule< Settings >, smtrat::CubeLIAModule< Se
smtrat::CSplitModule< Settings >, smtrat::CoveringNGModule< Settings >, and smtrat::BVModule< Settings >.

0.15.211.5.127 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.211.5.128 validityCheck() `template<class Settings > bool smtrat::GBModule< Settings >::validityCheck ( ) [protected]`

0.15.211.6 Friends And Related Function Documentation

0.15.211.6.1 InequalitiesTable< Settings > template<class Settings >

friend class InequalitiesTable< Settings > [friend]

0.15.211.7 Field Documentation

0.15.211.7.1 mAdditionalVarMap template<class Settings >

std::map<ConstraintT, carl::Variable> smtrat::GBModule< Settings >::mAdditionalVarMap [protected]

0.15.211.7.2 mAllBackends std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]

The backends of this module which have been used.

0.15.211.7.3 mAllModels std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]

Stores all satisfying assignments.

0.15.211.7.4 mBackendsFoundAnswer std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

0.15.211.7.5 mBacktrackPoints template<class Settings >

std::vector<ModuleInput::const_iterator> smtrat::GBModule< Settings >::mBacktrackPoints [protected]

The vector of backtrack points, which has pointers to received constraints.

0.15.211.7.6 mBasis template<class Settings >

Settings::Groebner smtrat::GBModule< Settings >::mBasis [protected]

The current Groebner basis.

0.15.211.7.7 mConstraintsToInform carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]

Stores the constraints which the backends must be informed about.

0.15.211.7.8 mFinalCheck bool smtrat::Module::mFinalCheck [protected], [inherited]

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

0.15.211.7.9 mFirstPosInLastBranches std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]

The beginning of the cyclic buffer storing the last branches.

0.15.211.7.10 mFirstSubformulaToPass ModuleInput::iterator smtrat::Module::mFirstSubformula↩ ToPass [protected], [inherited]

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.211.7.11 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module↩::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

0.15.211.7.12 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.211.7.13 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

0.15.211.7.14 mGbEqualities

`template<class Settings > FormulasT smtrat::GBModule< Settings >::mGbEqualities [protected]`

A workaround to associate equalities in the passed formula originating from the gb (in contrast to those which originate from simplified formulae)

0.15.211.7.15 mInequalities

`template<class Settings > InequalitiesTable<Settings> smtrat::GBModule< Settings >::mInequalities [protected]`

The inequalities table for handling inequalities.

0.15.211.7.16 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

0.15.211.7.17 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

0.15.211.7.18 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

0.15.211.7.19 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

0.15.211.7.20 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

0.15.211.7.21 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

0.15.211.7.22 mNewInequalities

`template<class Settings > std::list<typename InequalitiesTable<Settings>::Rows::iterator> smtrat::GBModule< Settings >::mNewInequalities [protected]`

A list of inequalities which were added after the last consistency check.

0.15.211.7.23 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

0.15.211.7.24 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

0.15.211.7.25 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

0.15.211.7.26 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

0.15.211.7.27 mRecalculateGB

`template<class Settings > bool smtrat::GBModule< Settings >::mRecalculateGB [protected]`

After popping in the history, it might be necessary to recalculate. This flag indicates this.

0.15.211.7.28 mRewriteRules

`template<class Settings > groebner::RewriteRules smtrat::GBModule< Settings >::mRewriteRules [protected]`

The rewrite rules for the variables.

0.15.211.7.29 mSmallerMusesCheckCounter

`unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

0.15.211.7.30 mSolverState

`std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

0.15.211.7.31 mStateHistory

`template<class Settings > std::list<GBModuleState<Settings> > smtrat::GBModule< Settings >::mStateHistory [protected]`

Saves the relevant history to support backtracking.

0.15.211.7.32 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

0.15.211.7.33 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.211.7.34 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

0.15.212 smtrat::GBModuleState< Settings > Class Template Reference

A class to save the current state of a GBModule.

`#include <GBModuleState.h>`

Public Member Functions

- GBModuleState ()
- GBModuleState (const typename Settings::Groebner &basisCalculation, const std::map< carl::Variable, std::pair< TermT, carl::BitVector > > &rewrites)
- const Settings::Groebner & getBasis () const
- const std::map< carl::Variable, std::pair< TermT, carl::BitVector > > & getRewriteRules () const

Protected Attributes

- const Settings::Groebner mBasis

  The state of the basis.
- const std::map< carl::Variable, std::pair< TermT, carl::BitVector > > mRewrites

0.15.212.1 Detailed Description

template<typename Settings>
class smtrat::GBModuleState< Settings >

A class to save the current state of a GBModule.
Used for backtracking-support

0.15.212.2 Constructor & Destructor Documentation

0.15.212.2.1 GBModuleState() [1/2]

```
template<typename Settings >
smtrat::GBModuleState< Settings >::GBModuleState ( ) [inline]
```

0.15.212.2.2 GBModuleState() [2/2]

```
template<typename Settings >
smtrat::GBModuleState< Settings >::GBModuleState (
            const typename Settings::Groebner & basisCalculation,
            const std::map< carl::Variable, std::pair< TermT, carl::BitVector > > & rewrites
) [inline]
```

`#include <GBPPModule.h>`

Public Types

- typedef Settings SettingsType
- enum class LemmaType : unsigned { NORMAL = 0 , PERMANENT = 1 }

Public Member Functions

- GBPPModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- ~GBPPModule ()
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

  Checks the received formula for consistency.
- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

Partition the variables from the current model into equivalence classes according to their assigned value.

- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

Prints the vector of the received formula.

- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore ([[maybe_unused]] const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore ([[maybe_unused]] const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.

- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.

- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &↩ _premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeft↩ Case=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std↩ ::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.

- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

0.15.213.4 Member Function Documentation

0.15.213.4.1 add()

```
bool smtrat::PModule::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.213.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
    const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

0.15.213.4.3 addCore()

```
virtual bool smtrat::Module::addCore (
    [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected],
[virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.213.4.4 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula
(
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

0.15.213.4.5 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

0.15.213.4.6 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

0.15.213.4.7 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.
Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

0.15.213.4.8 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.
Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.213.4.9 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
    const FormulaT & _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.213.4.10 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.213.4.11 allModels()

```
const std::vector<Model>& smtrat::Module::allModels ( ) const [inline],
[inherited]
```

Returns

All satisfying assignments, if existent.

0.15.213.4.12 anAnswerFound()

```
bool smtrat::Module::anAnswerFound ( ) const [inline], [protected],
[inherited]
```

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns

True, if one of them has determined a result.

0.15.213.4.13 answerFound()

```
const smtrat::Conditionals& smtrat::Module::answerFound ( ) const
[inline], [inherited]
```

Returns

A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.213.4.14 appliedPreprocessing()

`bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]`

Returns

true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

0.15.213.4.15 backendsModel()

`const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

0.15.213.4.16 branchAt() [1/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.213.4.17 branchAt() [2/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

0.15.213.4.18 branchAt() [3/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.213.4.19 branchAt() [4/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

0.15.213.4.20 check()

```
Answer smtrat::PModule::check (
    bool _final = false,
    bool _full = true,
    carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.213.4.21 checkCore()

```
template<typename Settings >
Answer smtrat::GBPPModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.213.4.22 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

0.15.213.4.23 checkModel() `unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns

false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

0.15.213.4.24 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

0.15.213.4.25 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

0.15.213.4.26 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

0.15.213.4.27 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

0.15.213.4.28 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

0.15.213.4.29 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

0.15.213.4.30 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.
If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

0.15.213.4.31 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

0.15.213.4.32 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ToInform ( ) const [inline], [inherited]`

Returns

The constraints which the backends must be informed about.

0.15.213.4.33 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

0.15.213.4.34 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

0.15.213.4.35 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.213.4.36 deinformCore()

`virtual void smtrat::Module::deinformCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only

sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.213.4.37 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns

The index of the smallest (regarding the size of the sets) element of origins

0.15.213.4.38 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module. Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

0.15.213.4.39 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceived↩
VariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

0.15.213.4.40 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::find↩
BestOrigin (
    const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

0.15.213.4.41 firstSubformulaToPass() `ModuleInput::const_iterator smtrat::Module::firstSubformula↩ ToPass ( ) const [inline], [inherited]`

Returns

The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.213.4.42 firstUncheckedReceivedSubformula() `ModuleInput::const_iterator smtrat::Module↩ ::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns

The position of the first (by this module) unchecked sub-formula of the received formula.

0.15.213.4.43 freeSplittingVariable() `static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

0.15.213.4.44 generateTrivialInfeasibleSubset() `void smtrat::Module::generateTrivialInfeasible↩ Subset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

0.15.213.4.45 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

0.15.213.4.46 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

0.15.213.4.47 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

0.15.213.4.48 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::get↩ InfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.
Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns

The infeasible subsets the given backend provides.

0.15.213.4.49 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns

Set of all formulas

0.15.213.4.50 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.
The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns

Equivalence classes.

0.15.213.4.51 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

0.15.213.4.52 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

0.15.213.4.53 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
    ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns

The origins of the passed formula at the given position.

0.15.213.4.54 getReceivedFormulaSimplified() `std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns

A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

0.15.213.4.55 hasLemmas() `bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

0.15.213.4.56 hasValidInfeasibleSubset() `bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns

true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

0.15.213.4.57 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns

A unique ID to identify this module instance.

0.15.213.4.58 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasibleSubsets ( ) const [inline], [inherited]`

Returns

The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

0.15.213.4.59 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.213.4.60 informBackends()

`void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

0.15.213.4.61 informCore()

`virtual bool smtrat::Module::informCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.213.4.62 informedConstraints()

`const carl::FastSet<FormulaT>& smtrat::Module::informedConstraints ( ) const [inline], [inherited]`

Returns

The position of the first constraint of which no backend has been informed about.

0.15.213.4.63 init()

`void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.
This method must not be called twice and only before the first runBackends call.
Reimplemented in smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntBlastModule< Settings >, smtrat::FPPModule< Settings >, smtrat::CurryModule< Settings >, and smtrat::BVModule< Settings >.

0.15.213.4.64 is_minimizing()

`bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

0.15.213.4.65 isLemmaLevel()

`bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

0.15.213.4.66 isPreprocessor() `bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns

true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

0.15.213.4.67 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns

A constant reference to the lemmas being valid formulas this module or its backends made.

0.15.213.4.68 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.
({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns

The vector being the two given vectors merged.

0.15.213.4.69 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns

The assignment of the current satisfiable result, if existent.

0.15.213.4.70 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns

true, if there is no variable assigned by both models; false, otherwise.

0.15.213.4.71 moduleName()

`virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns

The name of the given module type as name.

Reimplemented in smtrat::VSModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::STropModule< Settings >, smtrat::SplitSOSModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntEqModule< Settings >, smtrat::IntBlastModule< Settings >, smtrat::IncWidthModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::GBModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::CurryModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::BVModule< Settings >, and smtrat::BEModule< Settings >.

0.15.213.4.72 objective()

`carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

0.15.213.4.73 originInReceivedFormula()

`bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

0.15.213.4.74 passedFormulaBegin()

`ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula. TODO: disable this method

0.15.213.4.75 passedFormulaEnd()

`ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula.

0.15.213.4.76 pPassedFormula()

`const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to the backends of this module.

0.15.213.4.77 pReceivedFormula()

`const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to this module.

0.15.213.4.78 print()

`void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

0.15.213.4.79 printAllModels()

`void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.213.4.80 printInfeasibleSubsets()

`void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

0.15.213.4.81 printModel()

`void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.213.4.82 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

0.15.213.4.83 printReceivedFormula()

`void smtrat::Module::printReceivedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

0.15.213.4.84 probablyLooping()

`bool smtrat::Module::probablyLooping ( const typename Poly::PolyType & _branchingPolynomial, const Rational & _branchingValue ) const [protected], [inherited]`

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns

true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

0.15.213.4.85 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

0.15.213.4.86 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

0.15.213.4.87 receivedVariable()

`bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

0.15.213.4.88 remove()

`void smtrat::PModule::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

0.15.213.4.89 removeCore()

`virtual void smtrat::Module::removeCore ( [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the

remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

0.15.213.4.90 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin (
            ModuleInput::iterator _formula,
            const FormulaT & _origin ) [inline], [protected], [inherited]
```

0.15.213.4.91 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins (
            ModuleInput::iterator _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected], [inherited]
```

0.15.213.4.92 rPassedFormula()

```
const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]
```

Returns

A reference to the formula passed to the backends of this module.

0.15.213.4.93 rReceivedFormula()

```
const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]
```

Returns

A reference to the formula passed to this module.

0.15.213.4.94 runBackends() [1/2]

```
virtual Answer smtrat::PModule::runBackends ( ) [inline], [virtual], [inherited]
```

Reimplemented from smtrat::Module.

0.15.213.4.95 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
            bool _final,
            bool _full,
            carl::Variable _objective ) [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.213.4.96 setId()

`void smtrat::Module::setId ( std::size_t _id ) [inline], [inherited]`

Sets this modules unique ID to identify itself.

Parameters

↩ _↩ *id*	The id to set this module's id to.

0.15.213.4.97 setThreadPriority()

`void smtrat::Module::setThreadPriority ( thread_priority _threadPriority ) [inline], [inherited]`

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

0.15.213.4.98 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns

True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

0.15.213.4.99 splitUnequalConstraint()

`void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

0.15.213.4.100 threadPriority()

`thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns

The priority of this module to get a thread for running its check procedure.

0.15.213.4.101 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::SATModule< Settings >.

0.15.213.4.102 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

0.15.213.4.103 updateModel() `template<typename Settings > void smtrat::GBPPModule< Settings >::updateModel ( ) const [virtual]`

Updates the current assignment into the model.
Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.
Reimplemented from smtrat::Module.

0.15.213.4.104 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.213.5 Field Documentation

0.15.213.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

0.15.213.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

0.15.213.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

0.15.213.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

0.15.213.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

0.15.213.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

0.15.213.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaToPass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.213.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

0.15.213.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.213.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

0.15.213.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

0.15.213.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

0.15.213.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

0.15.213.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

0.15.213.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

0.15.213.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

0.15.213.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

0.15.213.5.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

0.15.213.5.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

0.15.213.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

0.15.213.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

0.15.213.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

0.15.213.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheoryPropagations [protected], [inherited]`

0.15.213.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.213.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

0.15.229 smtrat::ICEModule< Settings > Class Template Reference

`#include <ICEModule.h>`

Public Types

- typedef Settings SettingsType
- enum class LemmaType : unsigned { NORMAL = 0 , PERMANENT = 1 }

Public Member Functions

- ICEModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=nullptr)
- ~ICEModule ()
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool isPreprocessor () const
- bool appliedPreprocessing () const
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_VARIABLE)

Checks the received formula for consistency.

- Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void updateModel () const

  Updates the current assignment into the model.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- virtual std::string moduleName () const
- carl::Variable objective () const
- bool is_minimizing () const

- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore ([[maybe_unused]] const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore ([[maybe_unused]] const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore ([[maybe_unused]] ModuleInput::const_iterator formula)

Removes everything related to the given sub-formula of the received formula.

- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.

- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

false, if this module should avoid too expensive procedures and rather return unknown instead.

- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

0.15.229.4.1 add()

```
bool smtrat::PModule::add (
            ModuleInput::const_iterator _subformula ) [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.229.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
            const FormulaT & _constraint ) [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

0.15.229.4.3 addCore() [1/2]

```
virtual bool smtrat::Module::addCore (
            [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected],
[virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.229.4.4 addCore() [2/2] template<typename Settings >

```
bool smtrat::ICEModule< Settings >::addCore (
            ModuleInput::const_iterator _subformula )
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.229.4.5 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
            const FormulaT & formula )  [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

0.15.229.4.6 addLemma()

```
void smtrat::Module::addLemma (
            const FormulaT & _lemma,
            const LemmaType & _lt = LemmaType::NORMAL,
            const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) )  [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

0.15.229.4.7 addOrigin()

```
void smtrat::Module::addOrigin (
            ModuleInput::iterator _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

0.15.229.4.8 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
            ModuleInput::const_iterator _subformula )  [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.
Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

0.15.229.4.9 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.
Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.229.4.10 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.229.4.11 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.229.4.12 allModels() `const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns

All satisfying assignments, if existent.

0.15.229.4.13 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns

True, if one of them has determined a result.

0.15.229.4.14 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns

A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.229.4.15 appliedPreprocessing() `bool smtrat::PModule::appliedPreprocessing ( ) const [inline], [inherited]`

Returns

true, if the current received formula has been simplified and the result of this simplification is stored in the passed formula.

0.15.229.4.16 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

0.15.229.4.17 branchAt() [1/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

0.15.229.4.18 branchAt() [2/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

0.15.229.4.19 branchAt() [3/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

0.15.229.4.20 branchAt() [4/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

0.15.229.4.21 check()

```
Answer smtrat::PModule::check (
    bool _final = false,
    bool _full = true,
    carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.229.4.22 checkCore()

```
template<typename Settings >
Answer smtrat::ICEModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Returns

SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.229.4.23 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
    std::vector< FormulaSetT >::const_iterator _infsubset,
    const std::string & _filename = "smaller_muses",
    unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

0.15.229.4.24 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns

false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

0.15.229.4.25 cleanModel() `void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

0.15.229.4.26 clearLemmas() `void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

0.15.229.4.27 clearModel() `void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

0.15.229.4.28 clearModels() `void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

0.15.229.4.29 clearPassedFormula() `void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

0.15.229.4.30 collectOrigins() [1/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulaSetT & _origins ) const [inherited]`

0.15.229.4.31 collectOrigins() [2/2] `void smtrat::Module::collectOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inherited]`

Collects the formulas in the given formula, which are part of the received formula.
If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

0.15.229.4.32 collectTheoryPropagations() `void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

0.15.229.4.33 constraintsToInform() `const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns

The constraints which the backends must be informed about.

0.15.229.4.34 currentlySatisfied()

`virtual unsigned smtrat::Module::currentlySatisfied ( const FormulaT & ) const [inline], [virtual], [inherited]`

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

0.15.229.4.35 currentlySatisfiedByBackend()

`unsigned smtrat::Module::currentlySatisfiedByBackend ( const FormulaT & _formula ) const [inherited]`

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

0.15.229.4.36 deinform()

`void smtrat::Module::deinform ( const FormulaT & _constraint ) [inherited]`

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.229.4.37 deinformCore()

`virtual void smtrat::Module::deinformCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.229.4.38 determine_smallest_origin()

`size_t smtrat::Module::determine_smallest_origin ( const std::vector< FormulaT > & origins ) const [protected], [inherited]`

Parameters

origins	A vector of sets of origins.

Returns

The index of the smallest (regarding the size of the sets) element of origins

0.15.229.4.39 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::eraseSubformulaFromPassedFormula (
            ModuleInput::iterator _subformula,
            bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module. Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

0.15.229.4.40 excludeNotReceivedVariablesFromModel()

```
void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]
```

Excludes all variables from the current model, which do not occur in the received formula.

0.15.229.4.41 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
            const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

0.15.229.4.42 firstSubformulaToPass()

```
ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]
```

Returns

The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.229.4.43 firstUncheckedReceivedSubformula()

```
ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]
```

Returns

The position of the first (by this module) unchecked sub-formula of the received formula.

0.15.229.4.44 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

0.15.229.4.45 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasible↩ Subset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

0.15.229.4.46 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

0.15.229.4.47 getBackendsModel()

`void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

0.15.229.4.48 getInfeasibleSubsets() [1/2]

`void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

0.15.229.4.49 getInfeasibleSubsets() [2/2]

`std::vector< FormulaSetT > smtrat::Module::get↩ InfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.
Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns

The infeasible subsets the given backend provides.

0.15.229.4.50 getInformationRelevantFormulas()

`const std::set< FormulaT > & smtrat::Module↩ ::getInformationRelevantFormulas ( ) [protected], [inherited]`

Gets all InformationRelevantFormulas.

Returns

Set of all formulas

0.15.229.4.51 getModelEqualities()

`std::list< std::vector< carl::Variable > > smtrat::Module↩ ::getModelEqualities ( ) const [virtual], [inherited]`

Partition the variables from the current model into equivalence classes according to their assigned value.
The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns

Equivalence classes.

0.15.229.4.52 getOrigins() [1/3]

```
void smtrat::Module::getOrigins (
const FormulaT & _formula,
FormulaSetT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

0.15.229.4.53 getOrigins() [2/3]

```
void smtrat::Module::getOrigins (
const FormulaT & _formula,
FormulasT & _origins ) const [inline], [protected], [inherited]
```

Parameters

_formula	
_origins	

0.15.229.4.54 getOrigins() [3/3]

```
const FormulaT& smtrat::Module::getOrigins (
ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]
```

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns

The origins of the passed formula at the given position.

0.15.229.4.55 getReceivedFormulaSimplified()

```
std::pair< bool, FormulaT > smtrat::PModule::getReceivedFormulaSimplified ( ) [virtual], [inherited]
```

Returns

A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented from smtrat::Module.

0.15.229.4.56 hasLemmas()

```
bool smtrat::Module::hasLemmas ( ) [inline], [inherited]
```

Checks whether this module or any of its backends provides any lemmas.

0.15.229.4.57 hasValidInfeasibleSubset()

```
bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]
```

Returns

true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

0.15.229.4.58 id() `std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns

A unique ID to identify this module instance.

0.15.229.4.59 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns

The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

0.15.229.4.60 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.229.4.61 informBackends() `void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

0.15.229.4.62 informCore() `virtual bool smtrat::Module::informCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.229.4.63 informedConstraints()

`const carl::FastSet<FormulaT>& smtrat::Module::informedConstraints ( ) const [inline], [inherited]`

Returns

The position of the first constraint of which no backend has been informed about.

0.15.229.4.64 init()

`void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.
This method must not be called twice and only before the first runBackends call.
Reimplemented in smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntBlastModule< Settings >, smtrat::FPPModule< Settings >, smtrat::CurryModule< Settings >, and smtrat::BVModule< Settings >.

0.15.229.4.65 is_minimizing()

`bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

0.15.229.4.66 isLemmaLevel()

`bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

0.15.229.4.67 isPreprocessor()

`bool smtrat::PModule::isPreprocessor ( ) const [inline], [inherited]`

Returns

true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

0.15.229.4.68 lemmas()

`const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns

A constant reference to the lemmas being valid formulas this module or its backends made.

0.15.229.4.69 merge()

`std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.
({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns

The vector being the two given vectors merged.

0.15.229.4.70 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns

The assignment of the current satisfiable result, if existent.

0.15.229.4.71 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns

true, if there is no variable assigned by both models; false, otherwise.

0.15.229.4.72 moduleName() `virtual std::string smtrat::Module::moduleName ( ) const [inline], [virtual], [inherited]`

Returns

The name of the given module type as name.

Reimplemented in smtrat::VSModule< Settings >, smtrat::UnionFindModule< Settings >, smtrat::UFCegarModule< Settings >, smtrat::STropModule< Settings >, smtrat::SplitSOSModule< Settings >, smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LVEModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntEqModule< Settings >, smtrat::IntBlastModule< Settings >, smtrat::IncWidthModule< Settings >, smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, smtrat::ICPModule< ICPSettings1 >, smtrat::GBModule< Settings >, smtrat::FouMoModule< Settings >, smtrat::CurryModule< Settings >, smtrat::CubeLIAModule< Settings >, smtrat::CSplitModule< Settings >, smtrat::BVModule< Settings >, and smtrat::BEModule< Settings >.

0.15.229.4.73 objective() `carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

0.15.229.4.74 originInReceivedFormula() `bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

0.15.229.4.75 passedFormulaBegin() `ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula. TODO: disable this method

0.15.229.4.76 passedFormulaEnd() `ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula.

0.15.229.4.77 pPassedFormula() `const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to the backends of this module.

0.15.229.4.78 pReceivedFormula() `const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to this module.

0.15.229.4.79 print() `void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

0.15.229.4.80 printAllModels() `void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.229.4.81 printInfeasibleSubsets() `void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

0.15.229.4.82 printModel() `void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.229.4.83 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

0.15.229.4.84 printReceivedFormula()

`void smtrat::Module::printReceivedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

0.15.229.4.85 probablyLooping()

`bool smtrat::Module::probablyLooping ( const typename Poly::PolyType & _branchingPolynomial, const Rational & _branchingValue ) const [protected], [inherited]`

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns

true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

0.15.229.4.86 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

0.15.229.4.87 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

0.15.229.4.88 receivedVariable()

```
bool smtrat::Module::receivedVariable (
    carl::Variable::Arg _var ) const [inline], [inherited]
```

0.15.229.4.89 remove()

```
void smtrat::PModule::remove (
    ModuleInput::const_iterator _subformula ) [virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented from smtrat::Module.

0.15.229.4.90 removeCore() [1/2]

```
virtual void smtrat::Module::removeCore (
    [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected],
[virtual], [inherited]
```

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

0.15.229.4.91 removeCore() [2/2]

```
template<typename Settings >
void smtrat::ICEModule< Settings >::removeCore (
    ModuleInput::const_iterator _subformula )
```

Removes the subformula of the received formula at the given position to the considered ones of this module.
Note that this includes every stored calculation which depended on this subformula, but should keep the other stored calculation, if possible, untouched.

Parameters

_subformula	The position of the subformula to remove.

0.15.229.4.92 removeOrigin()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

0.15.229.4.93 removeOrigins()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::remove↩
Origins (
    ModuleInput::iterator _formula,
    const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected],
[inherited]
```

0.15.229.4.94 rPassedFormula() `const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]`

Returns

A reference to the formula passed to the backends of this module.

0.15.229.4.95 rReceivedFormula() `const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]`

Returns

A reference to the formula passed to this module.

0.15.229.4.96 runBackends() [1/2] `virtual Answer smtrat::PModule::runBackends ( ) [inline], [virtual], [inherited]`

Reimplemented from smtrat::Module.

0.15.229.4.97 runBackends() [2/2]

```
Answer smtrat::PModule::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT.
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.229.4.98 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ _↩ *id*	The id to set this module's id to.

0.15.229.4.99 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

0.15.229.4.100 solverState() `Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns

True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

0.15.229.4.101 splitUnequalConstraint() `void smtrat::Module::splitUnequalConstraint ( const FormulaT & _unequalConstraint ) [protected], [inherited]`

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

0.15.229.4.102 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns

The priority of this module to get a thread for running its check procedure.

0.15.229.4.103 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::SATModule< Settings >.

0.15.229.4.104 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

0.15.229.4.105 updateModel() `void smtrat::PModule::updateModel ( ) const [virtual], [inherited]`

Updates the current assignment into the model.
Note, that this is a unique but possibly symbolic assignment maybe containing newly introduced variables.
Reimplemented from smtrat::Module.

0.15.229.4.106 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.229.5 Field Documentation

0.15.229.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

0.15.229.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

0.15.229.5.3 mBackendsFoundAnswer `std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

0.15.229.5.4 mConstraintsToInform `carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

0.15.229.5.5 mFinalCheck `bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

0.15.229.5.6 mFirstPosInLastBranches `std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

0.15.229.5.7 mFirstSubformulaToPass `ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩ Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.229.5.8 mFirstUncheckedReceivedSubformula `ModuleInput::const_iterator smtrat::Module↩ ::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

0.15.229.5.9 mFoundAnswer `Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.229.5.10 mFullCheck `bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

0.15.229.5.11 mInfeasibleSubsets `std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

0.15.229.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

0.15.229.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

0.15.229.5.14 mLemmas

`std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

0.15.229.5.15 mModel

`Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

0.15.229.5.16 mModelComputed

`bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

0.15.229.5.17 mNumOfBranchVarsToStore

`std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

0.15.229.5.18 mObjectiveVariable

`carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

0.15.229.5.19 mOldSplittingVariables

`std::vector< FormulaT > smtrat::Module::mOldSplittingVariables [static], [inherited]`

Reusable splitting variables.

0.15.229.5.20 mpManager

`Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

0.15.229.5.21 mSmallerMusesCheckCounter

`unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

0.15.229.5.22 mSolverState

`std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

0.15.229.5.23 mTheoryPropagations

`std::vector<TheoryPropagation> smtrat::Module::mTheoryPropagations [protected], [inherited]`

0.15.229.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.229.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

0.15.230 smtrat::ICPModule< Settings > Class Template Reference

`#include <ICPModule.h>`

- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

  Stores all lemmas of any backend of this module in its own lemma vector.
- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _↩ ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- virtual bool informCore ([[maybe_unused]] const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore ([[maybe_unused]] const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

  Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.
- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.

- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.
- virtual Answer runBackends ()
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const

- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions
- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

Destructor:

0.15.230.4 Member Function Documentation

0.15.230.4.1 add()

```
bool smtrat::Module::add (
            ModuleInput::const_iterator _subformula )  [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.230.4.2 addConstraintToInform()

```
void smtrat::Module::addConstraintToInform (
            const FormulaT & _constraint )  [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

0.15.230.4.3 addCore() [1/2]

```
virtual bool smtrat::Module::addCore (
            [[maybe_unused] ] ModuleInput::const_iterator formula )  [inline], [protected],
[virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.230.4.4 addCore() [2/2]

```
template<class Settings >
bool smtrat::ICPModule< Settings >::addCore (
            ModuleInput::const_iterator  )
```

0.15.230.4.5 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula (
    const FormulaT & formula ) [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

0.15.230.4.6 addLemma()

```
void smtrat::Module::addLemma (
    const FormulaT & _lemma,
    const LemmaType & _lt = LemmaType::NORMAL,
    const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) ) [inline], [inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

0.15.230.4.7 addOrigin()

```
void smtrat::Module::addOrigin (
    ModuleInput::iterator _formula,
    const FormulaT & _origin ) [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

0.15.230.4.8 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool> smtrat::Module::addReceivedSubformulaToPassedFormula (
    ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.
Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

0.15.230.4.9 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
```

```
const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.
Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.230.4.10 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.230.4.11 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.230.4.12 allModels() `const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns

All satisfying assignments, if existent.

0.15.230.4.13 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns

True, if one of them has determined a result.

0.15.230.4.14 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns

A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.230.4.15 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

0.15.230.4.16 branchAt() [1/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.230.4.17 branchAt() [2/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

0.15.230.4.18 branchAt() [3/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.230.4.19 branchAt() [4/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

0.15.230.4.20 check()

```
Answer smtrat::Module::check (
    bool _final = false,
    bool _full = true,
    carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.230.4.21 checkCore()

```
template<class Settings >
Answer smtrat::ICPModule< Settings >::checkCore ( ) [virtual]
```

Checks the received formula for consistency.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.230.4.22 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
std::vector< FormulaSetT >::const_iterator _infsubset,
const std::string & _filename = "smaller_muses",
unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

0.15.230.4.23 checkModel()

```
unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]
```

Returns

false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

0.15.230.4.24 cleanModel()

```
void smtrat::Module::cleanModel ( ) const [inline], [protected],
[inherited]
```

Substitutes variable occurrences by its model value in the model values of other variables.

0.15.230.4.25 clearLemmas()

```
void smtrat::Module::clearLemmas ( ) [inline], [inherited]
```

Deletes all yet found lemmas.

0.15.230.4.26 clearModel()

```
void smtrat::Module::clearModel ( ) const [inline], [protected],
[inherited]
```

Clears the assignment, if any was found.

0.15.230.4.27 clearModels()

```
void smtrat::Module::clearModels ( ) const [inline], [protected],
[inherited]
```

Clears all assignments, if any was found.

0.15.230.4.28 clearPassedFormula()

`void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

0.15.230.4.29 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

0.15.230.4.30 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.
If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

0.15.230.4.31 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

0.15.230.4.32 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ToInform ( ) const [inline], [inherited]`

Returns

The constraints which the backends must be informed about.

0.15.230.4.33 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

0.15.230.4.34 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

0.15.230.4.35 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.230.4.36 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual],
[inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.230.4.37 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns

The index of the smallest (regarding the size of the sets) element of origins

0.15.230.4.38 eraseSubformulaFromPassedFormula()

```
template<class Settings >
ModuleInput::iterator smtrat::ICPModule< Settings >::eraseSubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module. Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.
_ignoreOrigins	SAT, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented from smtrat::Module.

0.15.230.4.39 excludeNotReceivedVariablesFromModel()

`void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]`

Excludes all variables from the current model, which do not occur in the received formula.

0.15.230.4.40 findBestOrigin()

`std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin ( const std::vector< FormulaT > & _origins ) const [protected], [inherited]`

Parameters

_origins	

Returns

0.15.230.4.41 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns

The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.230.4.42 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns

The position of the first (by this module) unchecked sub-formula of the received formula.

0.15.230.4.43 freeSplittingVariable()

`static void smtrat::Module::freeSplittingVariable ( const FormulaT & _splittingVariable ) [inline], [static], [inherited]`

0.15.230.4.44 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

0.15.230.4.45 getBackendsAllModels()

`void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

0.15.230.4.46 getBackendsModel()

`void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

0.15.230.4.47 getCurrentBoxAsFormulas()

`template<class Settings > FormulasT smtrat::ICPModule< Settings >::getCurrentBoxAsFormulas ( ) const`

0.15.230.4.48 getCurrentBoxAsIntervals() template<class Settings >

EvalRationalIntervalMap smtrat::ICPModule< Settings >::getCurrentBoxAsIntervals ( ) const

0.15.230.4.49 getInfeasibleSubsets() [1/2] void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]

Copies the infeasible subsets of the passed formula.

0.15.230.4.50 getInfeasibleSubsets() [2/2] std::vector< FormulaSetT > smtrat::Module::get↩InfeasibleSubsets (

const Module & *_backend*) const [protected], [inherited]

Get the infeasible subsets the given backend provides.
Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns

The infeasible subsets the given backend provides.

0.15.230.4.51 getInformationRelevantFormulas() const std::set< FormulaT > & smtrat::Module↩::getInformationRelevantFormulas ( ) [protected], [inherited]

Gets all InformationRelevantFormulas.

Returns

Set of all formulas

0.15.230.4.52 getModelEqualities() std::list< std::vector< carl::Variable > > smtrat::Module↩::getModelEqualities ( ) const [virtual], [inherited]

Partition the variables from the current model into equivalence classes according to their assigned value.
The result is a set of equivalence classes of variables where all variables within one class are assigned the same value. Note that the number of classes may not be minimal, i.e. two classes may actually be equivalent.

Returns

Equivalence classes.

0.15.230.4.53 getOrigins() [1/3] void smtrat::Module::getOrigins (

const FormulaT & *_formula*,
FormulaSetT & *_origins*) const [inline], [protected], [inherited]

Parameters

_formula	
_origins	

0.15.230.4.54 getOrigins() [2/3]

`void smtrat::Module::getOrigins ( const FormulaT & _formula, FormulasT & _origins ) const [inline], [protected], [inherited]`

Parameters

_formula	
_origins	

0.15.230.4.55 getOrigins() [3/3]

`const FormulaT& smtrat::Module::getOrigins ( ModuleInput::const_iterator _formula ) const [inline], [protected], [inherited]`

Gets the origins of the passed formula at the given position.

Parameters

_formula	The position of a formula in the passed formulas.

Returns

The origins of the passed formula at the given position.

0.15.230.4.56 getReceivedFormulaSimplified()

`std::pair< bool, FormulaT > smtrat::Module::getReceivedFormulaSimplified ( ) [virtual], [inherited]`

Returns

A pair of a Boolean and a formula, where the Boolean is true, if the received formula could be simplified to an equisatisfiable formula. The formula is equisatisfiable to this module's reveived formula, if the Boolean is true.

Reimplemented in smtrat::PModule.

0.15.230.4.57 hasLemmas()

`bool smtrat::Module::hasLemmas ( ) [inline], [inherited]`

Checks whether this module or any of its backends provides any lemmas.

0.15.230.4.58 hasValidInfeasibleSubset()

`bool smtrat::Module::hasValidInfeasibleSubset ( ) const [inherited]`

Returns

true, if the module has at least one valid infeasible subset, that is all its elements are sub-formulas of the received formula (pointer must be equal).

0.15.230.4.59 id()

`std::size_t smtrat::Module::id ( ) const [inline], [inherited]`

Returns

A unique ID to identify this module instance.

0.15.230.4.60 infeasibleSubsets() `const std::vector<FormulaSetT>& smtrat::Module::infeasible↩ Subsets ( ) const [inline], [inherited]`

Returns

The infeasible subsets of the set of received formulas (empty, if this module has not detected unsatisfiability of the conjunction of received formulas.

0.15.230.4.61 inform() `bool smtrat::Module::inform ( const FormulaT & _constraint ) [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.230.4.62 informBackends() `void smtrat::Module::informBackends ( const FormulaT & _constraint ) [inline], [protected], [inherited]`

Informs all backends of this module about the given constraint.

Parameters

_constraint	The constraint to inform about.

0.15.230.4.63 informCore() [1/2] `virtual bool smtrat::Module::informCore ( [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual], [inherited]`

Informs the module about the given constraint.
It should be tried to inform this module about any constraint it could receive eventually before assertSubformula is called (preferably for the first time, but at least before adding a formula containing that constraint).

Parameters

_constraint	The constraint to inform about.

Returns

false, if it can be easily decided whether the given constraint is inconsistent; true, otherwise.

0.15.230.4.64 informCore() [2/2] `template<class Settings > bool smtrat::ICPModule< Settings >::informCore ( const FormulaT & )`

0.15.230.4.65 informedConstraints() `const carl::FastSet<FormulaT>& smtrat::Module::informedConstraints ( ) const [inline], [inherited]`

Returns

The position of the first constraint of which no backend has been informed about.

0.15.230.4.66 init() `void smtrat::Module::init ( ) [virtual], [inherited]`

Informs all backends about the so far encountered constraints, which have not yet been communicated.
This method must not be called twice and only before the first runBackends call.
Reimplemented in smtrat::PBPPModule< Settings >, smtrat::PBGaussModule< Settings >, smtrat::NRAILModule< Settings >, smtrat::NewCoveringModule< Settings >, smtrat::NewCADModule< Settings >, smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, smtrat::LRAModule< LRASettings1 >, smtrat::IntBlastModule< Settings >, smtrat::FPPModule< Settings >, smtrat::CurryModule< Settings >, and smtrat::BVModule< Settings >.

0.15.230.4.67 is_minimizing() `bool smtrat::Module::is_minimizing ( ) const [inline], [inherited]`

0.15.230.4.68 isLemmaLevel() `bool smtrat::Module::isLemmaLevel ( LemmaLevel level ) [protected], [inherited]`

Checks if current lemma level is greater or equal to given level.

Parameters

level	Level to check.

0.15.230.4.69 isPreprocessor() `bool smtrat::Module::isPreprocessor ( ) const [inline], [inherited]`

Returns

true, if this module is a preprocessor that is a module, which simplifies its received formula to an equisatisfiable formula being passed to its backends. The simplified formula can be obtained with getReceivedFormulaSimplified().

0.15.230.4.70 lemmas() `const std::vector<Lemma>& smtrat::Module::lemmas ( ) const [inline], [inherited]`

Returns

A constant reference to the lemmas being valid formulas this module or its backends made.

0.15.230.4.71 merge() `std::vector< FormulaT > smtrat::Module::merge ( const std::vector< FormulaT > & _vecSetA, const std::vector< FormulaT > & _vecSetB ) const [protected], [inherited]`

Merges the two vectors of sets into the first one.
({a,b},{a,c}) and ({b,d},{b}) -> ({a,b,d},{a,b},{a,b,c,d},{a,b,c})

Parameters

_vecSetA	A vector of sets of constraints.
_vecSetB	A vector of sets of constraints.

Returns

The vector being the two given vectors merged.

0.15.230.4.72 model() `const Model& smtrat::Module::model ( ) const [inline], [inherited]`

Returns

The assignment of the current satisfiable result, if existent.

0.15.230.4.73 modelsDisjoint() `bool smtrat::Module::modelsDisjoint ( const Model & _modelA, const Model & _modelB ) [static], [protected], [inherited]`

Checks whether there is no variable assigned by both models.

Parameters

_modelA	The first model to check for.
_modelB	The second model to check for.

Returns

true, if there is no variable assigned by both models; false, otherwise.

0.15.230.4.74 moduleName() `template<class Settings > std::string smtrat::ICPModule< Settings >::moduleName ( ) const [inline], [virtual]`

Returns

The name of the given module type as name.

Reimplemented from smtrat::Module.

0.15.230.4.75 objective() `carl::Variable smtrat::Module::objective ( ) const [inline], [inherited]`

0.15.230.4.76 originInReceivedFormula() `bool smtrat::Module::originInReceivedFormula ( const FormulaT & _origin ) const [protected], [inherited]`

0.15.230.4.77 passedFormulaBegin() `ModuleInput::iterator smtrat::Module::passedFormulaBegin ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula. TODO: disable this method

0.15.230.4.78 passedFormulaEnd() `ModuleInput::iterator smtrat::Module::passedFormulaEnd ( ) [inline], [protected], [inherited]`

Returns

An iterator to the end of the passed formula.

0.15.230.4.79 pPassedFormula() `const ModuleInput* smtrat::Module::pPassedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to the backends of this module.

0.15.230.4.80 pReceivedFormula() `const ModuleInput* smtrat::Module::pReceivedFormula ( ) const [inline], [inherited]`

Returns

A pointer to the formula passed to this module.

0.15.230.4.81 print() `void smtrat::Module::print ( const std::string & _initiation = "***" ) const [inherited]`

Prints everything relevant of the solver.

Parameters

_initiation	The line initiation.

0.15.230.4.82 printAllModels() `void smtrat::Module::printAllModels ( std::ostream & _out = std::cout ) [inherited]`

Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.230.4.83 printInfeasibleSubsets() `void smtrat::Module::printInfeasibleSubsets ( const std::string & _initiation = "***" ) const [inherited]`

Prints the infeasible subsets.

Parameters

_initiation	The line initiation.

0.15.230.4.84 printModel() `void smtrat::Module::printModel ( std::ostream & _out = std::cout ) const [inherited]`

Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Parameters

_out	The stream to print the assignment on.

0.15.230.4.85 printPassedFormula()

`void smtrat::Module::printPassedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of passed formula.

Parameters

_initiation	The line initiation.

0.15.230.4.86 printReceivedFormula()

`void smtrat::Module::printReceivedFormula ( const std::string & _initiation = "***" ) const [inherited]`

Prints the vector of the received formula.

Parameters

_initiation	The line initiation.

0.15.230.4.87 probablyLooping()

`bool smtrat::Module::probablyLooping ( const typename Poly::PolyType & _branchingPolynomial, const Rational & _branchingValue ) const [protected], [inherited]`

Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.

Parameters

_branchingPolynomial	The polynomial to branch at (in most branching strategies this is just a variable).
_branchingValue	The value to branch at.

Returns

true, if this branching is probably part of an infinite loop of branchings; false, otherwise.

0.15.230.4.88 receivedFormulaChecked()

`void smtrat::Module::receivedFormulaChecked ( ) [inline], [inherited]`

Notifies that the received formulas has been checked.

0.15.230.4.89 receivedFormulasAsInfeasibleSubset()

`void smtrat::Module::receivedFormulasAs↩InfeasibleSubset ( ModuleInput::const_iterator _subformula ) [inline], [protected], [inherited]`

Stores an infeasible subset consisting only of the given received formula.

0.15.230.4.90 receivedVariable()

`bool smtrat::Module::receivedVariable ( carl::Variable::Arg _var ) const [inline], [inherited]`

0.15.230.4.91 remove()

`void smtrat::Module::remove ( ModuleInput::const_iterator _subformula ) [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

_subformula	The sub formula of the received formula to remove.

Reimplemented in smtrat::PModule.

0.15.230.4.92 removeCore() [1/2]

`virtual void smtrat::Module::removeCore ( [[maybe_unused] ] ModuleInput::const_iterator formula ) [inline], [protected], [virtual], [inherited]`

Removes everything related to the given sub-formula of the received formula.
However, it is desired not to lose track of search spaces where no satisfying assignment can be found for the remaining sub-formulas.

Parameters

formula	The sub formula of the received formula to remove.

0.15.230.4.93 removeCore() [2/2]

`template<class Settings > void smtrat::ICPModule< Settings >::removeCore ( ModuleInput::const_iterator )`

0.15.230.4.94 removeOrigin()

`std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigin ( ModuleInput::iterator _formula, const FormulaT & _origin ) [inline], [protected], [inherited]`

0.15.230.4.95 removeOrigins()

`std::pair<ModuleInput::iterator,bool> smtrat::Module::removeOrigins ( ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> & _origins ) [inline], [protected], [inherited]`

0.15.230.4.96 rPassedFormula()

`const ModuleInput& smtrat::Module::rPassedFormula ( ) const [inline], [inherited]`

Returns

A reference to the formula passed to the backends of this module.

0.15.230.4.97 rReceivedFormula()

`const ModuleInput& smtrat::Module::rReceivedFormula ( ) const [inline], [inherited]`

Returns

A reference to the formula passed to this module.

0.15.230.4.98 runBackends() [1/2]

`virtual Answer smtrat::Module::runBackends ( ) [inline], [protected], [virtual], [inherited]`

Reimplemented in smtrat::PModule.

0.15.230.4.99 runBackends() [2/2]

```
Answer smtrat::Module::runBackends (
    bool _final,
    bool _full,
    carl::Variable _objective ) [protected], [virtual], [inherited]
```

Runs the backend solvers on the passed formula.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the passed formula is consistent; False, if the passed formula is inconsistent; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.230.4.100 setId()

```
void smtrat::Module::setId (
    std::size_t _id ) [inline], [inherited]
```

Sets this modules unique ID to identify itself.

Parameters

↩ _↩ *id*	The id to set this module's id to.

0.15.230.4.101 setThreadPriority()

```
void smtrat::Module::setThreadPriority (
    thread_priority _threadPriority ) [inline], [inherited]
```

Sets the priority of this module to get a thread for running its check procedure.

Parameters

_threadPriority	The priority to set this module's thread priority to.

0.15.230.4.102 solverState()

`Answer smtrat::Module::solverState ( ) const [inline], [inherited]`

Returns

True, if this module is in a state, such that it has found a solution for its received formula; False, if this module is in a state, such that it has determined that there is no solution for its received formula; Unknown, otherwise.

0.15.230.4.103 splitUnequalConstraint()

```
void smtrat::Module::splitUnequalConstraint (
    const FormulaT & _unequalConstraint ) [protected], [inherited]
```

Adds the following lemmas for the given constraint p!=0.

```
(p!=0 <-> (p<0 or p>0))
```

and not(p<0 and p>0)

Parameters

_unequalConstraint	A constraint having the relation symbol !=.

0.15.230.4.104 threadPriority() `thread_priority smtrat::Module::threadPriority ( ) const [inline], [inherited]`

Returns

The priority of this module to get a thread for running its check procedure.

0.15.230.4.105 updateAllModels() `void smtrat::Module::updateAllModels ( ) [virtual], [inherited]`

Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented in smtrat::SATModule< Settings >.

0.15.230.4.106 updateLemmas() `void smtrat::Module::updateLemmas ( ) [inherited]`

Stores all lemmas of any backend of this module in its own lemma vector.

0.15.230.4.107 updateModel() `template<class Settings > void smtrat::ICPModule< Settings >::updateModel ( ) const [virtual]`

Updates the model, if the solver has detected the consistency of the received formula, beforehand.
Reimplemented from smtrat::Module.

0.15.230.4.108 usedBackends() `const std::vector<Module*>& smtrat::Module::usedBackends ( ) const [inline], [inherited]`

Returns

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.230.5 Field Documentation

0.15.230.5.1 mAllBackends `std::vector<Module*> smtrat::Module::mAllBackends [protected], [inherited]`

The backends of this module which have been used.

0.15.230.5.2 mAllModels `std::vector<Model> smtrat::Module::mAllModels [mutable], [protected], [inherited]`

Stores all satisfying assignments.

0.15.230.5.3 mBackendsFoundAnswer

`std::atomic_bool* smtrat::Module::mBackendsFoundAnswer [protected], [inherited]`

This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.

0.15.230.5.4 mConstraintsToInform

`carl::FastSet<FormulaT> smtrat::Module::mConstraintsToInform [protected], [inherited]`

Stores the constraints which the backends must be informed about.

0.15.230.5.5 mFinalCheck

`bool smtrat::Module::mFinalCheck [protected], [inherited]`

true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

0.15.230.5.6 mFirstPosInLastBranches

`std::size_t smtrat::Module::mFirstPosInLastBranches = 0 [static], [inherited]`

The beginning of the cyclic buffer storing the last branches.

0.15.230.5.7 mFirstSubformulaToPass

`ModuleInput::iterator smtrat::Module::mFirstSubformulaTo↩Pass [protected], [inherited]`

Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.230.5.8 mFirstUncheckedReceivedSubformula

`ModuleInput::const_iterator smtrat::Module↩::mFirstUncheckedReceivedSubformula [protected], [inherited]`

Stores the position of the first (by this module) unchecked sub-formula of the received formula.

0.15.230.5.9 mFoundAnswer

`Conditionals smtrat::Module::mFoundAnswer [protected], [inherited]`

Vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.230.5.10 mFullCheck

`bool smtrat::Module::mFullCheck [protected], [inherited]`

false, if this module should avoid too expensive procedures and rather return unknown instead.

0.15.230.5.11 mInfeasibleSubsets

`std::vector<FormulaSetT> smtrat::Module::mInfeasibleSubsets [protected], [inherited]`

Stores the infeasible subsets.

0.15.230.5.12 mInformedConstraints

`carl::FastSet<FormulaT> smtrat::Module::mInformedConstraints [protected], [inherited]`

Stores the position of the first constraint of which no backend has been informed about.

0.15.230.5.13 mLastBranches

`std::vector< Branching > smtrat::Module::mLastBranches = std↩::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0)) [static], [inherited]`

Stores the last branches in a cycle buffer.

0.15.230.5.14 mLemmas `std::vector<Lemma> smtrat::Module::mLemmas [protected], [inherited]`

Stores the lemmas being valid formulas this module or its backends made.

0.15.230.5.15 mModel `Model smtrat::Module::mModel [mutable], [protected], [inherited]`

Stores the assignment of the current satisfiable result, if existent.

0.15.230.5.16 mModelComputed `bool smtrat::Module::mModelComputed [mutable], [protected], [inherited]`

True, if the model has already been computed.

0.15.230.5.17 mNumOfBranchVarsToStore `std::size_t smtrat::Module::mNumOfBranchVarsToStore = 5 [static], [inherited]`

The number of different variables to consider for a probable infinite loop of branchings.

0.15.230.5.18 mObjectiveVariable `carl::Variable smtrat::Module::mObjectiveVariable [protected], [inherited]`

Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.

0.15.230.5.19 mOldSplittingVariables `std::vector< FormulaT > smtrat::Module::mOldSplitting↩ Variables [static], [inherited]`

Reusable splitting variables.

0.15.230.5.20 mpManager `Manager* const smtrat::Module::mpManager [protected], [inherited]`

A reference to the manager.

0.15.230.5.21 mSmallerMusesCheckCounter `unsigned smtrat::Module::mSmallerMusesCheckCounter [mutable], [protected], [inherited]`

Counter used for the generation of the smt2 files to check for smaller muses.

0.15.230.5.22 mSolverState `std::atomic<Answer> smtrat::Module::mSolverState [protected], [inherited]`

States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.

0.15.230.5.23 mTheoryPropagations `std::vector<TheoryPropagation> smtrat::Module::mTheory↩ Propagations [protected], [inherited]`

0.15.230.5.24 mUsedBackends `std::vector<Module*> smtrat::Module::mUsedBackends [protected], [inherited]`

The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).

0.15.230.5.25 mVariableCounters `std::vector<std::size_t> smtrat::Module::mVariableCounters [protected], [inherited]`

Maps variables to the number of their occurrences.

`#include <IncWidthModule.h>`

Public Types

- typedef Settings SettingsType
- enum class LemmaType : unsigned { NORMAL = 0 , PERMANENT = 1 }

Public Member Functions

- std::string moduleName () const
- IncWidthModule (const ModuleInput *_formula, Conditionals &_conditionals, Manager *_manager=NULL)
- ~IncWidthModule ()
- bool addCore (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- void removeCore (ModuleInput::const_iterator _subformula)

  Removes the subformula of the received formula at the given position to the considered ones of this module.
- void updateModel () const

  Updates the current assignment into the model.
- Answer checkCore ()

  Checks the received formula for consistency.
- bool inform (const FormulaT &_constraint)

  Informs the module about the given constraint.
- void deinform (const FormulaT &_constraint)

The inverse of informing about a constraint.

- virtual void init ()

  Informs all backends about the so far encountered constraints, which have not yet been communicated.
- bool add (ModuleInput::const_iterator _subformula)

  The module has to take the given sub-formula of the received formula into account.
- virtual Answer check (bool _final=false, bool _full=true, carl::Variable _objective=carl::Variable::NO_↩ VARIABLE)

  Checks the received formula for consistency.
- virtual void remove (ModuleInput::const_iterator _subformula)

  Removes everything related to the given sub-formula of the received formula.
- virtual void updateAllModels ()

  Updates all satisfying models, if the solver has detected the consistency of the received formula, beforehand.
- virtual std::list< std::vector< carl::Variable > > getModelEqualities () const

  Partition the variables from the current model into equivalence classes according to their assigned value.
- unsigned currentlySatisfiedByBackend (const FormulaT &_formula) const
- virtual unsigned currentlySatisfied (const FormulaT &) const
- bool receivedVariable (carl::Variable::Arg _var) const
- Answer solverState () const
- std::size_t id () const
- void setId (std::size_t _id)

  Sets this modules unique ID to identify itself.
- thread_priority threadPriority () const
- void setThreadPriority (thread_priority _threadPriority)

  Sets the priority of this module to get a thread for running its check procedure.
- const ModuleInput * pReceivedFormula () const
- const ModuleInput & rReceivedFormula () const
- const ModuleInput * pPassedFormula () const
- const ModuleInput & rPassedFormula () const
- const Model & model () const
- const std::vector< Model > & allModels () const
- const std::vector< FormulaSetT > & infeasibleSubsets () const
- const std::vector< Module * > & usedBackends () const
- const carl::FastSet< FormulaT > & constraintsToInform () const
- const carl::FastSet< FormulaT > & informedConstraints () const
- void addLemma (const FormulaT &_lemma, const LemmaType &_lt=LemmaType::NORMAL, const FormulaT &_preferredFormula=FormulaT(carl::FormulaType::TRUE))

  Stores a lemma being a valid formula.
- bool hasLemmas ()

  Checks whether this module or any of its backends provides any lemmas.
- void clearLemmas ()

  Deletes all yet found lemmas.
- const std::vector< Lemma > & lemmas () const
- ModuleInput::const_iterator firstUncheckedReceivedSubformula () const
- ModuleInput::const_iterator firstSubformulaToPass () const
- void receivedFormulaChecked ()

  Notifies that the received formulas has been checked.
- const smtrat::Conditionals & answerFound () const
- bool isPreprocessor () const
- carl::Variable objective () const
- bool is_minimizing () const
- void excludeNotReceivedVariablesFromModel () const

  Excludes all variables from the current model, which do not occur in the received formula.
- void updateLemmas ()

Stores all lemmas of any backend of this module in its own lemma vector.

- void collectTheoryPropagations ()
- void collectOrigins (const FormulaT &_formula, FormulasT &_origins) const

  Collects the formulas in the given formula, which are part of the received formula.
- void collectOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- bool hasValidInfeasibleSubset () const
- void checkInfSubsetForMinimality (std::vector< FormulaSetT >::const_iterator _infsubset, const std::string &_filename="smaller_muses", unsigned _maxSizeDifference=1) const

  Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.
- virtual std::pair< bool, FormulaT > getReceivedFormulaSimplified ()
- void print (const std::string &_initiation="***") const

  Prints everything relevant of the solver.
- void printReceivedFormula (const std::string &_initiation="***") const

  Prints the vector of the received formula.
- void printPassedFormula (const std::string &_initiation="***") const

  Prints the vector of passed formula.
- void printInfeasibleSubsets (const std::string &_initiation="***") const

  Prints the infeasible subsets.
- void printModel (std::ostream &_out=std::cout) const

  Prints the assignment of this module satisfying its received formula if it satisfiable and this module could find an assignment.
- void printAllModels (std::ostream &_out=std::cout)

  Prints all assignments of this module satisfying its received formula if it satisfiable and this module could find an assignment.

Static Public Member Functions

- static void freeSplittingVariable (const FormulaT &_splittingVariable)

Static Public Attributes

- static size_t mNumOfBranchVarsToStore = 5

  The number of different variables to consider for a probable infinite loop of branchings.
- static std::vector< Branching > mLastBranches = std::vector<Branching>(mNumOfBranchVarsToStore, Branching(typename Poly::PolyType(), 0))

  Stores the last branches in a cycle buffer.
- static size_t mFirstPosInLastBranches = 0

  The beginning of the cyclic buffer storing the last branches.
- static std::vector< FormulaT > mOldSplittingVariables

  Reusable splitting variables.

Protected Member Functions

- virtual bool informCore ([[maybe_unused]] const FormulaT &_constraint)

  Informs the module about the given constraint.
- virtual void deinformCore ([[maybe_unused]] const FormulaT &_constraint)

  The inverse of informing about a constraint.
- virtual bool addCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  The module has to take the given sub-formula of the received formula into account.
- virtual void removeCore ([[maybe_unused]] ModuleInput::const_iterator formula)

  Removes everything related to the given sub-formula of the received formula.
- bool anAnswerFound () const

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

- void clearModel () const

  Clears the assignment, if any was found.
- void clearModels () const

  Clears all assignments, if any was found.
- void cleanModel () const

  Substitutes variable occurrences by its model value in the model values of other variables.
- ModuleInput::iterator passedFormulaBegin ()
- ModuleInput::iterator passedFormulaEnd ()
- void addOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)

  Adds the given set of formulas in the received formula to the origins of the given passed formula.
- const FormulaT & getOrigins (ModuleInput::const_iterator _formula) const

  Gets the origins of the passed formula at the given position.
- void getOrigins (const FormulaT &_formula, FormulasT &_origins) const
- void getOrigins (const FormulaT &_formula, FormulaSetT &_origins) const
- std::pair< ModuleInput::iterator, bool > removeOrigin (ModuleInput::iterator _formula, const FormulaT &_origin)
- std::pair< ModuleInput::iterator, bool > removeOrigins (ModuleInput::iterator _formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)
- void informBackends (const FormulaT &_constraint)

  Informs all backends of this module about the given constraint.
- virtual void addConstraintToInform (const FormulaT &_constraint)

  Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.
- std::pair< ModuleInput::iterator, bool > addReceivedSubformulaToPassedFormula (ModuleInput::const_iterator _subformula)

  Copies the given sub-formula of the received formula to the passed formula.
- bool originInReceivedFormula (const FormulaT &_origin) const
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula)

  Adds the given formula to the passed formula with no origin.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const std::shared_ptr< std::vector< FormulaT >> &_origins)

  Adds the given formula to the passed formula.
- std::pair< ModuleInput::iterator, bool > addSubformulaToPassedFormula (const FormulaT &_formula, const FormulaT &_origin)

  Adds the given formula to the passed formula.
- void generateTrivialInfeasibleSubset ()

  Stores the trivial infeasible subset being the set of received formulas.
- void receivedFormulasAsInfeasibleSubset (ModuleInput::const_iterator _subformula)

  Stores an infeasible subset consisting only of the given received formula.
- std::vector< FormulaT >::const_iterator findBestOrigin (const std::vector< FormulaT > &_origins) const
- void getInfeasibleSubsets ()

  Copies the infeasible subsets of the passed formula.
- std::vector< FormulaSetT > getInfeasibleSubsets (const Module &_backend) const

  Get the infeasible subsets the given backend provides.
- const Model & backendsModel () const

  Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.
- void getBackendsModel () const
- void getBackendsAllModels () const

  Stores all models of a backend in the list of all models of this module.
- virtual Answer runBackends (bool _final, bool _full, carl::Variable _objective)

  Runs the backend solvers on the passed formula.

- virtual Answer runBackends ()
- virtual ModuleInput::iterator eraseSubformulaFromPassedFormula (ModuleInput::iterator _subformula, bool _ignoreOrigins=false)

  Removes everything related to the sub-formula to remove from the passed formula in the backends of this module.
- void clearPassedFormula ()
- std::vector< FormulaT > merge (const std::vector< FormulaT > &, const std::vector< FormulaT > &) const

  Merges the two vectors of sets into the first one.
- size_t determine_smallest_origin (const std::vector< FormulaT > &origins) const
- bool probablyLooping (const typename Poly::PolyType &_branchingPolynomial, const Rational &_branchingValue) const

  Checks whether given the current branching value and branching variable/polynomial it is (highly) probable that this branching is part of an infinite loop of branchings.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)

  Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
- bool branchAt (const Poly &_polynomial, bool _integral, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, std::vector< FormulaT > &&_premise, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false)
- bool branchAt (carl::Variable::Arg _var, const Rational &_value, bool _leftCaseWeak=true, bool _preferLeftCase=true, bool _useReceivedFormulaAsPremise=false, const std::vector< FormulaT > &_premise=std::vector< FormulaT >())
- void splitUnequalConstraint (const FormulaT &)

  Adds the following lemmas for the given constraint p!=0.
- unsigned checkModel () const
- void addInformationRelevantFormula (const FormulaT &formula)

  Adds a formula to the InformationRelevantFormula.
- const std::set< FormulaT > & getInformationRelevantFormulas ()

  Gets all InformationRelevantFormulas.
- bool isLemmaLevel (LemmaLevel level)

  Checks if current lemma level is greater or equal to given level.

Static Protected Member Functions

- static bool modelsDisjoint (const Model &_modelA, const Model &_modelB)

  Checks whether there is no variable assigned by both models.

Protected Attributes

- std::vector< FormulaSetT > mInfeasibleSubsets

  Stores the infeasible subsets.
- Manager *const mpManager

  A reference to the manager.
- Model mModel

  Stores the assignment of the current satisfiable result, if existent.
- std::vector< Model > mAllModels

  Stores all satisfying assignments.
- bool mModelComputed

  True, if the model has already been computed.
- bool mFinalCheck

  true, if the check procedure should perform a final check which especially means not to postpone splitting decisions

- bool mFullCheck

  false, if this module should avoid too expensive procedures and rather return unknown instead.
- carl::Variable mObjectiveVariable

  Objective variable to be minimized. If set to NO_VARIABLE, a normal sat check should be performed.
- std::vector< TheoryPropagation > mTheoryPropagations
- std::atomic< Answer > mSolverState

  States whether the received formula is known to be satisfiable or unsatisfiable otherwise it is set to unknown.
- std::atomic_bool * mBackendsFoundAnswer

  This flag is passed to any backend and if it determines an answer to a prior check call, this flag is fired.
- Conditionals mFoundAnswer

  Vector of Booleans: If any of them is true, we have to terminate a running check procedure.
- std::vector< Module * > mUsedBackends

  The backends of this module which are currently used (conditions to use this module are fulfilled for the passed formula).
- std::vector< Module * > mAllBackends

  The backends of this module which have been used.
- std::vector< Lemma > mLemmas

  Stores the lemmas being valid formulas this module or its backends made.
- ModuleInput::iterator mFirstSubformulaToPass

  Stores the position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.
- carl::FastSet< FormulaT > mConstraintsToInform

  Stores the constraints which the backends must be informed about.
- carl::FastSet< FormulaT > mInformedConstraints

  Stores the position of the first constraint of which no backend has been informed about.
- ModuleInput::const_iterator mFirstUncheckedReceivedSubformula

  Stores the position of the first (by this module) unchecked sub-formula of the received formula.
- unsigned mSmallerMusesCheckCounter

  Counter used for the generation of the smt2 files to check for smaller muses.
- std::vector< std::size_t > mVariableCounters

  Maps variables to the number of their occurrences.

0.15.238.4 Member Function Documentation

0.15.238.4.1 add() bool smtrat::Module::add (

```
            ModuleInput::const_iterator _subformula )  [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.238.4.2 addConstraintToInform() void smtrat::Module::addConstraintToInform (

```
            const FormulaT & _constraint )  [protected], [virtual], [inherited]
```

Adds a constraint to the collection of constraints of this module, which are informed to a freshly generated backend.

Parameters

_constraint	The constraint to add.

Reimplemented in smtrat::SATModule< Settings >.

0.15.238.4.3 addCore() [1/2] virtual bool smtrat::Module::addCore (

```
            [[maybe_unused] ] ModuleInput::const_iterator formula )  [inline], [protected],
[virtual], [inherited]
```

The module has to take the given sub-formula of the received formula into account.

Parameters

formula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.238.4.4 addCore() [2/2] template<typename Settings >

```
bool smtrat::IncWidthModule< Settings >::addCore (
            ModuleInput::const_iterator _subformula )
```

The module has to take the given sub-formula of the received formula into account.

Parameters

_subformula	The sub-formula to take additionally into account.

Returns

false, if it can be easily decided that this sub-formula causes a conflict with the already considered sub-formulas; true, otherwise.

0.15.238.4.5 addInformationRelevantFormula()

```
void smtrat::Module::addInformationRelevantFormula
(
            const FormulaT & formula )  [protected], [inherited]
```

Adds a formula to the InformationRelevantFormula.

Parameters

formula	Formula to add

0.15.238.4.6 addLemma()

```
void smtrat::Module::addLemma (
            const FormulaT & _lemma,
            const LemmaType & _lt = LemmaType::NORMAL,
            const FormulaT & _preferredFormula = FormulaT( carl::FormulaType::TRUE ) )  [inline],
[inherited]
```

Stores a lemma being a valid formula.

Parameters

_lemma	The eduction/lemma to store.
_lt	The type of the lemma.
_preferredFormula	Hint for the next decision, which formula should be assigned to true.

0.15.238.4.7 addOrigin()

```
void smtrat::Module::addOrigin (
            ModuleInput::iterator _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given set of formulas in the received formula to the origins of the given passed formula.

Parameters

_formula	The passed formula to set the origins for.
_origin	A set of formulas in the received formula of this module.

0.15.238.4.8 addReceivedSubformulaToPassedFormula()

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addReceivedSubformulaToPassedFormula (
            ModuleInput::const_iterator _subformula )  [inline], [protected], [inherited]
```

Copies the given sub-formula of the received formula to the passed formula.
Note, that there is always a link between sub-formulas of the passed formulas to sub-formulas of the received formulas, which are responsible for its occurrence.

Parameters

_subformula	The sub-formula of the received formula to copy.

0.15.238.4.9 addSubformulaToPassedFormula() [1/3]

```
std::pair<ModuleInput::iterator,bool> smtrat↩
::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula with no origin.
Note that in the next call of this module's removeSubformula, all formulas in the passed formula without origins will be removed.

Parameters

_formula	The formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.238.4.10 addSubformulaToPassedFormula() [2/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const FormulaT & _origin )  [inline], [protected], [inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origin	The sub-formula of the received formula being responsible for the occurrence of the formula to add to the passed formula.

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.238.4.11 addSubformulaToPassedFormula() [3/3]

```
std::pair<ModuleInput::iterator,bool>
smtrat::Module::addSubformulaToPassedFormula (
            const FormulaT & _formula,
            const std::shared_ptr< std::vector< FormulaT >> & _origins )  [inline], [protected],
[inherited]
```

Adds the given formula to the passed formula.

Parameters

_formula	The formula to add to the passed formula.
_origins	The link of the formula to add to the passed formula to sub-formulas of the received formulas, which are responsible for its occurrence

Returns

A pair to the position where the formula to add has been inserted (or its first sub-formula which has not yet been in the passed formula, in case the formula to add is a conjunction), and a Boolean stating whether anything has been added to the passed formula.

0.15.238.4.12 allModels() `const std::vector<Model>& smtrat::Module::allModels ( ) const [inline], [inherited]`

Returns

All satisfying assignments, if existent.

0.15.238.4.13 anAnswerFound() `bool smtrat::Module::anAnswerFound ( ) const [inline], [protected], [inherited]`

Checks for all antecedent modules and those which run in parallel with the same antecedent modules, whether one of them has determined a result.

Returns

True, if one of them has determined a result.

0.15.238.4.14 answerFound() `const smtrat::Conditionals& smtrat::Module::answerFound ( ) const [inline], [inherited]`

Returns

A vector of Booleans: If any of them is true, we have to terminate a running check procedure.

0.15.238.4.15 backendsModel() `const Model & smtrat::Module::backendsModel ( ) const [protected], [inherited]`

Stores the model of a backend which determined satisfiability of the passed formula in the model of this module.

0.15.238.4.16 branchAt() [1/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline], [protected], [inherited]
```

0.15.238.4.17 branchAt() [2/4]

```
bool smtrat::Module::branchAt (
    carl::Variable::Arg _var,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [inline], [protected], [inherited]
```

0.15.238.4.18 branchAt() [3/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false,
    const std::vector< FormulaT > & _premise = std::vector<FormulaT>() ) [inline],
[protected], [inherited]
```

0.15.238.4.19 branchAt() [4/4]

```
bool smtrat::Module::branchAt (
    const Poly & _polynomial,
    bool _integral,
    const Rational & _value,
    std::vector< FormulaT > && _premise,
    bool _leftCaseWeak = true,
    bool _preferLeftCase = true,
    bool _useReceivedFormulaAsPremise = false ) [protected], [inherited]
```

Adds a lemmas which provoke a branching for the given variable at the given value, if this module returns Unknown and there exists a preceding SATModule.
Note that the given value is rounded down and up, if the given variable is integer-valued.

Parameters

_polynomial	The variable to branch for.
_integral	A flag being true, if all variables in the polynomial to branch for are integral.
_value	The value to branch at.
_premise	The sub-formulas of the received formula from which the branch is followed. Note, that a premise is not necessary, as every branch is a valid formula. But a premise can prevent from branching unnecessarily.
_leftCaseWeak	true, if a branching in the form of (or (<= p b) (> p b)) is desired. false, if a branching in the form of (or (< p b) (>= p b)) is desired.
_preferLeftCase	true, if the left case (polynomial less(or equal) 0 shall be chosen first. false, otherwise.
_useReceivedFormulaAsPremise	true, if the whole received formula should be used as premise

0.15.238.4.20 check()

```
Answer smtrat::Module::check (
    bool _final = false,
    bool _full = true,
    carl::Variable _objective = carl::Variable::NO_VARIABLE ) [virtual], [inherited]
```

Checks the received formula for consistency.
Note, that this is an implementation of the satisfiability check of the conjunction of the so far received formulas, which does actually nothing but passing the problem to its backends. This implementation is only used internally and must be overwritten by any derived module.

Parameters

_final	true, if this satisfiability check will be the last one (for a global sat-check), if its result is SAT
_full	false, if this module should avoid too expensive procedures and rather return unknown instead.
_objective	if not set to NO_VARIABLE, the module should find an assignment minimizing this objective variable; otherwise any assignment is good.

Returns

True, if the received formula is satisfiable; False, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented in smtrat::PModule.

0.15.238.4.21 checkCore()

`template<typename Settings >`
`Answer smtrat::IncWidthModule< Settings >::checkCore ( ) [virtual]`

Checks the received formula for consistency.

Returns

SAT, if the received formula is satisfiable; UNSAT, if the received formula is not satisfiable; Unknown, otherwise.

Reimplemented from smtrat::Module.

0.15.238.4.22 checkInfSubsetForMinimality()

```
void smtrat::Module::checkInfSubsetForMinimality (
std::vector< FormulaSetT >::const_iterator _infsubset,
const std::string & _filename = "smaller_muses",
unsigned _maxSizeDifference = 1 ) const [inherited]
```

Checks the given infeasible subset for minimality by storing all subsets of it, which have a smaller size which differs from the size of the infeasible subset not more than the given threshold.

Parameters

_infsubset	The infeasible subset to check for minimality.
_filename	The name of the file to store the infeasible subsets in order to be able to check their infeasibility.
_maxSizeDifference	The maximal difference between the sizes of the subsets compared to the size of the infeasible subset.

0.15.238.4.23 checkModel()

`unsigned smtrat::Module::checkModel ( ) const [protected], [inherited]`

Returns

false, if the current model of this module does not satisfy the current given formula; true, if it cannot be said whether the model satisfies the given formula.

0.15.238.4.24 cleanModel()

`void smtrat::Module::cleanModel ( ) const [inline], [protected], [inherited]`

Substitutes variable occurrences by its model value in the model values of other variables.

0.15.238.4.25 clearLemmas()

`void smtrat::Module::clearLemmas ( ) [inline], [inherited]`

Deletes all yet found lemmas.

0.15.238.4.26 clearModel()

`void smtrat::Module::clearModel ( ) const [inline], [protected], [inherited]`

Clears the assignment, if any was found.

0.15.238.4.27 clearModels()

`void smtrat::Module::clearModels ( ) const [inline], [protected], [inherited]`

Clears all assignments, if any was found.

0.15.238.4.28 clearPassedFormula()

`void smtrat::Module::clearPassedFormula ( ) [protected], [inherited]`

0.15.238.4.29 collectOrigins() [1/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulaSetT & _origins ) const [inherited]
```

0.15.238.4.30 collectOrigins() [2/2]

```
void smtrat::Module::collectOrigins (
    const FormulaT & _formula,
    FormulasT & _origins ) const [inherited]
```

Collects the formulas in the given formula, which are part of the received formula.
If the given formula directly occurs in the received formula, it is inserted into the given set. Otherwise, the given formula must be of type AND and all its sub-formulas part of the received formula. Hence, they will be added to the given set.

Parameters

_formula	The formula from which to collect the formulas being sub-formulas of the received formula (origins).
_origins	The set in which to store the origins.

0.15.238.4.31 collectTheoryPropagations()

`void smtrat::Module::collectTheoryPropagations ( ) [inherited]`

0.15.238.4.32 constraintsToInform()

`const carl::FastSet<FormulaT>& smtrat::Module::constraints↩ ToInform ( ) const [inline], [inherited]`

Returns

The constraints which the backends must be informed about.

0.15.238.4.33 currentlySatisfied()

```
virtual unsigned smtrat::Module::currentlySatisfied (
    const FormulaT & ) const [inline], [virtual], [inherited]
```

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise; 3, if we do not know anything (default)

Reimplemented in smtrat::LRAModule< Settings >, smtrat::LRAModule< LRASettingsICP >, and smtrat::LRAModule< LRASettings

0.15.238.4.34 currentlySatisfiedByBackend()

```
unsigned smtrat::Module::currentlySatisfiedByBackend (
    const FormulaT & _formula ) const [inherited]
```

Returns

0, if the given formula is conflicted by the current model; 1, if the given formula is satisfied by the current model; 2, otherwise 3, if we do not know anything (default)

0.15.238.4.35 deinform()

```
void smtrat::Module::deinform (
    const FormulaT & _constraint ) [inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.238.4.36 deinformCore()

```
virtual void smtrat::Module::deinformCore (
    [[maybe_unused] ] const FormulaT & _constraint ) [inline], [protected], [virtual],
[inherited]
```

The inverse of informing about a constraint.
All data structures which were kept regarding this constraint are going to be removed. Note, that this makes only sense if it is not likely enough that a formula with this constraint must be solved again.

Parameters

_constraint	The constraint to remove from internal data structures.

0.15.238.4.37 determine_smallest_origin()

```
size_t smtrat::Module::determine_smallest_origin (
    const std::vector< FormulaT > & origins ) const [protected], [inherited]
```

Parameters

origins	A vector of sets of origins.

Returns

The index of the smallest (regarding the size of the sets) element of origins

0.15.238.4.38 eraseSubformulaFromPassedFormula()

```
ModuleInput::iterator smtrat::Module::erase↩
SubformulaFromPassedFormula (
    ModuleInput::iterator _subformula,
    bool _ignoreOrigins = false ) [protected], [virtual], [inherited]
```

Removes everything related to the sub-formula to remove from the passed formula in the backends of this module. Afterwards the sub-formula is removed from the passed formula.

Parameters

_subformula	The sub-formula to remove from the passed formula.

Parameters

_ignoreOrigins	True, if the sub-formula shall be removed regardless of its origins (should only be applied with expertise).

Returns

Reimplemented in smtrat::ICPModule< Settings >, smtrat::ICPModule< ICPSettings4 >, and smtrat::ICPModule< ICPSettings1 >.

0.15.238.4.39 excludeNotReceivedVariablesFromModel()

`void smtrat::Module::excludeNotReceivedVariablesFromModel ( ) const [inherited]`

Excludes all variables from the current model, which do not occur in the received formula.

0.15.238.4.40 findBestOrigin()

```
std::vector< FormulaT >::const_iterator smtrat::Module::findBestOrigin (
            const std::vector< FormulaT > & _origins ) const [protected], [inherited]
```

Parameters

_origins	

Returns

0.15.238.4.41 firstSubformulaToPass()

`ModuleInput::const_iterator smtrat::Module::firstSubformulaToPass ( ) const [inline], [inherited]`

Returns

The position of the first sub-formula in the passed formula, which has not yet been considered for a consistency check of the backends.

0.15.238.4.42 firstUncheckedReceivedSubformula()

`ModuleInput::const_iterator smtrat::Module::firstUncheckedReceivedSubformula ( ) const [inline], [inherited]`

Returns

The position of the first (by this module) unchecked sub-formula of the received formula.

0.15.238.4.43 freeSplittingVariable()

```
static void smtrat::Module::freeSplittingVariable (
            const FormulaT & _splittingVariable ) [inline], [static], [inherited]
```

0.15.238.4.44 generateTrivialInfeasibleSubset()

`void smtrat::Module::generateTrivialInfeasibleSubset ( ) [inline], [protected], [inherited]`

Stores the trivial infeasible subset being the set of received formulas.

0.15.238.4.45 getBackendsAllModels() `void smtrat::Module::getBackendsAllModels ( ) const [protected], [inherited]`

Stores all models of a backend in the list of all models of this module.

0.15.238.4.46 getBackendsModel() `void smtrat::Module::getBackendsModel ( ) const [protected], [inherited]`

0.15.238.4.47 getInfeasibleSubsets() [1/2] `void smtrat::Module::getInfeasibleSubsets ( ) [protected], [inherited]`

Copies the infeasible subsets of the passed formula.

0.15.238.4.48 getInfeasibleSubsets() [2/2] `std::vector< FormulaSetT > smtrat::Module::getInfeasibleSubsets ( const Module & _backend ) const [protected], [inherited]`

Get the infeasible subsets the given backend provides.
Note, that an infeasible subset in a backend contains sub formulas of the passed formula and an infeasible subset of this module contains sub formulas of the received formula. In this method the LATTER is returned.

Parameters

_backend	The backend from which to obtain the infeasible subsets.

Returns

The infeasible subsets the given backend provides.
